BRITISH LIBRARY

Oceanography. *Verh. Ges. Erdk. Berlin* **25** (1898): 111–127. **Schott.**

Dr. Gerhard Schott: Die oceanographischen Aufgaben und der voraussichtliche Verlauf der geplanten deutschen Tiefsee-Expedition 1898–99.

This is referred to in a note, vol. xi. p. 673.

Oceanography. *B.S.G. Com. Bordeaux* **21** (1898): 81–100. **Thoulet.**

Étude sur la distribution de la magnétite dans les fonds du golfe de Gascogne. Par J. Thoulet. *With Chart.*

Oceanography—Deposits. *P.R.S. Edinburgh* **21** (1897): 25–34. **Hartley.**

On the Cause and Nature of the Chemical Changes occurring in Oceanic Deposits. By Wm. Hartley.

Oceanography—Deposits. *P.R.S. Edinburgh* **21** (1897): 35–39. **Irvine and Murray.**

On Chemical Changes in Marine Muds. By Robert Irvine and John Murray, LL.D.

Oceanography—Fauna. **Monaco.**

Résultats des Campagnes Scientifiques accomplies sur son yacht par le Prince Albert 1er, Prince de Monaco, publiés sous sa direction avec le concours du Baron Jules de Guerne, et M. Jules Richard. Fasc. I.—XII. Imprimerie de Monaco, 1889–1898. Size 14 × 11½. *Maps and Plates. Presented by H.S.H. the Prince of Monaco.*

These fine volumes contain the reports of specialists on the collections made by the Prince of Monaco on his yacht.

Oceanography—North Atlantic. **Pettersson and Ekman.**

Die hydrographischen Verhältnisse der Oberen Wasserschichten des nördlichen Nordmeeres zwischen Spitzbergen, Grönland und der Norwegischen Küste in den Jahren 1896 und 1897. Von O. Pettersson und G. Ekman. Unter Mitwirkung von P. T. Cleve.—Bihang till K. Svenska Vet.-Akad. Handlingar. Band 23, Afd. II., No. 4. Stockholm: P. A. Norstedt & Söner, 1898. Size 8½ × 6, pp. 56. *Maps and Plate. Presented by the Authors.*

The results of this research are given by Prof. Pettersson in the *Journal* for June, vol. xi. p. 611.

Physical Geography. **Klein.**

Jahrbuch der Astronomie und Geophysik. Enthaltend die wichtigsten Fortschritte auf den Gebieten der Astrophysik, Meteorologie und physikalischen Erdkunde. Unter Mitwirkung von Fachmännern herausgegeben von Dr. Hermann J. Klein. VIII. Jahrgang, 1897. Leipzig: E. H. Mayer, 1898. Size 9 × 6, pp. viii. and 370. *Maps and Plates.*

River-temperature. *P. & T.R.S. Canada* **2** (1896) (Sec. iii.): 37–44. **Barnes.**

On some Measurements of the Temperature of the River Water opposite Montreal, made during the Winter with a Differential Platinum Thermometer. By Howard T. Barnes.

Sand-dunes. *Le Globe, B.S.G. Genève* **37** (1898): 22–31. **Ritter.**

Les Dunes. Par M. Étienne Ritter.

This short paper deals with continental or desert dunes, sea-shore dunes, the formation of inverse dunes, small sand-waves—in which the two slopes are different from those of large dunes—on the geographical distribution of the large and the inverse dunes in a chain, and on the dimensions of the constituent sand-grains.

Seismology. *British Assoc. Reports* (1897): 129–206. **Milne.**

Seismological Investigations.—Second Report of the Committee. *With Diagrams.*

This report includes a record of the work done in establishing a seismological survey of the world, accounts of various seismological researches, and of suboceanic changes, all by Prof. John Milne.

Soil Temperatures. **Callendar and McLeod.**

P. & T.R.S. Canada **2** (1896) (Sec. iii): 109–117.

Observations of Soil Temperatures with Electrical Resistance Thermometers. By Hugh L. Callendar and C. H. McLeod. *With Diagrams.*

Terrestrial Magnetism. *P.R.S.* **63** (1898): 64–78. **Ellis.**

On the Relation between the Diurnal Range of Magnetic Declination and Horizontal Force and the Period of Solar Spot Frequency. By William Ellis, F.R.S. *With Diagrams.*

Terrestrial Magnetism. **Naumann.**
Geotektonik und Erdmagnetismus. Von Dr. Edmund Naumann.—Verhandlungen des Zwölften Deutschen Geographentages, Jena 1897. Berlin: D. Reimer, 1897. Pp. 142–166. *Plate.*

Terrestrial Magnetism. **Schmidt.**
Die geographischen Aufgaben der erdmagnetischen Forschung. Von Gymnasial-Oberlehrer Dr. Adolf Schmidt.—Verhandlungen des Zwölften Deutschen Geographentages, Jena 1897. Berlin: D. Reimer, 1897. Pp. 124–141.

Terrestrial Magnetism. **Carlheim-Gyllensköld.**
Sur la forme analytique de l'attraction magnétique de la Terre, exprimée en fonction du temps. . . . Af V. Carlheim-Gyllensköld. Stockholm: P. A. Norstedt & Söner, 1896. Size 9½ × 8, pp. 36. *Presented by the University of Upsala.*

Terrestrial Magnetism. *Ann. Hydrographie* **26** (1898): 21–31. **Schmidt.**
Ueber die Darstellung der Ergebnisse erdmagnetischer Beobachtungen im Anschluss an die Theorie. Von Dr. Ad. Schmidt.

Terrestrial Magnetism. *Terrestrial Magnetism* **2** (1897): 105–114. **Eschenhagen.**
On Minute, Rapid, Periodic Changes of the Earth's Magnetism. By Prof. Max Eschenhagen.

Terrestrial Magnetism. **Leist.**
The Influence of Planets on the Observed Phenomena of Terrestial Magnetism. By Ernest Leist. Moscow, 1892. Size 9 × 6, pp. 1–123. *Maps and Diagrams.* [In Russian.]
Works published by the Physico-Mathematical Faculty of the University of Yuryeff (Dorpat). The data and discussion are given.

Terrestrial Magnetism. *Nature* **57** (1897): 160–163, 180–184. **Rücker.**
Recent Researches on Terrestrial Magnetism. By Prof. A. W. Rücker, F.R.S. *With Diagrams.*
This is a report of the Rede Lecture, an abstract of which appears in the *Journal* for May, vol. xi. p. 522.

Tides. *J. School G.* **2** (1898): 122–132. **Davis.**
Waves and Tides. By W. M. Davis.
A clear and simple statement of the essential principles of wave and tidal motion in water.

Underground Water. *Die Natur* **47** (1898): 17–19, 30–32, 40–41. **Ule.**
Das Wasser im Boden. Von Willi Ule.

Zoogeography. *C. Rd.* **126** (1898): 1358–1361. **Bouvier.**
Note préliminaire sur la distribution géographique et l'évolution des Péripates. Note de M. E. L. Bouvier.
Peripatus is a low form of articulated animal hitherto known only in Central America and the West Indies, the Cape of Good Hope, Australia, and New Zealand. The author shows that it also occurs in Gabun, and is there of a form intermediate between that of Central America and South Africa. The bearing of this fact on the former distribution of land and sea is of some importance.

Zoogeography. *P.R. Dublin S.* **8** (1897): 439–468. **Carpenter.**
The Geographical Distribution of Dragon-flies. By George H. Carpenter, B.SC. *With Map.*
The map shows the approximate range of dragon-fly faunas, and closely corresponds to the faunal regions deduced from the study of the distribution of mammalia.

Zoogeography. *Natural Science* **12** (1898): 100–105. **Duerden.**
The Geographical Distribution of the Actinaria of Jamaica. By J. E. Duerden, B.SC.
This subject is treated as bearing on the question of a former connection between the Atlantic and Pacific across Central America. A considerable amount of agreement has been found between the Pacific coast actinarians of Central America and those of Jamaica.

ANTHROPOGEOGRAPHY AND HISTORICAL GEOGRAPHY.

Geographical Progress. *L'Universo* **8** (1898): 81–86, 97–101. **Porena.**

Il Giubileo della Nuova geografia. Del Prof. Filippo Porena.

The inaugural discourse of the University of Naples summarized, on the progress of geographical exploration during the last half-century.

Historical. **Castanhoso and Pereira.**

Quarto Centenario do Descobrimento da India. Contribuições da Sociedade de Geographia de Lisboa. Dos feitos de D. Christovam da Gama em Ethiopia. Tratado composto por Miguel de Castanhoso publicado por Francisco Maria Esteves Pereira. Lisboa: Imp. Nacional, 1898. Size 10 × 6½, pp. xlviii. and 154.

Historical. **Lopes.**

Quarto Centenario do Descobrimento da India. Contribuções da Sociedade de Geographia de Lisboa. Textos em Aljamia Portuguesa. Documentos para a Historia do dominio Português em Safim extrahidos dos originaes da Torre do Tombo. Por David Lopes. Lisboa: Imp. Nacional, 1897. Size 10 × 6½, pp. 158.

Historical—Cabot. **Dawson.**

The Voyages of the Cabots, latest phases of the Controversy. By Samuel Edward Dawson, LIT.D. From the *Transactions* of the Royal Society of Canada for 1897. Ottawa: James Hope & Co., 1897. Size 10 × 7, pp. 139–268. *Maps. Presented by the Author.*

Historical—Map. *Riv. G. Italiana* **5** (1898): 50–51. ——

Il planisfero portoghese di Bartolomeo Velio (1561) di recente scoperto nel R. Istituto di Belle Arti in Firenze. Di F. L. P.

Historical—Measures. *B.S.G. Madrid* **39** (1897), (Suppl.): 1–14. **Blázquez.**

La milla romana. Por D. Antonio Blázquez.

The conclusions of this discussion are that the Roman mile, deduced by six different methods, is from 1670 to 1672 metres, *i.e.* from 5479 to 5485 feet, instead of 1481 metres or 4859 feet, as formerly held.

Historical—Mlle. Tinné. *Questions Diplomat. et Colon.* **2** (1898): 75–79. **Vuillot.**

Au Sahara. La vérité sur la mort de M^lle^ Tinné. Par P. Vuillot.

The tribe responsible for the murder of the French traveller, Mlle. Tinné, in 1869 has been the subject of frequent discussion. M. Schirmer having recently recurred to the view that the Tuareg Asjer were guilty of the crime, M. Vuillot here states the case in their favour, and expresses the belief that they have always been loyal to France, and innocent of the murder.

Historical—Vasco da Gama. **Ruge.**

Die Entdeckung des Seeweges nach Ostindien durch Vasco da Gama 1497–8. Vortrag, gehalten in der Gehe-Stiftung zu Dresden am 9 Oktober 1897. Von Prof. Dr. S. Ruge. Dresden: Zahn and Jaensch, 1898. Size 9½ × 6, pp. 48. *Maps.*

Historical—Vasco da Gama. **Ravenstein.**

A Journal of the First Voyage of Vasco da Gama, 1497–1499. Translated and Edited, with Notes, an Introduction and Appendices, by E. G. Ravenstein. London: Printed for the Hakluyt Society, 1898. Size 9 × 6, pp. xxxvi. and 250. *Maps. Presented by the Hakluyt Society.*

This was noticed in the *Journal* for July, p. 20.

NEW MAPS.

By J. COLES, *Map Curator*, R.G.S.

EUROPE.

England and Wales. **Wells.**

Map of Canals and Navigable Rivers of England and Wales. By Lionel B. Wells, M.INST.C.E. Scale 1 : 420,000 or 6·7 stat. miles to an inch. George Falkner & Sons, Manchester and London, 1898. *Price* £2 10*s. in sheets.*

This map shows the present state of inland navigation in England and Wales. By the colouring and manner in which the canals are drawn, the class of vessel by which they can be navigated is shown; those that have fallen into decay are specially distinguished.

England and Wales. **Ordnance Survey.**

Publications issued since June 8, 1898.

1-inch—General Maps:—

ENGLAND AND WALES (revision):—20, 52, 54, 120, 216, 279, 293, engraved in outline. 1*s.* each.

6-inch—County Maps:—

BRITISH LIBRARY

History. Edited by Reginald Lane Poole, M.A., PH.D., Fellow of Magdalen College and Lecturer in Diplomatic in the University of Oxford. Part xviii. *Price* 3*s.* 6*d.* Oxford: The Clarendon Press; London, Edinburgh, Glasgow, and New York: Henry Frowde, M.A.; Edinburgh: W. & A. K. Johnston, 1898. *Presented by the Clarendon Press.*

Part xviii. contains the following maps: No. 7, Europe in 1360, by C. Oman, M.A.; No. 31, Ireland from 1541 to 1653, by Robert Dunlop, M.A.; No. 79, Western Asia at the time of Saladin, A.D. 1190, by Stanley Lane-Poole, M A. Each of these maps is accompanied by explanatory letterpress.

ASIA.

China. **Oxenham.**

Historical Atlas of the Chinese Empire. By E. L. Oxenham, F.R.G.S. (late H.B.M. Consul at Chinkiang). Second edition, giving the original Chinese maps with their English counterparts. London: Royal Geographical Society, and John Murray, 1898. *Price* £1 10*s.*; to Fellows of the R.G.S., 17*s.* 6*d.*

The Chinese edition of this historical atlas appeared in 1887, having been compiled by the late Mr. E. L. Oxenham, F.R.G.S., from original maps, and the Chinese works of Chinese scholars. In consequence of representations made to him, Mr. Oxenham decided to issue a second edition of this atlas, containing the original Chinese maps with their English counterparts. His premature death prevented his carrying out his intention, and the Council of the Royal Geographical Society decided to defray the expense of preparing the atlas in its present form for publication.

Indian Government Surveys. **Surveyor-General's Office, Calcutta.**

India, 128 miles to an inch, 1897.—Indian Atlas, Quarter-sheets, 4 miles to an inch: Nos. 3 N.E., parts of districts Karachi and Hyderabad (Sind, Bombay Presidency), additions to 1895; 26 S.E., part of district Ratnágiri (Bombay Presidency), 1898; No. 48 S.W., parts of districts Hissar and Karnal and Native States of Patiala and Jind (Punjab), 1898; 52 N.W., parts of Native States, Gwalior, and Indore (Central Indian Agency), Oodeypore, Tonk, Jhallawar, and Kotah (Rajputana Agency), additions to 1891; 52 S.E., parts of district Sangor and Bhopal, Gwalior, Pathari, Kurwai, Tonk, Muhammadgarh, and Nawab Básoda (Native States), additions to 1896; 67 S.E., parts of districts Bareilly, Pilibhit, and Shahjahanpur (North-West Provinces), and Kheri (Oudh), additions to 1895; 69 N.W., parts of Gwalior and Bundelkhand (Central India Agency), and of districts Jalaun, Jhansi, Hamirpur, and Etawah (North-West Provinces), additions to 1894; 71 N.E., part of districts Jubbulpore, Damoh, Mandla, and Narsinghpur (Central Provinces), and of Rewah (Central Indian Agency), additions to 1888; 77 S.E., parts of districts Nellore, Coddapah, North Arcot, and Chingleput (Madras Presidency), 1897; 87 N.W., parts of districts Kheri, Bahraich, Sitapur, Baru Banki, and Gonda (Oudh), additions to 1892; 129 N.E., parts of district Lakhimpur (Assam) and the Miri and Mishmi Hills, additions to 1896.—Skeleton map of district Pubnah, 4 miles to an inch, additions to 1897.—District Burdwan (Bengal), 8 miles to an inch, 1890.—District Dacca (Bengal), 8 miles to an inch, 1890.—District Montgomery (Punjab), 8 miles to an inch, 1898.—Punjab Survey, 1 inch to a mile. Parts of district Hissar (Punjab) and Bickaneer State (Rajputana Agency), Seasons 1867-68, 1882-84, corrections to 1895.—Bengal Survey, 1 mile to an inch. Qatar National Library

Anniversary Lodge, 1893–95; (21) Beset off Cape Mercy; (22) Eskimo young man, Whale sound; (23) Eskimo woman, Whale sound; (24) On the Great Ice; (25) Moving the big meteorite; (26) Gnome glacier; (27) Icing sledge shoes; (28) Bowdoin glacier.

Manchuria. **Smith.**

Thirty-two Photographs taken by Dr. Donaldson Smith during his journey through Manchuria, 1897. *Presented by Dr. Donaldson Smith.*

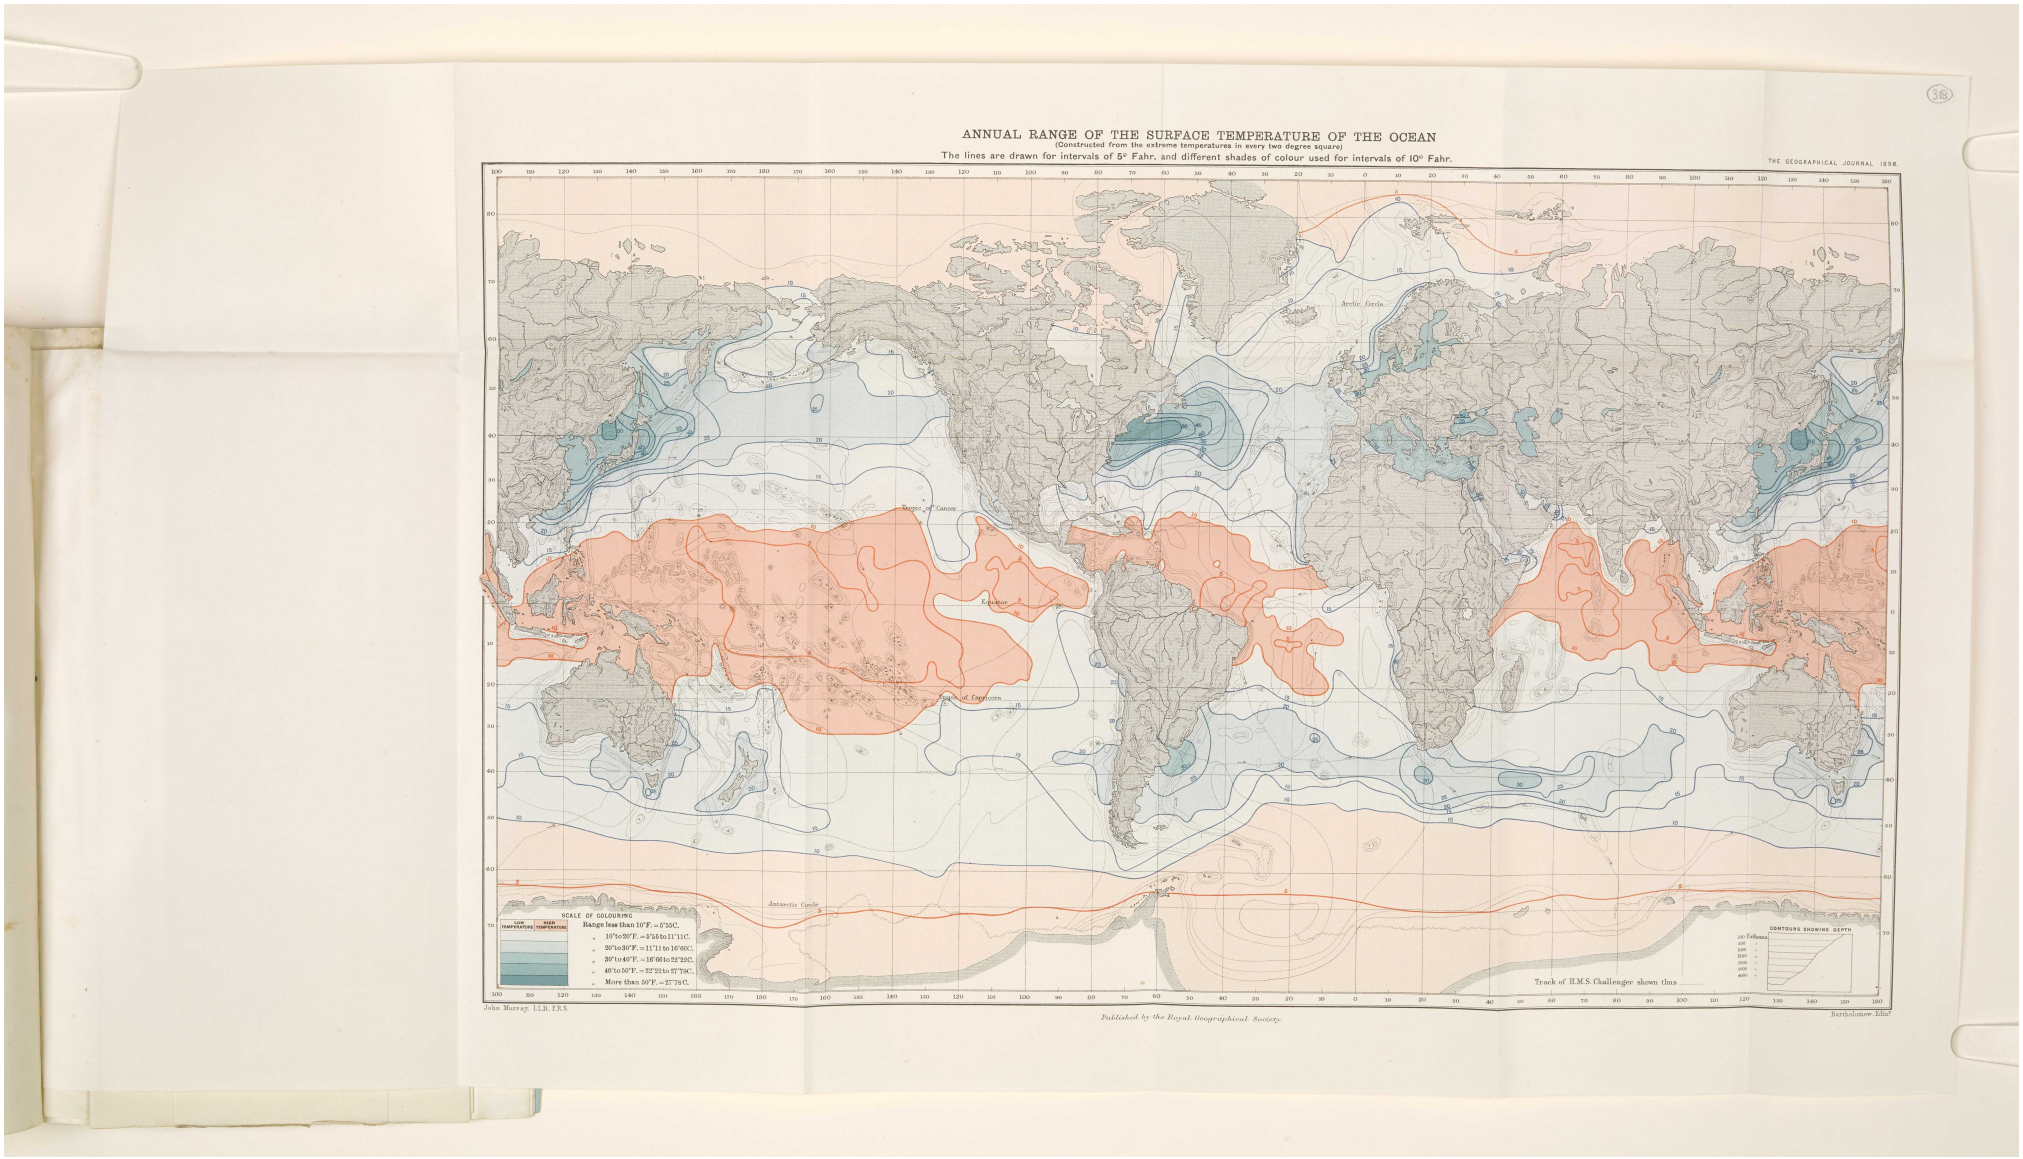
The following is a list of the titles of these photographs:—

(1) Mongolian spotted deer; (2) Yang Shu Pai; (3) A group of Mongols; (4) Salt caravans; (5) Main street of Tsitsihar; (6) Main street in Tsitsihar; (7) Prince Nau Hang Wang; (8) Prince Nau Hang Wang; (9) The "belle" of the Mongols, on the banks of the river Tshor; (10) Chinese junks at Tsitsihar; (11) San Ti Ying, temple and hot springs; (12) The Sungari river from a cattle boat; (13) Taking cart across the river Torre in ferry boat; (14) A Golde (one of the natives of the upper Amur districts) at a railway station near Vladivostock; (15) Mongol village, Hu Pu; (16) At the junction of the Amur and Sungari rivers; (17) Statue of the first governor of the Amur provinces at Kabasopka; (18) Entrance to Lamasery at Ching Pong; (19) Shiao Ho Tsu; (20) Ta Lai Hu Shu; (21) La Ho Ku, Mongols in camp; (22) The river Tshor at Pu La Su Ku, Lamasery in the distance; (23) The river Tshor at Pu La Su Ku; (24) The flooded Nonni; (25) A Nonni steamer on the Amur; (26) Lamas; (27) Mongol women; (28) Mongol village; (29) A Lama and some of his relatives examining a camera; (30) Temple and graves outside of walled town, Shi Hia; (31) Lassooing pony at Dolon Nor; (32) No title.

North-West Frontier of India. **Tate.**

Thirty-four Photographs taken in the neighbourhood of the Railway to Kandahar, by G. P. Tate, Esq. *Presented by G. P. Tate, Esq.*

This set of photographs contains different views of the railway to Kandahar, types of natives, some interesting geological features, and the scenery of the adjacent country. The following is a list of the subjects:—



(1) Chitkan of Panjgur, showing huts for troops in 1892; (2) Village of Turbat in Kej; (3) Types of inhabitants, Kej; (4) Village of Gushtang, in Kej (Makran); (5) Fisher village on the Kalmat creek; (6) Cavalry lines in Chitkan of Panjgur, 1891–92; (7) Tennis court at Chitkan of Panjgur, 1891–92; (8) "A bit" in Panjgur; (9) Fort at Pidárk, Makran; (10) Village on the Kalmat creek, Makran coast; (11) Mir Muhamad Ali Khan, Gichki, Sardar, and Khan's deputy in Panjgur; (12) "A bit" in Panjgur; (13) Fort at Khudabadan, Panjgur; (14) Officer's quarters, and hospital for troops and civil patients, Chitkan of Panjgur, 1891–92; (15) Fort at Hor, Kolwah valley, Kej; (16) General view in Kej, 1891–92; (17) "A bit" in Panjgur; (18) Miri fort in Kej; (19) Bridge near the Mushkáf railway, showing sandstone ridges; (20) "A bit" in Mushkáf-Bolan railway, showing clay and recent stratified rock (sandstones) forming cliffs in Mushkáf river; (21) Inside Kalmat creek, Makran coast, 1891–92; (22) "A bit" showing relative position of railway line as first constructed, and the "high-level" line now in use and recently finished; (23) Railway bridge near river at Mach, Bolan pass; (24) The railway station at Hirok, Mushkáf-Bolan railway; (25) "A bit" on the Mushkáf-Bolan railway; (26) The Laleji plain in Mushkáf-Bolan railway, clay hills capped with sandstones, and containing layers of same; (27) A bridge on the Mushkáf-Bolan railway, showing piers constructed for double line of rails if required; (28) Bridge and tunnel on Mushkáf-Bolan railway; (29) Tunnel through watershed near Kolpur; (30) Kolpur station, and houses of officers and staff, Mushkáf-Bolan railway; (31) "A bit" on railway line near Hirok, showing nature of hills; (32) General view of portion of the line; (33) "A bit" on the Mushkáf-Bolan railway, showing stratified recent sandstones; (34) Mushkáf-Bolan railway, "A bit" in the Bolan pass, showing nature of hills.

N.B.—It would greatly add to the value of the collection of Photographs which has been established in the Map Room, if all the Fellows of the Society who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they will be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

The Society's Policies are The Most Profitable and Useful Documents of the kind that can be obtained,

Every source from which Profit is derivable being so productive, viz. Low Rates of Mortality and Expenditure and Remunerative Investments: with Division of the Whole Profits among the Members. They, also, confer unusual privileges, for

Members may, in their own Option,

1. KEEP UP THEIR POLICIES till they become due in the usual way.
2. HAVE THEM DECLARED "PAID-UP" free of future premiums.
3. BORROW ON THEM any Sums within their Surrender Values.
4. SURRENDER THEM *after payment of one full annual premium.*
5. WHEN POLICIES LAPSE, the Surrender Value is credited to them, and

There are now at **Credit of Lapsed Policies,** notwithstanding the efforts made, by advertisement and otherwise, to find the Members to whom they belonged, or their representatives,

Unclaimed Surrender Values amounting to over £16,000,

application for which may be made to the Directors on forms to be obtained at the Society's Offices or Agencies. Thus, the

SERIOUS OBJECTIONS OFTEN TAKEN TO LIFE ASSURANCE,

that the Policyholder is deprived of the use of his money as long as his Policy exists, or may even lose it altogether in the event of his allowing the Policy to lapse, cannot apply to the Society's Policies, such Inconvenience and Loss being

Absolutely Impossible in the Scottish Widows' Fund.

RESULTS OF THE SOCIETY'S OPERATIONS FOR 1897.

NEW ASSURANCES (net)	£1,337,400	MORTALITY 69 p. cent. of Expectation	
NEW PREMIUMS	£56,318	RATE OF INTEREST p. cent.	£3 18 9
ANNUAL INCOME OVER	£1,540,000	EXPENSES ON PREMS. p. ct.	£9 16 3
CLAIMS PAID	£720,630	ON TOTAL REVENUE p. ct.	£6 4 5
ADDITION TO FUNDS	£642,236	AVERAGE BONUS PAID on Policies of *all durations*	£54 p. ct.
TOTAL FUNDS	£14,142,982		

Tables of Bonuses, Paid-up Policies, Surrender Values, and Loans, referred to in the above Options, practically under all existing Policies, may be had on application.

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that—

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his admission fee, and "£2 as his first annual subscription; or he may compound, either at his entrance by one payment of "£35, or at any subsequent period on the following basis:—

Fellows of 20 years' standing and over	...	...	£12 10s.
„ 15 „ „ and under 20	...		£16
„ 10 „ „ „ 15	...		£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the Society so long as "he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's Periodical Publications.

Copies of the Year Book, Regulations, and Candidates' Certificates may be had on application at the Society's Office, 1, Savile Row, London, W.

28 & 29, St. Swithin's Lane; 62, King William St.; 8, Holborn Viaduct, E.C.

JOSEPH TUCKER,

INDIA, CHINA, COLONIAL, AND FOREIGN STORES,
79, NEWINGTON GREEN ROAD, LONDON, N.

Complete Outfits and Supplies for all Climates can be selected from stock, arranged, packed, and shipped within a few hours.

The latest inventions for saving space and weight and for promoting health and comfort are continually being added.

The Times, January 2, 1900 (*re* Exhibit at Livingstone Exhibition): "There are wonderful beds and chairs, which resolve themselves into a bundle of sticks and a small parcel; there is a combined washhand-stand and bath, so compact and convenient that it almost vanishes before the eyes. One article specially worth notice is a real sun-helmet, a thing as different as possible from the heavy police helmets, slightly disguised in khaki, with which our troops were furnished."

The Outfitter, January 6, 1900: "JOSEPH TUCKER exhibited air-tight trunks and boxes, cabin trunks, tents and hammocks, sleeping valises, camp furniture, folding bedsteads, mattresses, mosquito netting, holdalls, and kit-bags; also special woollen material clothing, hosiery and haberdashery, boots and shoes, helmets, hats and caps, blankets, sheets, pillows, cushions, and travelling rugs. Altogether, the outfitting trade is well and worthily represented in its special section, and one can thoroughly appreciate the pains taken nowadays to cater for the hygienic requirements of travellers and missionaries."

Nursing Notes, June, 1900: "Everything connected with tropical outfits can be procured at TUCKER'S COLONIAL STORES, 79, Newington Green Road, N. (three minutes from Mildmay Park, N.L.Ry.). They are great missionary outfitters, and therefore have a wide experience of what is required in the most various climates, and their prices are reasonable."

Illustrated Price List and Patterns post free.

Established 1868. **79, NEWINGTON GREEN ROAD, N.** *Telegraphic Address: "Turbala, London."*

NOTICE.

PHOTOGRAPHS.

ROYAL GEOGRAPHICAL SOCIETY.

It would greatly add to the value of the Collection of Photographs which has been established in the Map Room of the Royal Geographical Society, if all the Fellows who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they would be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

KODAK

THERE IS NO KODAK BUT THE EASTMAN KODAK.

Light-weight Kodaks taking extremely light and unbreakable spools of film.—These are some advantages of Kodak photography that commend the system to explorers and travellers. The spools of exposures may readily and safely be posted for development and printing. Kodaks from £1 1s. to £7 7s. KODAK, Ltd., 43 Clerkenwell Road, London, E.C. *Retail Branches:* 60 Cheapside, E.C.; 115 Oxford Street, W.; 171-173 Regent Street, W.

Full catalogue of KODAKS post free on application.

NOTICE.

The "PROCEEDINGS OF THE ROYAL GEOGRAPHICAL SOCIETY," new series, consists of 14 volumes, extending from 1879 to 1892.

Each volume covers on an average 840 pages, the selling price being 18s. per volume.

These volumes not only contain full reports of the papers read at the Royal Geographical Society, by all the great travellers and geographers of the period, but constitute a record of exploration and geographical work in all parts of the world.

Each volume contains numerous maps, all of them original, embodying the results of exploration, and executed in the best style. In the 14 volumes there are some 350 maps, besides numerous illustrations of characteristic scenery in the least-known parts of the world.

It is believed that a complete set of the *Proceedings* would be a valuable addition to public libraries and other institutions, while many private individuals might wish to have the volumes. As it is desired to reduce the stock in hand, the series is now offered, bound in cloth, at £6 per set. Application to be made to the Chief Clerk, Royal Geographical Society, 1, Savile Row, London, W.

In addition to the *Proceedings*, the Society has issued four volumes of "Supplementary Papers" containing a large number of Memoirs and Narratives of considerable length, besides several valuable Bibliographies. These will be sold for half price, £2 for the four volumes. These contain over 30 Maps and numerous Illustrations.

JOHNSTON, *late H.M. Commissioner for CENTRAL AFRICA.*

BENJAMIN EDGINGTON'S Tents and Camp Equipments for Africa, &c.

Made from a Special Canvas, treated by the Copper Rot-Proof Process.

"After four years in East Central Africa, I have no hesitation in saying that, as far as my experience and observation go, your tents are the best that can be procured.

"I have seen other tents, when almost new, torn to pieces after a tropic storm, or giving way after one rainy season, while one of your double-roof tents which I used constantly for two years in Central Africa, is still as strong and sound as ever.

"Yours faithfully,
"R. U. MOFFAT, M.B.,
"Medical Officer, Uganda Protectorate."

AERTEX CELLULAR

THE CELLULAR CLOTHING CO.'S ORIGINAL UNDERWEAR AND SHIRTS.

THE HEALTHIEST AND MOST ECONOMICAL FOR TRAVELLERS.

Extract from C.T.C. HANDBOOK AND GUIDE, 1896-97, p. 52.

"From the peculiar manner in which CELLULAR CLOTH is woven (forming a network of minute air-cells next the skin), it allows, even more fully than wool, the free evaporation of perspiration on the side next the skin. . . . It is less bulky, and is lighter to carry; it dries much more quickly; it is more easily washed, and its prime cost is much smaller. Last, but not least, it is quite free from that bane of all woollen goods, the liability to shrinkage."

BEST FOR ALL SEASONS AND CLIMATES.

ESTIMATES FOR OUTFITS SUPPLIED ON APPLICATION.

DR. J. COLLIS BROWNE'S CHLORODYNE

ONLY GENUINE

ORIGINAL AND

IS THE GREAT SPECIFIC FOR CHOLERA,

COUGHS, COLDS, ASTHMA, BRONCHITIS.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Dr. J. C. BROWNE (late Army Medical Staff) DISCOVERED a REMEDY to denote which he coined the word CHLORODYNE. Dr. Browne is the SOLE INVENTOR, and, as the composition of Chlorodyne cannot possibly be discovered by Analysis (organic substances defying elimination), and since the formula has never been published, it is evident that any statement to the effect that a compound is identical with Dr. Browne's Chlorodyne *must be false*.

This Caution is necessary, as many persons deceive purchasers by false representations.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Vice-Chancellor Sir W. PAGE WOOD stated publicly in Court that Dr. J. COLLIS BROWNE was UNDOUBTEDLY the INVENTOR of CHLORODYNE, that the whole story of the defendant Freeman was deliberately untrue, and he regretted to say it had been sworn to."—See *The Times*, July 13th, 1864.

DIARRHŒA, DYSENTERY. GENERAL BOARD of HEALTH, London, REPORT that it ACTS as a CHARM, one dose generally sufficient.

Dr. GIBBON, Army Medical Staff, Calcutta, states: "2 DOSES COMPLETELY CURED ME of DIARRHŒA."

From SYMES & Co., Pharmaceutical Chemists, Simla. *Jan.* 5, 1880.

To J. T. DAVENPORT, London.

DEAR SIR, — We congratulate you upon the widespread reputation this justly-esteemed medicine has earned for itself all over the East. As a remedy of general utility, we much question whether a better is imported, and we shall be glad to hear of its finding a place in every Anglo-Indian home. The other brands, we are happy to say, are now relegated to the native bazaars, and, judging from their sale, we fancy their sojourn there will be but evanescent. We could multiply instances *ad infinitum* of the extraordinary efficacy of DR. COLLIS BROWNE'S CHLORODYNE in Diarrhœa and Dysentery, Spasms, Cramps, Neuralgia, the Vomiting of Pregnancy, and as a general sedative, that have occurred under our personal observation during many years. In Choleraic Diarrhœa, and even in the more terrible forms of Cholera itself, we have witnessed its surprisingly controlling power.

We have never used any other form of this medicine than Collis Browne's, from a firm conviction that it is decidedly the best, and also from a sense of duty we owe to the profession and the public, as we are of opinion that the substitution of any other than Collis Browne's is a deliberate breach of faith on the part of the chemist to prescriber and patient alike.—We are, Sir, faithfully yours, SYMES & CO., *Members of the Pharmaceutical Society of Great Britain, Hix Excellency the Viceroy's Chemists.*

DR. J. COLLIS BROWNE'S CHLORODYNE is the TRUE PALLIATIVE in NEURALGIA, GOUT, CANCER, TOOTHACHE, RHEUMATISM.

DR. J. COLLIS BROWNE'S CHLORODYNE is a liquid medicine which assuages PAIN of EVERY KIND, affords a calm refreshing sleep WITHOUT HEADACHE, and INVIGORATES the nervous system when exhausted.

DR. J. COLLIS BROWNE'S CHLORODYNE rapidly cuts short all attacks of EPILEPSY, SPASMS, COLIC, PALPITATION, HYSTERIA.

IMPORTANT CAUTION. The IMMENSE SALE of this REMEDY has given rise to many UNSCRUPULOUS IMITATIONS. Be careful to observe Trade Mark. Of all Chemists, 1s. 1½d., 2s. 9d., and 4s. 6d.

BRITISH LIBRARY

The
Geographical Journal.

No. 6. DECEMBER, 1900. Vol. XVI.

THE PRESIDENT'S OPENING ADDRESS, SESSION 1900–1901.*

The most important geographical event since the close of the last session has been the return of the expedition of the Duke of Abruzzi from Franz Josef Land. His Royal Highness has the great merit of having personally organized and fitted out the expedition in every detail; and an expedition has seldom sailed which has been so carefully and thoroughly equipped. Its geographical results are of great importance, for it has finally discovered the northern limits of the Franz Josef group, and confirmed Nansen's discovery of a deep ocean to the north; while the sledging party under Captain Cagni reached the highest northern latitude yet attained. I had a very interesting conversation with the Duke of Abruzzi at Christiania, and, if it can be arranged, his Royal Highness will be pleased to give us an account of his expedition in the course of the session.

The Danish expedition to East Greenland, under Lieutenant Amdrup, has also returned, after successfully continuing the work of Dr. Nathorst last year, while a Norwegian whaler was able to follow the coast to 75° 30′ N. Thus the dotted line which has so long indicated the supposed position of the East Greenland coast on our maps will now give place to a definite surveyed line; thanks chiefly to the persevering efforts of Danish geographers and explorers since the days of Graah.

We are still anxiously waiting for news of the expeditions of Sverdrup and Peary up Smith sound. The *Windward* went out to bring them succour, but she has not yet returned.

* Delivered at the Meeting of the Society, November 12, 1900.

BRITISH LIBRARY

The two recent expeditions to the antarctic regions have both supplied us with valuable information. In Dr. Cook's work there are extremely interesting appendices by members of the Belgian expedition; and Mr. Borchgrevink's paper is accompanied by a very able report on the meteorology and magnetic work of Sir George Newnes's expedition by Mr. Bernacchi, and by a map drawn by Mr. Colbeck, based on his own survey. The biological collections of Sir George's expedition have arrived, and have, I understand, been handed over to the authorities of the British Museum at South Kensington.

Our own antarctic expedition is now, at last, making progress as regards equipment and other arrangements. The ship is in an advanced state, and we have had every reason to be satisfied with the work of the Dundee Shipping Company. Captain Scott, R.N., the commander of the expedition, was only able to take charge last August, but he has already shown that he possesses many of those qualities which are essential for so difficult and responsible a post.

The German expedition is far more advanced than we are, in every department of its work, under the direction of its able and accomplished commander, Prof. von Drygalski; but this is because his Committees have seen the wisdom of giving him a perfectly free hand. I am glad to say that the commanders of the two expeditions have had an opportunity of becoming friends, and of exchanging views during the autumn; and Captain Scott, if not too much trammelled by Committees, will soon make up for lost time. Captain Scott has also derived very great advantage from his intercourse with the scientific men who are conducting dredging operations and physical investigations on board the *Michael Sars* on the Norwegian coast. Dr. Hjört and our gold medallist, Dr. Nansen, have given Captain Scott the results of their great experience as regards the best nets for dredging, and the latest inventions connected with oceanic researches generally. They spared no pains to inform him on these points, and, as they are gifted with remarkable powers of exposition, the advantage derived from conversations with them is very great. Captain Scott will, I am sure, desire to join in a cordial expression of thanks from this Society to our Norwegian colleagues.

Our friend Dr. Sven Hedin has, during the past year, been actively at work in the Lob-nor country and the basin of the Tarim; and I believe that his archæological discoveries will throw a flood of light on the past history of that region. The complete record of the scientific work of Dr. Sven Hedin's former journey has, meanwhile, been published in a special number of *Petermanns Mitteilungen*, fully illustrated by maps. Another important geographical work which has appeared during the recess, is the statement of the Argentine case in the boundary arbitration now in progress. It is very fully illustrated by maps and photographic views. Still another excellent book is a 'Glimpse of

BRITISH LIBRARY

Guatemala,' which is most beautifully illustrated, with valuable chapters on the Maya ruins, by Mr. Maudslay, and a most charming and interesting narrative of travel by Mrs. Maudslay. The biography of my old friend Mr. Oswell, the companion of Livingstone, with an introduction by Mr. Francis Galton, is very interesting, and contains a good deal of hitherto unpublished matter respecting the early exploration of Southern Africa. The Duke of Abruzzi's ascent of Mount St. Elias, by Dr. Filippo de Filippi, is a beautifully illustrated work, with a well-written and interesting narrative.

It is in Africa that the greatest amount of geographical work has been done this year. But a review of it must, alas! commence with a reference to the loss of a valued young explorer. It was only last session that Captain Wellby's father read us the account of his gallant son's splendid geographical achievement in marching from Abyssinia to the Nile. You will all remember how we looked forward to welcoming him on his return from the front. Now that can never be. Captain Wellby has fallen, fighting for his country in a most righteous war. It was a glorious death, fitting close of an adventurous and active life. We are left to mourn the death of a young officer who was a great explorer and an ornament to the army. His noble example has been followed by others; for there has been remarkable activity in the exploration of Africa this year. Major Gibbons has followed Mr. Grogan from the Cape to Cairo. Mr. Moore has returned after his important investigation of the Central African lakes. Mr. Harrison has brought home an admirable map of the region between Lake Rudolf and Addis Abeba. Our gold medallist, M. Foureau, has safely returned after his wonderful journey across the Sahara, of which he has promised to send us some account. Last, but certainly not least, Dr. Donaldson Smith, who is an old friend and known to us all from his previous work, has made very remarkable journeys, involving new discoveries between Lake Rudolf and the Nile; and I am sure we are all delighted to welcome him here this evening.

Already the benefits to geographical knowledge of the effective occupation of the Sudan are beginning to be felt; the first sheets of the new maps of the Nile, as far as the Bahr Ghazal, the results of the survey under Colonel Talbot, have reached us; while Sir W. Garstin's journey up the Nile to the lakes will no doubt yield further important results in the same direction. Major Wynn has gone out to Abyssinia, and will shortly be followed by Major Austin and Major Bright, the two latter to the Sudan; and between them we may expect great accessions to our knowledge of the eastern tributaries of the Nile, and of their basins.

From South Africa again we have in the map room several sheets of the maps which have been made during the war by the surveyors sent out by the Intelligence Department. And in this connection I am pleased to learn that serious steps have been taken to carry out

administrative surveys of all those territories in Africa which are directly dependent on the Home Government, and that in conjunction with the other European Powers which have African possessions.

AN EXPEDITION BETWEEN LAKE RUDOLF AND THE NILE.*

By Dr. A. DONALDSON SMITH.

In 1895, when my first expedition reached Lake Rudolf, it had been a whole year on the march, and had been successful also in exploring much more new country than I had anticipated, so I contented myself in making a fortnight's journey up the Mela river. On this side journey, however, I made up my mind, on looking across a vast expanse of plain towards the west, that some day I must pursue the setting sun from Rudolf to the Nile, and I continually watched for an opportuity to satisfy my desire. Since I could not do this at once, I filled in a part of the intervening time by a journey through some of the unknown parts of the Khingan range in Mongolia in 1897, a short account of which was published in the *Geographical Journal* of May, 1898.

The whole of the winter of 1898–99 I was in the jungle in Somaliland, hoping for an opportunity to cross the border, but owing to political reasons and to the gratuitous interference of the Consul-General, I was unable to put my project into execution until mid-summer. During May and June, while negotiations with the Foreign Office were under way, I employed my time in recruiting twenty-eight Sikhs and Gurkhas in the Punjab. I thought it advisable to enter *viâ* Kismayu, but the Mombasa local authorities stopped me. To be brief, I fitted out three distinct expeditions before I managed to get finally out of the reach of incomprehensible officials. I started from Berbera on August 1, 1899. After the first march eleven of my Sikh ex-Sepoys deserted, having become aware that they must sweat occasionally, and that they could not be supplied with all the manifold luxuries they were accustomed to in the Indian army. Knowing that I should never succeed if I took one of the officially recognized headmen with me, I had great difficulty in getting Somali camel-men, since all the Berbera headmen formed a ring against me. Several camel-men having deserted me at Hargeisa, and fearing further official interference, I started across the Haud with only seventeen Somalis, and as many Gurkhas and Sikhs, besides my assistant, Mr. Frazer, and my excellent Goarnese cook, kindly lent me by Captain P. Z. Cox. During the journey to the Shebeli river *viâ* Milmil, Sesebane, and

Sheneli, I increased my following to forty-eight men. Near Milmil a small caravan of camels and women which was following us was attacked by three highwaymen. One of the robbers was captured by my boys and brought before me. He was a lad of eighteen, with wiry limbs and an intelligent expression, and struck me as a likely recruit, and a better brigand than the majority of my men. So I contented myself by making him march handcuffed for a day, and then enlisted the homeless fellow as a camel-man. He became known as Ali Hatbury, or "Ali of the handcuffs," and proved one of my best boys.

My surveys began immediately upon leaving Sesebane. Although I had with me all the most recent maps, the "tug" Fafan had been given no resting-place by cartographers. All the way to the Juba river we had work to do filling in what had been to all intents and purposes a blank upon the maps, except where I came upon my old line of march in 1895 at Turr. Sportsmen had knocked about the country in places, but they evidently never thought that Longfellow's idea of a brook applied to a tug or wady from the different positions the poor sandy river-beds were made to assume.

At the end of our march on September 8, we reached the Shebeli river at a spot called Godi, over 400 miles from Berbera by road, and crossed without unloading the camels. It contained only from 2 to 3 feet of water in its deepest part. So dry was the country about the river that I pitched my camp in a dark grove of immense cedar trees within a few yards of the stream, not having to fear malarial poisoning. Not a single mosquito disturbed our rest at night. On September 11 we started west again across a rich river-made plain, passing numerous villages of Aulihan and Dagodi to the foot of the highlands, which intervene between the river Web and the Shebeli. We followed up a tug to its sources in these highlands, and found many pools of water in it. Considering the extreme dryness of the season, I believe this tug must be usually a flowing river. The natives would sell us nothing at any price, although they were rich in live stock. For the next few days we experienced a delightful change from the trying heat of the low plains, where the mean temperature for the twenty-four hours was over 90° Fahr. The plateau was only 2500 feet above the sea, but that was a sufficient elevation to give a slight tonic effect to the atmosphere. The land was only suitable for grazing purposes to a limited extent, since the granite and iron ore, of which the hills were composed, was bare, or else covered with a thin layer of sub-soil, which supplied nourishment to a tangled mass of mimosa and acacia trees and bushes. Inhabitants were consequently very few, and giraffes very plentiful. Water is to be obtained in holes in the rock.

Near some villages called Mucha, which we reached on September 14, there were some remarkable deep rock wells. Two days after leaving these we descended from the plateau and reached my old line of march

at Gohule. From here until we reached the Boran at El Dere I cannot add to the description I gave to you of the country when I read my paper before the Society in 1896. The rivers Web and Juba had only half their usual supply of water. The people were flourishing, and nothing could have exceeded their meanness in not wishing to sell us food, which made it most difficult for me to keep my men supplied, there being also little game on our line of march. The Boran, on the other hand, were most friendly. I must here refer to the Abyssinian method of annexation. In 1895 I saw the worst side of their treatment; but on my recent journey, I found that their treatment of tribes, once thoroughly brought to submission, was commendable. In their first attacks they are certainly very cruel, but later, when the natives have been so harried that they look upon their masters with the greatest respect, they are given back a good proportion of their belongings and very nearly their original self-government, but a moderate tax being imposed. From the Somalis to the Boran I was surprised to find the natives quite as rich apparently as they were before they had come under Abyssinian rule.

Since I could fill in many blank spaces on my former map before reaching Lake Stefanie, I started survey work again at El Dere, and continued it to the Nile. Marching in as straight a line as possible from Berbera, El Dere may be considered to be 750 miles by road and the same distance from the Nile. Three long marches from El Dere to Le lead us through a very wooded and broken country, where elephants abound and man is a rare visitor. There are many mountains scattered about, principally of limestone rock, and the deep wells at Le I now believe to have been originally formed by the disintegrating effects of water on chalk, in which the natives have actively assisted. My Somalis gave me infinite trouble and annoyance. They were never satisfied unless they had over ten pounds of camel meat or mutton a day per man, and when food was scarce I had to be constantly on the alert to prevent them from poisoning my transport animals, so that they could eat the meat, or from stealing sheep, but they were not, however, as miserable petty thieves as most of my Indians. All but four of them mutinied at a place called Gof on November 4, and remained out over night, putting me in a decidedly disagreeable situation. If I call my Somalis howling hungry humbugs, I describe some bad points of their character, but it would be unjust in me not to mention their superb physical condition, swift-footedness and endurance, and their intelligence, which made them compare favourably with the Indians. Of my nine Gurkhas, five only were pure-blooded men from the backwoods of Nepal, and these were among the best men in camp. The other four Gurkhas had Rajput or other blood in their veins, and it is with regret that I look upon them as human beings. These latter, and as many more Sikhs, continually

strove to commit suicide by hiding if the march was long, and gave me and the Somalis infinite trouble in hunting them up. Two Indians were cunning enough to evade the Somalis search-parties sent after them at different points on the journey, and were never heard from again. Whenever the march was protracted over five hours, either my assistant or I fell back far to the rear of the caravan to protect tired Indians from themselves.

Between Goff and Lake Stefanie the Abyssinian highlands are

Mursu. Sikh. Somali. Gurkha.

ON THE OMO AT MURSU.

continued south as a long mountain chain all the way to Mount Koroli and Marsabit, near the southern end of Lake Rudolf, a fact that I was not aware of on my first journey. Proceeding westward three marches from Gof, and passing Egder, we arrived on November 8 at a large settlement called Gorili, at an elevation of 3000 feet, where the people welcomed us with large vessels of honey and milk. There were Arab and Somali traders among them from Kismayu, buying ivory in exchange for cattle.

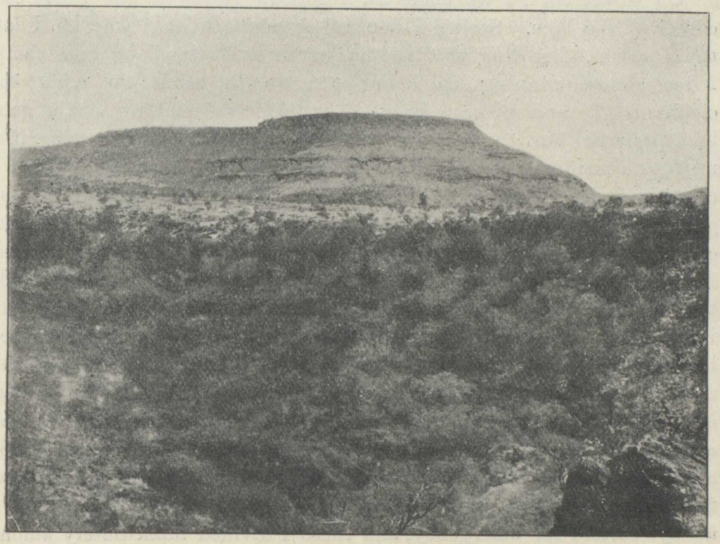
On the next day we rose over 1500 feet to Mega, a beautiful broad open meadow or series of meadows between mountain peaks, into which tiny watercourses trickle, and where there was a delightful freshness in the atmosphere and in everything living. Besides the many cattle, sheep, goats, and donkeys which were to be seen grazing on the fine green grass, we were much impressed by the numerous droves of sleek ponies. For some reasons the natives west of Egder did not wish us to be a witness of their wealth, and whenever we managed to get a guide from them, he persisted in taking us by the most unfrequented paths, and away from the western course, which I was determined to pursue. I had finally to give up trusting in guides altogether, load up a two days' supply of water on camels, and march ahead. We camped when we got tired, irrespective of water or people, and then sent men in all directions to prospect. As it turned out, we usually found water and villages not far from camp, though with a considerable amount of trouble. We marched rapidly along easy paths after leaving Mega, through the same green upland basins, for a little over four hours, all of us revelling in the delicious cool atmosphere. The good old Gurkha Havildar voiced the sentiment of the crowd by exclaiming, "Ah! Sahib, if we could always have it like this."

We were at an elevation of over 5000 feet, when suddenly, on rounding a little promontory, the caravan was brought to an abrupt halt. We found ourselves perched on the edge of a precipice that sheared off almost perpendicularly down to a broad plain 1700 feet below us. Across the plain, some 30 miles to the west, rose what appeared to be a low mountain range, the southern extension of the Tertala mountains; but the plain itself we found to be over 3000 feet above the sea-level, a no mean elevation compared to the valleys of Lake Stefanie and Rudolf. On my first journey I crossed this plain 80 miles north of here, where it was only a narrow valley running up to its origin in the Amara mountains. The view was, indeed, magnificent from this great wall, the western edge of the Boran highlands, which run from the Amara to Marsabit, but it was appalling when I came to consider how my poor camels were to get beyond it. To my surprise, we found a winding path had been laboriously made by the natives for their donkeys, many stones, weighing two or three tons, having been rolled aside. We set to work on this road, and after a day's hard labour got it in fit enough condition to take the camels down empty. All the loads were carried down by my men, and then the long line of grunting, stumbling, patient "ounts" were shoved and lifted after. In spite of the inimitable Kipling, I have the greatest respect for the long-suffering camel. On this occasion only one animal was injured, but he was afterwards consumed by us to his last marrow-bone. Thus you see that the good that a camel does is not interred with his bones.



There were numerous villages about the foothills and on the plain,

BRITISH LIBRARY

and many natives helped us down the paths. The most important settlement, about an hour's march from the foot of the mountain, called Saki, was in a most flourishing condition, judging from the large numbers of cattle which the people owned. A couple of marches west of Saki we got into a very bad washed-out stony country, where the plain was cut into hideous designs by the rushing of the waters in times of flood. A guide whom we had got at Saki insisted on going to the north, which I would not do, so I felt that I had only myself to blame for getting into the bad land. It took five long marches to get across the plain, on account of several stretches of this character. A specimen of one of the tiny gazelle, or dig-dig, of this plain, which I

BAD LANDS, NEAR SAKI, EAST OF LAKE STEFANIE.

presented to the British Museum, has been proven to be new to science by Mr. Oldfield Thomas (*Madoqua guntheri smithii*). On November 19 we were among the mountains again, and not far from the south-east end of Lake Stefanie.

There was one rather isolated mountain called Janissa, 5600 feet high, which I decided to ascend while my camels were resting. From the top of it I got a splendid view, and picked up most important points of my previous journey—Mount Kanjaro, the Tertala range, Lakes Stefanie and Rudolf, and Mount Koroli—and could thus check my work, which I was most pleased to find correct. The trip was not without other advantages also, for on the very top of the mountain

The Geographical Journal(Journal of the Royal Geographical Society): Volume XVI, No. 6 [340v] (33/232)

I bagged two specimens of *Cervicapra chanleri*, a beautiful antelope not known to exist near Lake Stefanie. Two marches beyond Mount Janissa we came to what appeared to be an enormous barnyard, with a solid stone floor, and in the centre a bubbling warm spring. The water was sparkling with carbonic acid gas, tasting like acidulated seltzer, and it was evidently the drinking-place of many scores of elephants, judging from appearances. Elephants were ubiquitous; you could scarcely move in any wooded valley without disturbing many of them. The next day we were well down in the valley of Lake Stefanie, and looking forward to plenty of fresh fish and plenty of water for washing.

On November 26 we made an afternoon march to the south-east corner of the lake. Seeing a herd of elephants a long way off, I left the caravan, directing the men to march on to the lake and camp. After almost running an hour or more to catch up with the elephants, I came upon a herd of buffalo, and picking out a good bull, preferred him to the tuskers. Killing the bull and cutting him up took considerable time, and it was not until near sunset that I came in sight of the camp. To my horror I saw nothing but blazing grass where the camp should have been, and on some rising ground, covered with smoking ashes, stood my boys, looking like the central figures in one of Doré's conceptions of the Inférno. I certainly thought my ship had been burnt up, but my boys were only resting a moment after their heroic efforts to save the kit, which they had accomplished to the last camel-blanket. No wonder my camel-men's faces looked doubly sad when they brought me a tin of water and asked me to taste it. It was the briniest water I ever touched, and then I too felt sad. I learned that the lake with its undrinkable water was 2 miles away over a sea of mud covered with dead fishes. I only had two small barrels of water in camp, which I always carried for emergency, and these I divided immediately among the poor parched boys, who had been fighting the fire. Every man was tired, and yet I had to send at once several boys with camels to travel all night back to the mineral spring and fetch water the next day. Here is where the Somalis showed their pluck. Not a man that I ordered out objected, since it was a question of life or death. Other Somalis I sent in all directions to follow the paths made by the countless myriads of animals, and learn where they drank. Most of the Indians were dead to all intents and purposes, and considered themselves to belong already to another world. Luck was not so much against us, however, for in two hours my camel-men had found a spring of fresh water by following elephants' spoor, and soon after this the Indians were resurrected by a gallon of water each.

I will pass over our journey from this point to Lake Rudolf, which we reached on December 10. The formerly rich tribe of Rusia had

BRITISH LIBRARY

ceased to exist, and except a few representatives of the Hamar Koki tribe, we saw no human beings at all until we reached the river Nianam. The water was 12 feet lower in the shallow lake than it was in 1895.

I was quite surprised at first at the manner of our reception by the Murle and by their poverty. The rich villages that welcomed us in 1895 did not exist. There were only a few little groups of huts, principally on the west bank of the river, that showed the remnants of a once large and flourishing tribe. We spent nearly a whole day endeavouring to get the people to come to us; but finally, when we

GAZELLA GRANTII BRIGHTII.

gained their confidence, they were most eager to assist us. The secret of the natives' distress was to be found in Abyssinian raids. With the help of the natives and their canoes we easily crossed the Nianam, which was half dried up like all the streams we had crossed. On my first journey I followed up what I supposed to be the Nianam for a long distance to Mela; but since I was there that illustrious explorer, the late Captain Bottego, discovered another river, the Omo, coming in from the west. It is clear to me now that my river, which I will call the Mela, and the Omo together in equal volume join at Gumba to form the Nianam, the name given by Count Teleki to the large stream flowing into the lake.

A remarkable change now occurred in the fauna. Not only did

BRITISH LIBRARY

we find a completely different set of birds between the Nianam and the Nile, but scarcely any of the mammalia that we had been accustomed to were to be found in this western section. The Soemerings gazelle had given place to the larger Boran gazelle, and now this had disappeared, to make way for a smaller variety without any longitudinal black stripe on its side, and which Mr. Thomas has proved to be new after examining a specimen which I have given your museum (*Gazella grantii brightii*). The bouncing, nervous, long-necked Waller's gazelle, which had been a constant companion, was nowhere to be seen, but oribi and reed-buck took its place. Speake's gazelle was replaced by the beautiful *Gazella thomsoni*. The hartebeests, as a matter of course, thought it best to give themselves differently curved horns, and to go under the name of *Bubalis lelwel*, Heuglin. The birds were represented by curious scarlet-breasted barbettes, with their enormous dentated bill for cracking hard berries; by curious tiny flycatchers, with large scarlet wattles around their eyes; and by more than a hundred other different species, all of them strikingly beautiful, belonging principally to the West African types. Many troops of monkeys made the tall forest about the rivers and ponds ring with their chatter. The most beautiful of these, a large horse-tailed colobus (*Colobus guereza poliura*), was found to be new on examination of some skins which I gave to the museum.

I may mention here that from the time we left the Boran gallas until we reached Arabic-speaking natives near the Nile, we could communicate with none of the tribes except by signs, unless we remained long enough at some village to pick up a few words of the vernacular. I had hoped to find some Masai, but there were none. The whole way to Tarangole the natives refused to give us guides, although they were friendly in other respects. This was to be accounted for, I suppose, partly in my refusal to pursue any other than a westerly course, when the natives advised my going north or south, or even east again, and partly through fear that the guides would be killed by their hostile neighbours. We kept our course, however, although we literally got into many a hole, and struck out each morning regardless of paths, waterways, or dire prophecies on the part of the natives.

The day after Christmas we bade the Murle good-bye, and struck out in a northerly direction that would bring us to the Omo, near the point where that stream makes an acute angle as it bends from north to east around the Mela hills. At the end of a long march over a grassy open plain, we came to a place where the loose fireclay which underlay the sub-soil of the plain had been cut away by the action of waters to a depth of 50 feet, and in the deep round basin a dense forest of giant sycamores, mimosa cedar, and tamarind trees stretched before us for about 2 miles. Finding plenty of elephant paths, we wandered through the dark woods the next morning until we came to a pretty lake a mile

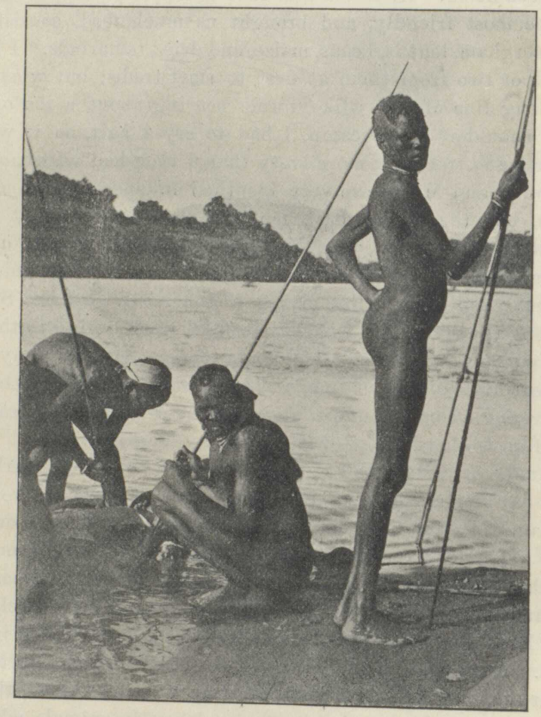
BRITISH LIBRARY

long, in which a school of over a hundred hippopotami disported themselves. The forest was alive with animal and bird life. The elephants were, indeed, so numerous that their stench was most disagreeable. From here to the river the land was so cut up that we did not reach the Omo until we had made a second march in the afternoon. I may say that most of our day had been spent in passing around and over little hills of crumbling clay. The Mursu, whom we found on the banks of the Omo, had escaped the raids of the Abyssinians, and were in a most flourishing condition. After we had shot a couple of hippos for them, they became most friendly, and brought us much food, consisting of durrha, or sorgham, lentils, beans, maize, and dried tamarinds. I bought a small tusk or two from them at first to start trade; but when I discovered a long line of ebony-like forms bearing about a ton of ivory upon their shoulders to my camp, I had to cry a halt, as it was impossible for me to transport more ivory than I then had with me.

The Mursu and Murle are very identical in speech, customs, and appearance, but the Mursu have more of the warlike spirit of the Turkana than the Murle. The Mursu shave the hair well up from above their ears, and also behind the head, a custom observed by the Dume, Bunno, and other tribes living to the north of Lake Stefanie. Moving along the river with camels was hard work, owing to the thick forests, in which much cutting had to be done. Several of my camels died from eating a poisonous vine, and many were made so ill that they never recovered. I have found it always dangerous to allow camels to remain in forests along rivers or lakes for any length of time.

On January 3 we left the river, and, proceeding west, arrived on the second day's march at another little pond at a point where several river-beds unite in one very deep and wide ravine. Thence our route lay across a fertile river-made plain to the base of a low mountain range. I have little doubt, from what I saw of the valleys passing to the right and left of the various mountain ranges and from levels taken, that Lake Rudolf, the Nile, and the Sobat were once united in a vast inland sea. A couple of hours' climb on January 6 got us over the crest of the first range of hills and on to a valley 15 miles broad, that provided excellent grazing to the numerous domestic animals which the natives of these parts owned. The waterways contained plenty of water in pools, and there were many broad stretches of open pasture, while the lower hills surrounding the plain were almost treeless, but covered with fine green grass. On the west, a splendid mountain range ran for 20 miles along the length of the valley; the highest point, Mount Etua, over 7000 feet high, stood out in bold relief as a bare-pointed volcanic remains—a splendid point for surveyors, and a magnificent mass from an artist's point of view. We saw this point from the Omo river, and did not lose it until we were 40 miles the other side.



Almost all the natives fled to the hills on our approach, and seemed

BRITISH LIBRARY

inclined to fight. From their long parallel-sided shields, their Masai-like spears, and their tall athletic build, I made them out to be a branch of the Turkana. A lot of about twenty warriors attacked two of my camel-men one day, who were loitering behind the caravan with my sheep and goats, and were only driven off by my boys firing at them. This was the only time on the journey that the natives attempted hostilities. The people here call themselves Mushas, but I could not get any vocabulary from them, as I only managed to get speech with them on

MURSU ON THE RIVER OMO.

two or three occasions before I was about to quit their country. We kept pretty much to the valleys, which were at an elevation of 1700 feet as we progressed through their country for seven long marches, occasionally going over some mountain passes, where stretches of open upland meadows and grass-covered hills made me feel that I should be wearing tweeds instead of khaki. In such places there were usually a good number of small villages, but occasionally, where the bush was very thick, we sometimes did not see a sign of any inhabitants

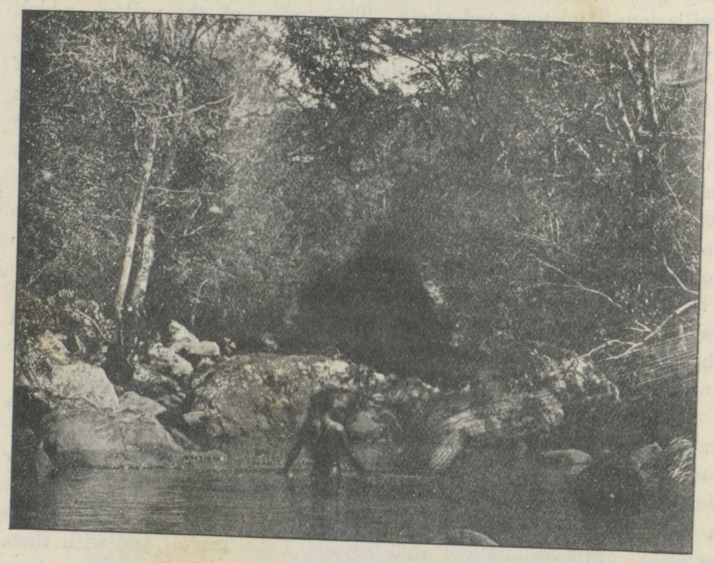
BRITISH LIBRARY



for a distance of five miles. I frequently saw the male members of the tribe, and tried to get them to approach the caravan, but in vain, and occasionally I met a few old women who had remained in their villages while the caravan passed them, and once a dozen hunters came into camp to sell ivory. I bought a few ornaments and a beautifully tanned goat-skin apron from the women, which were very like the things in use among the Turkana. Except for the goat-skin apron worn by the women, the Mushas contented themselves with the same cleanly nakedness that was the fashion from the Boran to the Egyptians. The taller mountain ranges of this country are of volcanic origin, and in many cases their slopes are covered with abominable brecchiated rock, principally granite, while most of the flat-topped hills are composed of argillacious sandstone and shale. The surface of the valleys, which are for the most part covered with bush and forest, is composed of the richest alluvial soil underlaid with clay. To the south of our line of march the broad, yellow, grassy plains were considerably below 1700 feet from the sea-level. In a large valley at the outskirts of this country we remained a week to rest the camels, where a shower or two of rain had freshened up the foliage of the mimosa bushes. A day or two before we left, the natives living in the vicinity began to come to camp, finding that we did not disturb them; and if we had remained longer, no doubt we should have been on intimate terms with the whole tribe. They did not care to sell me any sheep, however, and for this and various other reasons connected with my outfit of men and camels, I thought it best to push on. While here we had the last of the autumn showers.

Since the changing climatic conditions of East Africa is now a subject of much importance, I must not omit to mention some of my meteorological observations. It is well known that the "karif," or fierce winds, that sweep the Somali coast in the summer months are a part of the northern trade winds. Now, these northerly winds persisted until we had got well beyond Lake Rudolf, and with them came a little rain. It was the autumn rains that are expected in Somaliland in September which first struck us in a sudden burst after we had left the Dawa river on October 13. These rains followed us all the way to our camp of January 13. They were very scanty, but it was curious that they should progress so from east to west. Half a dozen slight showers were all that any particular section of country received. The reason that Somaliland and the lowlands to the south of Abyssinia are so dry must be found in the drying effects of the Abyssinian highlands on the northern trade winds, the lofty mountain ranges condensing all the moisture in the air, and allowing only a pitiful drop or so to work south. All the rivers and lakes which came under my observation were half dried up—surely because there was a scanty rainfall this year in the Abyssinian highlands. The

Qatar National Library

secret can only be solved by a study of the changes that occurred in the northern trade winds. Hardly had we left our camp of January 13 before we began to see the natives preparing for a spring rain, and a spring rain dependent upon the monsoon winds from the south, which gives life to Uganda and most of the East African Protectorates. Thus we had arrived at a point where the autumn rains of one country, dependent on the northern trade winds, would have met the monsoon rains coming from Madagascar had not these been extremely late in arriving this year, as they were in reaching India. The famine which we found to spread all along the upper Nile was dependent upon the same conditions as the famine in India, and the very low condition of

CEDAR VALLEY.

the Nile at Cairo was caused both by the changes in the monsoon and also by the northern trade winds, since the Sobat rises in Abyssinia.

On January 21 we ascended a steep pass to a long narrow plateau, over 3000 feet above the sea, the game path which we took leading us along a beautiful clear-flowing brook shaded by tall cedar trees. The accompanying photograph shows a pool in "Cedar valley" near our camp at the top of the pass, in which a Gurkha is to be seen following my example in having a delicious cool plunge. The men I had sent ahead, and who had found the trail up Cedar valley, did not go far enough across the flat top of the ridge, and consequently did not discover that this ended abruptly in a sheer precipice on the other side.

BRITISH LIBRARY

Beyond, to the west and north-west, stretched a vast plain, as far as we could see. For a distance of about 30 miles the plain did not look so unattractive with its occasional little watercourses, fringed by many a pretty bit of green meadow or shady grove, but towards the horizon the monotonous greyish-white appearance of the surface looked very ominous. We spent three days on the top of the mountains in finding a game trail, and clearing this so that the camels could descend. Game was abundant, and it was in this country that I secured the specimens of the new gazelle, which I previously referred to, and also two varieties of buck, *Aurebia haggardi* and *Aurebia montana*.

At the foot of the hills we crossed at right angles the line of march of the late Captain Wellby. A couple of marches beyond this brought us to a large watercourse flowing west, where we found a new tribe of natives, the Magois. Noticing from the distance that the people were preparing for a fight and driving away their cattle, I pushed ahead with two boys, and persuaded them to desist from their hostile exhibitions. One stout young fellow in particular persisted for a long time in giving frequent leaps into the air to show that he would fight if called upon to do so, but this man proved afterwards to be as friendly and jolly as he was fat. He is shown in the accompanying photograph.

A MAGOIS YOUTH.

The Magois were distinctly different from any tribe previously met with on the journey in appearance and customs. They had the heavy build and large features, with high cheek-bones, of the Soudanese, and, above all, the lines of raised tattooing on their cheeks that is so typical of the people about the Nile. I believe that it is not unlikely that they are a branch of the Dinkas, who, perhaps, being driven from the Sobat by the Neurs, put the desert between themselves and their persecutors. They seem to care principally for small red beads, of which they had many already, some of them worked in gorgeous patterns on leather plaques, with which the warriors adorned their massive head-dresses. The most *outré* of our fashionable young men can never aspire to the height of collar worn by some of the Magois. With a collar of beads, which shoved their chin high up in the air, their locks done up in a great chignon, composed principally of clay covered with ostrich feathers, they looked the very pink of gay deceivers.

Parallel lines of raised tattooing on the chest and abdomen, leopards'

BRITISH LIBRARY

skins hung over the back, and a bell hung on a slender cord around the waist, helped to liven up the men's appearance. These are the only people whom I have ever seen wearing a zebra's tail suspended from the elbows. Many of the younger girls had rather attractive features and pretty figures, but I will not mention the appearance of the fair sex after they get to be twenty. The worst burden which they have to carry in life, however, seems to be the countless necklaces of beads which spread over their bosoms to the waist, and the large bracelets and anklets of ivory, brass, and iron. Their hair is shaved above the ears, and cut fairly close on the top of the head.

The Magois represented to us that if we went north-east again we would find a stream of water winding northward about the foot of the mountains into a bigger river a long way off, but I had no intention of going to the Sobat and thus leaving my work incompleted. Whenever I asked one of the natives about the plain to the west, he would draw his hand across his throat to represent that we must surely die if we attempted to march in that direction. However, we loaded up all our water-barrels and started on January 28 in a westerly direction, towards two mountains which loomed up on the plains. For a short distance the ground was firm, and we marched along swiftly, but then we came to the worst cotton soil I ever took men or beasts over. It was so loose that we sank in it up to our knees at one moment, while the next instant we stumbled in some crack hidden by a tuft of the coarsest yellow grass. The intense heat added to our burdens, so that we were glad to camp at the end of seven hours.

The next day's march was even worse than the first, and at the end of it I determined to stop and hunt for water about the two mountains, which were then near us. At the end of thirty hours the barren mountains and all the plain for many miles to the west had been scoured for water, but in vain. My animals had been nearly three days without food or water, so that there was nothing to do but to look disappointment in the face, and turn back to Magois. Two of my men found a stream, before reported by the natives, running north, where they told me there were many people and signs of cultivation. This was the stream I have since learned was followed by Captain Wellby to the Sobat. It starts in the mountains north-east of Magois, and not far away in the south.

Another of my scouts reported water directly east, and nearer the Magois, so in the afternoon of January 30 we started off in the direction indicated. My own Somali had been lying to me, since he had only seen what appeared to be a promising waterway, and took it for granted there was water in it without fully satisfying himself on the subject. Owing to this blunder we had one of the worst marches the next day that we experienced throughout the journey. From three o'clock in the morning until all hours the next night the wearied men and animals

BRITISH LIBRARY

plodded on in intense heat, and over the same terrible ground, to a pool of water which I finally found in the Magois river-bed, not far to the east of the Magois villages. At midday I distributed the last of the water we were carrying, which gave the men three pints each, not enough for many of the men, especially the Indians, but sufficient for Frazer and myself, although we had harder work to do than any of the escort.

At 5 o'clock, when I reached water, there were only a few boys and two camels loaded with empty water-barrels with me. These barrels were soon filled and sent back to revive the broken-down men, who were being taken care of by my assistant many miles behind; and then

NEAR MAGOIS.

came the hunting up of the camels and donkeys, which had been deserted by their camel-men, and which were roaming about in the dark among the bushes with all their loads on them. All the men we got safely into camp during the night or the following morning, but I never recovered from the loss which I sustained in transport animals. Some five camels died within the next two days, and as many more within a fortnight; five donkeys were lost, not one of my two dozen sheep and goats ever reached camp alive, and many boxes were injured. I was obliged to throw away much valuable kit. Besides this, the men became so disheartened that they never afterwards recovered from their apathy. Two days after this found us back again among our friends the Magois.

We determined now to follow the wady as far as we could, even though it took us a little south of west. Two short marches on February 5 and 6 brought us to a long pool of still water, but here the river-bed spread out in many little dried-up ditches, that lost themselves within a quarter of a mile in the plain. Here we found another branch of the Magois, who called themselves Katua, and represented that they were very independent of their immediate neighbours, and at war with a tribe called Toporan, living in the mountains west of Turkana. The Katua occupied a dozen large villages, and owned an immense number of cattle and other live stock. Although rich, they wore scarcely any ornaments, and did not care much for any other kind of beads than the wonderfully fashionable little red sim-sim. Trading went on merrily until I had bought about sixty sheep and goats, and my stock of red beads was getting low, owing to the many drains upon it. Cloth and blue and yellow beads, of which I had a large supply, were valueless. In the trading the women figured largely, to my great annoyance, as they were so long in making up their minds, and so hard at a bargain. I was obliged to play salesman to these women for many hours a day, and I often wondered if European salesmen ever have to exact the same amount of patience.

To my surprise, I discovered these people to be cow worshippers, and to indulge in certain rites which were supposed to be peculiar to the Hindoo religion. Plastering themselves with cow-dung, and throwing bits of dried *bois de vache* at every one and everything they liked, seemed to be a matter of much import to them, and occasionally some old man or woman would be quite unmerciful in giving me a too generous dusting. The origin of this cow worship is presumably the same with the Katua as with the Hindoo, traceable to the great dependence placed upon the animal for sustenance. The Katua eat the cow, but all their people turn out when the beast is killed, and go through much ceremony. They would not sell me a single cow.

We were again confronted by the waterless plain to the west, but to the south-west, however, rose a mountain range 40 miles away, that I thought must surely provide water, and thither I accordingly sent Ali Esa, whom I had made headman, and seven other Somalis with a week's supply of water and food to reconnoitre. I employed my time that was not given up to trading, in surveying and collecting and studying the natives, of whose language I made a short vocabulary.

Just here, for the first and only time on the journey, I found a number of Rüppel's reed-buck, the original *Cervicapra bohor*. This animal was first described by Rüppel nearly eighty years ago from a skull, probably brought down the Nile by traders, but it was not until the arrival of my complete specimens at the museum that all the characteristics of the animal were known. It stands 40 inches at the

346

shoulder, and is remarkable on account of its pretty light yellowish hair, and the peculiar forward bend of its horns.

The natives were very busy moving their villages to the hills in anticipation of the spring rain, and by the time my scouts returned, there was scarcely a soul left in the huts by the river. Ali Esa returned on February 12, and, to my great relief, reported water and people at the mountains before mentioned. We set out, therefore, once again across the abominable plain, and after four long marches arrived on

RAFFIA PALMS, COUNTRY OF THE AKARA.

February 15 at some wells situated among pretty hills, the most northern extension of the Uganda highlands. Far away to the south we got glimpses of great rocky masses, towering about 7000 to 8000 feet above the level of the sea. The friendly natives, who are called Akara and Dinka-Dings, did not understand a word of the Magois language, nor were they as heavily built or as black as the latter. Fairly tall and slender, with small features and moderate-sized noses, they resembled the Masai more than they did the Sudanese. They are again different to the Latuka, their immediate neighbours on the west.

Two more marches in a north-westerly direction took us across as many very broad dry river-beds, in which the groves of handsome raffia palms, with their ripe yellow fruit, made a great display. The country was very thickly populated by the Akara, who seemed delighted to have us come among them.

According to old maps of this region, which were founded entirely on native reports, several running rivers should have been crossed by us on our journey from Lake Rudolf, one large one running north into the Sobat, and several others running north-west into the Nile. However many streams may rise in the tall mountains to the south, the water disappears except in the rainy season as it approaches the ghastly plain, and even the sandy beds themselves are soon obliterated in this great desert of the Sobat. Mr. Frazer and I made side trips to all the most northerly hills of the Akara, in order to secure further bases for the triangulation to the west, and to trace the courses of the wadies, which finally disappear on the surface of the plain not far from Katua.

Keeping westwards across a broad valley, we came to many more of the Akara, who were agriculturalists as well as stock raisers, and had substantial large wooden dwellings with peaked roofs. Some of the villages which we passed could easily have contained fifteen hundred souls or more. Although friendly and eager to trade, the Akara were very annoying in not pointing out to us where water lay to the west of each camp. The wadies, which contained water in pools and wells, ran only from south to north, and I suppose the natives thought me excessively stupid in not following these river-beds instead of intersecting them at right angles, which involved long marches across hot plains and a hunt at the end for water.

Near our camp of February 21, in a large open forest, I shot a male and female spotted bush-buck (*Tragelaphus bor*, Heuglin), much to my delight, since they are the only specimens of this beautifully marked animal that have ever been secured.

On the 22nd we rounded the extreme northern end of one of the arms of the Dinka-Ding mountains, and camped near some villages at Lumin. A plain or valley similar to the one we had just crossed stretched before us to another arm of the southern highlands. We had some water difficulties crossing this plain, since my few remaining camels were loaded heavily enough without my burdening them with water. Some camel gave out almost every march, which necessitated my throwing away more and more loads. Although there was much to interest me, I cannot reflect on my journey from the time we reached the great desert of the Sobat until we arrived at the Nile with pleasure unalloyed, for shoving along a caravan of dying camels and would-be dead Indians, by the help of careless Somalis and a few tired though good Indians, for many weeks is a thing that one cannot forget. We were soon to meet more Sudanese tribes, the Latuka, together with the Okatela and Beri.

The Akara, Dinka-Dings, Turkana, Mushas, Mursu, and Murle seemed to belong to the Masai and to the aboriginal pigmies who live north of Lake Stefanie, and to have nothing in common with the Sudanese.

On February 27 we reached some pools of water on the plain, not far from the Okatela mountains, and the same afternoon my boys reported many natives to be watching us in a suspicious manner. Two of my Somalis, whom I had sent to the mountains in search of water for our next march, came back in the evening with strange tales of the natives trying to surround them and take them prisoners. They also

TRAGELAPHUS BOR (HEUGLIN).

reported very many large villages in the hills. I wished to pass around the northern end of the mountain range and proceed straight to Lado, but the reported attitude of the natives decided me on taking the southern route to Tarangole. Although there was but slight danger of not succeeding to come to friendly terms with the natives, I was particularly anxious just here to avoid any risk even of a fight, since I was near Tarangole, the most northerly point of Colonel Macdonald's expedition, where friendly arrangements had been entered into between the British Government and the native chief. Two marches brought us to Omin, a very large village near Tarangole, perched on a hill called Alanga at the foot of the mountain. During most of the morning's march crowds of natives, armed with spears and bows and arrows,

Qatar National Library

followed the caravan at some distance in an unfriendly manner. After a time, however, others more civilized from near Omin joined them, and these latter approached to within 100 yards and made friendly advances. The best course for me to pursue was to go over to these people without escort, and the result was even more than I expected. In a couple of minutes the natives were crowding round me, patting me on the back and grasping my hand in a rather annoyingly familiar manner, that showed plainly enough that they were greatly relieved to find that we were not a hostile party of Egyptians or Mahdists, from both of whom they had received many unwelcome visits since Sir Samuel Baker's time.

At Omin we found quite a number of blacks dressed in loose white cotton suits, such as are worn by Sudanese townspeople, or occasionally in Dervish "jibbas." Each man who wore any clothing carried some old musket or rifle, of which he was immensely proud, even though the weapon were useless. The people were all under the chief Amara of Tarangole and Loguren, who only allowed those who carried rifles to wear clothing, or who, in other words, gave to any bit of cloth the dignity of a uniform. Whenever a man laid aside his rifle he also disembarrassed himself of all clothing. There were strangers here from many Sudanese tribes, some of them deserters from the Khalifa's forces after the Belgians had destroyed the Dervish influence on the upper Nile.

It was an agreeable change to meet natives who had some knowledge of Europeans, and with whom we could converse through the medium of Arabic. The great strength of the people, however, lay in the magnificent physique, pluck, and skill in the use of the spear and bows and arrows of the proud young men who never knew the use of cloth, and who do not imagine that there is a power on earth equal to that of their king Amara. The one great ornament of these warriors is a heavy helmet made of brass plates, laid together on a frame of interwoven grasses. It has the appearance of a solid brass Crusader's casque, and when worn easily by jaunty and graceful warriors the effect is most striking.

We spent nearly two days at Omin, during which time I arranged for a rendezvous with chief Amara, at a village called Lorkale, some 6 miles north of his capital Loguren, and near Tarangole. Since I had now picked up many points of Colonel Macdonald's survey, and found them to have been relatively very correct, as were those of Major Austin at Rudolf, I dropped my triangulation after leaving Omin, and carried on my chartographical work to the Nile by means of a pocket compass and dead reckoning. I had wrongly judged that the country to the west of Tarangole had been thoroughly explored by Emin Pasha, Sir Samuel Baker, and by members of the Macdonald Expedition, but I find my map to be the only one giving any detail.

On March 2 a tramp of four hours west, principally through a highly cultivated country, brought us to Lorkale, where we were joined by King Amara in the afternoon. We were quite unprepared to receive so great a chief. Accustomed as we had been to meet with petty chiefs ruling generally but a single village, we were rather taken aback at the display made by this commander of perhaps 25,000 warriors on his visit to our camp. He was accompanied by a flag-bearer and about 200 soldiers with rifles, and clad in various kinds of uniforms, principally white with gay-coloured sashes and turbans, and by a much larger following of archers and lancers, naked except for their quick-flashing, bright helmets. Everything about Amara was "spick and span," from his dark blue uniform of a Uganda rifleman to the European saddle upon his mule.

I received him with all the honours that I could command with my insignificant though trained escort, for it was deemed a great honour that he should pay me the first visit. His curiosity as to how I had come was too great, however, for him to wait until I called on him. It took him a long time to grasp the fact that we had not wandered either from Uganda or Egypt; and from the many questions he asked, it was apparent that the fact that we had come directly from the far East exercised a great moral influence over him, which I was pleased to think could not be otherwise than for the good of European interests on the upper Nile.

In return for the many presents which I made him, he gave me much durrha flour, honey, and ground nuts, but it was not until I had bidden him accept a large leopardine blanket that covered my bed that his heart really warmed towards me. I am sure he has never owned anything which pleases him more than this rug, which resembles the skin of some marvellous species of the cat family. Not only did the king at once send for an escort and guides for us, but he insisted on having a large tusk brought me from his village, to my regret, for I am afraid a poor native had some of his bones broken in consequence, if he did not fare worse. This man had made a mistake, and instead of bringing the tusk the king had ordered, he arrived at midnight with two ridiculously small cow tusks. Amara was so enraged that, picking up one of the latter, he began beating the wretched messenger in a terrible manner.

The smiling chief had suddenly turned into such a ferocious brute that when I endeavoured to prevent his killing his subject, he at first turned upon me a pair of eyes so full of passion that I feared lest he might deal his next blow at me, but I pretended that I had only interrupted him to praise the two small tusks, with which "I would be delighted," etc., and thus managed to quiet him. The unconscious body of his victim was almost hurled out of camp, and others sent to bring the proper tusk, which did not arrive until two o'clock in the morning.

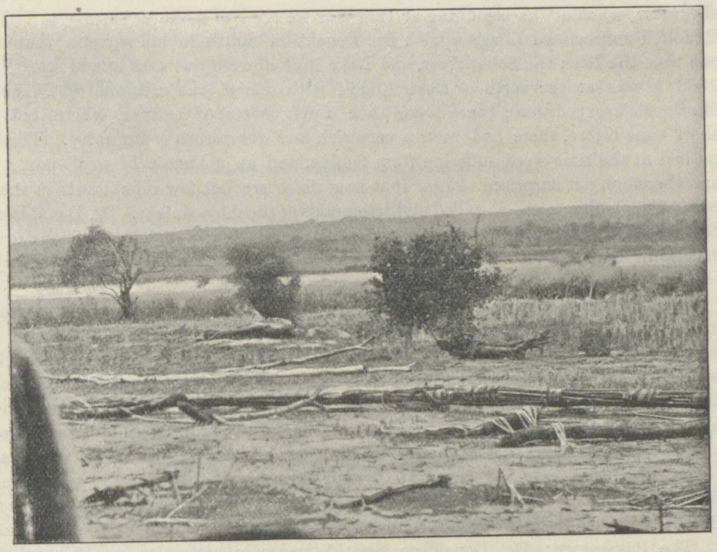
The Geographical Journal(Journal of the Royal Geographical Society): Volume XVI, No. 6 [348v] (49/232)

Amara was a splendid specimen of a Sudanese, over 6 feet in height, very broad and muscular, and with a strong, handsome face. But for his outburst of passion, which lasted but a minute, I should have thought him most cheerful and amiable.

Two long marches on March 3 and 4 brought us to a village where we were visited by a lady chieftain. I followed out my custom of offering a chair to a recognized chief, but I must confess the position was rather strange to me to be sitting with a well-formed young lady clad in the same manner only as Gunga Din, and talking over weighty affairs involving the welfare of her subjects with the latter. Her name was Kari, but she behaved herself in such a dignified manner as to preclude any idea that she would have recognized a name such as Caroline. The day after this we reached the village of the chief Uri Sube, the last of the villages under King Amara. From here on until we reached Loker we found ourselves in territory belonging to the Lukoyu, who inhabit principally the hills to the south, and possess but a few scattered hamlets in the bushy, wild plain through which we passed. We had much difficulty in cutting our way through the low forests and dense bush, occasionally getting tangled up in bamboo jungles, which we here encountered for the first time.

I heard from Amara that there was an Englishman stationed on the east bank of the Nile considerably south of Lado, so I abandoned my intention of going to the Belgians on account of the pleasure I felt it would give me to talk once more to an English officer, not dreaming that I could not enjoy the same benefit in the Uganda Protectorate that all civilized countries extend to visitors—that of being able to leave my valuables in bond at a frontier post, if I did not intend to enter them in the country. I firmly anticipated finding the Nile open, so that I could take my outfit to Cairo either in steamers or canoes. The first great disappointment came at Loker's, a large settlement situated almost on top of the long mountain which can be seen from the Nile 25 miles east of Fort Berkeley or Rejaf. On reaching here on March 10 we were informed that no steamers had come up the Nile, and that, furthermore, there were no canoes to be had. We were all cut up by the news, for my transport had already given out, and I was obliged to leave thirteen loads with the chief Loker to hold until I sent back for them. However, we reached Fort Berkeley on March 14, 1900, and although I was much pained at the extortions which were enforced upon me by the Government, according to Uganda Protectorate regulations, I shall never regret having touched an English outpost, from the simple fact that I met Captain Wm. K. Dugmore of the Uganda Rifles, and remained with him as his guest for nearly seven weeks.



I only wish I could look upon some other officials with whom I came in contact at Aden and Berbera with nearly the same respect as I do my good friend and hospitable host at Fort Berkeley. Learning from

despatches to Captain Dugmore, three months old, that "sudd" cutting had been begun on the Nile, I kept my men for nearly a month at the post, hoping that a steamer would come up the river and take us out *viâ* Omdurman. But on April 13, I found it necessary to send Mr. Frazer with all my men to Mombasa, except my cook and my bright Gurkha orderly, Hasap Singh. Famine was raging throughout the upper Nile districts, and had it not been for the great kindness of the Belgians in giving me grain, I could not have kept my men at all. I was obliged to remain longer myself, since I could get no transport for my collections and kit; and I had just made arrangements with the Belgians to go down

THE NILE AT FORT BERKELEY.

the Congo, a journey of four months in the rains, to the west coast, when, to my joy, Major Peake turned up in a gunboat, after having cut through the "sudd," and most kindly took me away with him on May 5, on his homeward journey of 1100 miles to Omdurman.

I reached Cairo the beginning of June, just ten months from the time of starting from the Somali coast for the interior, and a fortnight later found me in London with my collections safely installed at the British Museum of Natural History, to which I am presenting the most valuable of my specimens. The Academy of Natural Sciences of Philadelphia will also receive a large share. The collections include several hundred different species of birds, mammalia, plants, reptilia and batrachia, fishes, butterflies, etc.—a good number of them new to science.

I am much indebted to the Indian Survey Department for the loan of a valuable set of surveying instruments, by which I was enabled to lay down in detail over 500 miles of previously unmapped country between occasional known lines.

Before the reading of the paper, the President gave his introductory address (see p. 597). After the paper—

Major R. G. T. BRIGHT said: I have listened with very much interest to Dr. Donaldson Smith's paper. It is, perhaps, doubly interesting to one who has had the good fortune to pass over much of the country which he has traversed. Judging from the amount of water which Major Austin and I found in the country south of the Sobat, when at the beginning of this year we tried to make a journey to Lake Rudolf, I am inclined to agree with Dr. Donaldson Smith in his surmise that at one time the Nile, the Sobat river, and Lake Rudolf were one vast inland sea. In 1898 I was at the north of Lake Rudolf with one of the columns of Colonel Macdonald's expedition; there were then a few wretched natives, where, but a short time before, there had been a very rich and prosperous community. These natives at the time were suffering from famine, and an epidemic of small-pox. I am, therefore, not surprised to hear that now there are but few inhabitants in that part. This is due to the so-called civilizing raids of the Abyssinians. Dr. Donaldson Smith will, I am sure, not rest long. He has already led several expeditions to a successful issue, and I wish him, as in the present case, safe and many happy returns.

Dr. BOWDLER SHARPE: Dr. Donaldson Smith has on his former, as on his present expedition, greatly benefited zoological science, and his discoveries are quite on a par with the wonderful new facts which he has brought from the countries through which he has been. You have heard from the paper that we have at the Natural History Museum five new specimens of mammalia. I have not quite finished the birds, but there are certainly some new species, and many of great interest, especially from that new part of Africa which has not been visited by a naturalist before. I need hardly say that the British Museum thanks him on this occasion, as it has on former occasions, for not having forgotten zoological science. He has presented us with those specimens which we before had not in the Museum.

The PRESIDENT: Dr. Donaldson Smith's paper is certainly one of peculiar interest, even apart from his description of a new and almost entirely undiscovered region. I was particularly struck by the remarks (very important remarks, I think) he made respecting the meteorology of this country. The desert lands, especially to the eastward, are caused by the winds from the north blowing over the mountains of Abyssinia, and being thus wrung perfectly dry, coming down on their southern sides as dry winds. This no doubt accounts for many phenomena connected with the regions south of Abyssinia; but it requires a great deal more careful study, and this is a point of some importance, as the country will hereafter become a British settlement. Possibly connected with this question is the very remarkable fact that the whole fauna, both birds and mammals, appears to change as soon as Lake Rudolf is passed. There is a different fauna on the eastern to that on the western side. In considering the paper of Dr. Donaldson Smith, all these points give rise to reflection; but we get very little idea of the important geographical work he has done from simply listening to his paper, even when taken in conjunction with the paper he read to us a few years ago. He has not only explored a new region, but has done so with the greatest care; and has made a

Qatar National Library

BRITISH LIBRARY

most valuable series of surveys by triangulation. He produced on his first journey a number of extremely valuable maps, and will, I have no doubt, do the same with regard to his latest journey. He has also made, as Dr. Bowdler Sharpe told us, a most important collection of specimens of mammals and birds, as well as of batrachians and other lower forms. All this, I think, places Dr. Donaldson Smith in a very high position as an explorer of unknown countries, and I think that he deserves the highest praise that can be bestowed on him by geographers. I now propose a very cordial vote of thanks to Dr. Donaldson Smith, which I feel sure will be carried unanimously.

Note on Dr. Donaldson Smith's Map.—Heights determined by many boiling points, as well as aneroid observations. As far as Lake Stefanie the positions were determined by triangulations based on points fixed by me in 1895, aided by frequent astronomical observations with theodolite, three chronometers, and sextant. Between Lake Rudolf and Tarangole I depended upon triangulation almost entirely, aided by occasional astronomical observations for latitude. The base for this was plotted in the vicinity of the northern end of the lake from my previous observations, from a new set of measurements, and from points laid down by Major Austin.—A. D. S.

THE VOYAGES OF DIOGO CÃO AND BARTHOLOMEU DIAS, 1482-88.*

By E. G. RAVENSTEIN.

When Prince John, on August 26, 1481, and at the age of twenty-six, ascended the throne of his father Affonso, he found the royal treasury empty, and his ambitious nobles, jealous of their feudal privileges, ever ready to defy the authority of their king. But John was strong and energetic where his father had been weak and vacillating, cautious where he had been rash and regardless of consequences. Wise measures of administration once more filled the royal coffers, and a strong hand crushed the nascent conspiracy of the nobles.

The Guinea coast by this time had been explored as far as Cape S. Catharina. Lopo Gonçalves had been the first to cross the line; Fernão Po is credited with having discovered the Ilha Formosa, which now bears his name, in 1472; whilst Ruy de Sequeira, "about the same time," according to Galvão,† followed the coast as far as Cabo de S. Catharina (November 25), and also discovered the islands of S. Thomé (December 21) and S. Antonio (January 17).‡ This last subsequently

مكتبة قطر الوطنية
Qatar National Library

became known as Ilha do Principe, that is the island of Prince John, the future King John II., who had enjoyed the revenues of the Guinea trade ever since 1473.*

The Guinea trade by this time had become of importance, but since the termination in 1475 of the monopoly granted to Diogo Gomes nothing had been done to expand it; nor had steps been taken to render effective the claims to sovereignty put forth by Portugal. Hence foreign interlopers made their appearance on the coast, and during the unfortunate wars with Castile (1475–80) entire fleets sailed from Spanish ports to share in the profits of the trade there.

One of the first measures taken by King John was to put a stop to these irregularities. Royal ships were sent out to protect Portuguese interests, and on January 20, 1482, Diogo d'Azambuja † laid the foundations of the famous Castello de S. Jorge da Mina, which was the first European settlement on the Gold Coast, and the centre of Portuguese activity up to 1637, when it was captured by the Dutch.

The First Voyage of Diogo Cão, 1482–84.

When King John had thus attended to what he conceived to be his more immediate duty as a king and ruler, he took up the long-neglected work of his uncle Henry, for he was both "a good Catholic, anxious for the propagation of the faith, and a man of an inquiring spirit, desirous of investigating the secrets of nature." ‡

Diogo Cão, whom the king selected to initiate this work of exploration, was a "man of the people." Genealogists have provided him with a noble pedigree, but he was in truth the descendant of one Pedro Affonso Cão, or Cam, who, in the days of King Diniz (1279–1324), had been one of the bailiffs of Villa Real in Traz os Montes, and of his wife, Briolanja da Nobrega.§ In the patent of nobility of 1484,‖ by which the king "separated him from the common herd," the past services of

Statistica das Possessões Portuguezas' (Lisbon, 1844), ii. p. v.) makes him at the same time the discoverer of the Guinea islands, including Annobom, or New Year's island. This island, however, was only discovered at a much later period, and independently of the other islands, for it is absent from Soligo's chart (1485), and is shown on early charts as lying to the south or even south-east of St. Thomé, when it really lies to the south-west. The island was no doubt discovered by a ship attempting a "short cut" across the Guinea gulf, and carried upon it by the equatorial current. If Duarte Pacheco Pereira (b. 1450, d. 1533) ('Esmeraldo de situ orbis,' p. 78) tells us that S. Thomé and S. Antonio were "discovered" by King John, we may be permitted to assume that this "discovery" took place when King John was still heir-apparent.

* For documents proving this, see 'Annaes mar. e col.,' v., 1845, p. 38.

the recipient of the honour are referred to, and also those of his valiant father, Badalhouce, and of his grandfather, Gonçalo Cão, who may have fought in the famous battle of Aljubarrota (1385), when the Castillian pretender was routed, and the king, duly elected by the Cortes, got his own. Among the services rendered by Diogo Cão himself may be instanced the capture of three Spanish vessels on the Guinea coast in 1480.*

We do not know whether Cão was given the command of one or of more vessels, nor have the names of any of his officers been placed on record. But when we turn to ancient maps, we meet with a Rio do Infante, a Golfo de Alvaro Martins, a Cabo de Pero Dias, a Rio de Fernão Vaz, an Angra de João de Lisbõa, an Angra de Ruy Pires, and a Serra de Corte Real. There can be no reasonable doubt that the names attached to these bays, capes, or rivers are those of persons who were with one or more of the expeditions engaged in the discovery of these coasts. Of João Infante, Alvaro Martins, and Pero Dias, we know that they were with Dias, and may previously have been with Cão. João de Lisbõa won great distinction in the course of time, and in 1525 was appointed Piloto mór of India. Unfortunately, he died the year after.† Fernão Vaz may have been the pilot who, in 1486, witnessed the agreement between Fernão Dulmo and João Affonso do Estreito about the search for the Sette citades; who got into disgrace for poisoning his wife, and was himself poisoned by his mistress in 1502.‡ The name of Côrte Real we find on Behaim's globe only, and as the Côrte Reaes of Terçeira were a family of seamen, it is quite possible that a member of it may have joined one of these expeditions, perhaps Gaspar, the alleged discoverer of "terra nova." It is, however, quite possible that Behaim merely intended to pay a compliment to a family with whom he was distantly related.§ Of Ruy Pires we know nothing.

Cão was the first to carry "padrões," or pillars of stone,‖ on an exploring voyage. Up to his time the Portuguese had been content to erect perishable wooden crosses, or to carve inscriptions into trees, to mark the progress of their discoveries. King John conceived the happy idea of introducing stone pillars, surmounted by a cross, and bearing, in

BRITISH LIBRARY

addition to the royal arms, an inscription recording in Portuguese, and sometimes also in Latin, the date, the name of the king by whose order the voyage was made, and the name of the commander. The four padrões set up by Cão on his two voyages have been discovered *in situ*, and the inscription upon two of them (one for each voyage) are still legible, notwithstanding the lapse of four centuries, and have been deciphered.

During the first voyage two padrões were set up—one at the Congo mouth, the other on the *Cabo do Lobo* in lat. 13° 26′ S., now known as Cape St. Mary. The latter has been recovered intact. It consists of a shaft 1·69 m. high and 0·73 m. in circumference, surmounted by a cube 0·47 m. in height and 0·33 m. in breadth. Shaft and cube are cut out of a single block of lioz, a kind of limestone or coarse marble common in the environs of Lisbon. The cross has disappeared, with the exception of a stump, from which it is seen that it also was of stone, and fixed by means of lead.

THE ARMS OF PORTUGAL UP TO 1485.

The arms of Portugal carved upon the face of the cube are those in use up to 1485, in which year João II., being then at Beja, caused the green cross of the Order of Avis, which had been improperly introduced by his grandfather, who had been master of that order, to be withdrawn and the position of the quinas, or five escutcheons, to be changed.*

The inscription covers the three other sides of the cube. It is in Gothic letters and in Portuguese, and reads as follows: "In the year 6681 of the World, and in that of 1482 since the birth of our Lord Jesus Christ, the most serene, most excellent and potent prince, King D. João II. of Portugal did order (*mandou*) this land to be discovered and these padrões to be set up by Dº Cão, an esquire (*escudeiro*) of his household." There is no inscription in Latin.

As the year 6681 of Eusebius begins on September 1, 1481, we gather from this inscription that the order for the expedition was given between January and August, 1482. Of course the departure may have been delayed, but the delay cannot have been a long one, as Cão was home again before April, 1484.

* See Ruy de Pina, 'Chronica d'El-Rei D. João II.' (Lisbon, 1792), p. 64; Garcia de Resende, 'Chronica' (Lisbon, 1752), p. 27. The exact date when the change was made is not given, and Sr. José Bastos, the learned keeper of the Torre do Tombo, informs me that there are no documents in his charge which would enable him to settle the point. The change was obviously made prior to the introduction of the new coinage in June.

Further light is thrown upon Cão's first voyage by a chart of Cristoforo Soligo, evidently drawn immediately after his return, a notice of which we give in the Appendix. Apart from this, we are dependent upon João de Barros and the chroniclers Ruy de Pina and Garcia de Resende.*

Cão may thus be supposed to have left Lisbon about the middle of 1482—say in June. He called at S. Jorge da Mina for supplies, and then made straight for Cabo de Lopo Gonçalves. His progress south along this coast was necessarily slow, for the current sets to the northward, the winds are southerly, and the surf is heavy. Only on rare occasion is the mariner favoured with a current setting to the south. He is dependent, therefore, for his progress upon a judicious use of land and sea-breezes. Leaving behind him the Cabo de S. Catharina, with its "tree" marking the furthest point reached by the seamen employed by Fernão Gomez, the Cape of Pedro Dias,† and the wooded hills of the Holy Spirit, Cão seems to have made a first stay in a bay merely described as "Angra" on Soligo's chart, but named Gulf of Alvaro Martins on others, and now known as Mayumba bay. He then left behind him a country of heavy rains and most luxuriant vegetation, and entered upon a region occasionally actually arid. Passing beneath the Paps of Bamba (*os duos montes*), and along a coast for the most part cliff-bound, he entered the Bay of Loango, which must have taken his fancy, for he called it *Praia Formosa de S. Domingos*. It is possible that he arrived here on that saint's day, that is on August 4. Passing thence to the south, and along fine red cliffs (*barreiras vermelhas*), Cão become soon aware that he was approaching a large river, for when still 5 leagues out at sea—as a legend on Soligo's chart tells us—he found the water fresh—by no means an exaggeration, for islands of floating vegetation coming out of the Congo have been encountered 100 miles from its mouth, and 9 miles to seaward the surface water is quite fresh.‡

Great must have been the astonishment—nay, terror—of the natives when for the first time they saw rising above the horizon the sails of a white man's vessel; and beheld the bleached faces of its inmates. Cão sailed up the river § for a short distance, and at once entered into friendly relations

* According to Ruy de Pina, Cão's first voyage was undertaken in 1485–86; according to Barros ('Da Asia,' Dec. I., liv. iii. c. 3), in 1484–86. Both suppose Cão to have gone no further south than the Congo.

† Corrupted into Pedras point.

‡ 'Africa Pilot,' Part ii. (London, 1893), p. 154.

§ The Congo seems at first to have become known as Rio do Padrão, and river of the Mani Congo; but Duarte Pacheco already knows one of its native names, Nzadi, though in the corrupted form of Emzaze.

with the natives. Physically, they resembled the negroes of Guinea, but the interpreters whom Cão had with him failed to make themselves understood. The natives came freely on board to barter cloth in exchange for ivory, and gave their visitors to understand by signs that far in the interior there lived a powerful king. Cão at once despatched some Christian negroes to this king as his ambassadors. They were, as a matter of course, the bearers of suitable presents,* and were instructed to assure the king of the friendly intentions of his visitors from Portugal, and of their desire to trade. The native guides promised to bring these messengers back within a certain number of days.

Before leaving the Congo for the south, Cão set up the first of his padrões, emphatically called "the first" on Canerio's chart. It stood on Shark point (and not on Padron point of our chart), and was dedicated to S. Jorge, a saint for whom King John felt a "singular devotion." We learn from Fathers Cavazzi and Merolla† that the Dutch, when they occupied the Congo in 1642, wantonly destroyed this memorial of Portuguese enterprise. Merolla, who saw the fragments in 1682, was able to trace the royal arms and an inscription, of which unfortunately he made no copy. A tall wooden cross was subsequently erected on the spot where the pillar stood, and an oratory built near it where masses might be said.‡

THE PADRÃO OF SÃO JORGE.

The fragments of the padrão were appropriated by native priests, who looked upon them as most potent fetishes. Sr. Sori saw them in 1859;§ Burton visited the locality in 1863;‖ and Baron Schwerin, guided by Sr. F. J. de França, did so in April, 1887. The baron caused the bandages in which the fragments were wrapped up to be removed, in honour of which event the *Massebi*, a Portuguese gunboat, fired a salute.

---

* The damask petticoat which the king wore when he received Ruy de Sousa in 1491 is said to have been given him by Cão (Barros, 'Asia,' t. I. i. p. 231).

† Cavazzi, 'Istorica descrizione de tre' regni Congo,' etc. (Bologna, 1687), p. 319; Merolla, 'Relatione del viaggio nel regno di Congo' (Napoli, 1692).

‡ This plain statement disposes of the absurd story told by the Portuguese in 1859, according to which the padrão was broken by cannon-balls fired from an English ship, and that its fragments would have found their way to the British Museum had not the boat in which they were being conveyed on board capsized. (L. Cordeiro, *Boletim Lisbon Geogr. Soc.*, 1892, p. 152; and *Transactions South African Philos. Soc.*, 1898, p. 298.)

§ Sr. Sori's 'Descobrimentos dos Portuguezes nos Seculos, xv. e xvi.,' we were unable to obtain, and we take this information, together with our illustration, from Castilho's 'Os Padrões' (Lisbon, 1869), p. 17.

BRITISH LIBRARY

Mr. Dennett * examined the fragments in May of the same year. There were two large pieces, as shown in our illustration, and two ball-shaped pieces, 7 and 9 inches in diameter, lying at their foot. The material was a coarse white marble. The two larger fragments are now in the museum of the Lisbon Geographical Society.

The very hideous monument set up in 1859 by Sr. Sori was fortunately washed away by the sea in 1864. It was replaced, in 1892, by a memorial of better design, but still vastly inferior to the original padrão.

It is to be presumed that Cão, when, after a delay which may well have extended over several months, left for the south, was able to gain a fairly complete knowledge of the coast, for his progress must have been slow. We know from Soligo's chart that he discovered a river, which he named after Fernão Vaz,† as also the low sandy Ilhas das Cabras (Goat islands), off the modern city of Loanda.

Making a long stretch from the coast, Cão never noticed the most important river along the coast, the Kwanza, although its clayey waters discolour the sea for 10 or 15 miles. It is curious that none of his immediate successors should have been more fortunate. The river is not mentioned in Pacheco's 'Esmeraldo,' and is apparently shown for the first time on a chart of P. Reinel, who already knew its native name.

A remarkable headland, which from some bearings appears as a double peak, was appropriately named by Cão, "A terra da duas Pontas." It is now known as the "Morro," or hill, of Old Benguella. Further south, Cão seems to have examined the mouth of the Catumbela, for Rio do Paul—river of the swamp—is a very appropriate name for a river which, after the rains in March and April, overflows its banks and converts a great extent of country into a swamp or marsh. As Cão called the bay to the south Angra de St. Maria, he may have been in the vicinity of this river on Lady Day, March 25, 1483.

The bold granitic cliffs immediately to the south of Ponta Choca (13° 17′ S.) became known as Castello d'Alter pedroso;‡ and about 10 miles beyond, on a low point, which he called "Cabo do lobo" (seal point), Cão erected his second padrão, which was dedicated to St. Augustin, from which it must not be inferred that it was erected on August 28, as these dedications were made in Portugal. At the back of this cape, now known as St. Mary (13° 26′ S.), rose a Monte negro (black mountain), and Pacheco § tells us that it was called Ponta negra, or Preta (both meaning black point), because of a "black" trump, "manilha negra," which was played here in a game of manille. This

padrão has already been described by us. It was the second and last set up during this voyage, and Soligo's chart correctly describes it as "o ultimo padrão."

When Cão returned to the Congo, he was annoyed to find that the messengers whom he had despatched to the king had not yet returned, although they had been absent double the time expected. Cão, who was naturally anxious to return home with a report of his discovery of what seemed a powerful kingdom, therefore seized four native visitors to his ship as hostages, giving their friends * to understand that after the lapse of fifteen months he would bring them back and exchange them for his own men, who were still with the king. These latter, we learn from Ruy de Pina, had been made much of; but when the king heard of Cão's high-handed proceedings, he refused to admit them any longer to his presence, and threatened to kill them, should his own people not be restored in time.

THE COAT-OF-ARMS OF D. CÃO, 1484.

Among Cão's hostages was one Caçuto, a "nobleman" in his own country, and a man of some intelligence, who seems to have picked up Portuguese rapidly. King John was much pleased with this man, and the information which he was able to give. He, as well as his companions, were treated with much distinction, and dressed in fine cloth and silk!

Cão came back to Lisbon probably in the beginning of 1484, and certainly before April of that year. The king, first of all, made him a "cavalleiro" of his household. He then, on April 8, 1484, "in consideration of the services rendered in the course of a voyage of discovery to Guinea, from which he had now returned," granted him an annuity of ten thousand reals, to be continued to one surviving son; and a few days afterwards, on April 14, he separated his "cavalier" from the common herd and made him noble, and gave him a coat-of-arms charged with the two padrões which he had erected on the coast of Africa.†

* Garcia de Resende, 'Chronica,' c. 155, p. 68, says "certain months;" but Ruy de Pina, 'Chronica,' c. 56, p. 146, and Barros, 'Da Asia' (Lisbon, 1778), t. I. i. p. 174, say fifteen months.

† These documents, which prove absolutely that Cão was back from his first voyage before April 1, 1484, were first published by Albano da Silveira in 'Annaes mar. e col,' v., 1845, p. 37. L. Cordeiro republished them in the *Boletim*, 1892, p. 159.

BRITISH LIBRARY

The Second Voyage of Diogo Cão, 1485–6.

The materials for writing a history of Cão's second expedition are even less complete than those available for the first. There are the padrão of Cape Cross with its inscription, an important legend on the chart of Martellus Germanus, and the narrative of Martin Behaim, who claims to have commanded one of the vessels. Apart from these, we are dependent upon the accounts given by Ruy de Pina and João de Barros, for none of the later historians seem to have had access to original sources.

The narrative of Behaim, as gathered from the legends on his famous globe, and a paragraph in Schedel's 'Liber Chronicorum,' printed at Nürnberg in 1493, during Behaim's presence in that town, is as follows :—

In 1484 King John sent two vessels to the south, one being commanded by D. Cão, the other by Martin Behaim. They carried, in addition to goods for barter, eighteen horses with splendid harness, intended as presents for Moorish (*i.e.* Negro) kings. They traded with the Jolof and on the Gambia; visited King Furfur's land,* 1200 German leagues from Lisbon, where the Portugal pepper grows, and came to a country where they found cinnamon. They also discovered Prince's island, S. Thomé and Martin (Behaim's!) islands (*i.e.* Annobom). On January 18 they set up a column on Monte Negro (Cão's third pillar in 15° 40′). Having sailed 2300 leagues, they set up another pillar on Cape Ledo.† They were again with their king after an absence of 19 (16 or 26) months,‡ having lost many men from the heat, and bringing pepper, grains of paradise, and many other things in proof of the discoveries they had made.

We have elsewhere § considered the trust-worthiness of this account of Cão's expedition, and arrived at the opinion that Behaim did not accompany Cão, but may have been on the Guinea coast with an expedition such as that of João Affonso d'Aveiro.

Far more useful for our purpose is the pillar which formerly stood

---

hillock, and surmounted by a cross *azure*. Crest: the two columns crossed and tied with a ribbon *vert*. Our illustration is taken from the 'Thesouro de Nobreza,' of Francisco Coelho, 1575, as published by Luciano Cordeiro.

* King Furfur's land is clearly Benin, whence d'Aveiro, in 1486, brought the first Guinea pepper to Portugal. Behaim's cinnamon must have grown in Ptolemy's apocryphal Cinnamoniphera Regio.

† 2300 leagues on Behaim's globe actually carry us to a Cape Ledo, which critics may be forgiven for identifying with Dias' furthest.

‡ Nineteen months on the globe, 16 in the German, 26 in the Latin version of the chronicle.

on Cape Cross, and which Captain Becker of the *Falke* carried off to Kiel * in 1893. Dr. Scheppig has fully described the pillar.†

The shaft is 1·84 m. long, and has a circumference at the bottom of 0·93 m. It tapers slightly towards the top, and is surmounted by a cube 0·43 m. high, 0·45 m. broad, and 0·26 m. thick. The whole is hewn out of a single block of marble. The cross, also of marble, was fixed by means of lead. The arms carved on the face of the cube are those adopted by John II. in 1485. There are two inscriptions in Gothic characters, the one in Portuguese, the other in Latin. The Portuguese inscription says—

"In the year bjMbjclxxxb (6685) of the creation of the world, and

THE PADRÃO OF CAPE CROSS.

THE ROYAL COAT-OF-ARMS, 1485.

of Christ llllclxxxb (485), the excellent, illustrious King D. João II. of Portugal did direct this land to be discovered, and this padrão to be set up by Dº Cão, a cavalleiro (knight) of his household."

The Latin inscription reads as follows:—

"There had elapsed 6684 (5?) years since the creation of the world, and 148– since the birth of Christ, when the most excellent and most serene King, D. João II. of Portugal . . . ordered this column to be set up by his knight (*militem*) Iacobus Canus (*i.e.* Diogo Cão)."

Dr. Scheppig observes that the dates in this Latin inscription are both written in Arabic characters, "which, owing to their novel form, were still sources of frequent error and confusion," and that the fourth

* The German Emperor has since caused an exact copy of it to be erected, substituting granite for marble.

BRITISH LIBRARY

cipher in 6684 is certainly of abnormal shape, and may perhaps be meant for a 5, in which case both inscriptions would agree. As to "1485" no doubt whatever arises.

As the year 6685 of the Eusebian era begins on September 1, 1485, Cão must have departed after that day, and before the close of the year. As he had returned from his first voyage before April, 1484, his departure must have been delayed for reasons not known to us. Perhaps it was owing to the opposition of the Royal Councillors to further expeditions, perhaps a desire that the contemplated change of arms might be recorded on the padrões to be sent with the explorer.

During this voyage Cão seems to have commanded a fleet—at least, so we are told by Ruy de Pina, Garcia de Resende, and Martellus Germanus. He took with him, as a matter of course, the four men whom he had so unceremoniously carried off. These had been well treated in Portugal, and were the bearers of rich presents to their king, whom they were to invite to throw aside his idols and fetishes and embrace the only saving faith.*

It may be presumed that Cão, in the course of this second voyage, gained a fuller knowledge of the coast first discovered by him to the north of the Congo. He may thus have visited and named the bay called *Golfo do Judeu*, the Jews' bay, of old maps, either because there was a Jew on board his vessel, or, what is less likely, because he was struck with the Jewish physiognomy of some of the natives, who are absurdly supposed to keep the Jewish sabbath, when in reality they have fetishes and *Casas da tinta* like their neighbours.† He may also have entered the fine *Golfo das almadias* (Kabinda bay), still famous for its boats, as it appears to have been in the days of the early Portuguese.

There was great rejoicing when Cão entered the Congo, and it became known that the hostages whom he had carried off were on board his ship. He at once sent one of these men to the Mani Congo, to announce his arrival, and to beg that his own people should be sent down to the coast, when the other three would be released. When the man came back, Cão sent a present to the king, and let him know that he was about to follow the coast to the south, but that on his return he would seek speech with him, and hand over the presents with which he had been entrusted.‡

Passing southward along the coast, Cão landed several times for the

* I. da Costa Quintilla, 'Annaes da Marinha Portuguesa,' i. p. 197, says that the king sent an "ambassador" to the King of Congo, but Ruy de Pina (p. 147) and Garcia de Resende (p. 68) only say that he sent a "message" (*embaixada*) by these four men.

† Makoya, near Chinchosho, is one of the principal villages of these supposed Jews. See Bastian, 'Deutsche Expedition nach der Loangoküste,' ii. pp. 45, 275.

‡ All this according to Barros, Dec. I., liv. iii. c. 3.

Qatar National Library

purpose of carrying off natives who were to be taught Portuguese, so that on future occasions they might act as interpreters. Near Cape St. Bras he saw native fishgarths, and hence called that double of the Bill of Portland *Ponta das Cambóas*.*

When about 160 miles beyond the second padrão set up by him in 1483, he reached a second *Monte Negro*, a remarkable headland in 15° 41′ S., rising like an island to a height of 200 feet, and presenting a rugged black face towards the sea, and upon this he set up a padrão. The bay to the south he named *Angra das Aldeas*, because of two poor fishing villages. In design and size this padrão resembles that of Cape Cross. A trace of the royal crown is still visible, but time has obliterated the inscriptions.†

The aspect of the country had gradually grown poorer and poorer, until barren sandhills and arid rocks were all that could be seen from the sea, except at a few openings where streams or rivers had given birth to vegetation and verdure (*praias verdes*). Lofty mountains now and then were visible far inland. Passing along such a coast of low sandhills and white cliffs, Cão come past the broad Golfo da Baleia (Whale bay), separated by a "sleeve of sand" (Manga de Areia) from the open sea; he must have noticed the low black rocks with yellow specks, first known as Cabo preto;‡ and ultimately reached a truncated cone of red sandstone, in 21° 50′, upon which he set up the last of his padrões, already fully described by us. This was one of the Cabos do padrão of old charts, and is now known as Cape Cross. To the south of it, on Martellus Germanus's chart, we notice a Praia das Sardinhas (Sardine shore), now known as Sierra bay, and a Serra parda, which may safely be identified with the dark and rocky cliff now known as Cabo dos Farilhões (22° 9′ S.), surmounted by a sandy dune, and rising inland into peaks—*os montes do padrão*.

This cape, 430 leagues, or 1450 sea miles, to the south of Cape Catharina, is the furthest point reached by Cão, and if a legend on the chart of Henricus Martellus Germanus may be accepted, he died there. This legend is to the following effect:—

"This mountain, called the Black mountain [*i.e.* Monte negro, in 15° 41′] was reached by the fleet of [John] the second King of Portugal, which fleet was commanded by Diegus Canus, who, in memory of this

* Pacheco, 'Esmeraldo,' p. 85.

† Shaft, height, 2·01 m., circumference, 1·08 m.; cube, 0·46 m. high, 0·45 m. broad, 0·19 m. thick (L. Cordeiro, *Boletim*, 1892, and 'Diogo Cão,' p. 66). This pillar is now in the museum of the Lisbon Geographical Society, with the exception of the cross, which had disappeared. A new pillar, of poor design, was erected in its place in 1892.

‡ Subsequently as Cabo frio (Cold cape), because of the cold coast current which runs past it.

BRITISH LIBRARY

fact, set up a marble column, with the emblem of the cross, and proceeded onwards as far as the Serra parda, which is distant 1000 miles from the Black mountain, and here he died" (*et hic moritur*).

A "parecer," or opinion, drawn up by the Spanish astronomers and pilots who attended the congress of Badajoz in 1525, and signed by Hernan Colon, Juan Sebastian del Cano, and others, goes far to confirm this legend, for it tells us that Cão, in the course of his second voyage, discovered the coast from Montenegro as far as the Sierra Parda, where he died (*donde murio*), a distance of 200 leagues (680 sea miles).*

The distance between Cape Negro and Sierra Parda actually amounts to 435 sea miles (139 leagues, or 556 Italian or Roman miles), but if we assume the Mediterranean on the chart of Germanus (which has no scale) to measure 3000 Italian miles in length, as usually adopted, then the distance separating Montenegro from Sierra Parda on that chart would equal 1000 of these miles.

Of course, if Cão died near his last padrão, we are compelled to reject the account given by Ruy de Pina and Barros of the final stages of his expedition, and generally accepted. According to these historians, Cão returned to the Congo, had an interview with the Mani Congo, who expressed a desire for priests to convert his people, masons and carpenters to build churches and houses, labourers to break in oxen, and women to make bread, so that his kingdom might in every respect become like Portugal. He sent Caçuto, one of Cão's hostages, as ambassador to Portugal, and with him the sons of several of his courtiers, desiring that they should be taught to read and write and made Christians. At the same time he sent a present of ivory and palm cloth, the most valuable products of his kingdom.

Now, we have good reason to believe that Caçuto was received by the king in the beginning of 1489, the king being then at Beja, where he and his companions were baptized with much solemnity, the king himself, his queen, and gentlemen of title acting as sponsors.† We know, further, that Caçuto, henceforth known as D. João da Silva, was sent back to Congo with D. Gonçalo de Sousa, King João's ambassador, in December, 1490. Barros ‡ says that this happened two years after he had been baptized.

It might reasonably be concluded, from these dates, that Caçuto arrived in Portugal in December, 1488, was baptized at Beja in January, 1489, and again left for Congo, after a stay of two years, in December, 1490. But if this be so, he cannot have come with Cão, for Cão, or his ships,

* Navarrete, 'Colleccion,' iv. (Madrid, 1837), p. 347. Observe an omission after "el dicho cabo."

must have been back before August, 1487, in which month Dias started on his voyage, taking with him the people whom Cão had kidnapped. Nay, in all probability Cão's ships came home even earlier, say in September, 1486, for on October 10 of that year Dias seems already to have been appointed to the command of the expedition which was to make him famous for all time.*

Indeed, we are inclined to think that after Cão's death, his vessels returned straight home, and if they did so, and the Eusebian era is stated quite correctly on the padrão of Cape Cross, they can have been away at the outside for thirteen months, that is, from September, 1485, to September, 1486—not a long period, but amply sufficient for a voyage to Cape Cross and back, and a stay of several months on the Congo river.†

The Voyage of Bartholomeu Dias, 1487–88.

No sooner had Cão's vessels returned to the Tagus than King John, whose curiosity had been excited by the reports about the supposed Prester John, brought home by d'Aveiro,‡ determined to fit out another expedition to go in quest of him by doubling Africa, Friar Antonio of Lisbon and Pero of Montaroyo having already been despatched on the same errand by way of Jerusalem and Egypt. The command of this expedition was conferred upon Bartholomeu Dias de Novaes, a cavalier of the king's household, who, if we may trust Fernão Lopez de Castanheda ('Historia,' liv. i. c. 1), held at the time the appointment of superintendent of the royal warehouses (*almoxarife dos amazens*). Portuguese historians speak of this Dias as a kinsman or descendant of João Dias, who was associated with Gil Eannes in doubling Cape Bojador in 1434, and of Diniz Dias, a cavalier of King John I., whom Azurara credits with the discovery of Cape Verde in 1445, but I am not aware of any documentary evidence in favour of these assumptions. There can be no doubt, however, that Dias was a seaman of considerable experience. It may have been our Bartholomew whom King John, in 1478, when still crown-prince, in consideration of 12,000 reis expended in the purchase of a slave, exonerated from payment of the usual royalty on the ivory bought on the Guinea coasts.§ It certainly was our Bartholomew who commanded one of the vessels despatched in 1481 with Diogo d'Azambuja to the Gold Coast.

The appointment seems to have been made in October, 1486, for on

the 10th of that month King John, "in consideration of services which he hoped to receive," conferred upon Bartholomeu Dias, the "patron" of the *S. Christovão*, a royal vessel, an annuity of 6000 reis.* We shall see presently that ten months were allowed to elapse before the expedition actually left the Tagus.

The account which João de Barros has transmitted to us of the remarkable expedition which resulted in the discovery of the Cape of Good Hope † is fragmentary, and on some points undoubtedly erroneous. Unfortunately, up till now no official report of the expedition has been discovered; but there are a few incidental references to it, which enable us to amplify, and in some measure to correct, the version put forward by the great Portuguese historian.

Most important among these independent witnesses is a marginal note on fol. 13 of a copy of Pierre d'Ailly's 'Imago mundi,' which was the property of Christopher Columbus, and is still in the Columbine Library at Seville. This "note" reads as follows :— ‡

"Note, that in December of this year, 1488, there landed at Lisbon Bartholomeu Didacus [Dias], the commander of three caravels, whom the King of Portugal had sent to Guinea to seek out the land, and who reported that he had sailed 600 leagues beyond the furthest reached hitherto, that is, 450 leagues to the south and then 150 leagues to the north, as far as a cape named by him the Cape of Good Hope, which cape we judge to be in Agisimba,§ its latitude, as determined by the astrolabe, being 45° S., and its distance from Lisbon 3100 leagues. This voyage he [Dias] had depicted and described from league to league upon a chart, so that he might show it to the king; at all of which I was present (*in quibus omnibus interfui*)."

The same voyage is referred to in a second "note" discovered in the margin of the 'Historia rerum ubique gestarum' of Pope Pius II., printed at Venice in 1477. From this second note we learn that "one of the captains whom the most serene King of Portugal sent forth to seek out the land in Guinea brought back word in 1488 that he had sailed 45° beyond the equinoctial line." ‖

Las Casas ('Historia de las Indias,' lib. i. c. 7) assumed these notes to have been written by Bartholomew Columbus, whom, as the result

* Albano da Silveira (*Annaes mar. e col.*, v., 1845, p. 55) first published the royal rescript, since reprinted by Texeira de Aragão ('Vasco da Gama,' 3a ed. p. 24).

† 'Da Asia,' Dec. I. liv. iii. c. 4.

‡ For a facsimile, see 'Raccolta Columbiana' (Rome, 1892), pt. I. t. iii. tav. lxx., No. 23.

§ Agisymba, according to Marinus, was supposed to lie at a distance of 24,600 stadia (41°) to the south of the equator. This grossly exaggerated distance Ptolemy arbitrarily reduced by one-half, and on his map Agisymba lies beyond the Mountains of the Moon.

‖ See 'Raccolta,' serie B, No. 6.

of a misconception of the meaning of the concluding words of the note, he supposed to have taken part in this voyage. These assumptions, however, are absolutely inadmissible, for as early as February 10, 1488, Bartholomew had completed at London a map of the world for Henry VII.* If we remember that Bartholomew was detained by pirates for several weeks before he reached England, he must have left Lisbon towards the end of 1487. He did not return to that place until many years afterwards.

On the other hand, the note is unhesitatingly recognized as in the handwriting of Christopher by such competent authorities as Varnhagen (*Bulletin Paris Geog. Soc.*, xv., 1858, p. 71), d'Avezac (*ibid.*, xvi., 1858, p. 268), H. Harrisse ('Fernand Colomb.' (Paris, 1872), p. 120),† Asensio ('Cristobel Colon,' i. pp. 137, 217), and Cesare de Lollis, the editor of the 'Raccolta Colombiana,' published at Rome in 1892 (pt. i. t. iii. p. ix.).

And if Christopher is the author of these notes, they must have been written in 1488, for it was on March 28, 1488, that King Manuel, in response to an application, cordially invited his "especial friend," Christopher Columbus, to come to Lisbon, promising him protection against all criminal and civil proceedings that might be taken against him.‡ Such a promise was needed, for Columbus, in 1480, stole away from Lisbon without paying 220 ducats, which he owed to certain of his creditors.§ Columbus, when he received this royal invitation, was at Seville, where his son Ferdinand was born unto him on September 28, 1488. If he left Seville soon afterwards, he may certainly have been present on the memorable occasion, in December, 1488, when Bartholomeu Dias rendered an account to the king of the results of his hope-inspiring voyage.

If, then, Bartholomeu Dias returned in December, 1488, after an absence (according to De Barros) of sixteen months and seventeen days, he must have started towards the end of July or in the beginning of August, 1487; and if the Bartholomeu Dias referred to in the royal rescript of October 10, 1486 (*v.* preceding page) is the discoverer of the Cape, which hardly admits of a doubt, he cannot have started in July,

* For the curious inscription on this map, see Las Casas, 'Historia' (Madrid), i. p. 225, and list of errata, where "anno domini quater centesimo octiesque uno atque insuper anno octavo: decimque die tum tertia mensis Februarj" is correctly rendered February 13, 1488.

† Harrisse subsequently ('Christopher Colomb.' (Paris, 1884), ii. p. 19) changed his views. He assumes, erroneously as we conceive, that Dias returned in December, 1487, and that Christopher Columbus cannot have written this "note," as he is known to have been in Spain at least up to October, 1488, but that his brother Bartholomew may have done so.

‡ For the king's letter of invitation, see Navarrete, 'Collecion de los Viagens,' 2a ed. ii. p. 10; and Asensio, 'Cristobal Colon.,' ii. p. 132.

§ In his last will and testament, dated May 19, 1506, he charged his son Diogo to pay these debts "for conscience' sake" (Asensio, 'Cristobal Colon.,' ii. pp. 131–138).

1486, as usually assumed. He cannot have been in Lisbon in December, 1487.

This date (namely 1488) is further confirmed by Duarte Pacheco Pereira, the "Achilles Lusitano" of Camoens ('Canto,' x. 12), for in his 'Esmeraldo de Situ Orbis,' written soon after 1505, but only published in 1892, we are told that the Cape was discovered in 1488.* And Pacheco is a very competent witness, for Dias, on his homeward voyage, met him at the Ilha do Principe.†

Turning back now to Colon's "note," we find that Dias is supposed to have sailed 450 legoas, or 25·3°,‡ to the south of Cão's furthest; and as Cape Cross actually stands in lat. 21·8°, this would have brought him to lat. 47·1° S. A return voyage of 150 legoas, or 8·5° to the northwards, would have reduced his latitude to 38·6° S. But if Colon assumed Cape Cross to be in lat. 19° S., as on Dr. Hamy's and the Cantino charts, then the highest latitude reached would have been 44·3° S. We are justified in concluding from this that Colon's 45° does not refer to the Cape, but to the highest latitude reached. As to the 3100 leagues (174 degrees), the supposed distance from Lisbon, we have evidently to deal with a slip of the pen, for the distance to the Cape, following the coast, is only 6000 miles, or 100°.

A further statement respecting the date of the discovery of the Cape appears in the *Parecer*, or "opinion," of the Spanish astronomers and pilots already referred to. They say, "And beyond this [the Sierra Parda, where Cão died], Bartolomé Diaz, in the year 1488, discovered as far as the Cabo d'El-Rei, a distance of 350 leagues; and thence to the Cabo de boa Esperança, 250 leagues; and thence D. Vasco da Gama discovered 600 leagues . . ."

The distances given are exaggerations, for it seems to have been the object of these "experts" to push India and the Moluccas as far to the east as possible, so that the latter might fall within the Spanish sphere: the coast-line actually discovered by Dias measures less than 380 leagues. The nomenclature given is curious, for the designation of Cabo d'El-Rei is bestowed upon the Cape of Good Hope, and the latter name, not inappropriately, transferred to the furthest point reached by Dias. I have not come across a single chart or document bearing out this nomenclature.

There remain to be noticed two references to the expedition of Dias in the 'Roteiro' describing Vasco da Gama's first voyage, for which we are indebted to Pero d'Alemquer, the pilot of Dias' flagship;* and the statement of John of Empoli, the supercargo of one of the vessels of Affonso de Albuquerque's fleet (1503), that the Bahia dos Vaqueiros of Dias was renamed Bahia de St. Braz, because it was discovered on the day of that saint.†

Dias is supposed to have erected three padrões, but only one of these has up till now been discovered; and as the inscription upon it is no longer legible, it furnishes no evidence of the date of the voyage.

FRAGMENTS OF A PADRÃO OF B. DIAS, 1487.

This pillar stood on Dias Point, south of Angra pequena, or Lüderitz bay. Sir Home Popham saw it in 1786, but even then the inscription could no longer be deciphered.‡ Captain Vidal, in 1823, found the pillar in fragments.§ The shaft, of marble, rose originally about 6 feet above the ground, and was buried to a depth of 21 inches; it was surmounted by a stone cross 16 inches high. In 1856 Captain Carrew brought three fragments to Capetown, two of which, in 1865, were handed over to Chevalier du Prat, and are now at Lisbon; whilst the third, 22 inches high, 8 inches broad, and 5½ inches thick, is still in the Cape museum.‖ Of the fragments now at Lisbon, the kindness of my friend Captain E. de C. e Vasconcellos enables me to publish an illustration.

The "pillars" carried away by Dias seem to have resembled those entrusted to his predecessor, Cão, except that, in addition to the royal arms, there was carved upon them a pelican, the device which King John had assumed when a prince, together with the motto, "Por tua ley e por tua grey." Such, at least, would appear to have been the case, to judge from the description of a series of pictures, illustrating the discovery of India, which were to have been painted by order of King Manuel.¶

¶ See 'Alguns Documentos' (1892), p. 516; and Ruy de Pina, p. 65. Duarte Pacheco, 'Esmeraldo,' p. 97, says the inscriptions upon the pillar supposed to have been erected on St. Cruz were in Latin, Arabic, and Portuguese, and that it was visible from the sea. It is quite clear to us that Pacheco never saw this padrão, for when referring to the pillars set up by Cão during his two voyages, he says likewise that the inscriptions were in three languages, when, as a matter of fact, we now *know* that no Arabic inscriptions were to be found upon the pillars (see *ante*, pp. 628, 634).

Apart from what can be gathered from the above, and from a few early maps, we are dependent upon De Barros for what we know concerning the voyage of Bartholomeu Dias. Other historians have either slavishly copied him, or they adduce no fresh information. Strange to say, Ruy de Pina and Garcia de Resende, the chroniclers of King John II., although they refer casually to the discovery of the Cape of Good Hope, do not once mention the name of Bartholomeu Dias. As for Correa, the author of the 'Lendas da India,' he may safely be discarded.*

Bartholomeu Dias was given the command of two ships, of fifty tons each, and of a store-vessel.† His flagship, we think, must have been a *Christovão*, perhaps the very vessel which he commanded before his departure in 1486, and again in 1490–95; or possibly a new vessel bearing the familiar name. His chief pilot was Pero d'Alemquer, an experienced seaman, who subsequently served under Vasco da Gama. The master's name was Leitão. The second ship, the *St. Pantaleão*, had for its captain João Infante, a cavalier of the king's household, with whom were Alvaro Martins as pilot, and João Grego as master. The store-vessel was placed in charge of Pero Dias, a brother of Bartholomew. João de Santiago was pilot, João Alves master, and Fernão Colaço, of Lumiar, clerk.

There were on board two negroes whom Cão had kidnapped, as also four negresses from the Guinea coast. Strict orders had been given, not only to avoid every conflict with the natives, but also to gain their confidence by gifts. The four Guinea women were to be landed at various places, handsomely dressed, and furnished with samples of gold, silver, and spices, which the Portuguese were in quest of. These they were to exhibit wherever they went, proclaiming, at the same time, the greatness and munificence of the King of Portugal, and the ardent desire which possessed him to communicate with Prester John. Women were selected for this duty, as they would be respected even in the midst of tribal wars.

Dias, we have no doubt, was furnished with a copy of the chart compiled by D. Diogo Ortiz de Vilhegas, of Calçadilha, Dr. Rodrigo, of Pedras Negras (the king's physician), and Master Moses, a Jew, which had been given in May, 1487, to Pero de Covilhã.‡

---

* Correa does not mention the name of Dias. According to him, Janinfante, a foreign merchant and practical seaman, had the command. Failing in his attempt to double the Cape, he maintained that vessels larger than caravels were needed to ensure success. The king at once ordered such vessels to be built, but Janinfante died, and the command was given to Vasco da Gama!

BRITISH LIBRARY

The expedition left Lisbon at the end of July or in the beginning of August, 1487, and sailed direct for the Congo, beyond which the coast was examined with attention, capes and bays being named either after saints, on account of striking physical features, or in connection with some occurrence in the course of the voyage. On reaching the Angra do Salto, which we conceive to be identical with the Golfo das Aldeas,* now known as Port Alexander, the two negroes carried off by Cão were restored to their friends. It is just possible that the store-vessel was left in this safe and commodious harbour, where fish abounded, good water was plentiful, and natives with herds of sheep and bullocks within reach.

Struggling against south-westerly winds and a current setting to the north, Dias passed the last pillar set up by Cão.† He may have named the country to the south in honour of S. Barbara, whose day is December 4, and entered on December 8 the Golfo de S. Maria da Conceição, our modern Walvisch bay. Here he seems to have tarried, for, taking the saints' names bestowed along this coast for our guide, the next locality named by him must have been the Golfo de S. Thomé (December 21), only 145 miles beyond. It cannot have taken a fortnight to make so short a run. It was probably here that the first negress was landed.

We may then suppose Dias to have sailed southward along the desolate coast of sandhills, where he possibly experienced the hot blasts of an easterly wind, and hence bestowed upon this forbidding region the appropriate name of "Areias gordas," that is, "hell." The gulf of St. Thomas was probably named on December 21, and a few days afterwards Dias arrived at the Cabo da Volta and the Serra parda, where he erected the padrão dedicated to Santiago, fragments of which have been recovered, and have already been referred to. He also landed here the second of his negresses, probably leaving her with natives who had come down to the shore to fish.‡

* Cosa's Golfo do Saco and the G. do Salto of the Cantino map refer, no doubt, to the same locality. Cosa places the name near where Port Alexander should be, whilst Cantino locates it on a barren coast between that port and Great Fish bay, not frequented even by fishermen.

† We have absolutely no direct information about Dias's proceedings from the time he left Angra do Salto to his arrival at Cabo da Volta, where he set up his first pillar.

‡ De Barros's account of this important section of the voyage is very confused. He tells us (pp. 185, 186) that the first padrão, that of Sant Iago, was set up on a Serra parda, at the Angra dos Ilheos, in 24° S., or 120 leagues (400 miles), beyond Cão's furthest. But 120 leagues beyond Cão's furthest, which Barros (p. 175) assumes to have been in 22° S., would carry us to 28° 20′, or within 50 miles of an Angra das Voltas, which he places in 29° S., and which it is thought survives in Cape Volta, to the south of the Orange river, in 28° 42′ S.

It seems thus that the two localities, which De Barros separates by an interval of 5°, cannot in reality be very distant from each other.

On Cantino's chart, the deep bay to the east of this cape, our modern Angra pequena, is called Golfo de S. Christovão, and this, it appears, was the name originally bestowed upon a bay which subsequently became known as Angra or Golfo das Voltas—the "bay of tacks." *

It is not probable that Dias remained long in this bay. De Barros tells us that he stood off and on for five days, when there arose a strong wind, which compelled him to reduce his sails, and before which he ran south for thirteen days. This statement we are not prepared to accept, for northerly winds are exceedingly rare along this coast, and the squalls from the north-north-east or north-north-west, which are experienced occasionally, are never of long duration. But when Dias reached a higher latitude on the south-east edge of the Agulhas bank, and came under the influence of the "roaring forties," it is very likely that he met with gales and a heavy sea, and, considering the small size of the vessels, his men are to be excused if they stood in "mortal fear;" † and they naturally suffered from the cold, for in these latitudes they experienced a mean temperature of 50° or less, which is hard to bear for men fresh from a tropical climate.

During the first period of this long stretch to the south, Dias may be supposed to have kept within sight of the coast. He may thus have named the Golfo de S. Estevão, now Elizabeth bay, on December 26, and the Terra da Silvestre on December 31. He may even have heard the roar of the rollers thundering upon the shore of the Terra dos Bramidos,‡ and gained a view of the lofty Serra dos Reis on January 6,§ but beyond these he lost sight of the land, and when passing St. Helena bay, as we learn from Pero d'Alemquer, he was far out at sea.

When the storm subsided, Dias stood east, and having failed, in the course of several days, to meet with land, he turned his prow to the northward. Sailing in that direction for 150 leagues, he saw lofty mountains rising before him, and came to anchor in a bay which he called Bahia dos Vaqueiros (Cowherd's bay). This happened on

* Barros, p. 186, says, "*now* known as Angra das Voltas." Of the identity of this bay with our Angra pequena there can be no doubt. It is quite true that Duarte Pacheco places the Angra das Voltas in 29° 20′ S., the Strassburg Ptolemy in 28° S., and De Barros in 29° S.; but, on the other hand, Juan de la Cosa places this bay in 24° S., and the author of Cantino's chart in 26° 30′ S., its true latitudes being 26° 40′ S. Duarte Pacheco, in his 'Esmeraldo,' describes it as being 1 league broad at the mouth, 1½ league deep, affording a safe anchorage for a hundred vessels in from ten to twelve brasses. The only bay along this coast fitting this description, or the contours of our ancient maps, is our Angra pequena.

† De Barros, p. 187.

‡ "Bramidos" means "roars."

§ That is, mountains of the three magi.

February 3, 1488, and as this day is dedicated to St. Blaise, the bay, so we are told by John of Empoli,* was renamed Bahia de S. Braz. It is the Mossel bay of our days.

We learn from Pero d'Alemquer that the natives refused the presents which were offered them, and when Dias landed to take in water from a well close to the beach, he was pelted with stones. One of the natives was killed with an arrow from a crossbow, and they then retreated inland with their cattle.

During his onward course Dias had to struggle against the Agulhas current, as also against the prevailing south-easterly winds. He may, however, have taken advantage of an inshore counter-current, setting eastward, as also of occasional westerly winds. At all events, he made his way along a coast bounded by lofty mountains. Rounding Cabo do Recife (Cape Recife), he entered a vast bay, which was called Bahia da Roca (Rock bay), but which is now known as Algoa bay. Within it lay a group of rocky islets—the Ilhéos da Cruz. Duarte Pacheco ('Esmeraldo,' p. 94) says that the tallest of this group is also known as Penedo das Fontes (Fountain rock) because of two springs which rise upon it, and that Dias erected a pillar there, visible out at sea. As a matter of fact, the largest of these islets is nearly all bare rock, and there are no springs. Nor does it appear, if we may accept the results of M. de Mesquito Perestrello's careful survey of this coast in 1575,† that a stone pillar was ever set up on this islet, notwithstanding the name it bears.

It is, however, possible that Dias erected a wooden cross upon it, all traces of which had disappeared when Perestrello examined the coast. The islet may have been named because it was discovered on the day of the invention of the cross (May 2). In that case Dias must have spent three months in making good the 200 miles which separate it from Mossel bay, which is difficult to believe.

Having left here the last of his negresses—one had died during the voyage—in the company of two women who were gathering shellfish along the beach, Dias continued his voyage. He sailed past the Ilhéos chãos (Low islands), and about 12 miles beyond them, at or near a sandy cliff, still known as Cape Padrone, he set up a padrão dedicated to S. Gregorio.‡ It is quite possible that this pillar was erected on St.

* John of Empoli sailed with Affonso de Albuquerque to India in 1503. He was supercargo of a vessel chartered by the Marchiones of Lisbon. His narrative was published by Ramusio, i. 3rd ed. f. 144.

† Published in Pimental's 'Arte de Navegar' (Lisbon, 1762), pp. 446–456.

‡ Perestrello says the pillar stood on an islet at the foot of this cliff, the only islet between the Ilhéos chãos and the Rio do Infante, but only sunken rocks are met there now, and the islet may have been destroyed by the force of the breakers. I do not gather from Perestrello's account that he himself saw the pillar.

Gregory's day (March 12), though as a rule these dedications seem to have been made at home.

It was probably about this time, when the coast was actually seen to stretch away towards the north-east, in the desired direction, that the ship's companies began to murmur about the hardships to which they were being exposed. Dias, whose *Regimento*, or instructions, directed him to consult his officers on all occasions of importance, therefore invited them to land with him, together with a few leading seamen. The result of this council was a decision in favour of a return, and a document to that effect was signed by all present. Dias, however, persuaded his followers to go on eastward for two or three days longer, and promised that, unless something happened within that period to induce them to change their minds, he would accede to their wishes.

He was thus able to pass the remarkable rock identified by Perestrello with the Penedo das Fontes, where the dammed-up waters of a small stream soak through the beach ridge. This, I have no doubt, is Ship rock.* The Rio do Infante (Great Fish river) lies only about 16 miles beyond.† It was thus named because the captain of the *Pantaleão* was the first to land at its mouth. Here Dias turned back; Galvão ‡ says that he saw "the land of India, but, like Moses and the promised land, he did not enter it."

On passing his padrão, "he took leave of it as from a beloved son whom he never expected to see again." His forebodings proved true, for twelve years afterwards, when on a voyage to India in Cabral's armada, he perished almost within its sight.

During his homeward voyage Dias was favoured by winds and currents. It is almost certain that he named the Cabo do Infante, and probably that he dedicated the southernmost cape of all Africa to St. Brandan, an apocryphal Irishman, whose day is May 16.§

It was soon after this that he beheld, for the first time, and coming from the east, the remarkable group of mountains—broken land, or "terra fragosa," as the ancient maps have it—which fill Cape Peninsula,

* See 'Africa Pilot,' pt. ii. (1889), p. 126.

† Perestrello says 5 legoas, that is, 17 miles.

‡ 'The Discoveries of the World,' 1555 (Hakluyt Soc.), p. 77.

§ The Cabo (or rather Golfo) das Agulhas first appears on Cantino's chart. On all our ancient charts (2, 4, 5, 6, 7) the Cape of Good Hope is indicated as the southernmost point of Africa. Pacheco, in his 'Esmeraldo' (pp. 90, 92), places the Cape of Good Hope and St. Brandan's point in the same latitude, viz. 34° 30', and makes no mention of a Cabo das Agulhas, but in his 'Table of Latitudes' (p. 15), the latter is placed in 35° S., or 30' further south than the Cape, whilst St. Brandan's point is omitted. This almost looks as if the two names referred to the same locality.

the southern extremity of which, if we may believe Barros (p. 190), he named Cabo Tormentoso, in memory of the storms which he had experienced, a name which the king, whose hopes of reaching India by an ocean route seemed about to be realized, changed into Cabo da boa Esperança—the Cape of Good Hope.* We fancy that this is one of those pretty legends frequently associated with great events. Duarte Pacheco, a contemporary, distinctly tells us that it was Dias who gave the Cape its present name; Christopher Columbus, who was present when Dias made his report to the king, says the same. Barros, indeed, seems alone to be responsible for this legend, for if Camoens ('Canto,' v. 50) speaks of a "Cabo Tormentorio," we must remember that he lived through the terrible tempest which overwhelmed a part of Cabral's fleet. This was during the season of storms, in winter. Dias, who spent several months on the south coast, may of course have met with gales, which would justify an appellation such as "Cape of Storms." Still, on his homeward voyage, when alone he was in the immediate vicinity of the Cape, he seems to have been fortunate, for Pero d'Alemquer, his pilot, informs us that he left the Cape on a morning with a stern wind, which rapidly carried him northward.†

Before leaving the Cape, Dias erected the last of his padrões, which was dedicated to St. Philip.‡

After an absence of nine months, Dias rejoined his store-ship. He found that six men had been killed in a trade dispute with the natives, and Fernão Colaço, one of the three survivors, died of joy on beholding his comrades. The vessel, being worm-eaten, was burnt after the provisions had been taken out of her.

It was now about the middle of August, if we assume Dias to have parted from his store-vessel about the middle of November. There thus remained four months for making his way to Lisbon. Of what he did during these four months we know very little. We do not even know whether he called at the Congo.§ We know, however, that he touched at the Ilha do Principe, where he met Duarte Pacheco with part of his shipwrecked crew,‖ all of whom he took on board; that he then touched at Rio do Resgate—trade river—where he seems to have purchased some slaves, "so as not to come home empty-handed;" that João Fogaça, the Governor of S. Jorge da Mina, placed on board his vessel the gold he had obtained by barter; and that ultimately, in

* We have already seen that, according to the Spanish pilots, the Cape was originally called Cabo d'El-Rei (see p. 641).

† 'A Journal of the First Voyage of Vasco da Gama' (Hakluyt Soc.), p. 9.

‡ The site of this pillar is absolutely unknown.

§ The question of whether it was he or Cão who brought the envoy of the King of Congo to Portugal has already been discussed, p. 637.

‖ De Barros, *loc. cit.*, p. 191.

December, 1488, after an absence of sixteen months and seventeen days, he once more entered the Tagus. Dias had discovered 373 legoas or 1260 miles of coast; and his voyage, jointly with the reports received by that time from Pero de Covilhã, had demonstrated the fact that India might be reached by sea.

We are not aware that Dias ever received a reward for his great achievement. It seems not, for between 1490 and 1495 he still commanded the *Christovão*,* and when King John had overruled the objections of his advisers, who thought it unwise to expend, and possibly exhaust, the resources of the kingdom in distant adventures, which, even if successful, would raise against Portugal all those who now profited, or who in the future hoped to profit, from the India trade, it was not Dias who was placed at the head of the expedition which was to crown the enterprise started by Prince Henry. Dias was merely employed to superintend the building and outfit of the vessels intended for this expedition, the command of which was given by King John's successor, King Manuel, to Vasco da Gama.†

APPENDIX.

On the Maps illustrating the Voyages of Cão and Dias.

In writing the accounts of the voyages of Cão and Dias, we have largely profited by a few contemporary maps. These maps, unfortunately, are on a very small scale. This compelled their compilers to confine themselves to a selection among the place-names which they found upon the sailing charts at their disposal, and this selection may not in all cases have been a judicious one.

Another difficulty arises from the fact that successive explorers failed to identify the places already named by their predecessors, or deliberately set aside the claims of priority. As a result, Benguella bay became successively known as Angra de S. Maria, Bahia da Torre, das Vaccas, and de S. Antonio; and Saldanha's name, instead of being attached to Table bay, is conferred upon a bay which originally seems to have been dedicated to S. Lucia.

Of course, much of this confusion is due to the utter failure of these early explorers to determine accurately the latitudes of the places they visited. José Visinho, whom King John sent to the Guinea coast in 1484 or 1485 for the express purpose of determining latitudes by observing the declination of the sun, reported that the Los islands were in 5° N., when in reality they are in 9° 30′ N.; and Bartholomeu Columbus, to whom we are indebted for this information, adds that

* For an acquittance for 4,080,912 reals expended during these five years, dated February 27, 1498, see 'Alguns Documentos,' p. 19. The Bart. Dias who commanded the *Figa* in 1497 was not the great navigator, as believed by H. Lopes de Mendonça and the editor of 'Alguns Documentos,' who publishes a facsimile, p. 515.

† Dias accompanied Vasco da Gama, in 1497, as far as the Cape Verde islands, and thence sailed to the Gold Coast. He commanded a vessel in Cabral's fleet, and perished off the Cape in 1501. His grandson, Paulo Dias de Novaes, won fame as the firs conquistador of Angola.

he himself found by observations with a quadrant that the Gold Coast was under the equator.*

The earliest map to which we are able to refer is to be found in a codex which originally belonged to the family of Count Cornaro-Piscopi, then found its way into the Palace of the Doges, and may now be consulted in the British Museum (Eg. 73).† The volume contains 35 charts by various draughtsmen, collected in 1489. The charts which concern us are numbered 30 to 33 (originally 28–31). No. 30 is a chart of the Atlantic coast from Cape Finisterre to Cape Verde, and is stated to be by Cristoforo Soligo, a Venetian cosmographer‡—that is, Soligo copied it from some Portuguese original. Nos. 31–33 give a delineation of the entire coast from Portugal to the "ultimo padrão," set up by Cão on Cape St. Mary in lat. 13° 26′ S. In character these charts resemble No. 30, and I venture to ascribe them to Soligo or Seligo as copyist, not author.§ They were evidently drawn immediately after Cão's return from his first voyage in 1484 or 1485.

The charts are furnished with scales, but are still without parallels. A legend, written right against the mouth of the Niger, tells us "hic non apar polus," but this invisibility of the pole-star is not borne out by the scale of the chart. Assuming 75 Italian miles to be equal to one degree, the following latitudes would result from measurements made upon the charts :—

	On Charts.	Actual position.
Lisbon, assumed ...	38°·70 N., 9°·17 W. ...	38°·70 N., 9°·17 W.
Cape Verde	15°·37 N., 16°·02 W. ...	14°·75 N., 17°·53 W.
Cape Palmas	6°·17 N., 3°·66 W. ...	4°·35 N., 7°·45 W.
Niger mouth	9°·24 N., 10°·93 W. ...	5°·00 N., 5°·00 E.
Cape Lopez	2°·97 N., 15°·13 E. ...	0°·60 S., 8°·73 E.
Congo mouth	4°·43 S., 19°·41 E. ...	6°·07 S., 12°·15 E.

Our second map is by Henricus Martellus Germanus. It is one of many in a manuscript, 'Insularium illustratum,' now in the British Museum (Add. MS. 15,760). It is a map of the world very roughly drawn and without a scale, and is dated 1489, and thus shows the discoveries up to the return of Dias—1488. The author appears to have been an Italian, or if a German (Heinrich Hammer) he lived in Italy. Count Lavradio published a facsimile of this map of the world in 1863.

Behaim's famous globe is next in date, viz. 1492. As its author claims to have commanded one of the ships of Cão's second expedition, it might have proved of exceeding value had not the delineation of the south-west coast of Africa been intentionally falsified in order to make the Nurembergers believe that their clever townsman had doubled the cape and sailed a considerable distance beyond it.

The remaining cartographical materials available are the chart of the world by Juan de la Cosa (1500); a chart by an unknown author, now in the possession of Dr. Hamy (1502); a chart which Alberto Cantino caused to be designed at Lisbon for his patron, Hercules d'Este, Duke of Ferrara (1502); and a chart by Nicolas de Canerio of Genoa (1502). For an account of these charts, I refer to 'A Journal of the First Voyage of Vasco da Gama,' published by the Hakluyt Society in 1898, pp. 205–211.‖

---

* *Raccolta Columbiana*, I. t. iii., Serie B, No. 861; Serie C, Nos. 246 and 499.

† Zurla, 'Sulle antiche Mappe' (Ven., 1818), p. 88; D'Alberti, 'Le construzione navali' (Rome, 1893), p. 128.

‡ Zurla, 'Dei viaggi i delle scoperte Africane di Aloise Cadamosto,' pp. 21–23.

§ That these charts are not by the same author is seen from the fact that on No. 30 Cape Verde lies 1930 miglie to the south of Lisbon, on No. 31 only 1750 miglie.

‖ The copies of Dr. Henry's and Cantino's charts which accompany this paper are reprinted by kind permission of the Hakluyt Society.

The Geographical Journal(Journal of the Royal Geographical Society): Volume XVI, No. 6 [363r] (78/232)

BRITISH LIBRARY

LIST OF PLACE-NAMES.

The figures within brackets refer to the authorities, viz. (1) Soligo; (2) Henricus Martellus; (3) Behaim; (4) Juan de la Cosa; (5) Dr Hamy's chart; (6) Cantino's Chart; (7) Canerio; (8) Duarte Pacheco's 'Esmeraldo.'

The dates are those of the Saints mentioned.

Rio (Angra) de S. Maria da Nazareth (1–8). The Ogowe, which still enters Nazareth bay, 0° 40′ S.

Cabo de Lopo Gonçalves (1–8). Cape Lopez, 0° 37′ S.

Rio de S. Mathias (2, 3), February 24. Now the Mexias or Animba river, 0° 55′ S.

Praia do Judeo (3). The bay to the north of the Fernão Vaz river, 1° 15′ S.

Rio de S. André (3), November 30, is probably the same as the Rio das barreiras (8), subsequently known as Fernão Vaz, 1° 23′ S.

Rio de Campo (1), the river Kama, 1° 47′ S. It may have been named after Antonio do Campo, who accompanied Vasco da Gama on his second voyage.

Cabo de S. Catharina, November 25, where stood the "tree" of Fernão Gomez (1–8). Still known by its original name, 1° 50′ S.

Cabo de Pero Dias (7). Corrupted into Pedras point, 2° 41′ S.

Serras do Espirito Santo (3, 4, 6, 7). Still known by that name, 2° 50′ S.

Praia do Imperador, Emperor's shores (2, 3). Either off the Sette, 2° 24′ S., or off the Nyango, 3° S.

Ponta das barreiras, Cliff point (4), *Serra da Praia* (6), or *Cabo primeiro* (7). Cape Mayumbe, a red bluff, in lat. 3° 13′ S.

Golfo de Alvaro Martins (4, 6). Now Mayumbe bay, 3° 20′ S. It may be identical with Behaim's *Angra de S. Martha*, July 27.

Serra de barreiras (4). The white cliffs, backed by three ranges of hills (part of the *Serra comprida* or "Long Range" of old charts) to the south of Mabuti point, 3° 23′ S.

Os dous Montes, the Two Mountains (1, 7), or *Ponta dos Montes* (6), the two "Paps" of Banda point, or Cabo segundo, 3° 53′ S.

Barrocas das favaes, Bean-field ravines (6). The white cliffs to the south of Banda point.

Golfo do Judeu, Jews bay (2, 5). Castilho, guided by Pimental, identifies it with Kilongo bay, 4° 12′ S., and this I accept, although the *G. do Judeu* of Behaim's globe seems to represent Loango bay, whilst his *Golfo de S. Nicolão*, December 6, occupies the place of Kilongo. The Jew, later on, was converted into an Indian, and hence already on Reinel's chart (c. 1520), the bay between the *Cabo segundo* and the *Duas moutas* at the Kuilu, is called *Golfo do Indio*. The Repertorio dos tempos (1521), however, has an Angra da Judia two degrees to the north of the Congo, and Reinel's position only suits Kilongo bay. Later authorities distinguish between a Golfo do Judeu and a G. do Indio, identifying the latter with Loango bay. This I believe to be a duplication due to corrupt spelling.

Serra corasa (*corada*, "red, coloured") *de Corte Reial* (3), seems to refer to Mount Salombo and the red cliffs near it, 4° 20′ S.

As duas moutas, the "two copses" of Reinel, are identical with two wooded eminences known as the Paps of Kuilu, 4° 28′ S.

Praia and Serra formosa de S. Domingos, August 4, of Soligo stands clearly for Loango bay, 4° 38′ S. The "*Praia formosa*" and "*terra de S. Domingos*" of Cantino's chart, the *Ponta formosa* of Behaim, the "*praia formosa*" of Dr. Hamy's chart, and the *Praia de S. Domingos* of Canerio's, all refer to the same locality.

Cabo dos baixos, Cape of the Shoals (7). Beach point, 4° 50′ S.

Ponta branca, White point (1). Perhaps Massabe point, 5° 2′ S.

Golfo de S. Martinho (2, 3), November 11. Kakongo and Landana bay, 5° 10′ S.

Ponta formosa (3). A conspicuous bluff on Landana bay, 5° 13′ S.

Ponta da barreira vermelha, Red Cliff point (1, 4). A red clay cliff on Malemba bay. 5° 20′ S. The "Red cliffs" extend south to Cascaes point, 5° 23′ S.

Golfo das Almadias, Boat bay (3, 4, 6, 7). Undoubtedly Kabenda bay.

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984181.0x000058

مكتبة قطر الوطنية
Qatar National Library

Ponta dos Almadias (4). Kabenda point, which subsequently became known as Ponta do Palmar, 5° 33′.

Cabo do Palmar, Palm-grove cape (4, 6, 7). Red point, 5° 44′ S., where there is a palm grove, to judge from the charts.

Ponta do Paul, Swamp point (1). At the mouth of the Congo.

Rio poderoso, Powerful river (2, 3), *Rio do Padrão*, River of the Pillar (3, 4, 8), *Rio de Mani congo* (6, 7), *Emzaze* (8), is our river Congo.

Cabo or *Ponta do Padrão* (1, 2) and *Padrão primeiro* (7). The cape where Cão set up his first pillar, that is, Shark point at the Congo mouth, 5° 4′ S.

Cabo redondo, "Round cape" (6), corrupted on Behaim's globe into *muoruodo*, is Margate head, 6° 31′ S.

Serra formosa (6). The hills south of preceding.

Cabo redondo (1, 2). A cape near Funda bay, 6° 55′ S.

Ponta delgada (6). Loje point, low and sandy, 7° 48′ S.

Rio de Magdalena (1, 3, 4), July 22. The Loge river, 7° 58′ S.

Rio de Fernão Vaz (1, 3, 4). The river Dande, 8° 28′ S.

Rio Mondego (6). The river Bengo, 8° 42′ S.

Angra Grande (1), or *Golfo do Mestre* (6). Bengo bay.

Punta de Miguel (3), September 29, or *da Espichel* (4). The Morro das Lagostas, 8° 45′ S.

Ilhas das Cabras, Goat islands (3, 4, 6, 8). The islands opposite Loanda city, standing upon a tableland (the *Monte alto* of Behaim; the *Tablado* of Juan de la Cosa).

Punta das Ilhas das Cabras (6). Palmarinhas point.

The river *Kwanzo* is not to be found on early charts. P. Reinel (c. 1520) already knew the native name, and called it *Coamza*.

Cabo ledo, Joyful cape (4), still retains its ancient name. It is a rugged black promontory resembling a lion when seen from north-north-east, 9° 49′ S.

Punta das Camboas, Fish-garth point (6). Now Cabo de S. Braz, 10° S.

Terra das duas Pontas (1) is the Morro of old Benguela, which appears from some bearings as a double point, 10° 45′ S.

Cabo do Pichel, Tankard cape (6), and *Punta de S. Lourenço*, August 10 (4, 7, 8), appear to be identical with the preceding.

Rio de S. Lazaro, December 17 (6). The river Cuvo, 10° 50′ S.

Rio do Paul, Swamp river (1). River Catumbela, 12° 26′ S.

Angra or *Golfo de S. Maria* (1, 2, 6). Benguela bay, 12° 30′ S.

Cabo de S. Maria (5). Ponta de S. Joze.

Castel d'Alter poderoxo (1), *C. de S. Agostinho* (2), *Castel poderoso de S. Agostinho* (3), *Cabo do Castello pedroso* (7). There is a village, Alter pedroso (Stony Alter), near Portugalete (see note, p. 631). The "poderoxo" (powerful) of Soligo is evidently a clerical error. The full name would be Castello d'Alter pedrozo de S. Agostinho, a reference to the pillar set up to the south. I identify this "Castle" with the granite cliffs to the south of Ponta choca, 13° 17′ S.

Cabo do lobo or *dos lobos*, Seal cape (1, 5, 6), upon which Cão erected the pillar dedicated to S. Augustin (August 28); also known as *Ponta Negra* or *Ponta Preta* (8). Now Cape St. Mary, 13° 26′ S.

Ilha do lobo (4). One of the islets near the preceding.

Monte negro (5), or *Cabo negro* (7). The mountains rising above Cabo do Lobo.

Angra de João de Lisbõa (6). The Lucira grande bay, remarkable for its intensely green water, 13° 51′ S.

Golfo da Praia (4). Perhaps the Bahia das matilhas, with its red cliffs, 14° S.

Monte Negro (6). The dark-coloured Morro do velho, or Old Man peak, with islets to the south of it, 14° 23′ S.

Terra fragosa, Rugged land (2, 3), and *Terra parda*, Dark land (6), are descriptive terms applied to the country between the Morro do Velho and the Golfo das Aldeas.

Cabo do Leão, Lion cape (3), *Rio certo?* (3), *Cabo Zorto* (2), and *Cabo verde* should be along this part of the coast.

BRITISH LIBRARY

Monte negro, Black mountain (2, 3, 5, 7, 8), upon which Cão set up his third pillar, is now known as Cabo negro, and bounds Port Alexander in the north, 15° 40′ S.
Golfo or **Angra das Aldeas**, Bay of the Villages (6, 7, 8), which I believe to be identical with the *Golfo do Salto* (4). Here are—
Castello primeiro (7), the wall-like cliffs south of the Coroca river;
Punta de areia, Sandy point (6), now Bateman point; and
Punta dos baixos, Shoal point (4), the point opposite the Dormer bank.
Punto do Moço, Young Man's point (4). Now Albina point.
Golfo da balea, Whale bay (2, 5), or *Golfo das areias*, Sandy bay (6, 7). The Great Fish bay.
Manga das areias, Sandy sleeve (8). Tiger peninsula, in 1778 still an island.
Ponta das pedras, Stony point (8), and *Montanha da pedra*, Stony hill (6). The Monte Vermelho near south extremity of Great Fish bay, 16° 50′ S.
Praia verde, Green beach (2, 7). The mouth of the Cunene, 17° 15′ S.
Cabo preto (4) or *Cabo negro* (6, 8). Now Cabo frio, 18° 23′ S.
Serra de S. Lazaro, December 12.
Punta da Pedra, Rock point (7). Fort Rock point, a white block of granite.
Punta delgada, Point Slender (4). Rock spit, a sandy tongue.
Praia de Bragança (5). A João de Bragança was Moço do monte (chief forester) in 1494.
Angra de Ruy Pirez (8). Off Uniab river, 19° 50′ S.
Punta de Ruy Pirez (6). Palgrave point, 20° 31′ S.
Angra pequena de S. Amaro (8), September 2. Ogden harbour, described by Captain Morrell in 1832, but now non-existent, 20° 57′ S.
As areas, the Sands (8). Applied to sandhills along coast.
Praia das neves. Snow beach, of later maps, supposed to have been given to the sand-hills because of their whiteness, but evidently a misprint for *Praia das nevoas*, the Shore of Mist, as Homem has it, a very appropriate designation.
Golfo da Baleia, Whale bay (2, 4, 6). Cape Cross bay.
Cabo do Padrão (2, 4, 5, 6). Where Cão set up his last pillar; now Cape Cross, 21° 50′ S.
Praia das Sardinhas, Sardine shore (2). Sierra bay.
Serra parda (2, 3, 4). The Cabo dos Farilhões, dark and rocky, in the midst of sandy dunes, 22° 9′ S.
Terra de S. Barbara (6), December 4. The country to the south of Cape Cross.
Praia das Pedras, Stony beach (7, 8). Now Rock bay, 22° 18′ S.
Praia das alagoas (6), or *Praia verde* (7). Lagoon or verdant shore at the mouth of the Swakop, 22° 42′ S., marked by dense green foliage. Three small lagoons are just within the bar.
Praia das aves (6). A very appropriate name for a coast abounding in bird-life.
S. Ambrosio (7), April 4. Perhaps intended for the Swakop.
Golfo de S. Maria da Conceiçao (6, 8), or *Angra da temeridade* (7), is our Walvisch bay.
Cabo do Espiritu santo (2). Now Pelican point, in 22° 54′ S.
Golfo da Baleia, Whale bay (2, 8), or *Porto do Ilhéo* (7). Sandwich bay, 23° 21′ S. The island which formerly sheltered this bay may have grown, in course of time, into a spit of sand, an evolution not at all rare along the west coast of South Africa.
Praia das alagoas (7) may refer to the lagoon at the head of Sandwich bay, or to the mouth of the Kuiseb, which enters Walvisch bay.
Areias gordas (5), "Hell." An appropriate name for the sandy waste to the south.
Rostro da Pedra, the "Rocky beak" (4, 9), I believe to be Hallam's Bird island, in 24° 37′ S. The *terra da Roca* (6) faces it, and is also called *terra das baixas* (8), from the shoals close by.
Golfo de S. Thomé (6, 7), December 21. The bay or indentation to the north of Mount Sylvia, 25° 5′ S.
Calheta dos tres Irmãos, "Three Brothers creek" (6, 7), are the three Easter cliffs, separated by small indentations, 25° 25′ S.
Enseada pequena, Little bay (8), seems to be known also as *Golfo de S. Antonio* (7), and

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

there is little doubt, to judge from the description given by (8), that it is identical with Spencer bay and Mercury island, 25° 43′ S.

Golfo de S. Maria da Victoria (4, 5, 6) is evidently named in honour of the famous victory of Aljubarrota, on August 14, 1383. As placed on Cantino's chart, I should identify it with Hottentot bay, 26° 8′ S., but on Juan de la Cosa's and Dr. Hamy's charts it is associated with the *Angra* or *Golfo das Voltas*.

Ponta dos Ilhéos (6, 7, 8). An appropriate designation for the cape facing Ichabo I., in 26° 17′ S. Here also might be found the *Angra dos Ilhéos* of De Barros. On Diogo Homem's chart (1558), a pillar stands to the north of this point.

Golfo de S. Christovão (6), July 25, we believe to be the bay absurdly called Angra pequena on our modern maps, notwithstanding that it is the only large bay along the whole coast from Great Fish bay to St. Helena bay. It is identical with the *golfo* or *Angra das Voltas* of (4, 5, 7 and 8) (see note *, p. 645).

Punta da Angra (6), is Angra point of modern maps.

Cabo da Volta and *serra parda* (2), where stood the padrão of Santiago, is now known as Diaz point, 26° 38′ S.

Ilhéos dos baixos (4, 6). Halifax and other islets to the south of Diaz point.

Golfo de S. Estevão (5, 7), December 26. Elizabeth bay, 26° 52′ S.

Ilhéos seccos (4, 7). Possession and other islands further south. The *Ilhéo do pantano*, "Swamp island," of Germanus should be one of these.

Terra de S. Silvestre (6), December 31.

Volta das angras (2), fairly suits the modern Cape Volta in 28° 42′ S. Its latitude nearly agrees with that assigned by De Barros to his *Angra das voltas* (viz. 29° S).

Terra dos bramidos (4, 6). The coast to the south of Orange river, where the heavy swell causes a continuous roar (*bramido*).

Serra or *Lombada da Penha*, ridge or summit of the rock (6, 8). Vogel Klip, 29° 40′ S., 4300 feet. For "Serra de perétal" (7) we ought probably to read *Serra do penedo*, which means the same.

Morro de pedra (4, 8). Roodewall, a red cliff, 30° S.

Rio do Infante. Apparently named after João de Infante. The earliest record of the name I find in the *Repertorio dos Tempos* of 1521. It is the Olifant river, 31° 42′ S.

Serra dos Reis (47), January 6. Olifant Bergen, 32° 10′ S.

Angra de S. Helena (6, 7, 8). The bay discovered by Vasco da Gama.

Porto de S. Lucia (5). Now Saldanha bay.

Ilha branca, White island (5). Now Dassen island.

Punta da Praia (8), Green point, Table bay.

Pico fragoso (3). Now Table mountain.

Cabo de boa Esperança, Cape of Good Hope, 34° 22′ S. Supposed to have originally been named Cabo d'El-Rei (see p. 648).

Golfo dentro das serras, Gulf within the Mountain Ranges (2). Now False bay.

Ponta de S. Brandão (6, 8), May 16. Our modern Cape Agulhas, 34° 49′ S.

Gulfo das Agulhas (6). A bay to the east of the preceding, now Struis bay. See also note, p. 647.

Cabo do Infante (5, 6, 7, 8). Still known in a corrupted form as Cape Infanta, 34° 28′ S.

Rio da Nazareth (4, 5). Now Breede river.

Rio dos vaqueiros, River of Cowherds (2, 5). It is called Rio della vacche by Martellus Germanus, and corresponds to our Gouritz river, 34° 20′ S.

Cabo das vaccas (8), or *Cabo delgado* (4). Now Cape Vacca.

Angra das vaccas, Cow bay (4). Now Flesh bay, 34° 12′ S.

Ponta da estrella, Star point (4). Now Cape St. Blaize, 34° 10′ S.

Terra de S. João (7), June 24 or December 27. The country to the west of Mossel bay.

Golfo dos Vaqueiros, Gulf of the Cowherds (4), *Bahia da aguada*, Bay of the Watering-place (5), or *Golfo (Angra) de S. Braz* (6, 7, 8). Now Mossel bay.

Serra de S. Lazaro (5), December 17. Western Outeniqua mountains, rising 5000 feet.

Ponta da Pescaria, or Fishery point (7). Gericke point.

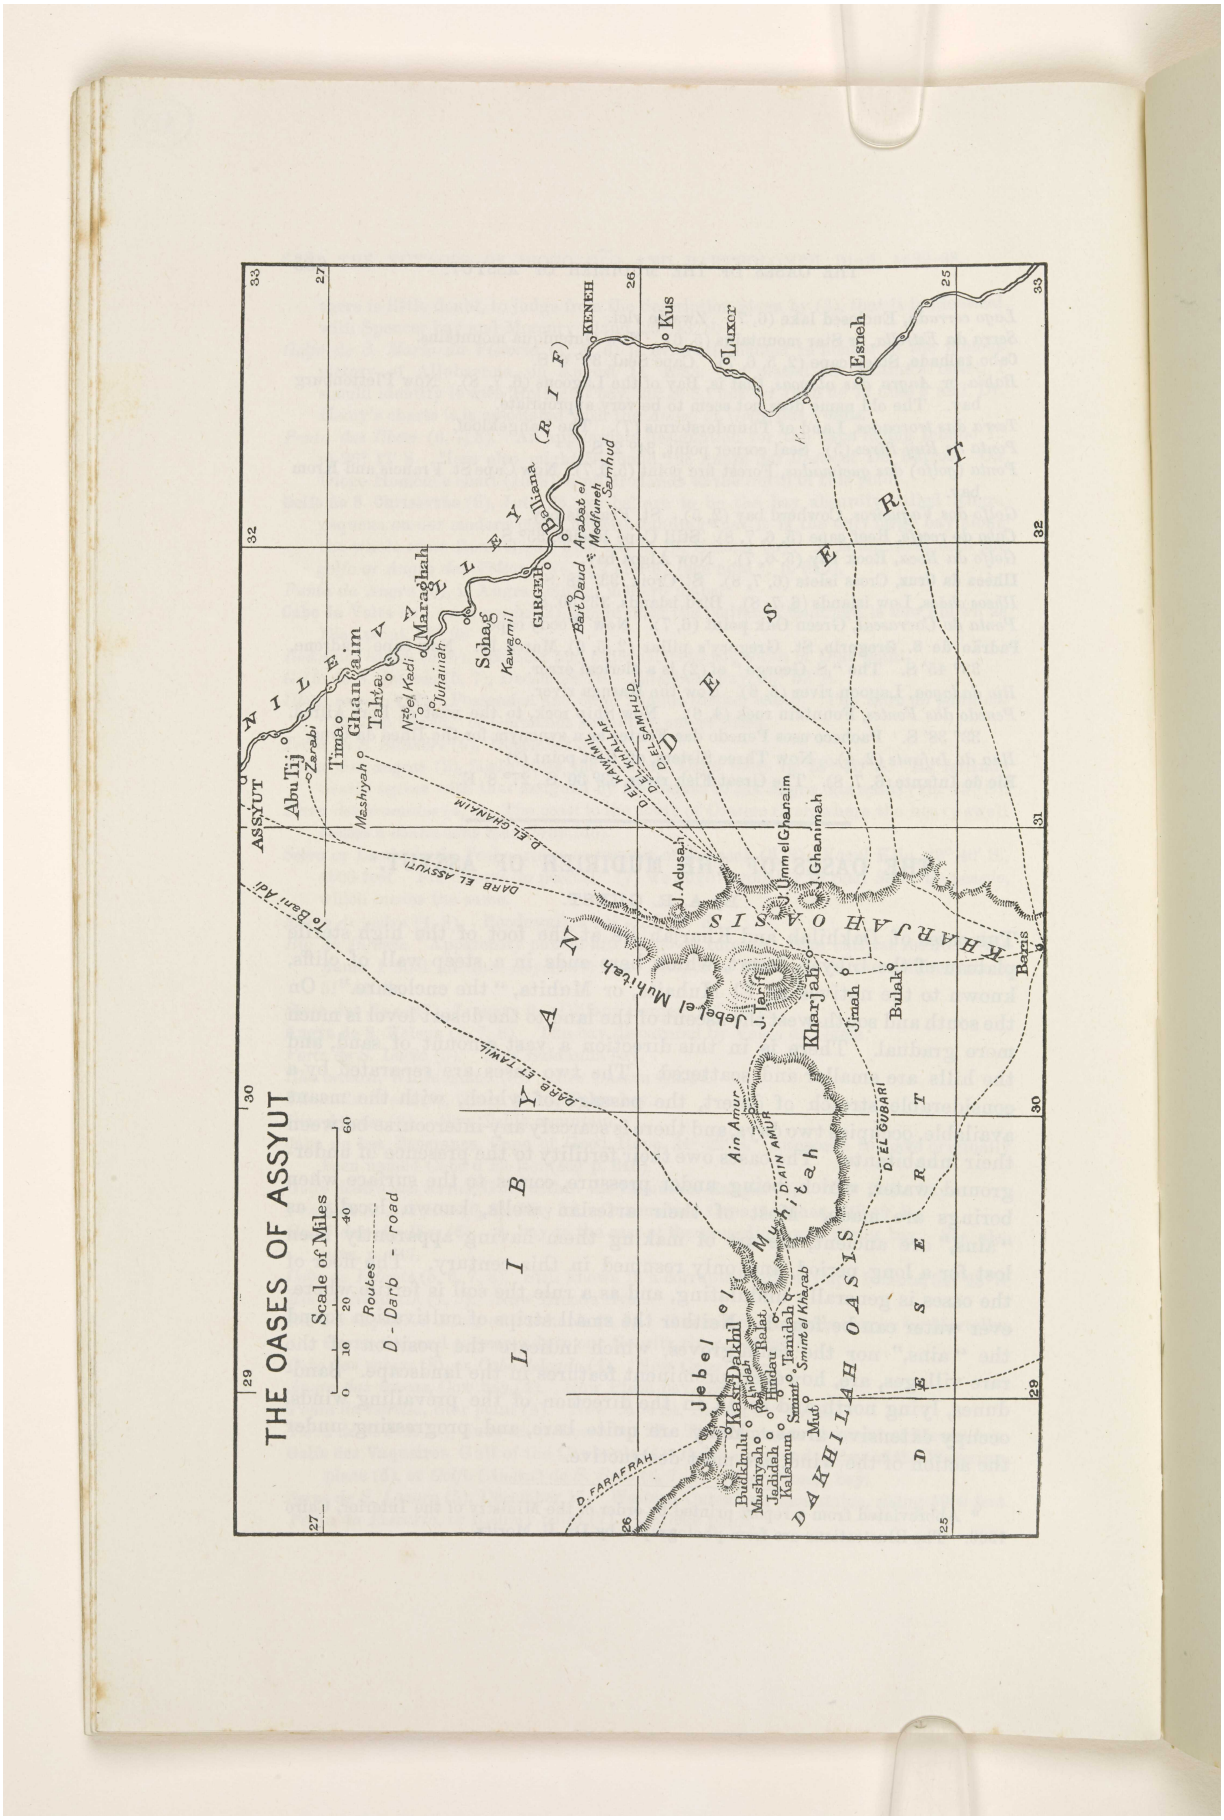
Lago cerrada, Enclosed lake (6, 7). Zwarte vlei.
Serra da Estrella, or Star mountains (5, 6). Now Outeniqua mountains.
Cabo talhado, Steep cape (2, 5, 6, 7). Cape Seal, 34° 6′ S.
Bahia or *Angra das alagoas*, that is, Bay of the Lagoons (6, 7, 8). Now Plettenburg bay. The old name does not seem to be very appropriate.
Terra das trovoados, Land of Thunderstorms (7). The Langekloof.
Ponta de Ruy Pirez (5). Seal corner point, 34° 2′ S.
Ponta (golfo) das queimadas, Forest fire point (5, 6, 7). Now Cape St. Francis and Krom bay.
Golfo dos Vaqueiros, Cowherd bay (2, 5). St. Francis bay.
Cabo do recife, Reef cape (5, 6, 7, 8). Still Cape Recife, 35° S.
Golfo da Roca, Rock bay (5, 6, 7). Now Algoa bay.
Ilhéos da Cruz, Cross islets (6, 7, 8). St. Croix, 33° 48′ S.
Ilheos chãos, Low islands (6, 7, 8). Bird islands, 33° 50′ S.
Ponta do Carrascal, Green Oak point (6, 7). Now Woody cape.
Padrão de S. Gregorio, St. Gregory's pillar (2, 5, 6), March 12. Now cape Padrone, 33° 45′ S. The "S. Georgo" of (2) is a clerical error.
Rio da lagoa, Lagoon river (5, 6). Now the Kasuga river.
Penedo das Fontes, Fountain rock (4, 6). Now Ship rock, to the west of Port Alfred, 33° 38′ S. Pacheco uses Penedo das Fontes as a synonym for the Ilheo da Cruz.
Ilha do Infante (2, 4). Now Three Sisters, off Riet point (?).
Rio do Infante (6, 7, 8). The Great Fish river, 33° 30′ S., 27° 8′ E.

THE OASES OF THE MUDIRIEH OF ASSYUT.*



By A. R. GUEST.

The oases of Dakhilah and Kharjah lie at the foot of the high sterile plateau of the Libyan desert, which here ends in a steep wall of cliffs, known to the natives as El Muhaita, or Muhita, "the enclosure." On the south and south-west the ascent of the land to the desert level is much more gradual. There is in this direction a vast amount of sand, and the hills are smaller and scattered. The two oases are separated by a considerable stretch of desert, the passage of which, with the means available, occupies two days, and there is scarcely any intercourse between their inhabitants. The oases owe their fertility to the presence of underground water, which, being under pressure, comes to the surface when borings are made. Most of their artesian wells, known locally as "ains," are ancient, the art of making them having apparently been lost for a long period, and only resumed in this century. The floor of the oases is generally undulating, and as a rule the soil is fertile wherever water can be found. Neither the small strips of cultivation round the "ains," nor the palm-groves, which indicate the position of the rare villages, are, however, prominent features in the landscape. Sand-dunes, lying north and south in the direction of the prevailing winds, occupy extensive areas. Many are quite bare, and, progressing under the action of the wind, are most destructive.

* Abbreviated from a report printed by order of the Ministry of the Interior, Cairo 1900. The illustrations are from photographs by Dr. B. Moritz.

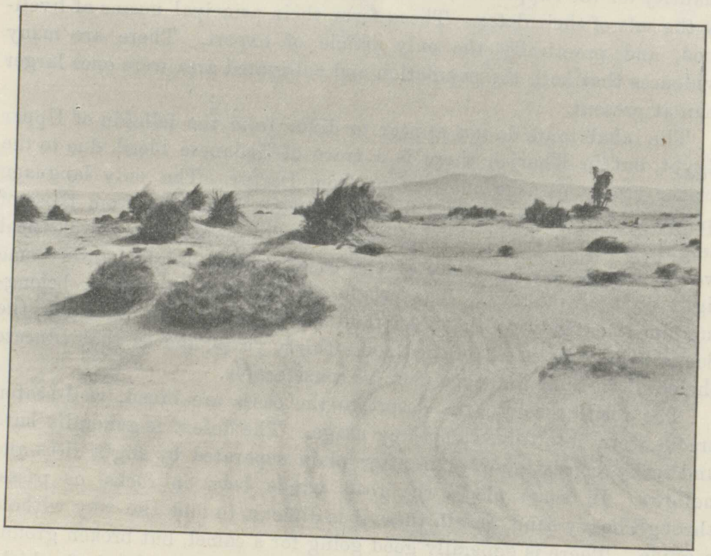
ER RAMLAH EL KABIR, ON THE ASSYUT ROAD TO KHARJAH.

The oases produce grain and other necessaries, but not in sufficient quantity for the support of the inhabitants, who make up the deficiency by the sale of their dates. These form their principal means of livelihood, and practically the only article of export. There are many evidences that both the population and cultivated area were once larger than at present.

The inhabitants do not appear to differ from the fellahin of Upper Egypt, but in Kharjah there is a trace of Sudanese blood, due to the former yearly passage of caravans from Darfur. The only language spoken is Arabic, the dialect in use differing somewhat from those of neighbouring districts. It is said that it employs many classical words, and a careful study of the oases dialect might throw some light on their history. The people are Moslems to a man, belonging almost entirely to the Shafii and Maliki sects. In Dakhilah, the Senussis have been established some thirty years, and as they educate the children their influence must be considerable.



The roads through the desert to the oases are broad, well-beaten tracks worn into furrows by long usage. The desert is generally hard and rocky, consisting of plain after plain separated by slight rises and hollows. In some places the road winds between rocks, or passes through heavy sand, and in these it is difficult to find the way without a guide. There is generally good going for a camel, but broken ground in each road would render it almost impassable for any kind of vehicle.

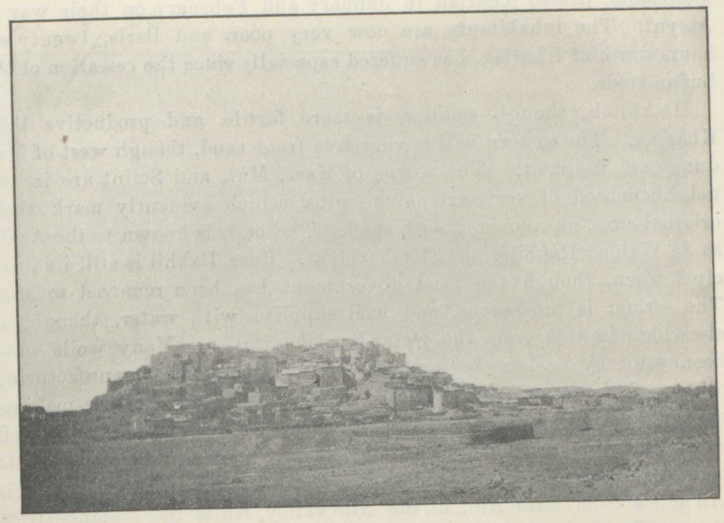
The principal traffic passes along during the date season, which begins in August and is practically over in January. During this period fellahin go in parties of ten or twenty from most of the adjacent "balads" (villages) in the Nile valley, to buy dates, which are exported principally from Kharjah. These fellahin are technically called "saffarah," while the merchants visiting the oases are called "Tujjar." Arabs from the west of the Nile valley go in small numbers to the oases as guides, hirers of camels, or traders, but there is no general migration of the Arab tribes to the oases at any season. These Arabs have few camels, and are in process of settling down to the condition of fellahin, the Bali tribe being the one which retains its nomad habits the most. It is the one which chiefly frequents Kharjah, while the Amaim go to both oases. About twenty years ago the guarding of the roads was entrusted to the various tribes, who then levied toll on each camel that passed along them. This arrangement has been abolished, but the tribes have not yet relinquished an idea of possession, and when a brigandage occurs on any road, the tribe to which its guardianship used to belong may be suspected. In addition to the Arab tribes of the adjacent provinces, the Rabayi, whose settlement is at Kardasah, in Gizeh, come down annually to Dakhilah *viâ* Farafrah. They arrive in August, bringing large numbers of camels, and returning by the Darb et Tawil to Assyut, and thence by the Nile valley to Gizeh.

A few words may now be devoted to the more special characteristics



OASIS OF KHARJAH.

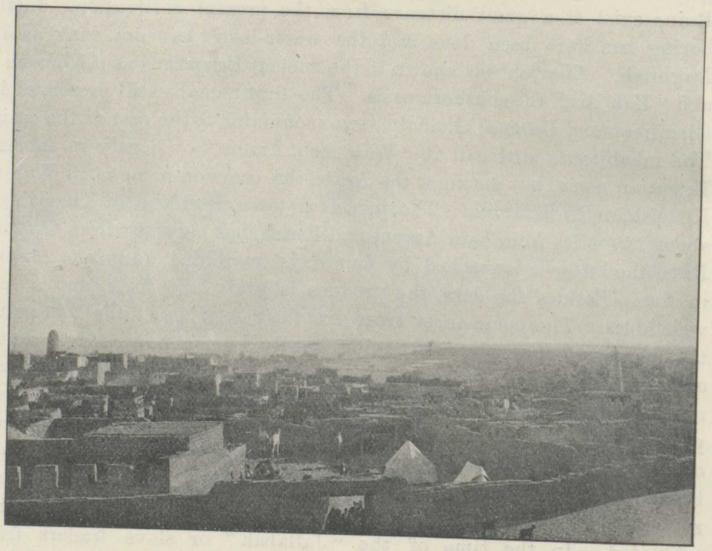
TOWN OF MUT, OASIS OF DAKHILAH.



of the two oases. Kharjah is but sparsely populated, its most striking feature being the amount of sand which chokes the valley, and which gives the impression that the oasis has been overwhelmed with sand. Ruins exist at a great distance from the present cultivation. Little boring has here been done, and the water-level has not sunk as in Dakhilah. Kharjah was known to the ancient Egyptians as "Khenem" and "Uah Ris," the southern oasis. The first name is still preserved in Ghanimah and Umm el Ghanaim, two mountains to the east of the oasis. The inhabitants still call it "Wah men Amum," obviously an ancient Egyptian name, but amongst the Arabs the common name is El Wah el Kharjah, or El Kibliyah. The principal town, itself called Kharjah, is about 130 miles from both Assyut and Esneh, but only 104 from Girgeh. From the latter it is reached by four days' marching, and from Assyut in five. Besides the date, the produce is grain and fruit, and a few vegetables. The commonest trees are the "sant" and the dom palm, the sycamore, once plentiful, being hardly known now. The "sant" are remarkably fine. Good pasture for camels is found in places, but none of these are owned by the inhabitants, goats being the most plentiful domestic animal. It is stated that some six or seven hundred camels come to Kharjah during the date season, of which about one hundred go on to Dakhilah, about a hundred also coming to Baris and returning to Esneh. These figures seem, however, considerably underestimated. In the time of the "Jallabah" or slave traders from Darfur, perhaps four thousand camels a year, belonging to Sudanese

مكتبة قطر الوطنية
Qatar National Library

merchants, passed Kharjah in January and February on their way to Assyut. The inhabitants are now very poor, and Baris, twenty-six hours south of Kharjah, has suffered especially since the cessation of the Sudan trade.

Dakhilah, though smaller, is more fertile and productive than Kharjah. The eastern half is very free from sand, though west of Mut dunes are frequent. The towns of Kasr, Mut, and Smint are in the neighbourhood of very extensive ruins, which evidently mark their original sites, now covered with sand. The oasis is known to the Arabs as El Wah ed Dakhilat, or El Gharbiyat. Kasr Dakhil is still its principal town, though the local government has been removed to Mut. The former is prosperous, and well supplied with water, though, as elsewhere in this oasis, the water-level has fallen. Many wells have been sunk by modern boring-machines. Kasr is the manufacturing centre of the oasis, the principal industries being pottery-making, weaving, basket-making, and the pressure of oil. The pottery is well worth attention, some of the vessels being exactly the same as those to be seen in fragments on the old sites. Balat, in the east of the oasis, is 170 miles from Bani Adi, in the Nile valley, while the distance from Kasr to Farafrah is about 115 miles, and from Tanidah to Kharjah 72. The only direct road to the Nile valley is that to Bani Adi. The productions of Dakhilah are similar to those of Kharjah, the dates fetching, however, a slightly higher price. The dom palm is very rare, though

RUINED TEMPLE, SMINT EL KHARAB.

not, as stated by Rohlfs, entirely absent. The number of camels which visit the oasis in the date season is estimated at two thousand.

The history of Kharjah and Dakhilah can be traced from very early times by the aid of the ancient inscriptions and documents, and the writings of Herodotus, Strabo, Plato, Ptolemy, Ulpian, Procopius, and the Arab geographers. Three of the latter, El Makrisi, El Istakhri, and Ibn Haukal, seem to have thought that the oases were actually abandoned at their epoch, but this would seem to be an error. What is probably true is that they had lost much of their importance by the closing of the desert roads to the west, which appear to have led to Ghanat, Fezzan, and even Marocco. According to El Masudi, Marwan, the last Umaiyad Khalif of Damascus, was slain at Abu Sir, near Mallawi, as he was preparing to proceed west to Marocco across the desert. The oldest official paper in the possession of the inhabitants which I have seen is dated 1180 A.H. A tradition quoted by Rohlfs, to the effect that the western roads were made impassable by a force of Mamluks, who stopped the wells in order to repel the raids made from that direction, appears to be demonstrably without foundation. From all we know of their history, we may deduce that the oases have never been places of great importance. That they were in a higher state of cultivation in the ancient Egyptian times than at present is unquestionable, and there is evidence that they were flourishing in the early days of the Roman emperors. It seems likely that

they shared in the decline of Egypt under the later Roman rule, being subject to raids from the south after the withdrawal of their garrison, while the closing of the roads to the west must have been a serious blow to their importance.

THE DANISH EAST GREENLAND EXPEDITION IN 1900.

By Lieut. G. C. AMDRUP, R.D.N.

Till 1898 no one had set foot upon the east coast of Greenland from about 65¾° lat. to about 70¼° lat. except some Eskimo, who, it was ascertained by the expedition of G. Colin in 1883–85, had formerly lived on the coast to about 67¾° lat. Several expeditions had tried to pass the ice-river which blocks the coast, but had not succeeded; one of them on board the French brig *Lilloise*, commanded by Lieut. Blosseville, disappeared, with all hands on board, in 1833. The coast from 68½° to 69° N. had been mapped from on board ship, but at a rather

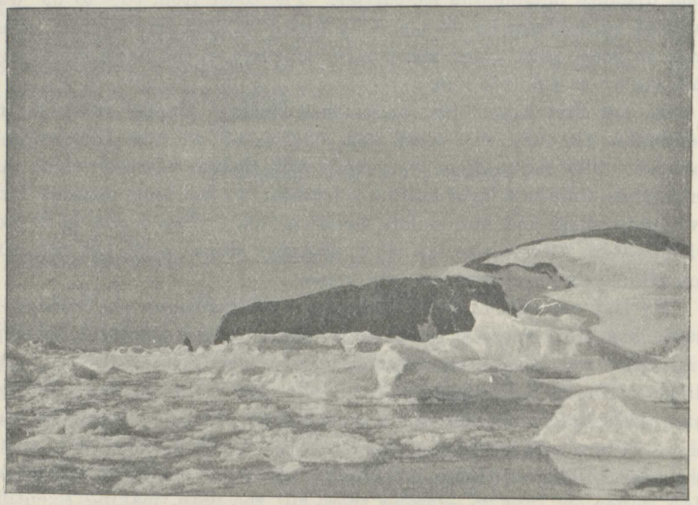
long distance outside the ice-barrier. The coast from 70½° to 69° was mapped by Scoresby in 1822, and by Ryder in 1892, but in both cases from on board ship. But many miles of coast on the chart were only still shown as a dotted line.

On my first expedition, undertaken during August 16, 1898, to September 12, 1899, the coast from 65¾° to 67° 22′ was explored and mapped. The explorations were made with sledges in winter-time, and in summer-time in a light-built wooden boat, 21 feet long, manned with two naturalists and two sailors, beside myself. Two depôts with provisions were erected, one at 66° 7′, and the other at 67° 15′, and fine scientific collections were brought home.



My last expedition, which returned to Copenhagen on October 4, 1900, has from every point of view been a great success. For this expedition was bought the Swedish vessel *Antarctic*, used in the expedition of Dr. A. G. Nathorst in 1899. Besides the crew, the expedition numbered five naturalists, one army officer for mapping, one artist, and three sailors, who would accompany us on the boat expedition along the coast. The expedition left Copenhagen on June 14, and arrived at Jan Mayen on June 25, staying there till the 28th, making scientific researches and collections. The edge of the ice-pack was met with on the north-west of Jan Mayen on the evening of the 28th, and was followed north-east and north until July 6 at four o'clock in the morning, when the ice (at 74° 30′ lat., 30° 58′ long. W.) allowed us to make way towards the west. Inside the dense band of pack of smaller

CAPE CHRISTIANSEN, 67° 13′ N. LAT.

floe-ice now came large ice-fields, often many miles in extent, with long channels between them. On July 10 we got the first glimpse of the coast, and on the 11th, at two o'clock in the morning, we anchored at Griper Road, on Sabine island. We examined Sabine island, and found a fine collection of fossils. The depôt for Sverdrup erected by Nathorst in 1899 was found in good condition. In a cairn next to the depôt I left a record, informing Sverdrup that the *Antarctic* would stay on the coast till September 1. Then we landed at Cape Borlase Warren, and steered south along the coast to Cape Dalton (69° 30′ lat.), where we arrived July 18. South of Cape Dalton the ice was so dense that it was impossible to enter it. With three companions I left the ship here, giving the leadership of the ship-expedition to Dr. N. Hartz, and the command of the ship to the first mate.

At Cape Dalton we built a small wooden house, where all our provisions, sledges, kayaks, etc., were stored. On July 22 we left Cape Dalton, bound for Tasiusak, 65° 35′, in a light wooden boat 18 feet long and 5 feet broad, with provisions for two months and a half and a good supply of ammunition, in case we should be obliged to winter on the coast. All the outfit was as light as possible, in order that we might be able to haul the boat over the ice without difficulty. All the provisions were stowed in boxes, in such a manner that they could not sink if the boat should be crushed in the ice. But we were always in luck's way, and on September 2 we arrived at Tasiusak, having done about 500 miles in the boat. My task was done; but, in addition, I also

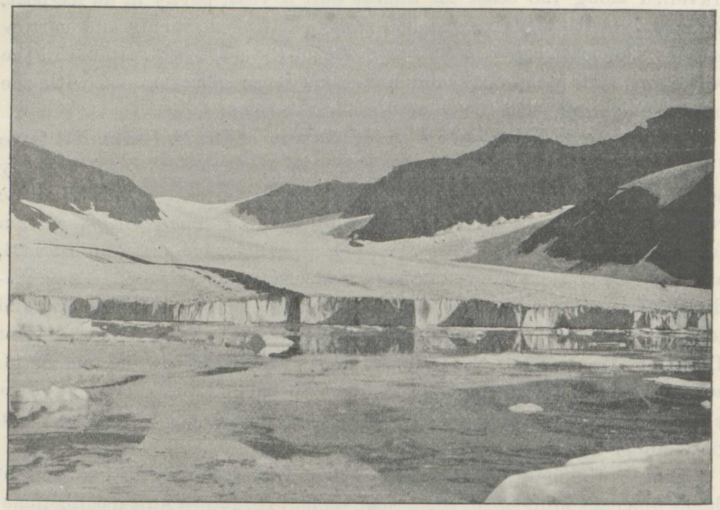
370

travelled along the coast for almost half a year, partly in an ice-boat, and partly with sledges, and had many exciting accidents and narrow escapes, the coast being, I dare say, one of the most inhospitable in the world, with its steep cliffs and numerous large glaciers, and with the polar ice driving with the current along the coast.

The ship expedition, under the leadership of Dr. N. Hartz, left Cape Dalton on July 22, and examined and mapped the coast to Scoresby sound. From July 1 to July 20, the expedition carried out scientific researches in Hurry inlet and Scoresby sound. Then the expedition left the sound, landed at Cape Grey, on the Liverpool coast, on July 23, and mapped and examined the bays west of Cape Gladstone. The expedition then made a short run in Davy sound and King Oscar's bay, and left the east coast of Greenland on September 1. After a short stay at Dyrefjord, in Iceland, the ship arrived at Tasiusak on September 11, when I took the leadership of the expedition and the command of the ship. We left Tasiusak on September 18, and arrived at Copenhagen on October 4.

Besides the mapping * of the coasts and bays, the expedition brought home fine palæontological, geological, zoological, and botanical collections; also a living specimen of the musk ox, and ten living specimens of the lemming (*Myodes torquatus*). Four ermines were killed and brought



VIEW FROM THE NORTH SIDE OF KAUGERDLUGSUAK.

* The new chart of the unknown coast and of the bays west of Cape Gladstone is still unfinished, and is for this reason not shown in the sketch-map.

A SMALL GLACIER EAST OF KAUGERDLUGSUAK.

home. An interesting ethnographical collection was made in the old huts and graves of the Eskimo. Especially interesting is a collection found at 68° 10′ lat., and sixteen skulls from old graves were obtained. No Eskimo lived on the unknown coast from Scoresby sound to 65° 45′ of Angmagsalik. No traces of Andrée or of Blosseville were seen. Hydrographical researches were made occasionally. Astronomical and magnetical determinations were made at many different localities on the coast.

ON THE AFGHAN FRONTIER: A RECONNAISSANCE IN SHUGNAN.*

(Notes from a Russian Officer's Journal.)

These notes are derived from the journal of a Russian officer, Lieut.-Colonel A. Serebrennikov, who was a member of one of two reconnoitring parties, despatched by the Russian Government into the little-known country of Shugnan from the Pamirsky Post during the year 1894.

The first party, of which Mr. Serebrennikov was a member, penetrated through the valley of the Shakh-Dara, whilst the second confined itself to the valley of the Gund river. Both parties ultimately united in the valley of the Kharokh river, near fort Kala-i-Bar-Panja, the capital of the Khanate of Shugnan.

This region is almost virgin ground for the explorer, most of the particulars we have of it at present being derived from hearsay. In view of this fact, and also

of the great probability that this hitherto neglected region may ultimately develop, by the march of political events, into a place of strategical importance, as the narrow belt of land separating two great powers—Russia and England—in Asia, it is to be hoped that the following short descriptive notes may induce some enterprising Englishman to undertake the task of exploration in a thorough and scientific spirit. This is the only excuse for offering these notes here. A military officer, whether English or Russian, on such a reconnoitring expedition has scarcely the means, if he had the will, to effect an exploration in the proper geographical meaning of the term. To get a written account at all, however sparse in detail it may be, from an eye-witness is a step in the right direction.

The first writer to mention Shugnan is the Chinese Buddhist monk Hwen-Thsang (in the seventh century); but every description, commencing with that of the Chinese traveller and ending with those of the English travellers Wood (1836), Forsyth, Trotter (1873) (in the nineteenth century), is largely made up from hearsay accounts. The first European who actually visited Shugnan *in propria persona* was the Russian Dr. Regel (1882–3). He was followed, a little later in 1883, by the mining engineer Ivanov. Neither traveller has published anything important on the country. In 1894, Lieut.-Colonel A. Serebrennikov, in the reconnoitring expedition to which reference has been made above, succeeded in riding along the entire courses of the rivers Shakh-Dara, Gund and Kharokh, and also along a portion of the Panj.*

As to the result of his travels we may now let him speak for himself.

A. M.

Pamirsky Post, Sunday, July 9, 1892.—There is a break in the monotonous run of garrison life at last! General Yonov has arrived with his staff, and after feastings, congratulations, etc., we settle down in earnest to discuss our proposed reconnaissance into Shugnan. There is no time to be lost, as we learn that the Afghans are expected almost daily to cross the river, and we must forestall them.

July 19.—Our two parties, each consisting of three officers, twelve infantry, twenty cossacks, and some guides, set out at eight o'clock this morning in a drizzling mist. We forded the river Murgh-ab after parting from and receiving the good wishes of all our brother-officers remaining behind, and also—last but not least—those of the only lady on the Pamirs, Madame S. G. Skerskaya, who had, in spite of the weather, made one of our honorary escort up to this point. The river is rather high at this season, and the waters rose to our horses' saddle-cloths even at the ford, but in autumn and winter, when its affluents are not fed by the melting of the glaciers, fording at any point is very easy.

How exceedingly monotonous and dreary the scenery on this vast Pamir plateau is! The low mountains, with vague outlines, which bound the broad river valleys, are quite bare and lifeless. In this respect how different from the awesome mightiness of some of the giants in the Alai range! But the fact which should astonish us is the tremendous height above sea-level, at which we are standing in these valleys. This, of course, cannot be seen, but only felt—fever, violent headaches, nose-bleeding, etc., are frequent symptoms here, and tell their own tale as regards altitude. The natives call these symptoms "tutek."

After passing the burial vaults of Shadjan, on the right side of the river, we turned sharply to the left, ascending a small plateau whereon are more graves, but

---

* The parts of Shugnan within the valley of the Panj have lately been visited by the two Danish Expeditions under Lieut. Olufsen. On the second of these a reconnaissance east of the river was also made.

BRITISH LIBRARY

without any inscriptions. We then descended into the valley of the Kara-su river (an affluent of the Murgh-ab). In this river there is a kind of "eyot" covered with parched and sickly-looking willows, and it is strange how our eyes would affectionately cling to this anæmic oasis, which represents the sole timber growth in the Pamir highland from Fergana and the Alai to the Koi-tezek pass on the Shugnan frontier, about 240 miles.

The river now washes its way through a thick bed of conglomerate, 45 to 50 feet deep.

After crossing over to the left bank of the stream, we followed the road which brought us almost straight to the "rabat" (Persian inn) at the mouth of the river Boz-Jilga. Here we stopped for the night. More by luck than by foresight, we resisted the temptation, weary as we were, of camping in the open—for the rabat, being merely a quadrangular room with a clay dome, could not, of course, accommodate us all—and erected two of our tents outside. It was fortunate we did so, for a stiff shower fell during the night.

As a rule, the rainfall is very slight on the Pamir, and rainy days do not average more than 8–10 per annum.

We set out at daybreak next morning and crossed the summit of the Naiza-tash. This latter slopes so gently, that a carriage could easily traverse it. The road now courses between low mountains, with the usual depressing and spiritless "Pamir" perspective, which, however, opens out when we enter the Alichur valley. Here the eye can take a wider sweep, and embraces the whole of the valley, lying there as if in the palm of one's hand, with the Chatyr-tash (the tent-stone) rising in the middle, and looking really like a huge tent in the distance. A strong wind is nearly always blowing along the Alichur valley, and in our case proved very disagreeable, as we had already marched 29 miles, and were feeling tired. We camped shortly afterwards for the night about 2 miles below the Chatyr-tash on a rather marshy plain, covered with fairly good grass. Here we consulted as to our plans for the morrow.

As it was imperative that we should reach Shugnan in time to forestall the designs of the Afghan raiders, we decided to push on 18 miles next day, as quickly as possible and without halting.

Although the Alichur valley is noted for its rich grazing lands, the nomadic tribes have not yet sufficiently got over their natural fear of the Afghans to make general use of them. This warlike, though treacherous race, may be justly termed the banditti of Central Asia, and, so long as they exist, will they be a constant thorn in the sides of both English and Russians. During the summer of 1891 and 1892 they established a small military post on the eastern borders of the Yashil-kul, near Sume-tash, whence they raided and blackmailed Russian subjects on the Pamirs. It cost the Russians a very sanguinary encounter before they could be ousted from their ill-famed stronghold.

July 21.—We started at 7.15 a.m., after leaving three cossacks (as we did also at the previous halting-places) to keep up our line of communications. We again followed the road, which from this point skirts the left bank of the Alichur river, winding up and down, in and out, at the base of the mountains. The lower parts of the valley are marshy, and we had to avoid them. We crossed the stream Bash Gumbez, which falls into the Alichur further down, and passed one of the rabats of Abdullah Khan. This rabat is in very good preservation, though over three hundred years old.

A disagreeable head wind was now blowing, and we were all glad when, at four o'clock, we saw in the distance the lately-built rabat near the Mukur-Shegembet river and ravine. It stands on a high bank, and can be clearly seen a good way

off. The soil thereabouts is salt, and vegetation grows scantily only along the banks of the river.

July 22.—We set out again early next morning, after leaving our usual post of three cossacks behind. The road here turns to the left, and soon takes us away from the Alichur valley.

Our most direct route would have been along the Yashil-kul lake, thence following the Gund river, which flows out of its western side. As this road, however, is very hard to traverse, we decided to take the longer but easier route over the summit of the Koi Tezek, and thence through the valley of the Toguz Bulak river.

This we did, and camped for the night by the salt lake Tuz-kul. Here we received a deputation of a hundred Shugnanis, who petitioned us on behalf of the inhabitants of the Shakh-Dara for protection against the Afghans. They were a poor, dispirited-looking body of men, and must have stood to the Afghans as sheep to wolves. Their dress, made from the coarsest stuffs, led us to think that they were all simple peasants; but in this we were mistaken, as we soon perceived, for no less a personage than Azis-Khan, nephew of the last independent ruler of Shakh-Dara, was amongst them. This was the ruler who had been executed in Rosh-kala by order of the Shugnan ruler (Shah-Abduraim-Khan).

Azis-Khan, our humble petitioner, was a young fellow of about twenty or twenty-two, of medium height, with the typical features of a mountain Tajik, and the customary curly whiskers, like those we see depicted on many of the old Assyrian bas-reliefs. His dress, consisting of a black cotton "khalat," or gown, was mean in the extreme, and neither in bearing nor in apparel did he betray any hint of his princely birth. The "caste" system does not exist in Shugnan, and, owing to the general poverty which prevails throughout the kingdom, there is no visible distinction, generally speaking, between prince and pauper. Of course, there are exceptions. Later on, I met another Shugnan prince, Timur-Shah, nephew of the last Shugnan Khan, Seid-Akhbar-Shah, whose dignified bearing and manners were quite in keeping with his birth. I suppose, though, it must be hard to be dignified on next-to-nothing a year, and an empty belly will certainly humble prince as well as pauper in the long run.

We took advantage of the visit to learn something about the country, state of the roads, etc., and heard pleasant news. In the first place, it appeared, according to Azis-Khan, that the roads up to Shakh-Dara would be found exceedingly good; and, in the second place, that the inhabitants of the latter were waiting our advent with impatience, being in mortal terror of the Afghans. We continued on our way, therefore, in the best of spirits.

On entering the Shakh-Dara territory we soon had practical demonstration that, so far as our welcome was concerned, things were as Azis-Khan had represented them. We were quickly surrounded by smiling helpers, all eager to do something for us—some collecting fuel, others helping to carry the heavy loads, etc. As regards the state of the roads, however, we were disappointed, for though they may have been "exceedingly good" according to the Shugnan standard, to us they seemed exceedingly bad, even in comparison with Pamir roads.

We halted for the night near the Mazar-Kyrk-Sheit, and several of our party, having an hour or so's daylight, took advantage of it to go fishing in the stream emptying itself into the Bulyun-kul lake. Although it was the warmest season of the year (July), our thermometer only registered 10° Réaumur (54½° F.) at 9.30 p.m., and had fallen to 7° (47¾° F.) by the morning.

We started at 6.50 a.m. in fine weather. At 9.10 a.m. we reached the top of Mount Koi-Tezek (14,000 feet), which marks the frontier line of Shugnan. During

BRITISH LIBRARY

six months of the year this mountain is covered with snow, and it is then quite impassable; in the summer, however, there is no difficulty. On the very summit the road forks, the right-hand branch leading to the valley of the Toguz-bulak river, a tributary of the Gund, and the left-hand one to the Shakh-Dara valley. Here we halted, and after dividing up our baggage train our party split up, I myself being with the division which pursued the Shakh-Dara route.

We reached the Kok-bai plateau, which is surrounded by snow-capped mountains. We were now at a great altitude, many of our party suffering from incipient headache, and all were glad when the road, after turning to the left, descended along the banks of the stream Kok-bai-Chat, source of the river Shakh-Dara. Here we camped for the night, starting again at 7.15 a.m. As we proceeded, the character of the country gradually changed, and the scenery began to get more diversified. It was indeed time, for we were all heartily sick of the great "monotonous Pamir," which should furnish an ideal country for the pessimist if he is ever in want of such.

Indeed, for an image to express downright, utter melancholy, in the abstract, I cannot think of anything more apt than the picture of a pessimist reading Schopenhauer in the Pamirs. It is the "land of no hope." But although the scenery was now more cheering to the eye, this was an advantage only purchased at the expense of weary limbs, for the roads went from bad to worse. We stumbled on, however, encouraged by the sight of wild-rose bushes and the warmer-tinted vegetation which bordered our route. A wild rose is perhaps not much, in an ordinary way, to make a fuss about, but to any poor wanderer, like ourselves, whose eyes were tired and aching from the monotony of a Pamir landscape, it will appear, as it did to us, as a sign from God in the midst of the wilderness. But we still had to go through some wearisome plodding, for the road hereabouts is most precipitous. My heart knocked apprehensively against my ribs several times when my horse stumbled on the edge of some chasm or slipped in some deep rut on a breakneck descent. The best thing for a man to do in such cases is to trust implicitly to his horse; and not to attempt to control or guide it in any way, for the horse's instinct will be a surer and safer guide out of the danger than the judgment of its rider. Many a life has been lost, of horse and man, through humanity's insufferable conceit in its own prowess, and through its often ignorant contempt for the powers of that noble servant of man, the horse.

After a rough up-and-down scramble, a steep descent brought us to the confluence of the Koi-bai-Chat and the Mats. From this spot we had a truly splendid view of the distant snow-capped Wakhan mountains and the green valley of the Jaushankuz river, the latter being one of the sources of the Shakh-Dara. Of the Wakhan mountain range, two peaks tower pre-eminent, one rising to a height of 23,000 feet, and the other, the Tsaritsa Maria, to 20,000 feet above sea-level. These two majestic mountains stand adjacent and tower above all the others in their impressive majesty and might.

We soon came out into the valley of the Jaushankuz river, and thence to a place called by the Kirghiz Depchi-utun, "the trough-like." The path here became very steep and broken, but afterwards improved greatly. At this point we met ten Tajiks, who, hearing of the approach of the expedition, had come forward several versts * to meet us. Our guide, Azis-Khan, displayed much pleasurable excitement at meeting his compatriots, and when he came upon a second "welcoming party" a mile or so further on, his delight was at its height.

When they saw us, the Tajiks dismounted from their horses and took us quite

* One Russian verst = 0·6 English mile.

by surprise with the fervour of their welcome. On meeting with persons either older or of higher social grade than themselves, the custom is for the younger to take the other's hand and kiss it, to which greeting the elder responds by either kissing him on the forehead or throwing him a kiss, the whole performance being accomplished generally with dignity and grace.

The Tajiks, therefore, on meeting us ran up alongside our horses, took our hands, kissed them, and seemed to expect us to be as demonstrative as they were. It was only later on, when our interpreters had explained to them that we were unfortunate enough to have different customs, that they greeted us with hand-shakings and by making the "kulduk," *i.e.* a low reverence, performed with hands on breast.

By midday we had taken up our quarters in the tent prepared for us, and received numerous visits from Tajik-Shugnanis as well as from an influential family of Kirghiz then nomadizing in the district—that of Bai-Kurban-dakhta. In the time of the Khans, Kirghiz nomads, to the number of forty or fifty families, regularly made their homes in the Shugnan district, but now there are only about seven families there, and even those edge as near as possible to the Pamir deserts, so as to have a refuge handy against the Afghans. The latter swoop down on the higher reaches of the Shakh-Dara every now and then from Wakhan, where they garrison the fortress Kala-i-Bar-Panja, the capital of the Khanate of Shugnan.

The intervening country is very precipitous, and is icebound for three to four months in the year. Indeed, it is only the great difficulty of communication which has hitherto protected the Kirghiz from being forced under the sway of the Afghans. As it is, the latter have only thought fit to demand that the Kirghiz shall maintain a post of observation on their behalf, and inform them of everything worthy of notice—especially regarding the actions of the Russians on the Pamir.

As the entire garrison turned out and greeted us with every demonstration of friendship, their faithfulness to their charge, I am afraid, is more assumed than real. We made a halt near by the demolished Kirghiz fortress Butenek-Kurgan on the rivulet Jaushankuz (*Anglicè*, "sown barley"), formed by the junction of the Kok-bai-Chat and Mats. The name is appropriate, and not merely poetical, because, as a fact, barley-sowing actually begins here. Most probably this Butenek Kurgan, like all the others of which we have occasion to mention, was a place fortified by the Kirghiz so as to serve as a defence from their Tajik persecutors.

In the times of the khans, or, as they were called, "Shah" (ruler), these Tajik invasions were looked upon as such matter-of-fact enterprises, that even the Shah himself would not scruple to enrich his coffers by the despatch of a marauding party or two. In fact, these raids came to be looked upon as so many legitimate commercial expeditions, combining personal gain with the pleasures of war, without any of its dangers.

The Jaushankuz valley, which widens at this part, is encompassed by low mountains, quite bare, alike of vegetation and of snow. The soil, though rather marshy, is covered with a rich grass, dotted here and there with willow bushes, averaging 6 feet in height.

We started at 9.30 a.m., accompanied by an enthusiastic and increasing crowd of Tajiks and Kirghiz. The road first traversed the plain, but soon led us to a ford across the river. The latter here takes a sharp bend to the right. After crossing the river we entered a large defile, at the mouth of which stand a number of peculiar stone masses bearing a rough resemblance to Kirghiz "kibitkas" (dwelling-tents). Regarding the latter there is a legend which says that they mark the site of a former rich "aul" (village). A holy man wandered in one day craving rest and food, but the rich inhabitants, who had waxed proud in their

BRITISH LIBRARY

prosperity, repulsed him with scornful words. The holy man thereupon, angered at their shameful forgetfulness of the laws of hospitality as enjoined by the prophet on all the faithful, changed their kibitkas into stone.

On the right-hand side, we soon come to a ravine which bears the characteristic name "Duzakh-Dara" (hell's ravine). This is quite a misnomer, if the much-quoted dictum, "Facilis est descensus averni," is right, for the road which leads through this ravine is most difficult. Right opposite the ravine Duzakh-Dara, in the centre of the Jaushankuz valley, may be seen ruins of the old fortlet Jaushankuz-kala.

After ascending a small ridge a little further on, the ruins of an old Shugnan village became visible. The road then led us through a small stone ravine, and thence continued along the Jaushankuz valley again, to the junction of the river with the Vrang. From this junction, in reality, commences the river Shakh-Dara. Here we were met by the Shugnan Khudoyar, who acts as "aksakala" (governor) over Shakh-Dara, having been appointed to the office by the Afghans, when they took possession of the country.

Khudoyar is a tall, fine-looking, energetic man, with the characteristic features of the Pamir-Tajiks. Barred from any but casual intercourse with the surrounding countries by almost untraversable mountains and the neighbouring desert, the Tajiks of Shugnan were forced to intermarry among themselves, and thus to keep pure, though debilitated, their original Aryan blood. Another thing to strengthen this isolation was the fact of their being "Shiites," who are heretics, and worse than dogs in the opinion of the surrounding Sunites. Khudoyar was accompanied by a "jiguit," a tall, fine young fellow, dressed in the gray uniform of the Afghans, with bright buttons, carrying a curved Afghan sword. I could not help looking on him with suspicion, and the more I looked, the less satisfaction I got from his cunning, evil-looking face. He disappeared soon—"gone home," we were told—and that was all the information we could glean about him.

Eventually we got quite accustomed to the various uniforms, but at the beginning the sight of them raised rather uncomfortable feelings.

Having passed the ruins of the "kishlag" (encampment) Vrang, we rode along the left side of the Shakh-Dara, sometimes making our way over bare rocks which overhang the water, and sometimes through willow bushes, till we reached the ancient fortress Koi-Kuvat. According to local tradition this fort was erected 700 years ago by the Amir Koi-Kuvat; and its strategical position, built as it is on an almost perpendicular rock, was certainly very well chosen. At the present, the old fortress walls enclose several huts, "saklya," which serve as winter quarters to Kurban-Datkha and his numerous family. The surrounding country is very beautiful. The river valley broadens out, and is rich in vegetation. Here we stopped for the night.

July 24.—A beautiful summer morning. Though still early, the southern sun was so hot, that some of us sought the friendly shade of the willow-clumps, where we could tranquilly lie and gaze our fill at the beautiful landscape before us. The bright emeralds of the valley at our feet, made brilliant by the changing glow of the sunlight, and the outlines of the mountains standing out clean-cut against the blue sky, whilst the river wound its way in between, all combined to make up a picture from which we were loth to move.

When the time fixed for the halt had expired, it was very unwillingly that we rose to our feet and prepared to continue our journey.

A little further on the road passed to the right bank of the Shakh-Dara, and we had to cross a deep ford. Further on, about half a mile from Baba-Abdal-Mazar, which was agreed on as our night's halting-place, we had again to ford another

BRITISH LIBRARY

river, the Baba-Abdal, an affluent on the right bank of the Shakh-Dara. This was altogether a disagreeable business, the waters being rather deep, and the current rapid and boisterous. As if these disadvantages were not enough, the bed of the stream, moreover, was strewn with big stones, and we had several narrow escapes from accidents. We stopped on the bank of the Shakh-Dara, in sight of the burial-place of Baba-Abdal. This holy man is so revered by the inhabitants that many of those accompanying our party descended from their horses and walked past the tomb as a sign of respect. The burial-place stands on an elevation, and is visible some distance off. The exterior is quite ordinary in appearance, and the interior consists of two rooms and a terrace. Long poles stick up over the roof, hung with tails of yaks and different-coloured rags—remnants of pious offerings from the faithful.

A little lower down the slope stand the ruins of a "kishlag," by all appearance not long abandoned. We arrived at our night's camp at 11.45 a.m., and prepared for a lengthened rest, as the Tajik guides told us that the next place where we could put our horses to grass was some distance off. As the country was quite unknown to us, we had to rely entirely on the guides, which we could do with the more confidence, because it was as much their interest as ours to lead us as quickly as possible to the confluence of the Shakh-Dara and Gund, the rendezvous where our two reconnoitring expeditions were again to join. The longer they delayed, the more anxiety they would have on account of the Afghans. During the remainder of the day I visited the sepulchre, the ruins of the kishlag, and the ravines of the river Baba-Abdal.

July 25.—We started at 6.45 a.m. on our difficult journey to the first Shugnan kishlag, Seij, on the right bank of the Shakh-Dara. The difficulty and danger lay in the fact that we had to wade four times across the river, which was at rather high water. The road follows first a terrace, slightly sloping towards the river, and after passing a meadow goes through a thicket of willow trees, then ascends a slope, descends to the meadow again, enters a thicket of brushwood, and finally, 2½ miles from Baba-Abdal-Mazar, runs close under high perpendicular rocks, which make it impossible to follow the right side of the river any further. As the ford was difficult, and would take some time, we resolved, after crossing, to wait till all the beasts of burden had arrived, and to see ourselves the most valuable bales and packages transferred safely across. The waiting would have been very dreary but for one incident, which, although rather unpleasant, served to pass the time. A pack-horse, carrying two cases of cartridges and a small barrel of spirits, slipped from the slope into the river. Through the efforts of the Tajiks, amongst whom was Azis-Khan, one case of cartridges was eventually saved, but the other sank in deep water and was lost. As regards the small spirit-barrel, that floated, and ten or twelve Tajiks immediately rushed into the water at the ford. By spreading themselves across the river they caught it, as it came down the stream. We regretted the loss of the cartridges, but the cossacks and soldiers regretted the spirits more, which had leaked out and become diluted with water. This cask was part of the very little we had remaining, hence their sorrowful looks. The crossing of the baggage and of the foot-soldiers took two hours and a half, and it was only at 10 a.m., *i.e.* after three hours and three-quarters, that we were able to continue our journey.

An hour after we had to recross the Shakh-Dara, which divides here into two streams. This made the fording easier, as, although the streams were still deep, the current was not so strong.

We halted once more amongst great thickets, "tugai," of poplars and willows. At 12 o'clock we continued our journey. The path now mounts up to

BRITISH LIBRARY

490 feet above the river, with abrupt descents and ascents, often across transversal gullies. On the left side can be seen the enormous Indich Bashur, hemmed in by precipitous cliffs, from the two clefts of which appear the peaks of the Wakhan mountains, covered with eternal snows; and below the mountains flows a small rivulet which falls into the Shakh-Dara. Right opposite the Indich Bashur, on the right side of the Shakh-Dara, there is a small kishlag, abandoned by its inhabitants, as we were told by the Tajiks, only last year. Having passed the Indich Bashur, we rode out on to a kind of level platform, where we met a fresh party of Tajiks, bearing a letter to us from the inhabitants of the lower kishlags, praying us to hasten. We now pushed on with all the speed which the difficult path would allow, and at 2 p.m. arrived at the third crossing. This proved to be the deepest, the water reaching to the saddle-cloths of our horses, besides which the bed was rough and stony. The breadth of the river here is about 60 feet. Hardly half a mile further on we had to cross again to the right side of the Shakh-Dara, but this time the ford was the shallowest and most convenient of all, and the bed quite even and firm. After this the road wends its way between enormous masses of stone, or on narrow ledges with walls so close to the rock that our stirrups grated on them as we went along. At last we began to ascend a very steep gradient on the bare rock, so steep and narrow that in some places steps had been hewn out and "balconies" constructed, *i.e.* widenings of the path by planks laid down and hanging over the precipice. We had been told about the fords, but not a word about this place, which proved to be the most dangerous on the whole road. In one place the rock wall projects so much over the ledge that our horses could not pass through, and we were obliged to carefully alight, take off the loads, and even to unsaddle the horses. Neither my companions nor myself shall ever forget this awful passage. Several Tajiks from Seij met us here, and helped us carry our luggage. Their agility, diligence, and, above all, the stamina they displayed in carrying heavy burdens weighing 144 to 180 pounds, were really wonderful. If it had not been for their help we should have been delayed here for several hours, but as it was we did it all in about half an hour.

A short ride brought us to the mouth of the river Drum, which flows into the Shakh-Dara. We halted here about 5 p.m. on a small spur jutting between these two rivers. Our hazardous journey had tired me thoroughly out, not so much physically, but on account of the strain on the nerves. I therefore postponed my inspection of the neighbourhood till the following day, and went to rest.

We were now approaching the Afghans, and had to be on the *qui vive*, especially when bivouacked, in order to guard against surprises. We had carefully chosen the position for our halt on this account, and having the water on both sides, and above us the perpendicular rocky banks of the river, 50 to 70 feet high, we felt quite safe from any night attack.

The only difficulty we were under was through the absence of green fodder, which put us under the necessity of buying hay from the inhabitants of Seij.

The night was fine and warm, with a light wind blowing up the valley. We had left our cold altitudes now, we hoped, for good. Towards evening, a band of excited Tajiks brought us the disquieting news that the Afghans were advancing in two columns from Kala-i-Bar-Panja, up the Shakh-Dara and Gund, to meet us. We had therefore to prepare for the worst.

July 27.—At 7 a.m. we cautiously set out to continue our journey. After having first crossed a rather well-preserved bridge on the right side of the Drum, and afterwards another bridge on the left side of the Shakh-Dara, the road began to ascend steeply till we at last emerged on to a small stony square place—a platform 120 to 150 feet above the level of the bridges. Higher and higher we

BRITISH LIBRARY

went, till we came out on a second platform. All traces of a road had now disappeared, and even the path was sometimes hard to trace. This was all tiring work, and having rested a few minutes, we began the third and most troublesome part of our ascent. This proved simply cruel, what path there was being covered with needle-pointed flints which were torture to walk on. We had to dismount, as the path crumbled away under the weight of our horses, and many a slip sent rocks and stones and soil rolling down the slopes. In many places the ascent was so steep that steps had been hewn in the cliff, which we walked up as on stairs. The fatigues of this ascent, in fact, transcend description. Really we had to stop every five or ten steps to take breath. In cases like this the best thing to do is to let the horse go in front, and for the man to be half-tugged up, holding on to its tail. This we did. If the ascent was so difficult for a horseman, it is easy to imagine how much more difficult it became when we had to help to drag up all our baggage. We were often obliged to unload the pack-horses and to carry the baggage over the most difficult places parcel by parcel; and even when we could load up the luggage again, the task was more often than not very dangerous on account of the narrowness of the path, bordered by a perpendicular cliff on the left and a precipice on the right. At last (at 9.45) we arrived at the summit, all of us more or less exhausted, with throats parched, and trembling all over from the strain. We could still look back and see the struggles of our companions. In one place a large load had slipped from the back of a horse to its hind quarters, together with the pack-saddle, and the horse was prancing with fright, to the danger of all surrounding it; in another place some loads had fallen down, and the "kerekesh" (guides) were struggling, some to put them on the restive horses again, others to drag them forward themselves. It is a miracle to me, however, how we managed to get through without a serious accident.

Having rested a little, we went on again, and were soon descending the slope leading to the Shakh-Dara at the spot where the river Badjan-Dara joins it. The descent is here, if anything, more precipitous than the former ascent, going down no less than 1000 feet; but, being a descent, we accomplished it without much difficulty along a path which had been specially laid out for us by Tajiks sent from Seij the day before, and to whom we had lent our spades and mattocks for the purpose. We rested at the foot amongst the enormous poplars and willows of a great "tugai" (grove), at the bottom of a deep valley surrounded by cliffs, and bearing the name of Kara-Dangue. On two sides we had the Shakh-Dara river and its affluent on the left side, the Badjan-Dara, and on the others there was the rocky declivity we had just descended. The cliffs here almost overhang the stream, and the sombre grandeur and gloom of the scene weighed heavily on all of us, so that we would willingly have chosen a more cheerful resting-place if the choice had been given us.

It was in this gloomy place that we received a letter from the chief of the Afghan detachment, then stopping at the fortress Rosh Kala, a little distance from our bivouac, literally gorgeous with all the flowers of Persian speech. To have read his compliments and the wordy welcome we received, any one unacquainted with Afghan ways would have imagined we were long-lost brethren; but as we knew that the Afghan praises most those whom he means to kill, the letter had no other effect on us than to make us exercise greater vigilance. The reader will see further on that we were right in our interpretation.

Our baggage train had not yet arrived, when darkness settled down on us like a funeral pall. A cool wind fanned us from the snowy heights of the Wakhan mountains, whose outlines were lightly silvered against the purple-black sky by the pale crescent of a young moon. Our tired men had dined hastily, many falling

BRITISH LIBRARY

asleep as they ate, and lay sprawling about in all sorts of ungainly postures. On account of the proximity of the Afghans and the obvious disadvantages of our position, we posted several foot soldiers as sentries on the ridge of the slope, which was the only place by which we could have been surprised.

In spite of my own fatigue, I could not get to sleep. The gloomy genius of the surroundings seemed to weigh on me, and the most hopeless thoughts thronged through my brain, and made me utterly miserable. "Out of the depths have I called unto Thee, O Lord!" The sombre, grand old psalm sank deep into me, and I felt a little perhaps of what our Aryan ancestors felt—fear of the unknown, the vast, illimitable nature surrounding us! Only the rhythmical gurgle of flowing water and the mournful soughing of trees rocked by the wind broke the heavy black silence. At last I fell into a troubled sleep, and when I woke again—what a relief! All was noise and bustle, and in the general hurry-scurry of my fellows I soon forgot the terrors of the night.

July 28.—A memorable day. We continued our journey at 7 a.m., and crossed the Badjan-Dara. This was comparatively easy, as the mountain-rivers rarely contain much water in the early morning. We had some more difficult ascents to get over, however. The first half of the one we now faced was not so steep but that the loaded horses and ourselves could ride up; but the second half was like a huge irregular staircase up a slightly slanting cliff. Here we experienced a renewal of our old troubles; but thanks to our men having in a measure gained fresh strength, and to the help afforded us by a number of willing Tajiks who had come to meet us, we made much better progress. We had to be careful also not to overtire our men on account of possible events.

In an old number of the journal *Razvyedchick*, I remember once reading an article on the training of German cavalry. One part described the exercises by which they were taught to ride over different obstacles in the road. Among others, I remember that one exercise was to ride "upstairs" and down. This seemed to me very curious at the time; but now, since I had had my own share of riding "upstairs" and other unpleasantness, I could not help admiring the effectiveness with which the German military code seeks to prepare their cavalry for all sorts of emergencies. It is certainly worthy of imitation by other nations.

We soon rode into a large place, from which could be seen the far-off kishlag Sendip, the residence of our titled companion, Azis-Khan.

This was a glorious day, and the scenery truly delightful after the gloomy grandeurs we had just escaped from. On account of the proximity of the Afghans we had resolved to move forward, massed together, with the baggage in the centre. While our soldiers were making the necessary arrangements I took the opportunity of taking a peep at the kishlag and the surrounding country through my field-glasses. The kishlags of the Shugnanis generally consist of a collection of a few homesteads with fields, but not grouped close together. Each family generally consists of the father, mother, and married brothers. The "saklyas" (huts) of the Tajiks are made of stones, held together with clay, and look like so many rude cowsheds. These huts often have no windows, and the doors are always made very small, several boards being roughly nailed together. Light enters through a quadrangular opening in the ceiling, which can be shut by a shield; and this opening at the same time serves as an outlet for smoke. The fireplace, "ruùz," is built against one of the walls of the hut, and the sanitary arrangements are very imperfect. As there are no windows, the huts of the Tajiks are very dark, damp, and foul. Of furniture there is hardly any, and its absence is badly compensated for by wide shelves along the walls. On these shelves the inmates sit, sleep, dine, etc. The majority of Tajiks' dwellings are

BRITISH LIBRARY

very unattractive, although one meets here and there an exception—as, for instance, that of Azis-Khan, of which the woodwork is decorated with clumsy though quaint carvings, and the walls are evenly plastered, with niches for utensils, clothes, etc. The stables, cowhouses, farmyards, barns for seeds, cellars, etc., generally adjoin the huts. We could not help especially noticing the very curious buildings called "topkhana." These are old quadrangular towers in which the inhabitants of the kishlags used to hide from the attacks of the enemy till relief came, or till the enemy got tired of waiting, or else starved them out. One often notices these "topkhanas" along the Shakh-Dara and Gund rivers. In one place on the latter there is a strong fortress, Chartym, consisting of seven such towers. The topkhanas were built generally on sites selected in the least accessible places. Of course, there was no artillery in those days, and the towers therefore generally answered their purpose very well. An entrance could only be effected through a small opening, made in the wall at such a height above the earth that a ladder had to be used. The defenders were at the top, and could fire at the enemy through embrasures.

At 8 a.m. we started. After leaving kishlag Sendip the road descends abruptly to the banks of the Shakh-Dara, and crosses an immense tugai over rather marshy soil. The trees grow so thickly here that at some places we rode through long vaults of green formed by the interlacing branches. The tugai ends just opposite the kishlag Denkent, and the road then gets bad on account of the small pointed stones with which it is strewn.

A little after one, after passing the kishlag Bar-vo-oz, we approached the kishlag Vez-dara, where it was resolved to put up for the night. As it was still early, we determined to leave the baggage train and the foot soldiers with directions for them to halt near Vez-dara, while we ourselves would go a little further on and have a look at the fortress Rosh-kala. We had been informed by the Tajiks that an Afghan detachment of about 120 to 150 foot soldiers and a few cavalry were stationed here; hence our curiosity. We only got a sight of Rosh-kala at 4 p.m. from a topkhana, after a wearisome ascent, of which we had not dreamt, having been told that the fortress was "not far."

While we were passing the topkhana we heard the ringing notes of a trumpet from the fortress, sounding quick notes resembling our cavalry signals. This was followed first by a single volley, and then an irregular fusillade from the opposite side of the Shakh-Dara. The significant "ping" of bullets splintering the rocks and stones in our path made us aware of the fact that we were the objects of these little attentions from the Afghans; but it is somewhat incomprehensible that, notwithstanding the short distance and the large target we offered, not one of us was hurt. As we had the strictest orders to refrain from using our arms, we resolved to return. We were joined by our foot soldiers at the bottom of the descent. They had been hastening towards us on hearing the shooting from Vez-Dara, thinking we had fallen into some ambuscade. On the night of July 28, our prospects of bringing our reconnaissance to a successful issue were not brilliant. We were no more than 5 or 6 miles distant from an enemy, numbering five times our men; and of what their sentiments were toward us we had just had proofs. The Pamirsky Post, from which we could obtain reinforcements, was about 180 miles distant, besides which the country was strange to us. We heard all sorts of contradictory rumours as to the Afghans; and lastly, we had not even the means for effectively defending our bivouac in case of attack, as we could only muster twelve foot soldiers and twenty cossacks. However, we did our best, and arranged officers' guard, stationed our outlook posts and despatched cossack patrols, and also parties of Tajiks to reconnoitre. The Tajiks willingly offered their

BRITISH LIBRARY

services, which we were glad to accept. The night passed anxiously for all of us. When day broke we set about doing what we could to fortify our position, and to get reliable information as to the intentions of the Afghans. How serious our position really was, may be judged from the fact that, two days afterwards, the Afghans came to within a mile from us, and several times fired at us.

With July 28 began a series of wearisome days and nights, when we expected an attack at any moment. We had meanwhile received some reinforcements, which put us on a more business-like footing, and enabled us to organize a more satisfactory defence of the camp; but, nevertheless, we were not able to breathe freely until August 13, *i.e.* seventeen days later, when General Yonov arrived with a fresh detachment of infantry and cossacks.

On the following day, early in the morning, the Afghans, having learnt of the arrival of our reinforcements, hastily retreated first to Rosh-kala, and then further back to the left side of the Panj to the fortress Kala-i-Bar-Panja. As they had destroyed in transit the bridge over the Shakh-Dara at Rosh-kala, and the full state of the river rendered fording impossible, our detachment could only move on to rejoin the Gund river reconnoitring party on August 20, by which date the bridge had been roughly repaired by the Tajiks. We were now penetrating into a country more and more under cultivation, but many of the fields had been either burnt or trodden down by the Afghans, to revenge themselves on the proprietors for going over to the Russians.

The fortress Rosh-kala, near which the detachment crossed to the right side of the Shakh-Dara, stands on a steep cliff. The south part of the cliff, which faces the river, rises to 1500 and even 2000 feet above the surrounding country. From this side Rosh-kala is quite inaccessible, but from the east and west sides it is, though with great difficulty, accessible. The north side faces the mountains on the right bank of the river, and is the weakest; but the fortress walls, made of stone, mount here to a great height. This cliff was the scene of the execution of the last independent ruler of Shakh-Dara, Mir Atam Bek, and his numerous followers, who fought for their independence against the Shugnan ruler, Abdurhaim Khan. By order of the latter these unfortunate men were precipitated from the height of the cliff and dashed to pieces on the stones lying at the cliff's base. Rosh-kala has many shelters erected for men and horses. Having taken advantage of these, the Afghans had ensconced themselves to their own comfort and convenience, and we had many bitter regrets for not having arrived before them. An immense vista of surrounding country can be seen from this cliff, and the kishlags, picturesquely scattered on both sides of the Shakh-Dara, viewed from the great eminence, look like small toys.

The nearer we approached the mouth of the Shakh-Dara, the denser grew the population, and the more comfortable the roads. The two rivers, Shakh-Dara and Gund, on joining, form the river Kharokh, which runs its course of about 3 to 4 miles, and then joins the river Wakhan Daria, thus forming the river Panj. The valley of the Kharokh is cultivated in sections belonging to different proprietors, who separate their lands from each other by small stone walls.

To get over to the right side of the Kharokh one has to cross the Gund by a bridge situated a few thousand yards from the place where the Gund joins the Shakh-Dara.

Having joined the Gund reconnoitring expedition here, the whole detachment took up its position in several gardens 2 or 3 miles from the mouth of the Kharokh, and remained here until September 15, waiting for further orders. The interval was spent in reconnoitring the country, also the roads down the Panj to Roshan, and to the locally celebrated ruby-mines; and also in studying the Tajiks,

BRITISH LIBRARY

their ways of life, and the numbers of the population in Shugnan, etc. The position we occupied in the valley of the Kharokh offered many conveniences, and if at some future time we should have to maintain a garrison in Shugnan, and to erect a fortified position there, this place should undoubtedly be chosen.

About 3 miles lower down the Panj, on the left bank of this river, stands the fortress Kala-i-Bar-Panja, the capital of Shugnan, which is also known as Ak-kurgan on account of the white (*ak*) cliff on which the fortress walls stand. These walls, as also the greater part of the interior of the fortress, can be easily seen from the right side of the river, as they stand within rifle-shot of the mountains. This latter fact nullifies the importance of Kala-i-Bar-Panja as a strategic position.

On the right (Russian) side of the Panj are about fourteen kishlags. The whole country is rather densely populated, and the inhabitants are fairly well-to-do. The climate is so mild that even vines grow here, and are cultivated by the Tajiks. A nearer acquaintance with the Tajiks, and the study of their customs and manners, forces us to sympathize with this persecuted nation, which has gone through so many trials. Indeed, it is a wonder how it is they have not disappeared from the face of the earth. In far-off times this nation turned their eyes towards the north, to the Russians, and waited patiently for the occasion when they might become subjects of the great white Tsar, and thus free themselves from the persecution of the Afghans. This desire to be under Russian government, which was one of the principal reasons why the Afghans persecuted them, did not weaken as time went on, notwithstanding that their hopes were not soon realized. With the appearance of the Russians on the borders of Shugnan in 1894, it seemed that the end of their miseries had come, but fate has once more mocked their hopes, for, as we could not gain permission to leave even a small garrison to winter in Shugnan, we had to return. This we did *viâ* the Gund valley on September 15, followed by a great number of Tajiks and their families. The latter were forced to migrate in anticipation of revengeful reprisals from the Afghans, which would undoubtedly follow their having extended such a friendly welcome to us.

The general character of the road in the Gund river valley is the same as in the Shakh-Dara river valley, but the river is impassable, and the inhabitants have therefore been obliged to erect bridges in several places. Our detachment soon arrived at the summit of Koi-Tezek and re-entered the inhospitable Pamir, and on September 24 reached again the Pamirsky Post from which it had started.

THE MONTHLY RECORD.

EUROPE.

The River System of North Wales.—An attempt has lately been made, in an article contributed by Mr. Philip Lake to the *Geological Magazine* (May and June, 1900), to elucidate the origin of the river system of North Wales, on the lines so successfully followed by Mr. Marr in reference to the English Lake District. The writer begins by a study of Bala lake (sounded by him in 1899) in its relation to the neighbouring valleys, showing that the discharge of the lake into the Dee is not what the general topography of the district would lead us to expect. The lake lies, in fact, not in the valley of the upper Dee, but in the well-defined valley which runs north-east from Barmouth to the town of Bala, and is shut off from the vale of Edeyrnion (the Dee valley between Llandderfel and Corwen) by a ridge of hills traversed by the gorge in which the Dee now flows. That the drainage of the district once flowed continuously from north-east to south-west, past the site

BRITISH LIBRARY

of Bala lake, into the valley of the Wnion, is indicated also by the apparent slope of the lake-floor in that direction, and by the existence of an extensive alluvial plain at the present foot of the lake, even larger than that now being formed at its head. Mr. Lake shows that in the direction of the Wnion valley there is no evidence that the lake is rock-bound, but that the old channel was probably blocked by drift, the reversal of the drainage being due, however, in part, to Earth-movements. The lake and valley adjoining it to the south-west lie in a trough between faults, which seem to have played an unusually important part in the production of the present topography, the present low watershed across the valley corresponding in position with other, oblique, faults. Passing to the consideration of the general drainage system of North Wales, the writer draws attention to the important series of deep valleys running for long distances from north-east to south-west, although interrupted, in certain cases, by low watersheds. The most marked of these lie on a straight line running from Ogwen lake to the head of the Wnion valley, and their position is probably due to Earth-movements. The valleys referred to cut up the whole country into parallel strips drained (generally southwards) into those valleys by another system of streams, the units of which can frequently be traced from one strip to the next, and which appear to represent a former drainage system, radial in character, having its centre near the sources of the Conway. This system—very similar to that now in existence in the Lake District—seems to have been subsequently modified by the formation of the present transverse valleys, in one of which Bala lake was formed.

Influence of Latitude on Plant-life in Germany.—Prof. Ihne, of Darmstadt, who has paid much attention to the phenomena of plant-growth as influenced by locality, and has superintended a careful series of observations in Germany for the purpose of elucidating the question, sets forth, in the seventh number of the *Geographische Zeitschrift*, the results obtained as regards the influence of latitude on the dates at which spring is announced by the bursting into flower of various typical trees and shrubs. By the method adopted, which is described at the outset of the paper, the first appearance of the leaf (though recorded in the observations) has not been taken into consideration, owing to the greater difficulty of obtaining a trustworty record of this than of the dates of flowering, while, given careful observation, the results arrived at may be taken to be the same. Mathematical accuracy is, of course, not to be expected, and the results as a whole are not invalidated by the impossibility of selecting stations at which observations for a sufficient number of years have been carried out, and where other factors besides latitude—longitude, altitude, exposure, soil, etc.—are the same. In his present investigation, Prof. Ihne has chosen localities differing as little as possible in these respects. All lie more or less in a line from north to south, the average difference of longitude being only 46 kilometres (28½ miles); and from his previous researches into the influence of longitude on the phenomena in question, which showed that for stations of moderate elevation in Central Europe, the advent of spring is retarded by 0·95 day for every 111 kilometres (60 geographical miles) in an easterly direction, Prof. Ihne shows that such a difference may well be left out of consideration. From the differences observed in the case of eight pairs of stations, which, when reduced to the unit of 1° of latitude (111 kilometres), show intervals of time for that distance varying from 3·4 to 4·6 days, Prof. Ihne arrives at the conclusion that for every additional degree of latitude the advent of spring is retarded by about four days.

BRITISH LIBRARY

important from the point of view of Great Britain is, as is well known, that for a line from Burma, in continuation of the railway already constructing to the Kunlong ferry on the Salwin, through Yunnan to the province of Sechuan, the wealth of which it is hoped to tap by this means. A survey of the proposed route was carried out about eighteen months ago on behalf of a British syndicate—"The Yunnan Company"—by Captain Davies and Lieut. Watts-Jones, working from the side of Burma, and Captain E. C. Pottinger starting from the Yangtse river. An account of his survey was given by the latter officer in February last at the Royal Artillery Institute, in the *Proceedings* of which body (April, 1900) a report of the lecture appears. Captain Pottinger was assisted in the work by Lieut. Hunter, R.E., and, until his death at Chungking from inflammation of the lungs, by Mr. L. Tucker, son of General Tucker, now in South Africa. Two native Indian surveyors also accompanied his party. During the voyage up the Yangtse, Captain Pottinger executed a survey of the rapids, while the surveyors landed frequently and sketched in as much as possible of the adjacent country. The serious work of the expedition began, however, only after arrival at Chungking, when it became necessary to decide on the line to be surveyed from the Yangtse to Yunnan-fu. The intervening country is exceedingly difficult, and the general consensus of opinion has hitherto been that it would be quite impassable for a railway. By the principal trade routes, the shorter of which reaches the river at Sui-fu, this seems to be the case, and even the telegraph route which starts from Lu-chao presents great difficulties, rising abruptly from 1000 to 5000 feet, falling to 2000, and again ascending to 8000. Tunnelling is out of the question, as what appear to be mountains are in reality the escarpments of tablelands, while the rivers often run in corkscrew gorges, with a drop, in places, of 500 feet in half a mile. However, by leaving the main road and exploring the adjacent country (of which existing maps are in places 40 miles out), Captain Pottinger at last found what he considers a practicable route. A tributary of the Yangtse was followed up as far as Yung-ning, beyond which the whole country begins to rise rapidly, the formation changing from sandstone to limestone, with coal outcrops all over the hills. The country becomes very irregular and broken, rivers and streams flowing in deep limestone gorges, disappearing underground and again emerging in the most confusing manner. There are many blind valleys and hollows, the drainage water escaping underground, and even from hill summits it was often impossible to estimate accurately the run of the rivers and ranges. Captain Pottinger was much struck by the absence of timber, every tree and shrub having been destroyed for firewood, so that stalks of poppies, sedges, etc., are now dried and used for that purpose. The people are, however, beginning to appreciate the advantages of coal. Bamboos are grown in the villages and used for all building purposes. In the mountains some of the Miao-tzu aborigines were met with, the women still retaining their tribal costume, though the men wear Chinese dress and are rapidly losing their original characteristics. The Burma party was finally met at Weining, and the main object of the expedition was completed. Captain Davies returned *viâ* Tongking, while Captain Pottinger and Lieut. Hunter worked their way back to the Yangtse by different routes, surveying as large a tract of country as possible. During the four months spent in the hills there had been hardly twenty days without rain.

Himalayan Ascents.*—In their recently published volume, Dr. and Mrs. Workman give a personal narrative of two summers' travel among the peaks,

* 'In the Ice World of the Himalaya.' By Fanny Bullock Workman and William Hunter Workman. London: Fisher Unwin. 1900.

مكتبة قطر الوطنية
Qatar National Library

passes, and glaciers of the Western Himalayas, with a brief account of an abortive autumn expedition into Sikkim. In the first season, 1898, the travellers cycled to Srinagar, which they made their starting-point for a tour among the mountains of Ladakh, Nubra, and Suru. In 1899 they adopted a more ambitious programme, securing the services of the well-known guide, Mattia Zurbriggen, and accomplishing some pioneer ascents in Baltistan, in the vicinity of Askole, near the foot of the Great Biafo glacier. The peaks ascended varied in height from 18,600 to nearly 21,000 feet, and the difficulties encountered taxed all the energies of the travellers, experienced mountaineers as they were. The authors regard as a complete delusion the idea that, apart from their altitude, the Himalayas are easy mountains to ascend, giving it as their opinion that many of the peaks will never be scaled by any creature without wings. The book makes no pretensions to scientific value, but the views and descriptions give a good idea of the sublime scenery of the snowy Himalaya, while Dr. Workman's remarks on the physiological effects of high altitudes are of some interest. Some additions to and rectifications of the maps were made, especially by the discovery of a large crescent-shaped glacier south and west of Mango Guzor, the highest of the peaks ascended. In the absence of native names for the features described, the travellers have given to these names of their own, which are not always felicitous. The appellation Siegfriedhorn, bestowed on one of the peaks ascended, sounds decidedly out of keeping with its surroundings. The explanations of Indian terms given in a short glossary are in several cases inadequate, if not misleading.

The Trade of the Persian Gulf.—The report for 1899, by Lieut.-Colonel Meade, on the trade of the Persian gulf, records an improvement as compared with 1898, though less than had been anticipated, owing to failure of rain towards the end of the season. This affects the export of cereals, on which the trade of the region largely depends, and which will have assumed larger proportions during the present year, as an abnormal harvest was expected. At most of the Persian gulf ports India heads the list, both of imports and exports, while, except at Bushire, the direct trade with the United Kingdom is but small. Apart from local trade, the only other countries having any large dealings with the Persian gulf are China, which takes opium from Bushire to the value of £285,000; and Turkey, whose trade is principally carried on with Bahrain. From that port pearls were exported in 1899 to the value of £454,900, as compared with £299,500 in 1898; and from the Arab coast ports to the value of £516,600, as compared with £343,700 in the former year. As regards shipping, Great Britain still practically holds the monopoly in the gulf, that of all other European nations being quite insignificant. Turkish shipping is represented principally at Bahrain and Bushire, while the trade between the Arab coast and Persian ports (principally Lingah) is chiefly carried on by Persian vessels. The rest of the local trade is mainly in the hands of Arab and Muskati owners. The report of the Vice-Consul at Mohammerah announces the re-opening of the direct trade-route from the Karun to the north of Persia, and also the completion of the new Ahwaz-Ispahan mule road, so that an increase of trade by the Karun—which in 1899 showed a falling off—may now be expected.

Map of Afghanistan: Correction.—In the map of Afghanistan and Baluchistan published in the November number of the *Journal*, the Russian railway from Merv to the Afghan frontier is made to terminate at the Jamshidi capital Kushk. This is an error. It terminates at the Russian station of Kushk, which is on the river of that name, at (or near) the point where the river intersects the Russo-Afghan boundary. The two places are quite distinct, and it is unfortunate that they should be called by the same name, although doubtless the Jamshidi Kushk has long been overshadowed by the Russian settlement.

Cession of Spanish Islands to the United States.—By a convention signed in Washington on November 7, the small islands of Cagayan Sulu and Sibutu off the north of Borneo, which had remained in possession of Spain, are made over to the United States in consideration for the payment of $100,000. The islands formed the last remnant of the Spanish empire in the far East.

The Khotan River.—In Captain Deasy's paper, p. 513, *antea*, the title of the illustration should be the *Sources*, not the *Sands*, of the Khotan river.

AFRICA.

The Blanchet Expedition: Death of the Leader.—The fuller details now received respecting the detention of M. Blanchet and his European companions on the borders of Adrar (*ante*, p. 227) give the affair a somewhat different complexion from that suggested by the first reports. The travellers received throughout the cordial support of the King of Adrar, Moktar uld Aida, who did his utmost to protect them during the disturbances which led to the flight of the French escort. After a virtual captivity of over two months, the steps taken by the French authorities to secure their release proved successful, and the expedition returned to St. Louis at the end of September. We regret to state, however, that M. Blanchet almost immediately (October 6) succumbed to yellow fever contracted during the journey to Dakar. A short preliminary account of the journey, to which we hope to recur shortly, appears in the new number of the *Annales de Géographie*.

The Northern Territories of the Gold Coast.—This name has been given officially to the latest territorial acquisitions in the Gold Coast Protectorate, lying north of Ashanti roughly between 8° and 11° N. lat. A large amount of information on these territories—a *terra incognita* until quite recent years—has been collected by officers of the administration, but little has hitherto been published. The recent issue by the War Office of a report, compiled by Lieut.-Colonel H. P. Northcott, in which the information so collected has been embodied, is therefore particularly welcome. It begins with a clear sketch of the geography of the territories, which lie wholly outside the belt of forest which extends about 200 miles from the coast. They form a gently undulating plateau, gradually rising northward from Kintampo and ending abruptly in a scarp facing north and falling very steeply about 700 feet, through a break in which the White Volta passes in its southward flow. North of the scarp is another plateau of a character similar to the first, but rising frequently into definite hills from 100 to 500 feet in height. The whole area is covered with coarse rank grass, burnt down annually, and dotted over with dwarfed and shadeless trees. The absence of large trees is probably due to the fires, for nearly every village possesses its "shade tree" (baobab, cotton, etc.), where are held the market and village parliament. The main river-system is formed by the Black Volta and White Volta, the former of which has no important affluents, the latter only one—the Kulpawn. These carry running water all the year round, and for four months are noble streams, but at the end of January they shrink to modest dimensions. During the dry season a scarcity of water is experienced in many parts. The basis of the soil is sandstone, covered in the lower levels with a thin layer of alluvium. In the hills granite and quartz are found. The report contains some account of the history of the native kingdoms of the territories, the principal of which is Mamprusi. This seems to have been founded by one Tosogo, who came west from Gurma about the beginning of the century, and conquered, besides, Moshi and Dagomba, which he placed under his brother and nephew respectively. Until recent years, a yearly present was made to the king of Mamprusi by the king of Moshi, whose election had also to be confirmed by the former. The lesser states of Wa, Bole, and Daboya seem to

BRITISH LIBRARY

have formed parts of the former kingdom of Yabum. The main trade of the region consists in the exchange of the cattle and sheep of the north for the kola-nuts of the south. There is some demand for European articles, and satisfactory results have followed from the establishment of Government stores at Wa and Gambaga, at which all payments are made in British currency. In the rainy season the White Volta would probably be navigable throughout the great part of its course by stern-wheel steamers, there being apparently only two sets of rapids forming a bar to navigation. The most important link in the chain of communication from the coast will be the proposed railway from Accra to Pong on the Volta, but motor cars, for which 70 miles of suitable road already exists, might prove of much value as a means of transport. Experimental gardens are needed to test the capability of the country to produce paying crops. The climate is appreciably better than on the coast, for though the heat is great in March, April, and May, the air is free from the oppressive moisture of the more southern districts. The report includes extensive vocabularies of the principal languages of the country. The map, which is based principally on the valuable work of the late Mr. Ferguson, shows the administrative subdivisions of the territory.

Organization of French Congo.—By a decree dated September 5 last, the northern territories of French Congo have been formed into an administrative province entitled "Territoire militaire des Pays et Protectorats du Tchad." This includes, firstly, the basin of the Kemo, a tributary of the Ubangi; and, secondly, the basin of the Shari and its affluents (excluding concessions already made), as well as the countries included within the French sphere by the Anglo-French conventions of 1898 and 1899, *i.e.* Bagirmi, Wadai, and Kanem. All these territories are placed under a commissioner, subordinate to the commissioner-general of French Congo. The latter functionary has under his immediate control all the territory of French Congo not included in the new province.

The Lemaire Expedition.—Captain Lemaire, leader of the Belgian Scientific Expedition to the Southern Congo basin, which left the mouth of the Zambezi in 1898, arrived on September 3 last at the mouth of the Congo, having effected the twenty-third crossing of Africa hitherto made in a little over two years. Some additional details respecting the geographical work done along the Congo-Zambezi watershed, with a map showing the routes followed, are given in the *Movement Géographique* for October 21 and 28. Captain Lemaire's Expedition from Lofoi, on the Lufira, to Lake Dilolo, was commenced on June 28, 1899, and on the return journey the watershed was followed with few intermissions from 22° to 27° E. long. (in part in company with Major Gibbons), being crossed no fewer than twenty-five times. The most important correction introduced into the map as regards the position of the watershed is its shifting to the north by more than a degree between the meridians of $24\frac{1}{2}°$ and $25\frac{1}{2}$ E. As is pointed out by M. Wauters, the stream crossed by Capello and Ivens in $25\frac{1}{2}°$, and taken by them to be the source of the Lualaba, must in reality bend back towards the Zambezi system, which thus receives a considerable northward extension. The sources of the Kapombo (Kabompo) and Lunga (not to be confounded with the Lunga of Capello) were found by Captain Lemaire to lie in about $11\frac{1}{2}°$ S. After the return to Lofoi, the expedition made its way by Mpweto to Lake Tanganyika, which was reached at Baudoinville on April 7 last. During his stay on the shores of the lake, Captain Lemaire took a series of astronomical observations which confirm the results gained by Mr. Fergusson, the surveyor attached to Mr. Moore's expedition. At Towa, the shore of the lake has to be shifted 50 kilometres (over 30 miles) to the west. From Tanganyika the expedition went west to the Congo by the usual route through the Manyuema country, which was found to be completely pacified,

the remainder of the journey to the Congo mouth being made by canoe, steamer, and railway. In addition to the careful surveys, the results of the expedition are of much value as regards meteorology, zoology, and botany.

AMERICA.

Currents in the Gulf of St. Lawrence.—The *régime* of the currents in the Gulf of St. Lawrence, as elucidated by surveys carried out during the years 1894 to 1896, is fully dealt with in a pamphlet published this year at Ottawa by order of the Minister of Marine and Fisheries. In the first half a description is given of the surface currents themselves, whether constant currents which run more or less continuously, in accordance with the general circulation of the water in the gulf area, or tidal currents produced or chiefly influenced by the tide. The second part treats of the causes which influence the currents in moving as they are found to do. The most important of the constant currents—one at the mouth of the St. Lawrence along the Gaspé coast, the other round Cape North on the west side of Cabot strait—are due to a general outward drift of the water of lower density, apparently derived from the outflow of the St. Lawrence river, which occupies the south-western half of the gulf. The Gaspé current usually occupies a belt of about 12 miles in width, lying from 2 to 14 miles off shore, in the vicinity of Fame point; but in certain cases it may be displaced or even reversed under the influence of abnormal winds. The Cape Breton current, on the west side of Cabot strait, flows almost constantly outwards to the south-east, while on the eastern side of the strait off Cape Ray there is usually a movement of the water to the north-west or inwards towards the gulf. On the west coast of Newfoundland there is an important current to the north-east, which is especially marked from the Bay of Islands to Rich point. In the strait of Belle Isle the current is essentially tidal in character, and there is no foundation for the belief that a constant current runs inwards towards the Gulf of St. Lawrence. At all three angles of the gulf the coldest water forms a layer between the depths of 30 and 50 fathoms, and this cold layer seems to extend very generally over the gulf area. Both this and the deeper water seem, however, to be quiescent. As regards surface density, the denser water, practically the same as that of the open Atlantic (1·0237 to 1·0242), occupies the north-eastern portion of the gulf, the dividing line running from Anticosti to the middle of Cabot strait. South-west of this line the density falls to 1·0220, and in the Gaspé current to 1·0210. In the deep layers it rises even here to 1·0261, which explains the fact that the colder water at 50 fathoms floats upon these. In tracing the general circulation of the gulf, the principle of the balance of flow must be kept in view. There is no confirmation to be found for the theory that a constant current enters the gulf by Belle Isle strait and leaves by Cabot strait. On the contrary, the total volume of water which leaves the gulf by the latter—vastly greater than the volume of fresh water received from the St. Lawrence, though this may be sufficient to dilute the water to the low observed density—is replaced principally by water which enters from the ocean at the same strait, in continuation of the general westward drift along the south coast of Newfoundland. The whole of such movements probably occur within a depth of 50 or 60 fathoms.

Influence of Wind on the Level of Lake Erie.—A recent number of the U.S. *Monthly Weather Review* (May, 1900) contains an interesting note by Prof. A. J. Henry on the fluctuations of level in Lake Erie brought about by the winds. In connection with the survey of the great lakes carried out by the Engineer Corps of the United States army, a continuous record of such fluctuations through a number of months has been kept, and as an equally full record of wind phenomena,

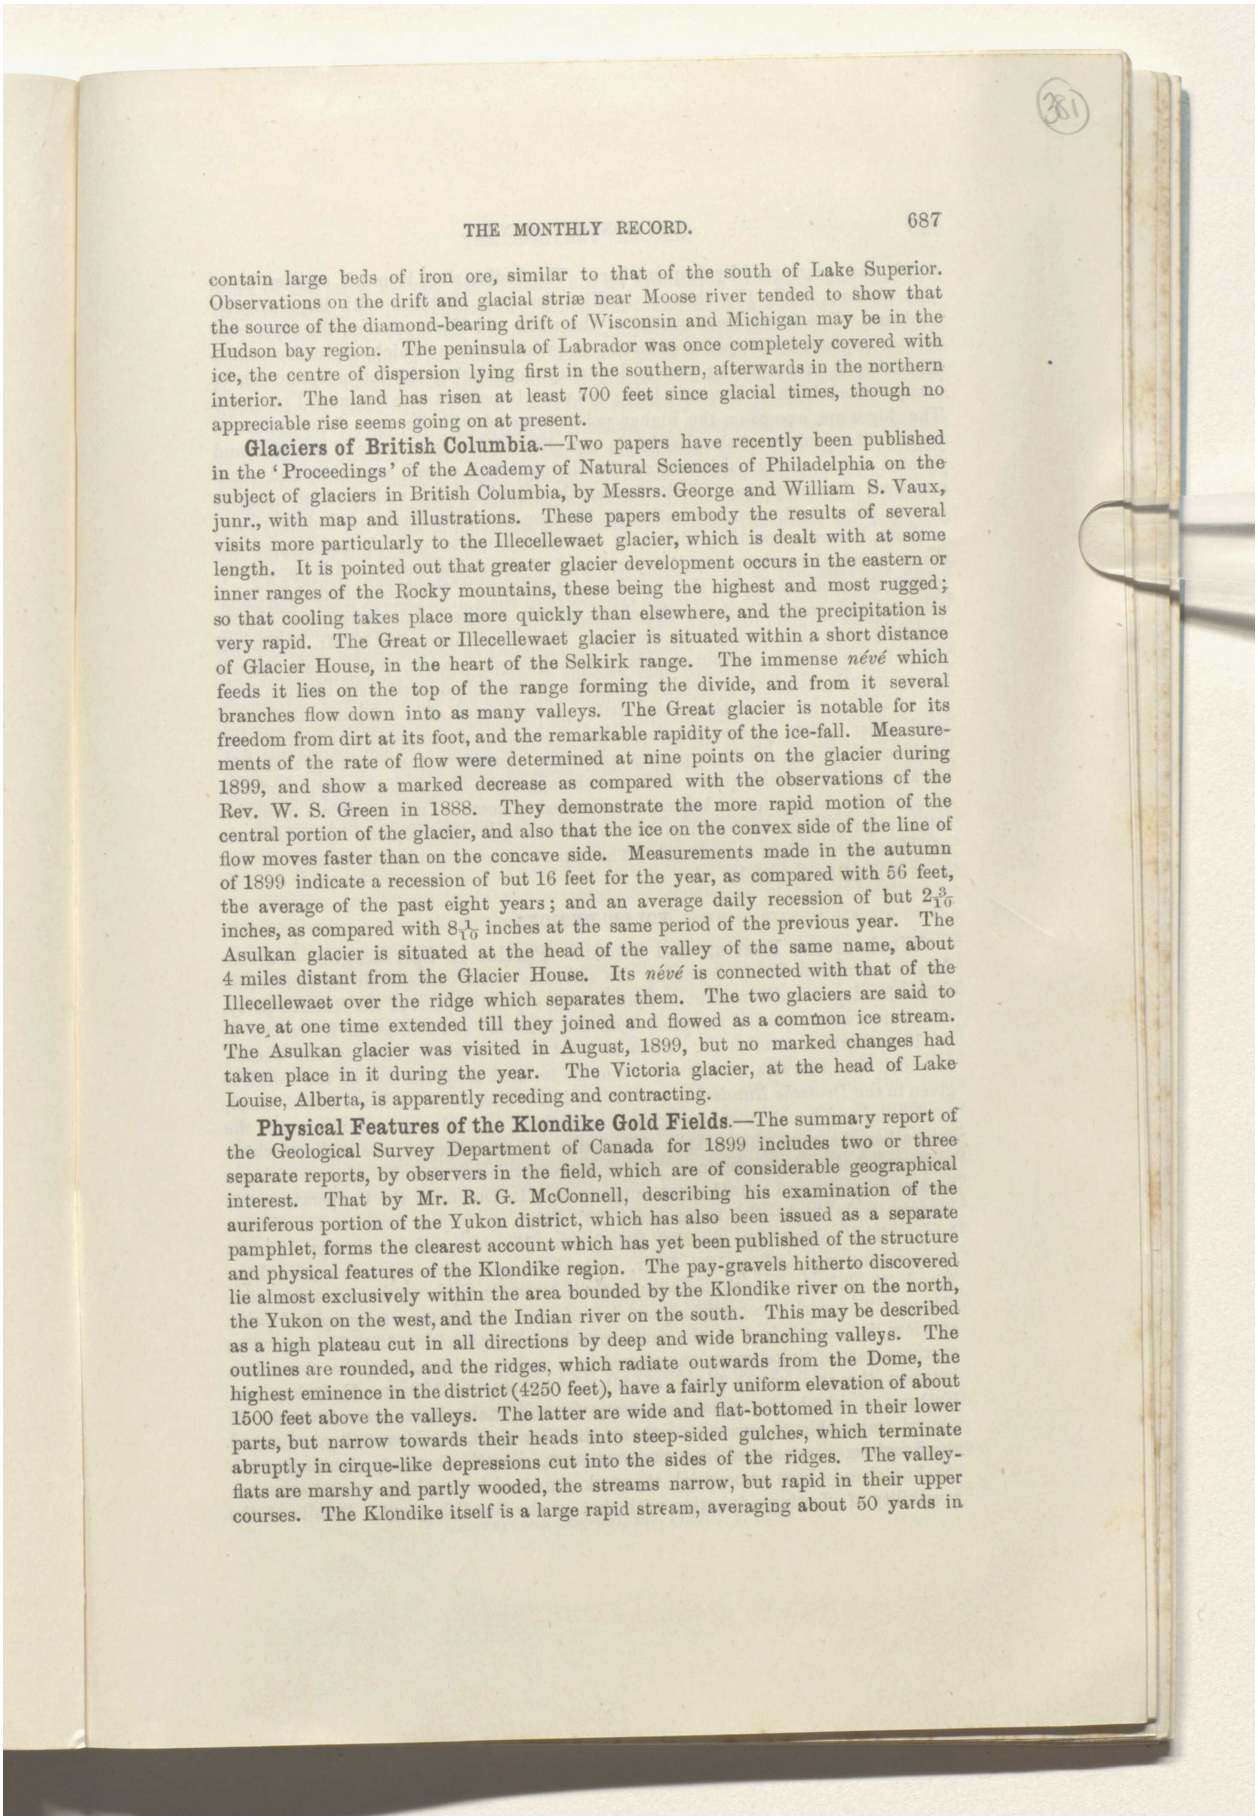
BRITISH LIBRARY



made at the Weather Bureau Offices at Detroit and Buffalo, is available, it is now possible to study the connection which exists between the two sets of facts. It has been known for some years that winds blowing parallel to the axis of the lake tend to heap up the water at the end towards which they blow, and to depress it at the opposite end, the heaping up of the waters in Buffalo harbour being at times a serious menace to wharf and dock property. The effect of the wind on the lake is well shown by the records kept during a storm moving north-east from the Mississippi valley. At Amherstburg the water first rose, then fell and rose again, while converse oscillations were recorded at Buffalo. The fall at the latter and rise at the former are due to the north-easterly winds in front of the advancing storm, while a second oscillation contrary to the first is caused by the shift of wind to a westerly quarter as the storm centre advances along the lake. The amplitude of the oscillations may reach an extreme value of 6 or 7 feet. In the case of a storm passing due east across the lake, with resulting north-west winds, the oscillation was rather transverse than longitudinal. Prof. Henry thinks we may conclude that the oscillations are stationary rather than progressive, no wave of water being propagated, but the whole lake oscillating about a nodal line, at which the fluctuations are zero.

Mr. A. P. Low's Explorations in Labrador.—In the *Journal* for 1899 (vol. xiii. p. 434), reference was made to Mr. A. P. Low's explorations, down to December, 1898, on the east coast of Hudson bay. During the following spring and summer, Mr. Low and his assistant, Mr. Young, who had wintered at Great Whale river, continued their work, both on the coast and in the northern interior of the Labrador peninsula, considerable additions to our knowledge of both being made. A sketch of the results appears in the summary report of the Canadian Geological Survey for 1899. On February 23, Mr. Low started northward, travelling over very rough ice, and meeting many parties of Eskimo on their way to the Hudson bay post. The northern tree limit on the coast was found to be just north of Richmond gulf. On March 2 the coast was left about 10 miles north of the Nastapoka river, the country rising rapidly to about 700 feet. A number of small lakes are surrounded by bare rocky hills, this barren region extending inland about 30 miles, beyond which the valleys contain some soil, supporting clumps of spruce and larch. After crossing the watershed between Hudson and Ongava bays, Mr. Low descended to Tasiagaluk, or Eskimo Seal lake, said to be over 100 miles long, though nowhere more than 15 miles across. It has several narrow bays, all, like the main body, with an east-and-west trend, and at its eastern end gradually narrows into the Leaf river, which is navigable by native umiaks down to Ungava bay. The surrounding country is comparatively flat, with low ridges of rocky hills. Failing to meet with caribou, Mr. Low was forced to return, and on April 3 started with Mr. Young and three others up Great Whale river. Progress was much hampered owing to the exceptionally mild and rainy weather, but the north branch of the river was surveyed to within a few miles of a large lake, which discharges both by this river and by the Little Whale river. The Abchigamich branch, which was surveyed for 15 miles, comes from the north-east, while the main branch makes a circuit from the south and west, its upper course being only 20 miles from the coast. After again returning to the coast, the explorers made ready their yacht for the summer's use, and in it surveyed the coast from Richmond gulf to Rupert river, near the south end of James bay. Summarizing the geological and other results, Mr. Low says crystalline schists, gneisses, and granite occupy the greater part of the area examined, and that a band of unaltered rocks belonging to the so-called Cambrian of Labrador occupies most of the coast and islands from Portland promontory to Cape Jones. At Nastapoka islands they

BRITISH LIBRARY

contain large beds of iron ore, similar to that of the south of Lake Superior. Observations on the drift and glacial striæ near Moose river tended to show that the source of the diamond-bearing drift of Wisconsin and Michigan may be in the Hudson bay region. The peninsula of Labrador was once completely covered with ice, the centre of dispersion lying first in the southern, afterwards in the northern interior. The land has risen at least 700 feet since glacial times, though no appreciable rise seems going on at present.

Glaciers of British Columbia.—Two papers have recently been published in the 'Proceedings' of the Academy of Natural Sciences of Philadelphia on the subject of glaciers in British Columbia, by Messrs. George and William S. Vaux, junr., with map and illustrations. These papers embody the results of several visits more particularly to the Illecellewaet glacier, which is dealt with at some length. It is pointed out that greater glacier development occurs in the eastern or inner ranges of the Rocky mountains, these being the highest and most rugged; so that cooling takes place more quickly than elsewhere, and the precipitation is very rapid. The Great or Illecellewaet glacier is situated within a short distance of Glacier House, in the heart of the Selkirk range. The immense *névé* which feeds it lies on the top of the range forming the divide, and from it several branches flow down into as many valleys. The Great glacier is notable for its freedom from dirt at its foot, and the remarkable rapidity of the ice-fall. Measurements of the rate of flow were determined at nine points on the glacier during 1899, and show a marked decrease as compared with the observations of the Rev. W. S. Green in 1888. They demonstrate the more rapid motion of the central portion of the glacier, and also that the ice on the convex side of the line of flow moves faster than on the concave side. Measurements made in the autumn of 1899 indicate a recession of but 16 feet for the year, as compared with 56 feet, the average of the past eight years; and an average daily recession of but $2\frac{3}{10}$ inches, as compared with $8\frac{1}{10}$ inches at the same period of the previous year. The Asulkan glacier is situated at the head of the valley of the same name, about 4 miles distant from the Glacier House. Its *névé* is connected with that of the Illecellewaet over the ridge which separates them. The two glaciers are said to have at one time extended till they joined and flowed as a common ice stream. The Asulkan glacier was visited in August, 1899, but no marked changes had taken place in it during the year. The Victoria glacier, at the head of Lake Louise, Alberta, is apparently receding and contracting.

Physical Features of the Klondike Gold Fields.—The summary report of the Geological Survey Department of Canada for 1899 includes two or three separate reports, by observers in the field, which are of considerable geographical interest. That by Mr. R. G. McConnell, describing his examination of the auriferous portion of the Yukon district, which has also been issued as a separate pamphlet, forms the clearest account which has yet been published of the structure and physical features of the Klondike region. The pay-gravels hitherto discovered lie almost exclusively within the area bounded by the Klondike river on the north, the Yukon on the west, and the Indian river on the south. This may be described as a high plateau cut in all directions by deep and wide branching valleys. The outlines are rounded, and the ridges, which radiate outwards from the Dome, the highest eminence in the district (4250 feet), have a fairly uniform elevation of about 1500 feet above the valleys. The latter are wide and flat-bottomed in their lower parts, but narrow towards their heads into steep-sided gulches, which terminate abruptly in cirque-like depressions cut into the sides of the ridges. The valley-flats are marshy and partly wooded, the streams narrow, but rapid in their upper courses. The Klondike itself is a large rapid stream, averaging about 50 yards in

BRITISH LIBRARY

width, and interrupted by frequent bars. The Indian river is much smaller, being very shallow, while the channel is filled for long stretches with large angular boulders. The forest trees consist of the white and black spruces, the aspen and balsam poplars, and a species of birch; the white spruce (which, especially on the Klondike, is of surprising size and quality, considering the latitude, and can be easily floated down to Dawson) being the most important tree for general purposes. The ridges are, except on the higher points, covered with an open forest of small trees. The geology of the district is complicated, but four series of stratified and foliated rocks, mostly palæozoic, can be distinguished, as well as granite and other eruptives of tertiary age. Of the former, the Klondike river series, which occupies a zone from north-west to south-east between the Klondike and Indian rivers, without, however, touching either, is the most important, as it constitutes the country rock along the productive portion of all the richer creeks, and is apparently genetically connected with the occurrence of the gold. The rocks are mainly light-coloured and greenish micaceous schists, greatly crushed and altered, and almost certainly derived originally from eruptives. The gravels are classed by Mr. McConnell under four heads, viz., stream gravels (present); terrace gravels, river gravels, and old valley gravels, the last-named including the remarkable deposit, very uniform from top to bottom, known as the quartz drift. It is formed of a compact mixture of small clear quartz grains, minute scales of sericite, and rounded or wedge-shaped boulders of quartz. Gold in paying quantities occurs in the stream gravels, the terrace gravels, and the quartz drift, and the aggregate length of the paying portion of the creeks, as at present known, is estimated at some 50 miles, while a moderate estimate of the gold included gives a value of about £19,000,000. Other sources will, however, in time be utilized. The report is accompanied by a map on the scale of 2 miles to 1 inch.

POLAR REGIONS.

Work of the Russian and Swedish Parties in Spitsbergen.—Further details are now to hand respecting the scientific work carried out in connection with the degree measurement in Spitsbergen, especially that of the Russian party, which met with a cordial reception from the Academy of Sciences on its return to St. Petersburg on October 21. Some account of the operations during the winter, in which the observers were for nine months isolated from the rest of the world, is given in the *Deutsche Rundschau* (vol. 23, p. 45). Their work included astronomical, pendulum, and hourly meteorological observations, as well as a careful study of the aurora borealis, with photographs of the same and of its spectra, the latter of which had never before been obtained. After November, snow-storms of great violence became frequent and caused much annoyance. In December the temperature was comparatively high—the mean being 23° Fahr., or higher than at St. Petersburg. The coldest day (−25·6 Fahr.) was March 4, while on April 13 the temperature was still −18·4 Fahr. Geodetic operations were commenced on March 31, and were continued with great activity in spite of unfavourable conditions. The work accomplished, which is of much value from a geographical point of view, is summarized in the tenth number of *Petermanns Mitteilungen*. The southern part of Spitsbergen was crossed in a variety of directions, the connection between the two coasts being established by way of Mounts Hedgehog and Keibau, on which the signals necessary for the triangulation were erected. It proved impossible to proceed north up the Stor fjord, but Mount Chydenius and the Svenberg were reached from the west coast, and the necessary signals erected. As has already been announced, the work remained incomplete, owing to the impossibility of effecting a junction with that of the Swedish party. Details of the

BRITISH LIBRARY

work of the latter are not yet to hand, but an interesting discovery was that of a mountain south of Treurenberg bay, which was found to have a height of 5580 feet, or 1180 feet higher than the Hornsundstind, hitherto supposed to be the highest summit in the whole of Spitsbergen. The new peak is said (*Globus*, vol. 78, p. 183) to belong to a range which appears to be connected with Mount Chydenius. Other unexpectedly great heights were found in the vicinity of Wijde bay.

Russian Expedition to Novaya Zemlya.—An expedition to the east coast of Novaya Zemlya has been undertaken by the Russian Lieut. Borissoff, who, after preparing winter quarters, passed through Matushkin strait into the Kara sea on August 13, for the purpose of establishing depôts of provisions for a sledge journey next spring. He hopes to make his way northwards along the coast, and complete the survey of the islands.

The Stein Arctic Expedition.—This expedition, as to the safety of which fears have been expressed in some quarters, has apparently extricated itself without mishap from its somewhat precarious position. The Austrian member of the party, Dr. Leopold Kann, arrived at Dundee on November 7, on board the whaler *Eclipse*, and from statements made by him it appears that the expedition has been fairly successful, having during the past summer made numerous excursions leading to an improved knowledge of Ellesmere Land. Details of Mr. Stein's movements have not transpired, but it appears that he was left by Dr. Kann at Cape York so far back as June 9. Visits seem to have been paid to his winter station, both by Peary and his assistants.

Suggested International Co-operation in Antarctic Research.—M. H. Arctowski repeats in *Ciel et Terre* the arguments which he brought before the British Association meeting at Dover,* as to the importance of wide international co-operation in the study of the atmospheric conditions of the antarctic area during the time when the forthcoming British and German expeditions are in the field. He points out that the laws governing atmospheric and oceanic circulation remain very obscure on account of the want of data from the antarctic area, and he emphasizes the importance of simultaneous and combined effort in obtaining records from a number of points on the margin of the south polar area. In 1902 the two expeditions will be supplemented in their work by the observatories of Melbourne and Cape Town, by the German station on Kerguelen, and by Argentine observers in the South Shetlands and at Staten island. He points out that there is still time to organize further co-operation, and that the need is urgent to investigate fully the meteorology of the stormy region of Cape Horn in particular. He suggests the establishment of a polygon of stations uniting South America and the antarctic lands, the suggested points being Punta Arenas, Staten island, Cape Pillar, one of the Diego Ramirez islands south-west of Cape Horn, the Falkland islands, South Georgia, the South Shetlands, and, finally, one or two stations in the lands discovered by the *Belgica*. He thinks that the Chilean government might be induced to send one or two meteorologists to the lighthouse at Cape Pillar; that France should send observers to Diego Ramirez; and that Russia, where neither men nor means are lacking for such an enterprise, should also co-operate.

MATHEMATICAL AND PHYSICAL GEOGRAPHY.

Currents in Australian Waters and the Southern Ocean.—In the fourth instalment of current-paper statistics, placed before the Royal Society of New South Wales, Mr. H. C. Russell has to record an unusually large list of such papers

* *Geographical Journal*, xiv. (1899), p. 584.

BRITISH LIBRARY

received between September, 1898, and October, 1899. In the absence of north-west winds, which had, during the preceding period, apparently carried the bottles to the south of Australia and New Zealand, current papers had arrived unusually fast on the Australian coasts, two and sometimes even three per day having come in, giving a total during the period in question of 124. As regards the currents in the sea east of Australia, these papers confirm the suggestion previously made by Mr. Russell, that there is first a drift to the east, especially south of Sydney, then northwards until the great current from the east passing south of New Caledonia is reached. This idea is supported also by the drift of the *Perthshire* after she was disabled in the Tasman sea. The steady eastward drift from the vicinity of Cape Horn across the Southern ocean is again exemplified by the track of three papers, which, thrown overboard, one at that cape and two near the Falkland isles, were all picked up either on the west or south coasts of Australia. The current would seem to maintain a very uniform course slightly to the north of east. Bottles thrown overboard in the vicinity of Kerguelen and the Crozets were picked up on the coasts of New Zealand, and though the course followed could not be ascertained, the northward tendency of the current just mentioned would seem to favour the idea that they may have been carried round the great Australian bight before passing through Bass strait or south of Tasmania. The rate of drift seems to have been abnormally high during the period under review, particularly that northwards along the east coast of Australia, which is accounted for by the prevalence of southerly winds during the winter and spring of 1899. The Cape Horn papers, however, show a similar abnormal rate, one showing an average per day of 12·2 miles. The papers were fairly evenly distributed through the year, the relatively small number received during April and September being perhaps accounted for by equinoctial disturbances. The record kept by six ships of the total number of bottles thrown out shows that the proportion of those picked up to the total varies from 1 in 7 to 1 in 48.

Lord Dunraven's 'Navigation.' *—There are already so many excellent works on Navigation, both from a theoretical and practical standpoint, that it may at first appear surprising that Lord Dunraven has thought it advisable to add to the number. Raper, Norie, Inman, and others give a vast amount of information on all matters connected with the subject, together with tables for the necessary computations, whilst Lecky's 'Wrinkles,' and books of a similar character, form most useful supplements to these for the practical man. Still, there is doubtless truth in Lord Dunraven's statement in his preface, that "most writers have treated the subject from the point of view of addressing themselves either to the highly educated or to the totally uneducated," and there is, he thinks, room for a treatise designed to meet the requirements of those who lie between these two extremes. This work does not, therefore, presuppose any great amount of mathematical knowledge on the part of the student, nor is it, on the other hand, written on the assumption that it is sufficient to give a number of rules to be learnt off by heart, without any appeal to the reasoning powers, which has too often been done in the past by writers on this and kindred subjects; but by a series of diagrams, lucid explanations, and clearly expressed investigations of formulæ, Lord Dunraven has succeeded in producing a work that will not only be useful to those who are thinking of going up for the Board of Trade examinations, for whom it should possess a special value, but to all who are interested in practical astronomy and navigation. Unlike Raper,

* 'Self-instruction in the Practice and Theory of Navigation.' By the Earl of Dunraven, Extra Master. In two volumes. London: Macmillan & Co. 1900. *Price* 21*s*.

مكتبة قطر الوطنية
Qatar National Library

Norie, and others, Lord Dunraven does not give tables of logarithms, logarithmic sines, tangents, cosines, etc., and his work cannot therefore be considered as superseding the standard works on the subject, but should be looked upon rather as supplementing them. In the examples given, Norie's tables have been generally used, but for those who are accustomed to the tables in Raper or Inman, a comparative statement is given at the commencement of the first volume. In order to prevent the work from being inconveniently large, it is divided into two volumes. The first contains, amongst other matters, chapters on logarithms and their use, the sailings, a day's work, the use of the compass, charts, and the simpler nautical astronomical problems. The second volume treats of the more advanced astronomical problems, magnetism and deviation, great circle sailing, tides, the law of storms, and the investigation of the formulæ employed. It further contains numerous exercises, together with the data from the Nautical Almanac of 1898 necessary to work them. There will doubtless be found those who are not altogether prepared to agree with Lord Dunraven in all the opinions he expresses, and would recommend different methods of working some of the problems; or perhaps some would, in certain examples, prefer to use other tables than those here employed. It is possible, too, that occasionally somewhat better and clearer diagrams might have been chosen to represent the cases under consideration; but, taken as a whole, Lord Dunraven may be congratulated on having produced a very practical and serviceable work. There is a full table of contents, but no index, which is certainly to be regretted.

GENERAL.

Memento of Captain Cook's Death.—As announced by the President at the opening meeting of the session, an interesting photograph of the club by which Captain Cook met his death at the hands of the Hawaiian savages has been presented to the Society by the present owner of the club. It is accompanied by an autograph letter of Sir Joseph Banks, the former owner of the relic, to whom it was given by Admiral John Hunter, and who in turn presented it to Thomas Legh, of Lyme Park, Cheshire. The latter was a traveller of some note in his day, publishing in 1816 a narrative of his journey in Egypt and beyond the cataracts. He was one of the founders of the Raleigh Club, the direct precursor of the Royal Geographical Society, and, on the formation of the latter, was one of its original Fellows. The donor of the photograph and letter is his daughter and only child, Mrs. Ellen J. Lowther, of Shigley Hall, Cheshire.

CORRESPONDENCE.

The Aurora Australis and Borealis.

80, Crescent Road, Toronto, Canada, October 24, 1900.

In the July number of the *Geographical Journal* I see recorded in a paper by Mr. Arctowski the observations on the auroræ australes made by the *Belgica* expedition in the antarctic. They possess special interest to me, for I have for years been wishing for just such observations. I send a paper of mine 'On the Magnetic Influence of the Sun on the Earth and on Comets,' and draw attention to a paragraph on p. 354, which shows the importance to be attached to auroral records in south polar regions.

Mr. Arctowski says it would be interesting to know if the northern auroræ correspond to the southern in general characteristics and in date, and invites investigations.

مكتبة قطر الوطنية
Qatar National Library

As to "characteristics," I may be permitted to say that the features of an auroral display are often so local that a concordance between those in both hemispheres is scarcely to be looked for. We may have a fine auroral arc here, and you may have only fine streamers in your hemisphere, or a rose aurora here with a crown, and you a pale lot of flashing merry-dancers. We may have a great magnetic disturbance, enough to work the telegraphic circuits by, along 10 or 15 degrees of longitude, but the aurora may be visible at one point only on the parallel. Therefore, I do not look for any similarity in the "characteristics" of an auroral display in the antarctic and the arctic regions, as noted in isolated localities.

But as for general excitement, I do expect a concordance, and Mr. Arçtowski's reports enable this to be established for the season of 1898.

We have two sets of observations which we can compare with his. One is to be found in the Weather Reports of the United States Bureau. The number of

AURORAL CURVES IN THE ANTARCTIC AND IN CANADA.

auroræ seen by the correspondents of that Bureau is published every month. The other is in the *Weather Review*, published in Toronto, which gives not only the numbers of auroræ seen by observers, but also the class of aurora, called first, second, third, and fourth.

Now, in examining both of these records, I find, as expected, a remarkable concordance with Mr. Arçtowski's figures. When I say "figures," I mean his observations as expressed in figures so as to make a curve of frequency and intensity.

The antarctic observations show a number of auroræ in March and in September, 1898, with but few in the intervening months. The same thing is noticeable both in the Washington and in the Toronto observations.

The intervening months show similar slight displays at identical times. And as to the two months mentioned, the data are enclosed in the form of curves, and will enable the reader to make the comparison, and establish the identity in times for himself.

BRITISH LIBRARY

I give to Mr. Arctowski's classes a numerical value for each. It may not be correct, for the relative value of each class may not be accurate, but it cannot be far wrong, and is sufficient for the purpose.

The Washington observations can only be classified in time, *i.e.* by the mere numbers of auroræ seen. The Toronto observations are turned into figures by taking an aurora of the first class as four, one of the second as three, of the third as two, and of the fourth as one.

It may be added that, by the records of the Toronto Magnetic Observatory, the months between March and September, 1898, were very quiet, but on the days of the auroræ in those two months there were severe magnetic storms. It seems certain that if there were a good magnetic observatory in the furthest south accessible, the disturbances would be found to correspond to the day, and possibly to the hour, with those in the northern hemisphere.

ARTHUR HARVEY, F.R.C.S.,
Ex-President of the Canadian Institute and of the Astronomical and Physical Society of Toronto.

Mr. Grogan's Picture of Mount Ruwenzori.

Holland House, New York City, November 11, 1900.

It has been brought to my notice that there is a marked resemblance between the picture of Mount Ruwenzori in my paper (*Geographical Journal*) for August, p. 179, and the photograph in Dr. Stuhlmann's book 'Mit Emin Pasha ins Herz von Africa.' My outline of the mountains was made from the high plateau behind Mboga, when I had a momentary glimpse of the summits through a break in the clouds. On looking through Stuhlmann's book, Mr. McCormick and I noticed that the points of view of Stuhlmann and myself were practically identical, and in the picture Mr. McCormick may have utilized Stuhlmann's photograph for subsidiary detail. This should undoubtedly have been acknowledged, and I trust that Dr. Stuhlmann will attribute the omission to my difficulty in writing and arranging for the publication of the paper and book at a distance from my publisher and artist, due to my having been tied to Gosport by my militia duties. A German critic labours under the delusion that the view of Ruwenzori was taken from the foot-hills of the mass. The view is from the other side of the Semliki valley, where the banana is found to a height of 7000 feet.

EDWARD S. GROGAN.

MEETINGS OF THE ROYAL GEOGRAPHICAL SOCIETY, SESSION 1900-1901.

First Ordinary Meeting, November 12, 1900.—Sir CLEMENTS MARKHAM, K.C.B., President, in the Chair.

ELECTIONS.—*Thomas Inglis Binnie, C.E. Surveyor B.C.A. Protectorate; Lieut. Philip Lansdale, East Lancashire Regiment; Frederick W. Mayers, Imperial Chinese Customs; Montagu Charles Summers.*

The Papers read were:—

"Opening Address." By the President. "An Expedition between Lake Rudolf and the Nile." By Dr. Donaldson Smith.

GEOGRAPHICAL LITERATURE OF THE MONTH.

Additions to the Library.

By HUGH ROBERT MILL, D.Sc., LL.D., *Librarian*, R.G.S.

THE following abbreviations of nouns and the adjectives derived from them are employed to indicate the source of articles from other publications. Geographical names are in each case written in full:—

A. = Academy, Academie, Akademie.
Abh. = Abhandlungen.
Ann. = Annals, Annales, Annalen.
B. = Bulletin, Bollettino, Boletim.
Com. = Commerce.
C. Rd. = Comptes Rendus.
Erdk. = Erdkunde.
G. = Geography, Geographie, Geografia.
Ges. = Gesellschaft.
I. = Institute, Institution.
Iz. = Izvestiya.
J. = Journal.
k. u. k. = kaiserlich und königlich.
M. = Mitteilungen.
Mag. = Magazine.
Mem. = Memoirs, Mémoires.
Met. = Meteorological.
P. = Proceedings.
R. = Royal.
Rev. = Review, Revue.
S. = Society, Société, Selskab.
Sitzb. = Sitzungsbericht.
T. = Transactions.
V. = Verein.
Verh. = Verhandlungen.
W. = Wissenschaft, and compounds.
Z. = Zeitschrift.
Zap. = Zapiski.

On account of the ambiguity of the words *octavo*, *quarto*, etc., the size of books in the list below is denoted by the length and breadth of the cover in inches to the nearest half-inch. The size of the *Journal* is 10 × 6½.

A selection of the works in this list will be noticed elsewhere in the "Journal."

EUROPE.

Alps. **Penck.**

Der Vernagtferner. Von A. Penck. (Separat-Abdruck aus dem Neuen Jahrbuch für Mineralogie, etc. 1898. Bd. ii.) Size 9 × 6, pp. [8]. *Presented by the Author.*

Alps. **Penck.**

Die vierte Eiszeit im Bereiche der Alpen. Vortrag, gehalten den 14 December 1898 von Albrecht Penck. (Vorträge des Vereines zur Verbreitung naturwissenschaftlicher Kenntnisse in Wien. XXXIX. Jahrg. Heft. 3.) Wien, 1899. Size 7½ × 4½, pp. 20. *Presented by the Author.*

Rumania. **Liddell.**

Trade of Roumania for the year 1899. Foreign Office, Annual No. 2486, 1900. Size 9½ × 6½, pp. 30. *Price* 2*d.*

Russia. *B. Comité Géolog. St. Pétersbourg* **18** (1899): 195–233. **Ballore.**

Description sismique de l'Empire Russe. Par F. de Montessus de Ballore. [In Russian, with *Résumé* in French.] *With Map.*

Russia—Lake Ladoga. *C. Rd.* **130** (1900): 1789–1793. **Schokalsky.**

Le lac Ladoga au point de vue thermique. Note de M. Jules de Schokalsky. *With Diagrams.*

See note in *Journal* for October, p. 471.

Scandinavia. **Ahlenius.**

Till kännedomen om Skandinaviens geografi och Kartografi under 1500-talets senare hälft. Af K. Ahlenius. (Mit einem Résumé in deutscher Sprache.) Upsala (C. J. Lundström); Leipzig: Otto Harrassowitz, (1900). Size 9½ × 6, pp. 140. *Presented by the Author.*

This is a study of the knowledge possessed by the geographers of Europe in the latter half of the sixteenth century as derived from maps and books. It is supplementary to the author's earlier work on Olaus Magnus.

Scandinavia—Ice Age. *J. Geology* **8** (1900): 326–332. **Reusch.**

A note on the last stage of the Ice Age in Central Scandinavia. By Hans Reusch. *With Illustrations.*

Spain—Barcelona. **Roberts.**

Trade of Barcelona for the year 1899. Foreign Office, Annual No. 2460, 1900. Size 10 × 6½, pp. 38. *Price* 2½*d.*

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence

BRITISH LIBRARY

Spain—Bilbao. **Larrea.**
Trade of Bilbao and District for the year 1899. Foreign Office, Annual No. 2445, 1900. Size 9½ × 6½, pp. 32. *Price* 2*d.*

Sweden. *B. Geolog. I. University Upsala* **4** (1899): 231–242. **Gavelin.**
On the glacial lakes in the upper part of the Ume river-valley. By Axel Gavelin. *With Map.*

Sweden—Climate. *La G., B.S.G. Paris* (1900): 199–208. **Egnel.**
Le climat de la Suède et les causes des variations de climat, d'après M. Ekholm. Par M. Egnel. *With Maps.*

The maps embrace the whole of Northern Europe. The article is a summary of the memoirs published in *Ymer* during 1899.

Sweden—Gothenburg. **Duff.**
Trade of Gothenburg for the year 1899. Foreign Office, Annual No. 2490, 1900. Size 10 × 6½, pp. 34. *Price* 2½*d.*

Switzerland. *Jahrb. Schweiz. Alpenclub* **35** (1899–1900): 187–202. **Correvon.**
La Vallée de Tourtemagne, en Valais. Par H. Correvon. *With Illustrations.*

Switzerland. *Le Globe B.S.G. Genève* **39** (1900): 109–112. **Rosier.**
Le milieu géographique Suisse considéré comme facteur du développement historique. (*Résumé.*) Par M. W. Rosier.

Turkey—Salonica. **Shipley.**
Trade of Salonica and District for the year 1899. Foreign Office, Annual No. 2468, 1900. Size 10 × 6, pp. 36. *Price* 2½*d.*

United Kingdom—England. **Barnes and Holroyd.**
Mém. S. Spéléologie No. **23** (1900): pp. 19.
La Blue-John-Mine à Castleton (Angleterre). Par MM. Barnes et Holroyd. *With Plans.*

United Kingdom—England. **Bosworth.**
Philips' County Readers. Kent, Past and Present. By George F. Bosworth. London: G. Philip & Son, 1901 [1900]. Size 7½ × 5, pp. x. and 268. *Maps and Illustrations. Price* 2*s. Presented by the Publishers.*

An excellent history of Kent adapted for use as a "reader" in the schools of that county. The geographical sections are subordinated to the historical.

United Kingdom—Ireland. *Economic P.R. Dublin S.* **1** (1899): 1–72. **Johnson.**
The Irish Peat Question. By T. Johnson, D.SC. *With Illustrations.*

United Kingdom—Orkneys. *T.R.S. Edinburgh* **39** (1897–98): 383–424. **Flett.**
The Old Red Sandstone of the Orkneys. By John S. Flett, M.B., etc. *With Map.*

United Kingdom—Scotland. *T.R.S. Edinburgh* **39** (1898–99): 779–826. **Buchanan.**
The Meteorology of Ben Nevis in Clear and in Foggy Weather. By J. Y. Buchanan. *With Diagrams.*

United Kingdom—Rainfall. **Wallis.**
British Rainfall, 1899. On the distribution of Rain over the British Isles during the year 1899, as observed at about 3500 Stations in Great Britain and Ireland, with articles upon various branches of Rainfall work. Compiled by H. Sowerby Wallis. London: E. Stanford, 1900. Size 9 × 5½, pp. 56 and 252. *Portrait, Charts, and Diagram. Price* 10*s. Presented by the Compiler.*

This volume is accompanied by a sketch of the career and an admirable portrait of Mr. G. J. Symons, the founder of the British Rainfall Organization. The work is one of national importance, although entirely organized by a private individual and carried out by the co-operation of a staff of volunteer unpaid workers, the magnitude of which is unexampled in modern scientific enterprise.

United Kingdom—Tide Tables. **Harris and Havergal.**
Tide Tables for the British and Irish Ports for the year 1901: also the times and heights of High Water at full and change for the principal places of the Globe. By Captain H. R. Harris and Commander A. Havergal. London: J. D. Potter, [1900]. Size 10 × 6½, pp. xl. and 262. *Price* 2*s. Presented by the Hydrographer, Admiralty.*

ASIA.

Central Asia. **Demidoff.**

After Wild Sheep in the Altai and Mongolia. By E. Demidoff. London: Rowland Ward, Limited, 1900. Size 9½ × 6½, pp. xii. and 324. *Map and Illustrations. Price* 21*s. net. Presented by the Publishers.*

Prince Demidoff and his wife, together with Mr. and Mrs. Littledale, made the journey which he describes in this volume during 1897. From Barnaul on the Ob the route led south-eastward to the sources of the Chuya river, and thence into Mongolia, up the Kobdo river almost to its source, and then along the northern slope of the Altai mountains. The book is excellently illustrated, and has a clear map.

Central Asia. **Hedin.**

Die geographisch-wissenschaftlichen Ergebnisse meiner Reisen in Zentralasien, 1894–1897. Von Dr. Sven Hedin (Dr. A. Petermanns Mitteilungen. Ergänzungsheft Nr. 131). Gotha: Justus Perthes, 1900. Size 11 × 7½, pp. 400. *Maps. Price* 20 *mark.*

The complete scientific geographical results of Dr. Sven Hedin's three years' work in Central Asia (1894–97).

Ceylon. **Leclercq.**

Un séjour dans l'Ile de Ceylan. Par Jules Leclercq. Paris: Plon-Nourrit et Cie, 1900. Size 7½ × 5, pp. 294. *Map and Illustrations. Price* 4 *fr. Presented by the Author.*

M. Leclercq visited Ceylon after having seen Java, in the hope that he might decide to which island belonged the distinction of being the earthly paradise, but after having tried both he is unable to pronounce for one or the other, so evenly balanced did he find their diverse excellences.

China. **Walton.**

China and the Present Crisis, with Notes on a Visit to Japan and Korea. By Joseph Walton, M.P. London: Low & Co., 1900. Size 8 × 5, pp. xii. and 320. *Map. Price* 6*s. Presented by the Publishers.*

The record of the travels, experiences, and opinions of a Member of Parliament after a tour of eight months' duration in China, and a brief visit to Japan and Korea.

India. **Hunter.**

A History of British India. By Sir William Wilson Hunter, K.C.S.I., etc., volume ii. To the Union of the old and new Companies under the Earl of Godolphin's Award. London: Longmans & Co., 1900. Size 9½ × 6, pp. 420. *Price* 16*s. Presented by Lady Hunter.*

This volume carries on the history of English enterprise in India from 1623 to 1708. The final chapter (1698–1708) had not been written at the time of the author's death, but is supplied following the indications of his notes by P. E. Roberts, who also contributes an introduction to the book.

India. **Sewell.**

A Forgotten Empire (Vijayanagar). A contribution to the History of India. By Robert Sewell. London: Sonnenschein & Co., 1900. Size 10½ × 6½, pp. xxii. and 428. *Maps and Illustrations. Price* 15*s. Presented by the Author.*

The history of the old kingdom which occupied the south of the Indian peninsula, and of the rise and fall of Portuguese power in India. An important part of the work is the translation for the first time of two important Portuguese documents, by Domingo Paes about 1520 and Fernão Nuniz about 1535. There are several maps and numerous photographs of ruins dating from the period of prosperity.

India—Burma. **Sherriff.**

Railway Communication with China. By William Sherriff. The Burmah-China Railway. [Reprinted from the *Manchester Guardian* of March 9, 1900.] Size 8½ × 6½, pp. 4. *Presented by the Author.*

India—Burma. _____

Tables for the Transliteration of Shan Names into English. Rangoon, 1900. Size 10 × 7, pp. 14. *Presented by the Government of Burma.*

India—Earthquake. *Mem. Geolog. Surv. India* **29** (1899): 380. **Oldham.**

Report on the Great Earthquake of June 12, 1897. By R. D. Oldham. *With Maps and Illustrations.*

This is an exhaustive report on the last great Indian earthquake, which is considered in all its aspects. The main memoir is supplemented by numerous special reports made by members of the Geological Survey deputed to investigate the phenomena in

The Geographical Journal(Journal of the Royal Geographical Society): Volume XVI, No. 6 [386r] (124/232)

special districts. The whole is richly illustrated by photographs, diagrams, and seismograph tracings.

India—Irrigation. *J.S. Arts* **48** (1900): 831–837. **Cotton.**

Irrigation in India.

A supplement to an article by General F. C. Cotton in *Blackwood's Magazine* for May, 1900.

India—Kashmir. *Globus* **78** (1900): 222–226. **Francke.**

Eine Besteigung des Karsongpasses (Kaschmir). Von Hermann Francke. *With Illustrations. Also a separate copy, presented by Herr G. Th. Reichelt.*

A summer trip from Leh to the summit of the Kasong pass.

India—North-West Frontier. **Walters.**

The operations of the Malakand Field Force and the Buner Field Force, 1897–98. Compiled in the Intelligence Branch . . . by Captain H. F. Walters. Simla, 1900. Size 13½ × 8½, pp. iv., 90, and 86. *Maps and Plates. Presented by the Intelligence Branch, Simla.*

India—Sikhim Himalayas. **Donaldson.**

Lepcha Land, or Six Weeks in the Sikhim Himalayas. By Florence Donaldson. London: Low & Co., 1900. Size 9 × 6, pp. xii. and 214. *Map and Illustrations. Price* 10*s.* 6*d. net. Presented by the Publishers.*

An excellent account of a six-weeks' journey in one of the least-known parts of the Indian frontier. The photographs are unusually well chosen and illustrative.

Japan—Hakodate. **Chalmers.**

Trade of Hakodate for the year 1899. Foreign Office, Annual No. 2503, 1900. Size 9½ × 6½, pp. 12. *Price* 1*d.*

Korea. *Rev Française* **25** (1900): 394–398. **Fauvel.**

Corée: Le port de Ma-San-Pho. Par M. A. A. Fauvel. *With Map.*

The position of this port, opened by Korea to foreign trade in 1899, was so little known that it is given erroneously in the supplement to Vivien de St. Martin's Gazetteer.

Malay Archipelago. *Nature* **62** (1900): 327–328. ———

The Cruise and Deep-Sea Exploration of the *Siboga* in the Indian Archipelago. *With Charts.*

Malay Archipelago—Amboina. **Vries.**

Tijds. K. Ned. Aard. Genoots. Amsterdam **17** (1900): 467–502, 593–621.

Reis door eenige eilandengroepen der Residentie Amboina. Door J. H. de Vries.

Malay Archipelago—Borneo. *Oester. Monats. Orient* **26** (1900): 76–79. **Breitenstein.**

Die Handelsverhältnisse auf Borneo und in Niederländisch-Indien. Von Dr. Heinrich Breitenstein.

Malay Archipelago—Borneo. **Keyser.**

Trade of Brunei and Sarawak for the Year 1899. Foreign Office, Annual No. 2491, 1900. Size 9½ × 6¼, pp. 12. *Price* 1*d.*

Malay Archipelago—Borneo and Java. **Breitenstein.**

21 Jahre in Indien. Aus dem Tagebuche eines Militärarztes. Erster Theil: Borneo. Zweiter Theil: Java. Von Dr. H. Breitenstein. Leipzig: Th. Grieben's Verlag (L. Fernau), 1899–1900. Size 9½ × 6, pp. (Theil i.) 264; (Theil ii.) xii. and 408. *Illustrations. Price* 12*s.*

The experiences and observations of an army surgeon who for twenty-one years was in the service of the Netherlands Government in Borneo and Java. The notes on the people and on the conditions as to health are of interest.

Malay Archipelago—Java. **Van der Stok.**

Tijds. K. Ned. Aard. Genoots. Amsterdam **17** (1900): 585–592.

Een nieuwe regenkaart van Java. Door Dr. J. P. Van der Stok. *With Map.*

A new rainfall map of Java on the scale of 1: 1,500,000. The distribution of rainfall is, as a rule, greatest on the watersheds between adjoining river-basins, but there are some curious anomalies, especially in the western half of the island.

Malay Archipelago—Sumatra. **Heldring.**

Tijds. K. Ned. Aard. Genoots. Amsterdam **17** (1900): 622–639.

Poeloe Weh; zijne topographische beschrijving en eenige opmerkingen met betrekking tot de beteekenis van het eiland. Door E. Heldring. *With Map.*

BRITISH LIBRARY

Description of the small island off the northern extremity of Sumatra at the entrance to the Strait of Malacca.

Philippine Islands—Diseases. **Flexner and Barker.**

Johns Hopkins University Circulars **19** (1900): 13–16.

Report of a Special Commission sent to the Philippines by the Johns Hopkins University to investigate the prevalent diseases of the Islands. By Prof. S. Flexner, M.D., and Prof. L. F. Barker, M.D.

Russia—Siberia. *Petermanns M.* **46** (1900): 161–165. **Diener.**

Die geologischen Ergebnisse der Reisen von Baron E. Toll entlang der nordsibirischen Eismeerküste und nach den Neusibirischen Inseln. Von Prof. Dr. C. Diener. *With Map.*

Russian. *La G., B.S.G. Paris* (1900): 81–100. **Saint-Yves.**

Notes sur la distribution des plantes en Sibérie et dans l'Asie centrale. Par M. G. Saint-Yves. *With Illustrations.*

The author, in discussing the vegetation of Northern and Central Asia, points out the close relation of the botanical and physical conditions of the continent, and the influence which the vegetation exercises on the mode of life of the people.

Siam—Malay States. *Scottish G. Mag.* **16** (1900): 505–523. **Annandale.**

The Siamese Malay States. By Nelson Annandale. *With Illustrations.*

Mr. Annandale was junior zoologist on Mr. W. W. Skeat's expedition to the Malay peninsula, and he gives here a narrative of the expedition and a sketch of his impressions of Siam and the Siamese.

Turkey—Baghdad. **Melvill.**

Trade of Baghdad for the year 1899. Foreign Office, Annual No. 2459, 1900. Size 10 × 6, pp. 8. *Price* ½*d.*

Turkey—Erzerum. **Lamb.**

Trade of Erzeroum for the year 1899. Foreign Office, Annual No. 2477, 1900. Size 10 × 6, pp. 10. *Price* 1*d.*

Turkey—Palestine. **Wilson.**

Palestine Exploration Fund, Quarterly Statement (1900): 365–369.

The Dead Sea. By Major-General Sir Charles Wilson, K.C.B.

Sir Charles Wilson is not inclined to agree with Mr. Gray Hill's suggestion (see *Journal* for November, p. 555) that the bed of the Dead sea is being raised by volcanic agency. He shows that all the variations of level may be explained by the fluctuation of the rainfall.

Turkey—Palestine. **Boddy.**

Days in Galilee and Scenes in Judæa, together with some account of a solitary cycling journey in Southern Palestine. By the Rev. Alexander A. Boddy. London: Gay & Bird, 1900. Size 9 × 6, pp. xxii. and 354. *Illustrations. Price* 7*s.* 6*d. Presented by the Author.*

The author, in apologizing for the predominance of the human element in parts of his narrative, remarks that he "finds it very difficult to keep the natural man in his place for long, even when in the Holy Land." Despite the somewhat deprecatory preface, this volume in no way falls short of the others from Mr. Boddy's pen.

Turkey—Smyrna. **Cumberbatch.**

Trade of Smyrna and District for the years 1897–99. Foreign Office, Annual No. 2462, 1900. Size 10 × 6½, pp. 58. *Plan. Price* 6*d.*

Western Asia—Ararat. *Jahrb. Schweiz. Alpenclub* **35** (1899–1900): 157–183. **Oswald.**

Eine Besteigung des Ararat. Von Dr. Ad. Oswald. *With Illustrations.*

The ascent of Ararat here described was made in October, 1897.

Western and Central Asia. *J. Bombay Br. R. Asiatic S.* **20** (1899): 156–190. **Modi.**

The Cities of Irân as described in the old Palahavi treatise of Shatrôiha-i-Irân. By Jivanji Jamshedji Modi.

AFRICA.

Abyssinia. **Wellby.**

King Menelek's Dominions and the Country between Lake Gallop (Rudolf) and the Nile Valley. By the late Captain M. S. Wellby. (From the *Geographical Journal* for September, 1900.) Size 10 × 6½, pp. 16. *Map.*

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence

Africa—Travel. **Grogan.**

Through Africa from the Cape to Cairo. By Ewart S. Grogan. (From the *Geographical Journal* for August, 1900.) Size 10 × 6½, pp. 22. *Map and Illustrations.*

Africa—Travel. **Grogan and Sharp.**

From the Cape to Cairo, the First Traverse of Africa from South to North. By Ewart S. Grogan and Arthur H. Sharp. London: Hurst & Blackett, 1900. Size 10 × 7½, pp. xvi. and 378. *Portrait, Maps, and Illustrations. Price* 21*s. net. Presented by the Publishers.*

A handsome volume, illustrated by drawings largely from the authors' photographs, and descriptive of the adventurous journey the geographical facts of which have been laid before the Society by Mr. Grogan, and published in the *Journal* for August, *ante*, p. 164.

Algeria. **Wilkin.**

Among the Berbers of Algeria. By Anthony Wilkin. London: T. Fisher Unwin, 1900. Size 9 × 6, pp. xiv. and 264. *Sketch-map and Illustrations. Price* 16*s. Presented by the Publisher.*

Records of an interesting journey, including visits to some of the mountainous and desert parts of Algeria not often visited by British travellers. The photographs are numerous, the subjects well chosen, they are admirably printed, and a fair proportion are good. The spelling of the place-names is French, with, however, a substitution of *w* for the consonantal *ou*, so that some of them will be difficult to trace on either French or English maps.

British East Africa—Zanzibar. **Cornish.**

Trade of Zanzibar for the year 1899. Foreign Office, Annual No. 2520, 1900. Size 9½ × 6½, pp. 14. *Price* 1*d.*

Comoro Group. **Vienne.**

Notice sur Mayotte et les Comores. Par Emile Vienne. (Exposition Universelle, 1900.) Size 9½ × 6½, pp. 200. *Illustrations. Presented by M. Charles Roux.*

So little has been written about the rarely visited islands of Mayotte and Comoro that this volume is relatively of greater importance than most of the other Exhibition memoirs of the French colonies.

Congo State. *Globus* **78** (1900): 93–96. ——

Die Entwickelung von Léopoldville am Stanley Pool. *With Illustration.*

A picture of the harbour at Leopoldville is given in this description of the growth of the great centre of river-trade on the Congo system.

Dahomey. **Fonssagrives.**

Notice sur le Dahomey, publiée à l'occasion de l'Exposition Universelle. . . . Par M. Jean Fonssagrives. [1900.] Size 9½ × 6½, pp. 408. *Map and Illustrations. Presented by M. Charles Roux.*

Egypt. **Kemeid.**

Cairo and Egypt and Life in the Land of the Pharaohs, being a Pictorial and Descriptive Guide to Cairo and the Nile. By Hallil J. Kemeid. Fourth Yearly Edition (Revised). London: Simpkin, Marshall, & Co., 1900. Size 7½ × 5, pp. 196. *Illustrations. Price* 1*s. Presented by the Publishers.*

Egypt—Port Said and Suez. **Cameron.**

Trade of Port Said and Suez for the year 1899. Foreign Office, Annual No. 2509, 1900. Size 10 × 6½, pp. 12. *Price* 1*d.*

Portuguese West Africa. **Sanders.**

Determination of the latitude of Ambriz and of San Salvador (Portuguese West-Africa). By C. Sanders. (K. Akad. van Wetenschappen te Amsterdam.) Reprinted from Proceedings of the Meeting of Saturday, January 27, 1900 (February 21, 1900). Size 10½ × 7½, pp. 10. *Presented by the Author.*

The author, as the mean of numerous observations, has fixed the latitude of the harbour light at Port Ambriz as 7° 49′ 48″ S., instead of 7° 52′ 9″ as given in the Admiralty chart; and for San Salvador do Congo he found 6° 15′ 16″, instead of the previously accepted value, 6° 20′ 10″.

Portuguese West Africa—Angola. **Hauser.**

Questions Dipl. et Colon. **10** (1900): 449–462.

Études sur les colonies portugaises. II. Angola. Par le Professeur Henri Hauser. *With Map.*

Réunion. **Garsault.**

Exposition Universelle de 1900. Colonies Françaises. Notice sur la Réunion rédigée sous la direction de M. A.-G. Garsault. Paris: J. André, 1900. Size 9½ × 6, pp. 308. *Map and Illustrations. Presented by M. Charles Roux.*

Rhodesia.

The British South Africa Company. Information as to Mining in Rhodesia, supplied to the British South Africa Company. 1900. Size 10½ × 8½, pp. 412. *Maps. Presented by the British South Africa Company.*

Reports of the work done by the numerous minor companies engaged in developing the resources of Rhodesia. The output of gold for the first six months of 1900 averaged over 5500 ozs. per month.

Sahara. *Rev. Française* **25** (1900): 415–420. **Vasco.**

Sahara: Le mission Foureau-Lamy. Par M. G. Vasco.

See also an account of this journey with illustrations in *A travers le Monde, Tour du Monde* 6 (1900), pp. 293–294.

Somaliland. **Swayne.**

Seventeen Trips through Somaliland and a Visit to Abyssinia. A Record of Exploration and Big Game Shooting, with descriptive notes on the Fauna of the Country. By Major H. G. C. Swayne. Second Edition. London: Rowland Ward, Limited, 1900. Size 8 × 5, pp. xxii. and 386. *Maps and Illustrations. Price 7s. 6d. net. Presented by the Publisher.*

A new edition of a well-known work of permanent interest.

Somaliland. *J. Manchester G.S.* **16** (1900): 1–30. **Kœttlitz.**

A Journey through Somaliland and Southern Abyssinia to the Shangalla or Berta Country and the Blue Nile, and through the Sudan to Egypt. By Dr. Reginald Kœttlitz. *With Illustrations.*

South Africa. **Colquhoun.**

The Renascence of South Africa. By Archibald R. Colquhoun. London: Hurst & Blackett, 1900. Size 8 × 5½, pp. viii. and 300. *Map. Price 6s. Presented by the Publishers.*

Six chapters deal with "The Land," "The People," "History," "The New Lands of Promise and Disappointment" (under which heading the author considers Mashonaland, Matabililand, British Central and East Africa), "The Economic Future," and "The Settlement." The author explains his object as being "to gather together and present in the simplest form the salient facts in the story of South Africa, and the principal features in the problem of settlement with which, as a nation, we are face to face."

South Africa—Boers. **Leclercq.**

Les Boers et leur état social. Par M. Jules Leclercq. (From 'La Reform Sociale, Bulletin de la Société d'Économie Sociale et des Unions de la Paix Sociale,' No. 931er Janvier 1900, pp. 70–82.) Paris, 1900. Size 10 × 6½. *Presented by the Author.*

Transvaal and Swazieland. *P.R. Dublin S.* **9** (1899): 12–21. **Lyburn.**

Mining and Minerals in the Transvaal and Swazieland. By E. St. John Lyburn. *With Plate.*

Tripoli—Bengazi. **Alvarez.**

Trade of Bengazi for the year 1899. Foreign Office, Annual No. 2456, 1900. Size 10 × 6, pp. 16. *Price 1d.*

Tunis. *Deutsche Rundschau G.* **22** (1900): 409–413, 486–491. **Levy.**

Die Grundlagen des französischen Protectorates in Tunesien. (Verwaltung, Justiz, Oeffentlicher Unterricht, Heerwesen.) Von Victor Levy. *With Illustrations.*

Tunis—Bizerta. *Rev. Maritime* **144** (1900): 473–508; **145** (1900): 50–79. **Castaing.**

Bizerte: Les souvenirs du passé. Par R. Castaing. *With Maps.*

This treatise traces the history of Bizerta from the Palæolithic period through the historic ages down to the present time.

West Africa. *Questions Dipl. et Colon.* **10** (1900): 412–423. **Hostains and d'Ollone.**

La Mission Hostains-d'Ollone. *With Map.*

BRITISH LIBRARY

NORTH AMERICA.

Alaska.

Eighth Annual Report of the Introduction of Domestic Reindeer into Alaska.—Annual Reports of the Department of the Interior, 1898. Report of the Commissioner of Education. Vol. ii. pp. 1773–1796. Washington, 1899.

Alaska. **Brady.**

Report of the Governor of Alaska.—Annual Reports of the Department of the Interior, 1898. Miscellaneous Reports. Pp. 181–227. *Plan.* Washington, 1898.

A frank statement of the condition of administration and economic development in Alaska.

Mexico and Guatemala. **Seler.**

Auf alten Wegen in Mexiko und Guatemala. Reiseerinnerungen und Eindrücke aus den Jahren 1895–1897. Von Cæcilie Seler. Berlin: Dietrich Reimer (Ernst Vohsen), 1900. Size 10 × 7, pp. xxiv. and 364. *Map and Illustrations. Price* 20 *mark. Presented by the Publisher.*

The record of a journey, "not to find novelties but to seek antiquities," in Central Mexico and Western Guatemala. The book is very richly illustrated, a number of hieroglyphic figures are even reproduced in colour in the text. There is a large-scale map of the route and many sketch-maps of particular localities.

St. Pierre and Miquelon. **Caperon.**

Les Colonies Françaises. Saint-Pierre et Miquelon. Par M. Maurice Caperon. Paris, 1900. Size 9 × 6, pp. 32. *Map and Illustrations. Presented by M. Charles Roux.*

United States. *G.Z.* 6 (1900): 417–434. **Deckert.**

Die Nordamerikanische Union als Weltmacht. (Ein Vortrag.) Von Dr. Emil Deckert.

On the United States as an expanding power.

United States. **Gardini.**

In der Sternenbanner-Republik. Reiseerinnerungen von Dr. Carlo Gardini. Nach der zweiten Auflage des italienischen Originals von M. Rumbauer. Oldenburg and Leipzig: A. Schwartz, [1900]. Size 8½ × 5½, pp. xvi. and 406. *Map and Illustrations. Presented by the Publisher.*

The translation of this excellent Italian work into German is justified, says the translator, because no books on travel in the United States have appeared in Germany for a long time. The book is in the form of a narrative of an extensive tour, with occasional appropriate digressions on the institutions and peculiarities of the country.

United States—Indians. **Grinnell.**

The North American Indians of To-day. By George Bird Grinnell, PH.D. London: C. Arthur Pearson, 1900. Size 12½ × 9, pp. 186. *Illustrations. Price* 21*s. net. Presented by the Publisher.*

On the present number and condition of the Red Indians in the United States. The book is illustrated by fifty-five splendid portraits of Indian chiefs, belonging to twenty-six tribes, in native dress.

CENTRAL AND SOUTH AMERICA.

Andes. **Burckhardt.**

Anales del Museo de la Plata. Seccion Geológica y Mineralógica. II.—Profils géologiques transversaux de la Cordillere Argentino-Chilienne, stratigraphie et tectonique. Par le Dr. Carl Burckhardt. Première Partie du Rapport définitif sur une Expédition géologique effectuée par Dr. Leo Wehrli et Dr. Carl Burckhardt. La Plata, 1900. Size 15 × 11, pp. viii. and 136. *Plates. Presented by the Museo de La Plata.*

This important work gives, in French, the full report of the researches carried on in 1897 by Drs. Burckhardt and Wehrli in the Argentino-Chilian Andes. It is richly provided with maps, sections, diagrams, and photographs.

Argentine-Chilian Boundary.

Argentine-Chilian Boundary. Report presented to the Tribunal appointed by Her Britannic Majesty's Government "To consider and report upon the Differences which have arisen with regard to the Frontier between the Argentine and Chilian

Republics," to justify the Argentine Claims for the Boundary in the Summit of the Cordillera de los Andes, according to the Treaties of 1881 and 1893. [4 vols.] London: Printed for the Government of the Argentine Republic by W. Clowes & Sons, Limited, 1900. Size 13½ × 10½, pp. xviii. and 1182. *Maps and Illustrations. Presented by the Argentine Government.*

These massive volumes contain a complete statement of the evidence for the Argentine case as to the boundary with Chile in Patagonia, including a collection of remarkably fine photographs and numerous maps.

Argentine Republic.

Annuaire Statistique de la Ville de Buénos-Ayres. IX^me^ Année, 1899. Buénos-Ayres, 1900. Size 10½ × 7½, pp. xxxii. and 330. *Plan.*

Argentine Republic. *B.I.G. Argentino* **20** (1899): 483–496. **Chanourdie.**

Las Inundaciones en el Rio Negro. Medios de remediarlas. Por Enrique Chanourdie. *With Illustrations.*

Argentine Republic. *B.I.G. Argentino* **20** (1899): 475-482. **Cibils.**

Ferrocarriles proyectados en el Neuquen. Por F. R. Cibils. *With Map.*

Argentine Republic. *B.I.G. Argentino* **20** (1899): 317–341. **Vallejo.**

Departamento Chamical (Prov. de la Rioja). Por G. Vallejo.

Barbados. **Williams.**

Barbados. Report for 1899. Colonial Reports, Annual No. 294, 1900. Size 10 × 6, pp. 34. *Price* 2½*d.*

British Guiana. **King.**

British Guiana. Reports for 1897–98 and 1898–99. Colonial Reports, Annual No. 290, 1900. Size 10 × 6, pp. 56. *Price* 3*d.*

Chile. **Darapsky.**

Das Departement Taltal (Chile). Seine Bodenbildung und Schätze. Von L. Darapsky. Text and Maps. Berlin: Dietrich Reimer (Ernst Vohsen), 1900. Size 10½ × 7, pp. x. and 230. *Illustrations. Price* 30 *m. Presented by the Publisher.*

A full and careful account, with numerous detailed maps and illustrations, of the nitrate-yielding province of Taltal, in the north of Chile.

Porto Rico. **Churchward.**

Trade of Porto Rico for the year 1899. Foreign Office, Annual No. 2465, 1900. Size 10 × 6½, pp. 24. *Price* 1½*d.*

Tobago

Imperial Department of Agriculture for the West Indies. Hints and Suggestions on Planting in Tobago. Issued by the Commissioner of Agriculture, 1900. (Pamphlet Series, No. 2.) Size 7 × 5, pp. 20. *Presented by the Commissioner, Imperial Department of Agriculture for the West Indies.*

Trinidad. **Eversley.**

The Trinidad Reviewer for the year 1900. Compiled by T. Fitz-Evan Eversley. London: The Robinson Printing Co. Size 9 × 6, pp. 568. *Map, Plans, and Illustrations. Price* 3*s. Presented by the Publishers.*

This gives an account of the history of Trinidad, with full details of the present condition of the colony, brief biographies of the colonial officials, a directory of the island, and masses of other information, all practical and well arranged.

Venezuela—Caracas. **Andral.**

Trade of Caracas and District for the year 1899. Foreign Office, Annual No. 2466, 1900. Size 9½ × 6½, pp. 24. *Price* 1½*d.*

West Indies. **Millspaugh.**

Plantæ Utowanæ. Plants collected in Bermuda, Porto Rico, St. Thomas, Culebras, Santo Domingo, Jamaica, Cuba, the Caymans, Cozumel, Yucatan, and the Alacran Shoals. Dec. 1898 to Mar. 1899. The Antillean Cruise of the yacht *Utowana*. Mr. Allison V. Armour, Owner and Master. By C. F. Millspaugh, M.D. Part i.—Catalogue of the Species. (Field Columbian Museum. Publication 43, Botanical Series, vol. ii. No. 1.) Chicago, 1900. Size 10 × 6½, pp. 110. *Map.*

Botanical collections made on a yachting trip through the West Indies.

BRITISH LIBRARY

AUSTRALASIA AND PACIFIC ISLANDS.

British New Guinea. **Winter.**

British New Guinea. Report for 1898–99. Colonial Reports, Annual No. 292, 1900. Size 10 × 6, pp. 56. *Price* 3*d.*

Cook Islands. **Gudgeon.**

Cook Islands. Report for 1899. Colonial Reports, Miscellaneous, No. 13, 1900. Size 10 × 6½, pp. 16. *Price* 1*d.*

French Pacific Islands. **Lemasson.**

Notice sur les Etablissements Français de l'Océanie. (Exposition Universelle de 1900.) Size 9½ × 6½, pp. 128. *Map and Illustrations. Presented by M. Charles Roux.*

This report passes in review all the Polynesian islands now under the French flag and gives statistics regarding them.

Melanesia. *Globus* **78** (1900): 69–78. **Luschan.**

R. Parkinsons Beobachtungen auf Bóbolo und Hún (Matty und Durour). Von Felix v. Luschan. *With Illustrations.*

These islands lying north of New Guinea in 2° S. and 143° E. are practically unvisited, and the observations of the people and their weapons here given is therefore of special interest.

POLAR REGIONS.

Antarctic—Belgian Expedition. **Cook.**

Through the First Antarctic Night, 1898–1899. A Narrative of the Voyage of the *Belgica* among Newly Discovered Lands and over an Unknown Sea about the South Pole. By Frederick A. Cook, M.D. With an Appendix containing a summary of the Scientific Results. London: W. Heinemann, 1900. Size 9½ × 6½, pp. xxiv. and 478. *Maps and Illustrations. Price* 20*s. net. Presented by the Publisher.*

This is the first account of the voyage of the *Belgica* published in book form. It gives a full description of the dreariness of the long drift in the antarctic pack, and makes clear several defects in the equipment of the expedition, which, however, notwithstanding exceptional drawbacks, did admirable scientific work. Dr. Cook's photographs and coloured illustrations are in every way admirable.

Arctic—Abruzzi Expedition. *National G. Mag.* **11** (1900): 411–413. ——

Nansen's 'Farthest North' Eclipsed. *With Portraits.*

With portraits of the Duke of the Abruzzi and Captain Cagni.

Arctic—Abruzzi Expedition. *B.S.G. Italiana* **1** (1900): 956–961. **Faustini.**

Il ritorno della Spedizione polare di S.A.R. il Duca degli Abruzzi.

MATHEMATICAL GEOGRAPHY.

Astronomy. *Indian Antiquary* **29** (1900): 189–190. **Jacobi.**

How to calculate the lagna. By Prof. Hermann Jacobi.

The term *lagna* means the point of the ecliptic upon the eastern horizon at a given time.

Cartography—Reliefs. *Mém. S.G. Genève* **39** (1900): 1–10. **Claparède.**

Les Reliefs Perron. Par Arthur de Claparède.

On the qualities desirable in relief models with special reference to M. Perron's great relief of Switzerland on the scale of 1 : 100,000.

Cartography—Reliefs. **Perron.**

Les Reliefs en général et du Relief au 1 : 100,000 de la Suisse en particulier. Par C. Perron. Genève: Librairie Stapelmohr, 1900. Size 8 × 5½, pp. 12. *Presented by the Author.*

On the principles of constructing reliefs on a true scale, and a short account of the new relief of Switzerland on the scale of 1 : 100,000. In this the heights are shown without exaggeration, and the whole is modelled to the true curvature of the Earth.

Navigation. **Dunraven.**

Self-Instruction in the Practice and Theory of Navigation. By the Earl of Dunraven. 2 vols. London: Macmillan & Co., 1900. Size 9 × 6, pp. (vol. i.) xxvi. and 354; (vol. ii.) x. and 390. *Diagrams. Price* 21*s. net. Presented by the Author.*

BRITISH LIBRARY

These volumes contain a statement of the methods of practical and theoretical navigation arranged for the use of students for the Board of Trade certificates, and with special reference to the needs of the yachtsman who is desirous of proving himself capable of commanding his own vessel. A special note is given, *ante*, p. 690.

Surveying. **Bertrand.**
Methods of Survey employed by the Chilean Boundary Commissions in the Cordillera of the Andes. By Prof. A. Bertrand. (From the *Geographical Journal* for September, 1900.) Size 10½ × 6½, pp. 16.

PHYSICAL AND BIOLOGICAL GEOGRAPHY.

Coast Forms. *J. Geology* **8** (1900): 481–484. **Branner.**
The Origin of Beach Cusps. By J. C. Branner. *With diagrams. Also a separate copy. Presented by the Author.*

The author comes to the conclusion that beach cusps are produced by the interference of two sets of waves of translation on the beach.

Geomorphology. **Benest.**
Fleuves sous-marins. Épanchements d'eaux douces au-dessous du niveau de la mer. Par Henry Benest. Extrait du *R. Geographical Journal*, du mois d'octobre 1899. (Université Nouvelle, Institut Géographique de Bruxelles. Publication No. 3.) Bruxelles, 1900. Size 10 × 6½, pp. 32. *Charts.*

Geomorphology. **Penck.**
Eduard Brückner, Die feste Erdrinde und ihre Formen. Ein Abriss der allgemeinen Geologie und der Morphologie der Erdoberfläche. Von Albrecht Penck. (Separatabdruck aus der "Zeitschr. f. d. österr. Gymn." 1899.) Heft 3. Size 9 × 6, pp. 6. *Presented by Dr. A. Penck.*

A review of Prof. Brückner's book.

Oceanography—Arctic Ocean. **Andréeff.**
Mém. S. Imp. Russe G. (G. Gén.) **34** (1900): 1-136.
Océan Arctique. Matériaux océanographiques rassemblés pendant les années 1889–1893. Par M. N. Andréeff. [In Russian.] *With Map.*

Oceanography—Atlantic. *P.R.S. Edinburgh* **22** (1897–99): 403–429. **Peake.**
On the Survey by the s.s. *Britannia* of the Cable Route between Bermuda, Turk's Islands, and Jamaica. By R. E. Peake. With Descriptions by Sir John Murray, K.C.B., F.R.S., of the Marine Deposits brought Home. *With Map.*

The map shows the marine deposits between the parallels of Bermuda and Barbuda, and is bounded by the meridians of 60° and 85° W.

Oceanography—Mediterranean. *B.S.G. Italiana* **1** (1900): 699–717, 757–776. **Bertacchi.**
L'Italia e il suo Mare. Come e quanto l'Italia possa aver contribuito alla conoscenza Scientifica del Mediterraneo. Memoria del Cosimo Bertacchi.

On the work done by Italians in the study of the Mediterranean sea.

Oceanography—North Sea. *P.R.S. Edinburgh* **22** (1897–99): 478–481. **Buchan.**
Tidal Currents of the North Sea. By Alexander Buchan, LL.D., F.R.S.

Phænology. **Ihne.**
Phänologische Mitteilungen (Jahrgang, 1899). Von E. Ihne. (Sonderabdruck aus dem xxxiii. Bericht der Oberhess. Ges. f. Natur- u. Heilkunde zu Giessen.) Size 9 × 6, pp. 30. *Presented by the Author.*

Instructions for observing the annual recurrence of seasonal changes in plants, with a special notation for recording the phenomena, a summary of recent literature on the subject, and a note on the influence of latitude on the date of the beginning of spring, which states that in Germany the commencement of spring is four days later for each degree of latitude towards the north. See note, *ante*, p. 680.

Phyto-Geography. *La G., B.S.G. Paris* (1900): 35–40. **Masclef.**
La Géographie botanique et son évolution au XIX^e^ siècle. Par M. A. Masclef.

Sand-dunes. **Baschin.**
Die Entstehung der Dünen. Von Otto Baschin. (Centralblatt der Bauverwaltung. XX. Jahrg. Nr. 38, 16 Mai 1900, pp. 231–232.) Size 13½ × 10. *Presented by the Author.*

Seismology. *P.R.S. Edinburgh* **22** (1897-99): 573–585. **Knott.**
The Propagation of Earthquake Vibrations through the Earth. By Prof. C. G. Knott, D.Sc. (Abstract.)

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence

Terrestrial Magnetism. *Ann. Hydrographie* **28** (1900): 363–370, 435–445. ——

Bericht der Deutschen Seewarte über die Ergebnisse der magnetischen Beobachtungen in dem deutschen Küstengebiete und in den deutschen Schutzgebieten während der Jahre 1897, 1898, und 1899.

Tide. *Nautical Mag.* **69** (1900): 466–483. **Moxly.**

The New Theory of Tide. By Rev. J. H. S. Moxly.

Tides. *Nautical Mag.* **69** (1900): 549–553. **Plumstead.**

Moxly's Theory of the Tides. By E. Plumstead.

Volcanic Phenomena. *Rev. Maritime* **146** (1900): 55–69. **Thoulet.**

Les phénomènes volcaniques dans leurs rapports avec l'océanographie. Par J. Thoulet.

Refers to volcanoes in general, and goes on to deal specially with submarine eruptions and the influence of volcanic phenomena on oceanic deposits.

ANTHROPOGEOGRAPHY AND HISTORICAL GEOGRAPHY.

Ancient Empires. **Maspero.**

The Passing of the Empires, 850 B.C. to 330 B.C. By G. Maspero. Edited by A. H. Sayce. Translated by M. L. McClure. London: Society for Promoting Christian Knowledge, 1900. Size 11 × 7½, pp. xii. and 824. *Maps and Illustrations. Price* 25*s.*

This volume concludes Prof. Maspero's great work on the history of the ancient East down to the downfall of Assyria and Egypt.

Historical. **Beazley.**

New Light on some Mediæval Maps. (IV.) By C. Raymond Beazley, M.A. (From the *Geographical Journal* for September, 1900.) Size 10 × 6½, pp. 12. *Facsimile Map.*

Statistics. *J.R. Statistical S.* **63** (1900): 459–479. **Craigie.**

Address to the Economic Science and Statistics Section of the British Association, held at Bradford, 1900. By Major P. G. Craigie, President of the Section.

On the collection of statistics, especially with regard to the census of the United Kingdom and to agricultural statistics in general.

BIOGRAPHY.

Gerlache and Lecointe. *Deutsche Rundschau G.* **22** (1900): 470–471. ——

Capitän Adrien de Gerlache und Lieutenant Georges Lecointe. *With Portraits.*

The commandant and captain of the Belgian Antarctic expedition.

Grabowsky. *Deutsche Rundschau G.* **22** (1900): 516–519. ——

Friedrich J. Grabowsky. *With Portrait.*

Herr Grabowsky made a journey of exploration in Borneo in 1880, and subsequently travelled extensively in the Malay archipelago and New Guinea, making ethnographical collections.

Jagor. *Deutsche Rundschau G.* **22** (1900): 520–521. ——

Dr. Friedrich Jagor. *With Portrait.*

Born in 1817, the son of an hotel-keeper; died in 1900, a distinguished ethnologist and scientific traveller.

Oswell. **Oswell.**

William Cotton Oswell, Hunter and Explorer. The Story of his Life, with certain correspondence and extracts from the private journal of David Livingstone, hitherto unpublished. By his eldest son, W. Edward Oswell. With an Introduction by Francis Galton, D.C.L., etc. 2 vols. London: W. Heinemann, 1900. Size 9 × 6, pp. (vol. i.) xxiv. and 268; (vol. ii.) xii. and 290. *Portraits, Maps, and Illustrations. Price* 25*s. net. Presented by the Publisher.*

This biography gives for the first time full details of the part played by the late Mr. Oswell in promoting and facilitating the early travels of Dr. Livingstone.

Smith. *Scottish G. Mag.* **16** (1900): 597-599. **[Geddes.]**

Robert Smith, B.Sc. By P. G. *With Portrait.*

A sympathetic notice of the life of Robert Smith, who, though only twenty-six years of age at his death, had qualified himself in a remarkable manner for the study

of botanical distribution, and whose botanical surveys of two of the 1-inch map-sheets of Scotland published this year are examples of how such work should be carried out.

GENERAL.

Astral Gravitation. **Jordan.**

Essays in illustration of the action of Astral Gravitation in Natural Phenomena. By William Leighton Jordan. London: Longmans & Co., 1900. Size 9 × 6, pp. xvi. and 192. *Diagrams. Presented by the Author.*

"Astral gravitation is a convenient term, and seems to me the most appropriate possible term, for representing generally the *resisting force* of gravitation opposing all motion. . . . It is the combined action of the gravitation of the universe, *excepting* the force whose action it opposes. . . . Newton excluded this force . . . but, I say, it has effective action in every detail of terrestrial phenomena." Such is the author's definition of the power in Nature whose effects he proceeds to trace.

Bibliography. **Baschin.**

Bibliotheca Geographica, herausgegeben von der Gesellschaft für Erdkunde zu Berlin. Bearbeitet von Otto Baschin. Band vi. Jahrgang 1897. Berlin: W. H. Kühl, 1900. Size 9½ × 6, pp. xvi. and 444. *Price* 8 *mark.*

This exhaustive geographical bibliography contains over 9000 titles of works published in 1897, including for the first time those appearing in Japanese.

Educational. **Pettipice.**

The Intermediate School Geography (Junior Grade). By T. W. Pettipice. Dublin: Blackie & Son [not dated]. Size 6½ × 4½, pp. 144. *Maps and Illustrations. Price* 1*s. Presented by the Publishers.*

Maps and diagrams, accompanied by lists of names of capes, bays, and similar features, with numerous small-type notes.

Educational. **Pettipice.**

The Irish School Geography for Elementary and Intermediate Schools. By T. W. Pettipice. Part iii. Dublin: Blackie & Son [not dated]. Size 6½ × 4½, pp. 96. *Maps and Illustrations. Price* 6*d. Presented by the Publishers.*

Highly compressed information illustrated by good sketch-maps.

Educational—Geography Chains. **Penck.**

Die Begründung der Lehrkanzel für Geographie und des geographischen Institutes an der Universität Wien. Von Dr. Albrecht Penck. Wien: Ed. Hölzel, 1898. Size 10½ × 7, pp. 14. *Presented by the Author.*

On the foundation of the Chain of Geography in the University of Vienna.

Medical Geography. **Newman.**

Bacteria, especially as they are related to the economy of nature to industrial processes and to the public health. By George Newman, M.D., etc. Second Edition, with additional matter, including New Chapters on Tropical Diseases and the Bacterial Treatment of Sewage. London: John Murray, 1900. Size 8½ × 6, pp. xvi. and 398. *Illustrations. Price* 6*s. Presented by the Publisher.*

The chapter on the Bacteriology of Tropical Diseases deals with the causes and mode of transmission of malaria, plague, leprosy, cholera, and yellow fever.

Parliamentary Reports, etc.

Catalogue of Parliamentary Peports, Papers, etc., relating to Miscellaneous Subjects, 1800 to 1879. Part ii. London: P. S. King & Son [1900]. Size 8½ × 5½, pp. 20.

Place-names. *B.S.G. Lyon* **16** (1900): 365–436. **Steyert.**

Étymologies Lyonnaises. Réponse à M. l'Abbé Devaux. Par M. A. Steyert.

On place-names and their transformations in passing from one language to another.

Rumanian Geographical Society.

Societatea Geografică Romînă. Buletin Număr Jubilar pentru împlinirea a 25 anĭ 1875, 15 Junie, 1900. Bucureşti, 1900. Size 9½ × 7, pp. vi. and 126. *Portraits. Presented by the Rumanian Geographical Society.*

The Rumanian Geographical Society, in celebration of its semi-jubilee, has published a special number of its *Bulletin*, giving an account of the work of the Society, a summary of the contents of the *Bulletin* from the beginning, a list of members, and portraits of the King and leading officers of the Society.

Travel. **Baring-Gould.**

With Note-book and Camera. A Winter Journey in Foreign Lands. By Edith M. E. Baring-Gould. With Preface by Sir W. Mackworth Young, K.C.S.I., Lieut.-Governor of the Punjab. London: Church Missionary Society, 1901 [1900]. Size 8½ × 6½, pp. viii. and 104. *Illustrations.* *Price* 1*s.* 6*d.* *Presented by the Church Missionary Society.*

Snapshots taken on a journey to India and back.

Travel. *B.S.G. Lyon* **16** (1900): 509–540. **Groffier.**

Explorations et travaux géographiques des Missionnaires Catholiques en 1899. Par M. Valérien Groffier.

Travel. **Selous.**

Sport and Travel East and West. By Frederick Courteney Selous. London: Longmans & Co., 1900. Size 9½ × 6½, pp. x. and 312. *Illustrations.* *Price* 12*s.* 6*d.* *net.* *Presented by the Publishers.*

In this volume Mr. Selous describes a series of hunting-trips in Asia Minor and North America, with a number of photographs and drawings of game and incidents of travel. The book is divided about equally between Asia Minor, which was visited in 1894–95, and the Rocky mountains, in which two trips were made in 1897 and 1898, and from both parts of the world there are many notes bearing on natural history, and especially on ornithology.

Tropical Agriculture. *Imp. and Asiatic Quarterly Rev.* **10** (1900): 246–251. **Wallace.**

The Garton lectures on Colonial and Indian Agriculture in Edinburgh University. By Robert Wallace.

England and Wales. **Bartholomew.**

Reduced Ordnance Survey of England and Wales. Scale 1 : 126,720 or 2 stat. miles to an inch. Sheet 23, Hereford. J. Bartholomew & Co., Edinburgh, 1900. *Price 2s. Presented by the Publishers.*

Historical Atlas. **Poole.**

Historical Atlas of Modern Europe from the Decline of the Roman Empire, comprising also maps of parts of Asia and of the New World connected with European History. Edited by Reginald Lane Poole, M.A., PH.D., Lecturer in Diplomatic in the University of Oxford. Part xxvii. Oxford: The Clarendon Press; London, Edinburgh, Glasgow, and New York: Henry Frowde, M.A.; Edinburgh: W. & A. K. Johnston. 1900. *Price 3s. 6d. Presented by the Clarendon Press.*

This part contains the following maps: No. 8, Europe at the accession of the Emperor Charles VI., 1519, by C. Oman, M.A.; No. 24, England and Wales, showing the Parliamentary Representation according to the Reform Act of 1832, by the Editor; No. 65, Italy, circa 1060–1167, by Miss Lina Eckenstein. Each map is accompanied by brief explanatory letterpress.

Spain. **Deposito de la Guerra, Madrid.**

Mapa Militar de la Capitania General del Norte. Scale 1 : 500,000 or 7·8 stat. miles to an inch. Deposito de la Guerra, Madrid, 1900. Part vi. *Price 1.50 pts.*

This map forms one of a series of military maps of Spain now in course of publication by the Spanish War Office, and includes the provinces of Santander, Vizcaya, Guipuzcoa, Alava, Navarra, Lugroño, and Burgos. No hill work is shown, but roads are indicated in red, and many place-names are given.

ASIA.

Asia Minor. **Huber.**

Empire Ottoman, Division Administrative. Scale 1 : 1,500,000 or 23·6 stat. miles to an inch. Par R. Huber. Paris: F. Lœffler. 4 sheets.

China. **Richthofen.**

Karte des nordöstlichen China von F. v. Richthofen. Scale 1 : 3,000,000 or 47·3 stat. miles to an inch. Berlin: Dietrich Reimer (Ernst Vohsen), 1900. *Price 1 mark.*

This is No. 3 of a series of maps of China now in course of publication in connection with the present military operations, based upon the surveys of Baron F. von Richthofen, with additional information. The present sheet includes Pekin, the Liau-tung and Shan-tung peninsulas, the entrance to the Yang-tse-kiang, and the region to the west as far as Sechuan and Kansu. It is coloured to show physical features, the lowlands being tinted green and the highlands brown, in addition to the usual hill shading.

AFRICA.

Egypt. **Schweinfurth.**

Aufnahmen in der Östlichen Wüste von Ägypten, von Georg Schweinfurth. 1 Serie (10 Blätter). Blatt IV., Die südliche Galâla. Scale 1 : 200,000 or 3·1 stat. miles to an inch. Blatt V., Die krystallinischen Küstengebirge am Roten Meer

BRITISH LIBRARY

zwischen dem Uadi Qeneh und Gebel Sēt. Scale 1:200,000 or 3·1 stat. miles to an inch. Berlin: D. Reimer (Ernst Vohsen), 1900.

The first portfolio of maps belonging to this series appeared last year, and was noticed in the *Geographical Journal* for June, 1899. This second issue contains only two maps, Nos. IV. and V., which include that portion of the desert between the Nile and the Red Sea situated approximately within the parallels of 27° and 29° 10′ N. lat., and between long. 31° 50′ E. and the coast. They show the results of Dr. Georg Schweinfurth's explorations and surveys undertaken in the years 1876–77–78, 1884–85, and 1887, and furnish a valuable addition to our knowledge of the geography of this region. The maps are printed in four colours—hill work brown, dry beds of streams green, water blue, and outline, routes and lettering black. Numerous notes on the character of the country traversed are added, and on Sheet V. there is a section showing the geological features of the region from Mount Om Mangul to the sea, along the parallel of 27° 15′ N. lat. Information obtained from the explorations of other travellers is fully acknowledged.

South Africa. **Bower.**

Large-scale Map of the Southern Transvaal and Northern Orange River Colony, with inset of Lydenburg District. Scale 1:253,440 or 4 stat. miles to an inch. Compiled from original surveys and official sources by Thomas Bowyer Bower, A.M.I.C.E., M.I.M.M., F.R.G.S. London: George Philip & Son, 1900. 3 sheets and index. *Price* £2 12*s.* 6*d.* *Presented by the Author.*

Up to the present time this is, doubtless, the best map that has been published of the area it represents, and its scale, 4 miles to an inch, is sufficiently large to admit of a considerable amount of detail being shown without overcrowding. It includes the country from Heilbron, in the Orange River Colony, on the south, to Wolvekraal on the Elands river, on the north, and from Klerksdorp, on the west, to the borders of Swaziland on the east. Pretoria and Johannesburg thus appear in about the centre of the map. On the western sheet there is an inset of part of the Lydenburg district on the same scale as the map itself. The map is printed in colours, and, in addition to the general topographical features and information usually contained on such maps, it shows farms with their official numbers, proclaimed goldfields, and gold reefs.

Mr. Bowyer Bower, the compiler of the map, has had exceptional opportunities for obtaining accurate information, and has himself surveyed a considerable extent of this area, besides which he has made good use of the surveys of others; thus his map will be most serviceable at the present time, although before long it is to be hoped that the country will be systematically triangulated and surveyed on a large scale. A useful index to the names of farms which appear on the map is given as a supplement.

AMERICA.

Argentine. **Buenos Aires and Pacific Railway Co., Ltd.**

Argentine Railways, 1900. Issued by the Buenos Aires and Pacific Railway Co., Ltd., London. Scale 1: 2,534,400 or 40 stat. miles to an inch. Inset map of Buenos Aires. Scale 1: 300,000 or 4·7 stat. miles to an inch. *Presented by the Buenos Aires and Pacific Railway Co.*

A roughly produced map, lithographed in colours, but showing very clearly the different railways and railway systems of the Argentine Republic up to date.

GENERAL.

French Colonies. **Pelet.**

Atlas des Colonies Françaises. Dressé par ordre du Ministère des Colonies. Par Paul Pelet. Paris: Armand Colin & Cie. Livraison iii. *Price* 3 *fr.*

The three maps contained in this part of Pelet's atlas of the French colonies are as follows: No. 9, Afrique Occidentale, I. Sénégal, 1: 3,000,000; No. 12, Congo (feuille sud), 1: 300,000; and No. 26, Polynésie: Établissements français de l'Océanie, on various scales. Like those previously published, these maps have been carefully produced, and are printed in colours. Considerable time has, however, been allowed to elapse between the time of their engraving and that of their publication, as the first is dated April, 1899; the second October, 1899; and the third 1898. Statistical and descriptive information accompanies each map.

Map Slides. **Dickinson and Andrews.**

The "Diagram" Series of Geographical Lantern Slides of Maps. By B. B. Dickinson, M.A., and A. W. Andrews, M.A. To be obtained from G. Philip & Son, London. *Price* 1*s.* 6*d. each* (*coloured*).

Messrs. Dickinson and Andrews deserve the thanks of all geographical lecturers

BRITISH LIBRARY

and teachers for having produced a series of most useful and effectively coloured lantern slides of maps of all parts of the world, which deserve to be more widely known and generally used than they are at present. The following is a list of those recently published, in addition to others which were noticed in the *Geographical Journal* for June, 1899 :—

The World.—(1) Orographical; (2) Mean annual rainfall; (3) Rainfall, December, January, February; (4) Rainfall, March, April, May; (5) Rainfall, June, July, August; (6) Rainfall, September, October, November; (7) Wind systems, January; (8) Wind systems, July; (9) Isobars, January; (10) Isobars, July; (11) Cables and telegraph lines; (12) Steamship routes and principal railways; (13) Strategic importance of the Canadian Pacific Railway.

Europe.—(14) British Isles, orographical; (15) England and Wales, orographical; (16) Wales, orographical; (17) Scotland, orographical; (18) Ireland, orographical; (19) France, political, 1789; (20) France, chief wine districts; (21) France, orographical; (22) German Empire, river basins; (23) German empire, orographical; (24) Holland and Belgium, river basins; (25) Holland and Belgium, political; (26) Netherlands, orographical; (27) Iberian peninsula, political; (28) Iberian peninsula, river basins; (29) Italy, river basins; (30) Italy, orographical; (31) Balkan peninsula, political; (32) Balkan peninsula, river basins; (33) Balkan peninsula, orographical; (34) Russia, river basins; (35) Austrian empire, orographical; (36) Austrian empire, river basins; (37) Switzerland, chief passes; (38) Switzerland, political; (39) Switzerland, river basins.

Asia.—(40) Asia, orographical; (41) South-East Asia, means of communication; (42) South-East Asia, commercial; (43) South-East Asia, orographical; (44) Indian empire, orographical; (45) North-West Frontier, political.

Africa.—(46) Means of communication; (47) Orographical; (48) Africa in 1884, before Berlin conference; (49) Africa in 1885, after Berlin conference; (50) Africa at the close of the Brussels conference, 1890; (51) Cape Colony, commercial; (52) Cape Colony, communications; (53) Cape Colony, south-west, orographical; (54) Cape Colony, east, orographical; (55) Cape Colony, west, orographical and political; (56) Cape Colony, west, political; (57) Natal, orographical; (58) British Central Africa, orographical.

America.—(59) North America, orographical; (60) North America, river basins; (61) North America, economic (minerals); (62) Canada, political; (63) Canada, mean temperature, June, July, August; (64) North-West Canada; (65) British North America, orographical; (66) British North America, zones of vegetation; (67) United States, historical, 1782; (68) United States, orographical; (69) United States, river basins; (70) United States, political; (71) Central America, political; (72) South America, orographical.

Australia.—(73) Orographical; (74) New Zealand, mean annual rainfall; (75) New Zealand, means of communication.

World. **Philip.**

Philips' London School Board Atlas. A series of forty coloured plates, containing over ninety maps and plans, printed in colours, and 8 pages of introductory letterpress. Edited by G. Philip, Junr., F.R.G.S. London: George Philip & Son, 1900. *Price* 1*s*. *Presented by the Publishers.*

This is a commendable attempt to produce a school atlas at a low price on the more enlightened and improved system of teaching geography, and certainly it is a great advance on the cheap school atlases published fifteen or twenty years ago. It has been compiled by Mr. George Philip, Junr., according, as it is stated in the introductory remarks, to the recommendations of a special advisory committee of the London School Board. The maps are both physical and political, and in some cases the latter are drawn on the same scale as the former. The relief is shown by hill-shading and tints of colouring, but occasionally the difference between the latter is not sufficient to be clearly distinguished. One commendable feature of the atlas is that the scales on which the maps are drawn all bear a fixed and simply expressed proportion to one another; that of the maps of the British Isles (1 : 5,000,000) has been taken as the unit, and as many maps as possible have been drawn on this scale. Insets of England or the British Isles, on the scale of the general maps, have been given on all the maps dealing with regions lying outside Europe. Care seems to have been taken in the selection of place-names, and in their spelling the system recommended by this Society has been taken as the guide. Preceding the maps are several pages of introductory letterpress, giving information on map-reading, scales of maps, projections, and matters of a kindred character, which in some respects might be improved and corrected. For instance, in reference to Mercator's projection it is stated that on it "the shortest distance between any two places on the Earth's surface can be found by simply connecting them with a straight line," and that "it is this feature

مكتبة قطر الوطنية
Qatar National Library

which makes Mercator's projection so useful to sailors." This is evidently a mistake. What is doubtless intended is that the correct bearing between any two places is shown by connecting them by a straight line, which is quite a different thing from the "shortest distance" between them.

Although there is room for improvement, still, bearing in mind the low price of the atlas, it must be considered, on the whole, to be a really creditable production, and furnishes additional evidence of the fact that the efforts of this Society in the direction of geographical education are beginning to bear fruit.

World. **Vivien de Saint Martin and Schrader.**

Atlas Universel de Géographie. Ouvrage commencé par M. Vivien de Saint Martin et continué par Fr. Schrader. Paris: Librairie Hachette et Cie. Sheets: 21, Italie; 40, Russie Orientale et Caucasie. *Price 2 fr. each sheet. Presented by the Publishers.*

CHARTS.

Admiralty Charts. **Hydrographic Department, Admiralty.**

Charts and Plans published by the Hydrographic Department, Admiralty, July and August, 1900. *Presented by the Hydrographic Department, Admiralty.*

No.	Inches.	
2640		The World, showing currents (republication). 2*s.* 6*d.*

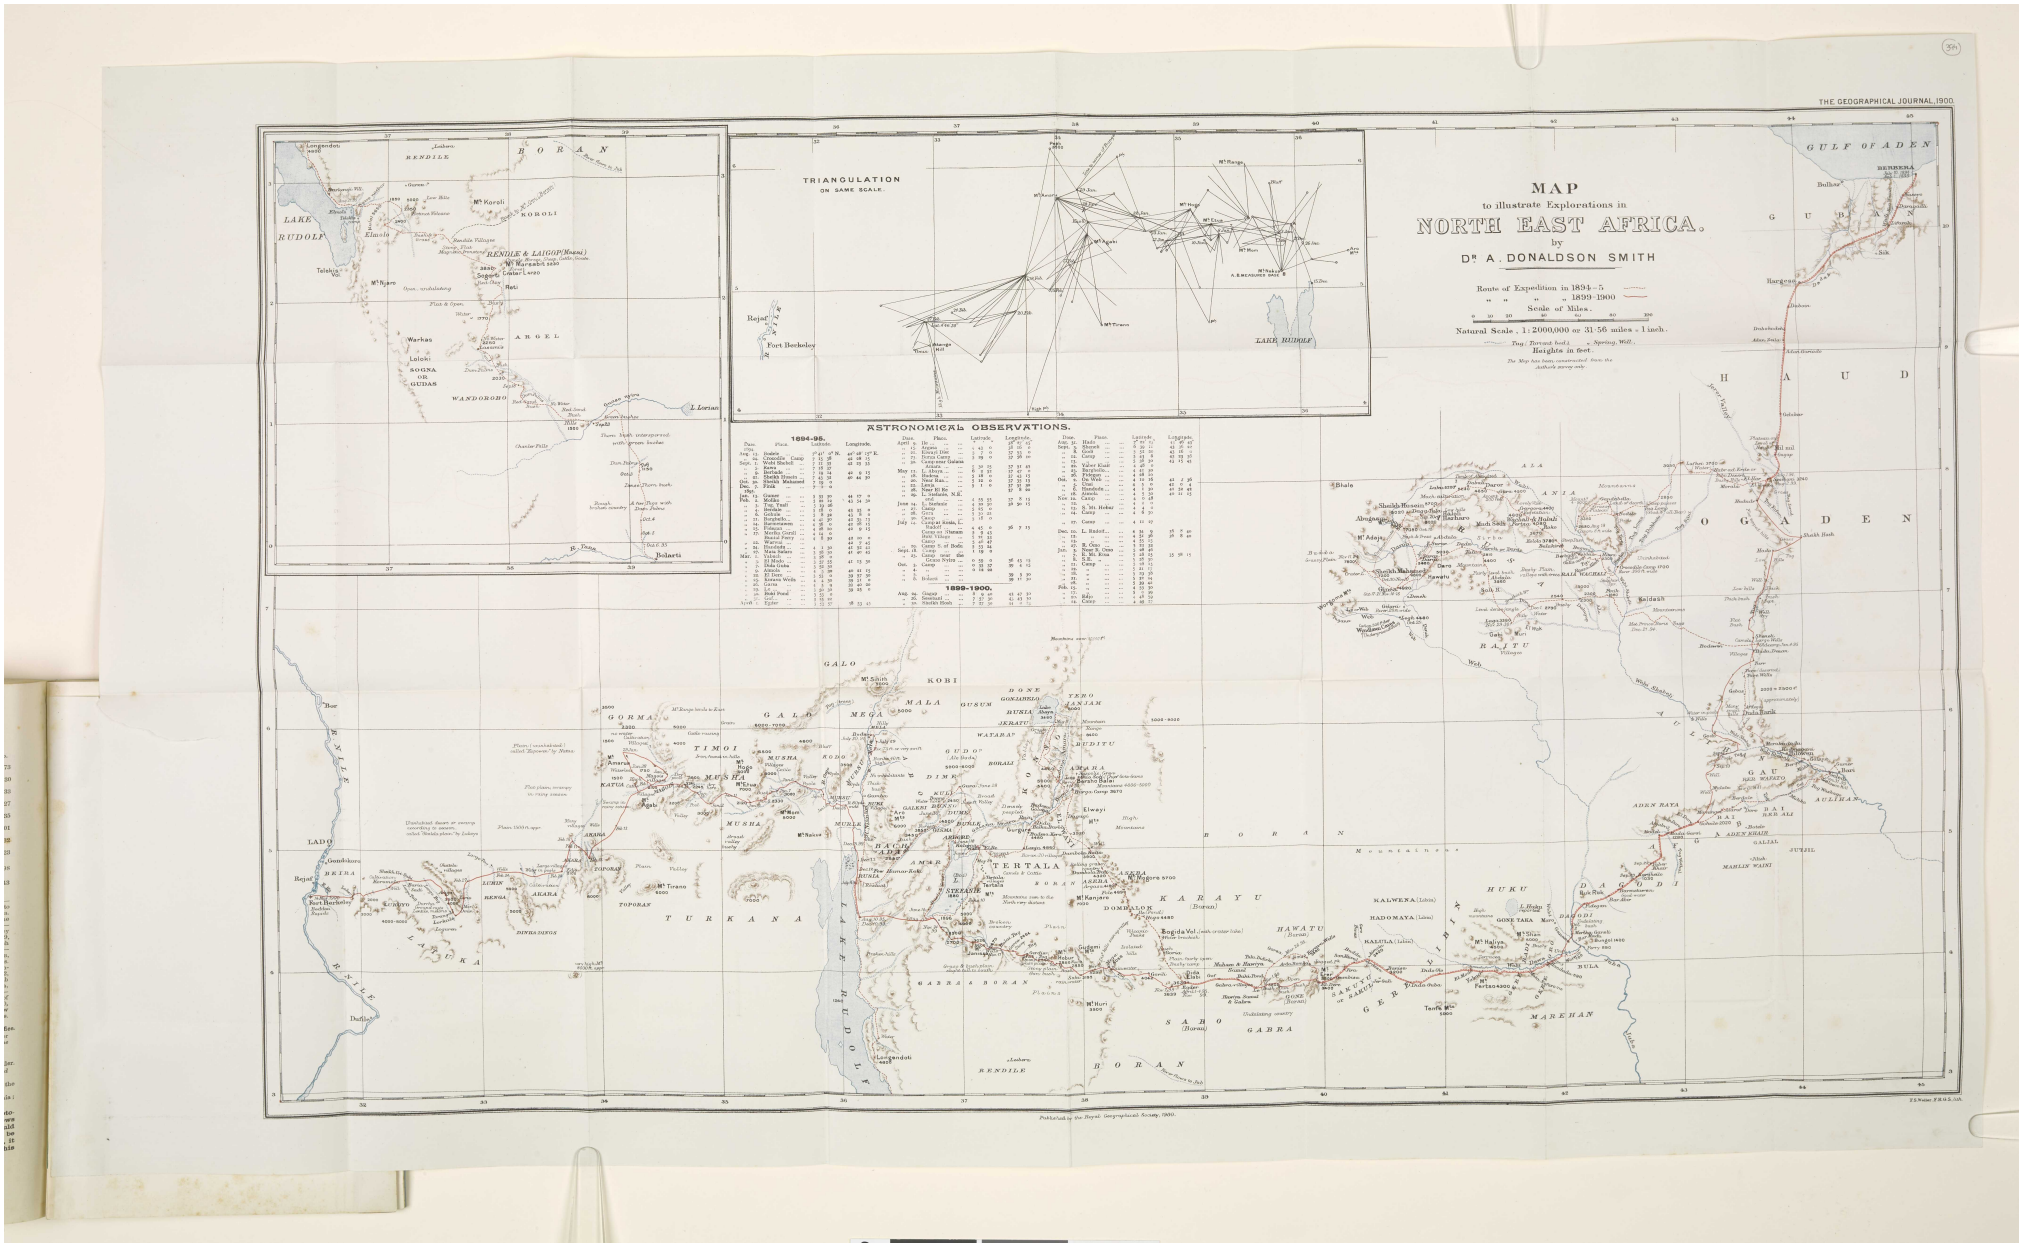
United States Charts. **U.S. Hydrographic Office.**

Pilot Charts of the North Atlantic Ocean for October, and North Pacific Ocean for November, 1900. U.S. Hydrographic Office, Washington, D.C. *Presented by the U.S. Hydrographic Office.*

PHOTOGRAPHS.

Sierra Leone. **Weller.**

Eight Photographs of Sierra Leone, taken by C. L. Weller, Esq., 1900. *Presented by C. R. Weller, Esq.*



These are whole-plate photographs, and serve to illustrate the character of the scenery and native life of Sierra Leone. The following is a list of their titles:—

(1) Village of Ybeng; (2) Rokelle river; (3, 4) Village of Rokon; (5) River Taia; (6) Natives building houses; (7) Group of natives; (8) Natives burning bush.

N.B.—It would greatly add to the value of the collection of Photographs which has been established in the Map Room, if all the Fellows of the Society who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they will be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

ENCYCL

About Christmas Presents.

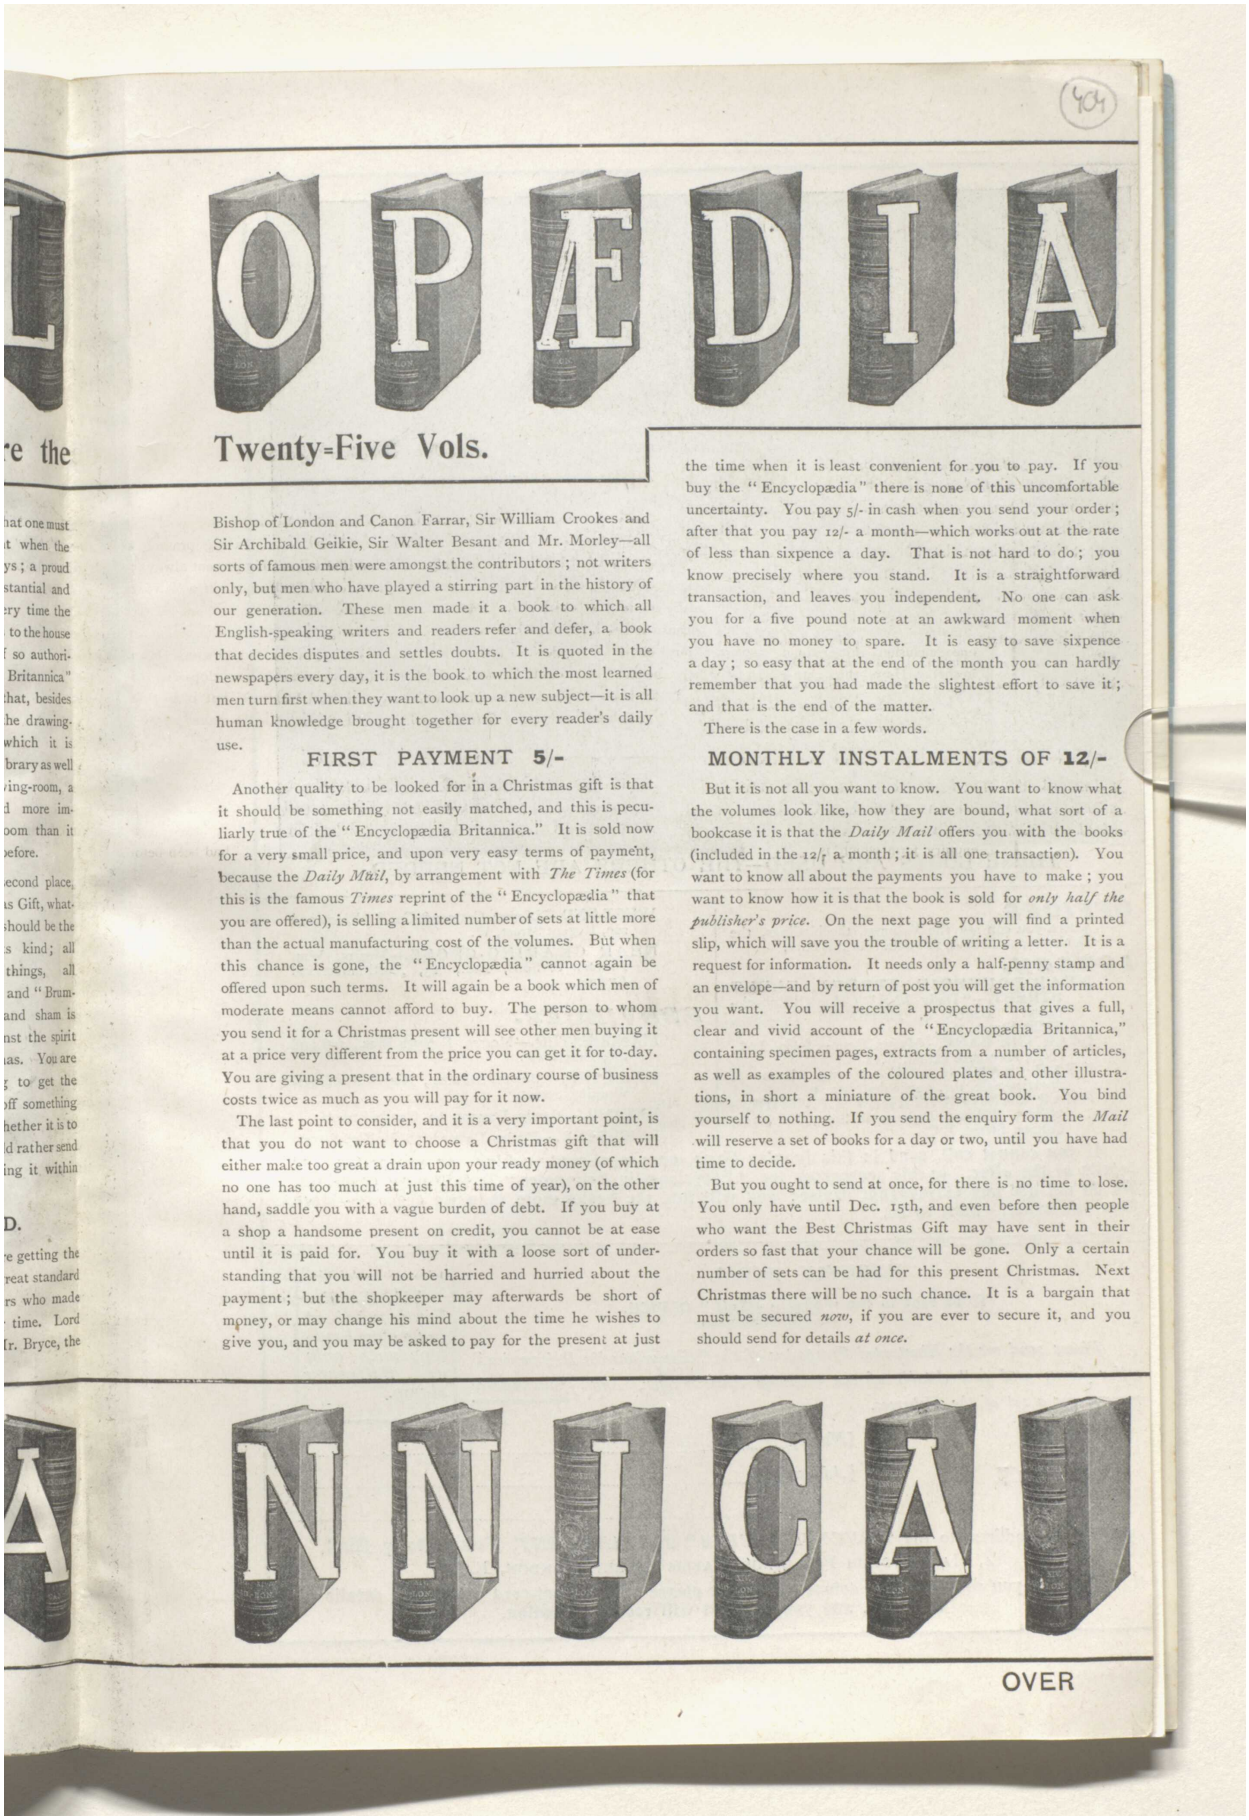
The purpose of this little note is to persuade the reader to select the "Encyclopædia Britannica"—the best of all Christmas presents: a royal gift; and yet a gift which may be obtained for only five shillings in ready money. But an argument is not the less worth reading because it leads to but one conclusion; if it is sound reasoning it must end in some one upshot. Here, then, are some brief statements about the "Encyclopædia" which the reader will judge for himself; and if they interest him he can obtain much fuller information by sending to the *Daily Mail* for the particulars of the offer. A half-penny stamp will carry to its destination the enquiry form which is printed on the fourth page of this advertisement, and by return of post specimen pages and details of the offer will be sent.

You are not asked to make up your mind now that you will choose this particular Christmas present—you are asked only to spend a half-penny in order to see what sort of a Christmas present it is. This advertisement cannot tell you that—the whole magazine is hardly large enough to describe a book that contains 22,000 pages: a library, rather than a book.

In the first place, this very fact that the "Encyclopædia Britannica" is the *biggest* book in the world is an argument in itself. A Christmas gift ought to arrive "with a bump," as the children say, it ought to make a place for itself among the other presents; and a box of 25 large volumes—weighing nearer two hundredweight than one—with another great package containing a revolving book-case, is a gift that does not permit itself to be overlooked. Nor is it only the first impression that one must consider. This present is not only a big present when the carrier delivers it, but it remains a big present always; a proud array of sumptuously bound volumes, in a substantial and convenient case; a present He or She will see every time the room is entered, a present that everyone who comes to the house will admire. It may seem undignified to speak of so authoritative and scholarly a work as the "Encyclopædia Britannica" as if it were a mere piece of furniture, but it is that, besides being a useful and dignified book. It makes of the drawing-room in which it is placed, a library as well as a drawing-room, a richer and more impressive room than it had been before.

In the second place, a Christmas Gift, whatever it is, should be the best of its kind; all shoddy things, all pinchbeck and "Brummagem" and sham is a sin against the spirit of Christmas. You are not trying to get the upper hand of Him or Her at Christmas, to pass off something second best; you want a genuine solid article, whether it is to be a modest gift or an important gift, and you would rather send an important gift if the price and terms of sale bring it within your means.

BEST IN THE WORLD.



If you decide upon the "Encyclopædia" you are getting the best—the very best in the world. It is the one great standard Library of Reference. The eleven hundred writers who made the "Encyclopædia" are the greatest men of our time. Lord Kelvin and Mr. Swinburne, Lord Rayleigh and Mr. Bryce, the

These are the

OPÆDIA

Twenty-Five Vols.

Bishop of London and Canon Farrar, Sir William Crookes and Sir Archibald Geikie, Sir Walter Besant and Mr. Morley—all sorts of famous men were amongst the contributors; not writers only, but men who have played a stirring part in the history of our generation. These men made it a book to which all English-speaking writers and readers refer and defer, a book that decides disputes and settles doubts. It is quoted in the newspapers every day, it is the book to which the most learned men turn first when they want to look up a new subject—it is all human knowledge brought together for every reader's daily use.

FIRST PAYMENT 5/-

Another quality to be looked for in a Christmas gift is that it should be something not easily matched, and this is peculiarly true of the "Encyclopædia Britannica." It is sold now for a very small price, and upon very easy terms of payment, because the *Daily Mail*, by arrangement with *The Times* (for this is the famous *Times* reprint of the "Encyclopædia" that you are offered), is selling a limited number of sets at little more than the actual manufacturing cost of the volumes. But when this chance is gone, the "Encyclopædia" cannot again be offered upon such terms. It will again be a book which men of moderate means cannot afford to buy. The person to whom you send it for a Christmas present will see other men buying it at a price very different from the price you can get it for to-day. You are giving a present that in the ordinary course of business costs twice as much as you will pay for it now.

The last point to consider, and it is a very important point, is that you do not want to choose a Christmas gift that will either make too great a drain upon your ready money (of which no one has too much at just this time of year), on the other hand, saddle you with a vague burden of debt. If you buy at a shop a handsome present on credit, you cannot be at ease until it is paid for. You buy it with a loose sort of understanding that you will not be harried and hurried about the payment; but the shopkeeper may afterwards be short of money, or may change his mind about the time he wishes to give you, and you may be asked to pay for the present at just the time when it is least convenient for you to pay. If you buy the "Encyclopædia" there is none of this uncomfortable uncertainty. You pay 5/- in cash when you send your order; after that you pay 12/- a month—which works out at the rate of less than sixpence a day. That is not hard to do; you know precisely where you stand. It is a straightforward transaction, and leaves you independent. No one can ask you for a five pound note at an awkward moment when you have no money to spare. It is easy to save sixpence a day; so easy that at the end of the month you can hardly remember that you had made the slightest effort to save it; and that is the end of the matter.

There is the case in a few words.

MONTHLY INSTALMENTS OF 12/-

But it is not all you want to know. You want to know what the volumes look like, how they are bound, what sort of a bookcase it is that the *Daily Mail* offers you with the books (included in the 12/- a month; it is all one transaction). You want to know all about the payments you have to make; you want to know how it is that the book is sold for *only half the publisher's price*. On the next page you will find a printed slip, which will save you the trouble of writing a letter. It is a request for information. It needs only a half-penny stamp and an envelope—and by return of post you will get the information you want. You will receive a prospectus that gives a full, clear and vivid account of the "Encyclopædia Britannica," containing specimen pages, extracts from a number of articles, as well as examples of the coloured plates and other illustrations, in short a miniature of the great book. You bind yourself to nothing. If you send the enquiry form the *Mail* will reserve a set of books for a day or two, until you have had time to decide.

But you ought to send at once, for there is no time to lose. You only have until Dec. 15th, and even before then people who want the Best Christmas Gift may have sent in their orders so fast that your chance will be gone. Only a certain number of sets can be had for this present Christmas. Next Christmas there will be no such chance. It is a bargain that must be secured *now*, if you are ever to secure it, and you should send for details *at once*.

CONDITIONS OF FELLOWSHIP, &c.

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that—

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his "admission fee, and £2 as his first annual subscription, or he may compound, "either at his entrance by one payment of £35, or at any subsequent period on the "following basis:—

Fellows of 20 years' standing and over						...	£12 10s.
,,	15	,,	,,	and under	20	...	£16
,,	10	,,	,,	,,	15	...	£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the "Society so long as he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's periodical publications. The *Geographical Journal* is forwarded, free of expense, to all Fellows whose addresses are known.

Copies of the Year Book, Regulations, and Candidates' Certificates may be had on application at the Society's House, 1, Savile Row, London, W.

SPECIAL HIGHEST POWER PRISM BINOCULAR

MAGNIFYING 12 DIAMETERS.

HIGHEST-POWER PRISM BINOCULAR

This Binocular Glass has been specially prepared to meet the demand for a short, handy, light glass of great power.

Power 12 Diameters. Price £9 9s. nett.

Extract from Daily Paper.—An officer in Natal says of a pair of Zeiss field glasses (8 diameters): "They are splendid for examining Boer positions, far better than anything else I've seen, except the swell naval gun telescope, about 4 feet long when shut up."

NOTE.—*These Highest-power Glasses magnify* 12 *Diameters, and are therefore* 33 *per cent. more powerful than those mentioned above.*

SOLD ONLY BY—

HEATH & CO., LTD.,

SCIENTIFIC INSTRUMENT MAKERS,

BY APPOINTMENT TO

THE LORDS COMMISSIONERS OF THE ADMIRALTY, THE HONOURABLE CORPORATION OF THE TRINITY HOUSE, THE BOARD OF TRADE, &c., &c.,

WORKS: CRAYFORD, KENT.

Managing Director—G. W. HEATH, F.R.G.S., M.I.Mec.E.

Samples can be seen at 2, Tower Royal, London, E.C. Orders executed from the Works.

SOMATOSE (MADE FROM BEEF)

The most Powerful Food known to Science. A True Meat Nutrient, and is especially valuable in all cases of

FEVER, DYSENTERY AND INFLUENZA.

Vide "LANCET" of Sept. 30th, 1899.

Is acknowledged by Eminent Medical Authorities at Home and Abroad to be

THE IDEAL FOOD FOR INVALIDS AND CONVALESCENTS.

It is an almost TASTELESS and ODOURLESS POWDER.
It contains nearly 80 per cent. of MEAT ALBUMEN.
It acts directly as a TONIC and creates an APPETITE.
It is NOT a DRUG, but a THERAPEUTIC FOOD.
It is easily SOLUBLE in Water, Milk, Soup, Coffee, Cocoa, etc.

SOMATOSE IS ALSO SOLD AS A LIQUID

Being a more convenient form of administration.

IRON-SOMATOSE

Contains the tonic qualities of IRON combined with the albuminous substance of MEAT.
Causes NO GASTRIC DISTURBANCE or CONSTIPATION.
Does NOT AFFECT THE TEETH.
Is a FREELY SOLUBLE preparation of IRON.

MILK-SOMATOSE

Contains the ALBUMINOUS MATTER of MILK, combined with 5 per cent. of TANNIC ACID.
Is SLIGHTLY ASTRINGENT and NON-IRRITANT.
Is most suitable for STRENGTHENING WEAK DIGESTIVE ORGANS.
Is ESPECIALLY VALUABLE for INFANTS and CHILDREN.

NOW USED IN ALL THE PRINCIPAL CIVIL & MILITARY HOSPITALS.

SOLD BY ALL CHEMISTS.

THE ASIATIC QUARTERLY REVIEW contains Articles by distinguished Statesmen, Officials, Politicians and Scholars of various nationalities, not only on current Oriental and Imperial politics, but also on Oriental Geography, History and Philology, besides Sketches of folk-lore, manners and customs, as interesting to specialists as to the General Reader.

The Imperial and Asiatic Quarterly Review.

(A PUBLICATION OF ABOUT 224 ROYAL OCTAVO PAGES.)

Subscriptions and Advertisements are to be sent to THE MANAGER OF "THE ASIATIC QUARTERLY REVIEW," ORIENTAL INSTITUTE, WOKING, *to whom also arrears due for either subscriptions or advertisements are to be paid, and with whom contracts for advertisements are to be made.**

Books for Review and Literary Contributions generally are to be forwarded to THE EDITOR OF "THE ASIATIC QUARTERLY REVIEW," ORIENTAL INSTITUTE, WOKING.

The January number of 1891 *has inaugurated an Enlarged Series of* "THE ASIATIC QUARTERLY REVIEW," *the scope of which has been extended to Africa and to the Colonies generally, and which has since that date appeared as—*

"THE IMPERIAL AND ASIATIC QUARTERLY REVIEW,
AND ORIENTAL AND COLONIAL RECORD."

The last number of "The Asiatic Quarterly Review," January, 1902, Third Series, Vol. XIII., No. 25. (Price 5s.) 224 pages, royal 8vo.

CONTENTS.

By the Hon. Mr. C. L. TUPPER: "Bonds of Empire."

ASIA.
D. DUNCAN, LL.D.: "Is the Education System of India a Failure as regards Moral Training?"
W. EGERTON, I.C.S.: "The Indian Civil Service as a Career."
A. ROGERS: "Agricola Redivivus."
ALEC MCMILLAN, I.C.S. (Retired): "Unity of Coinage for the Empire."

AFRICA.
PROFESSOR DR. E. MONTET: "The Religious Orders of Morocco."
HAROLD BINDLOSS: "British Dominion in Eastern Africa."

ORIENTALIA:
PROFESSOR DR. E. MONTET: "Quarterly Report on Semitic Studies and Orientalism."
H. BEVERIDGE: "Two Bodleian MSS."

GENERAL.
"PINYA": "A History of the French Missions to Siam."
A. FRANCIS STEUART: "Anglo-Indian Miniaturists."
L. C. INNES: "The Pelasgians: A New Theory."
MAJOR G. E. GERINI: "Siam's Intercourse with China."
PROFESSOR L. MILLS, D.D.: "Tansar's Alleged Letter."

PROCEEDINGS OF THE EAST INDIA ASSOCIATION.

Correspondence, Notes, and News: Storage of Water and Irrigation in India—"Poverty and Un-British Rule in India"—Oriental Studies—Archæological Exploration of India.

Reviews and Notices: Life of Sir William Wilson Hunter, K.C.S.I.—Life of Major-General Sir R. Murdoch Smith, K.C.M.G.—From Cyprus to Zanzibar by the Egyptian Delta—The Thirteen Colonies—Grammar of the Classical Arabic Language—Vedanta Philosophy—China under the Searchlight, etc.

Summary of Events in Asia, Africa, and the Colonies.

Appendix—Containing the Titles of the Articles which have appeared in this Review from the beginning (1886) to 1901 inclusive.

THE ASIATIC QUARTERLY REVIEW publishes Articles by Orientals of standing on Oriental subjects, thus adding the information derived from native authorities to that of European and other specialists.

PUBLISHED BY
THE ORIENTAL INSTITUTE, WOKING, ENGLAND.

* The following are the rates for Subscriptions: per annum, £1; per quarterly number, 5s., inclusive of postage.
The following is the ordinary rate for Literary Advertisements: per page, 5 guineas; half-page, £2 15s.; per line, 2s. For other Advertisements at the rate of 6 guineas per page. Special terms are made for continued Advertisements.

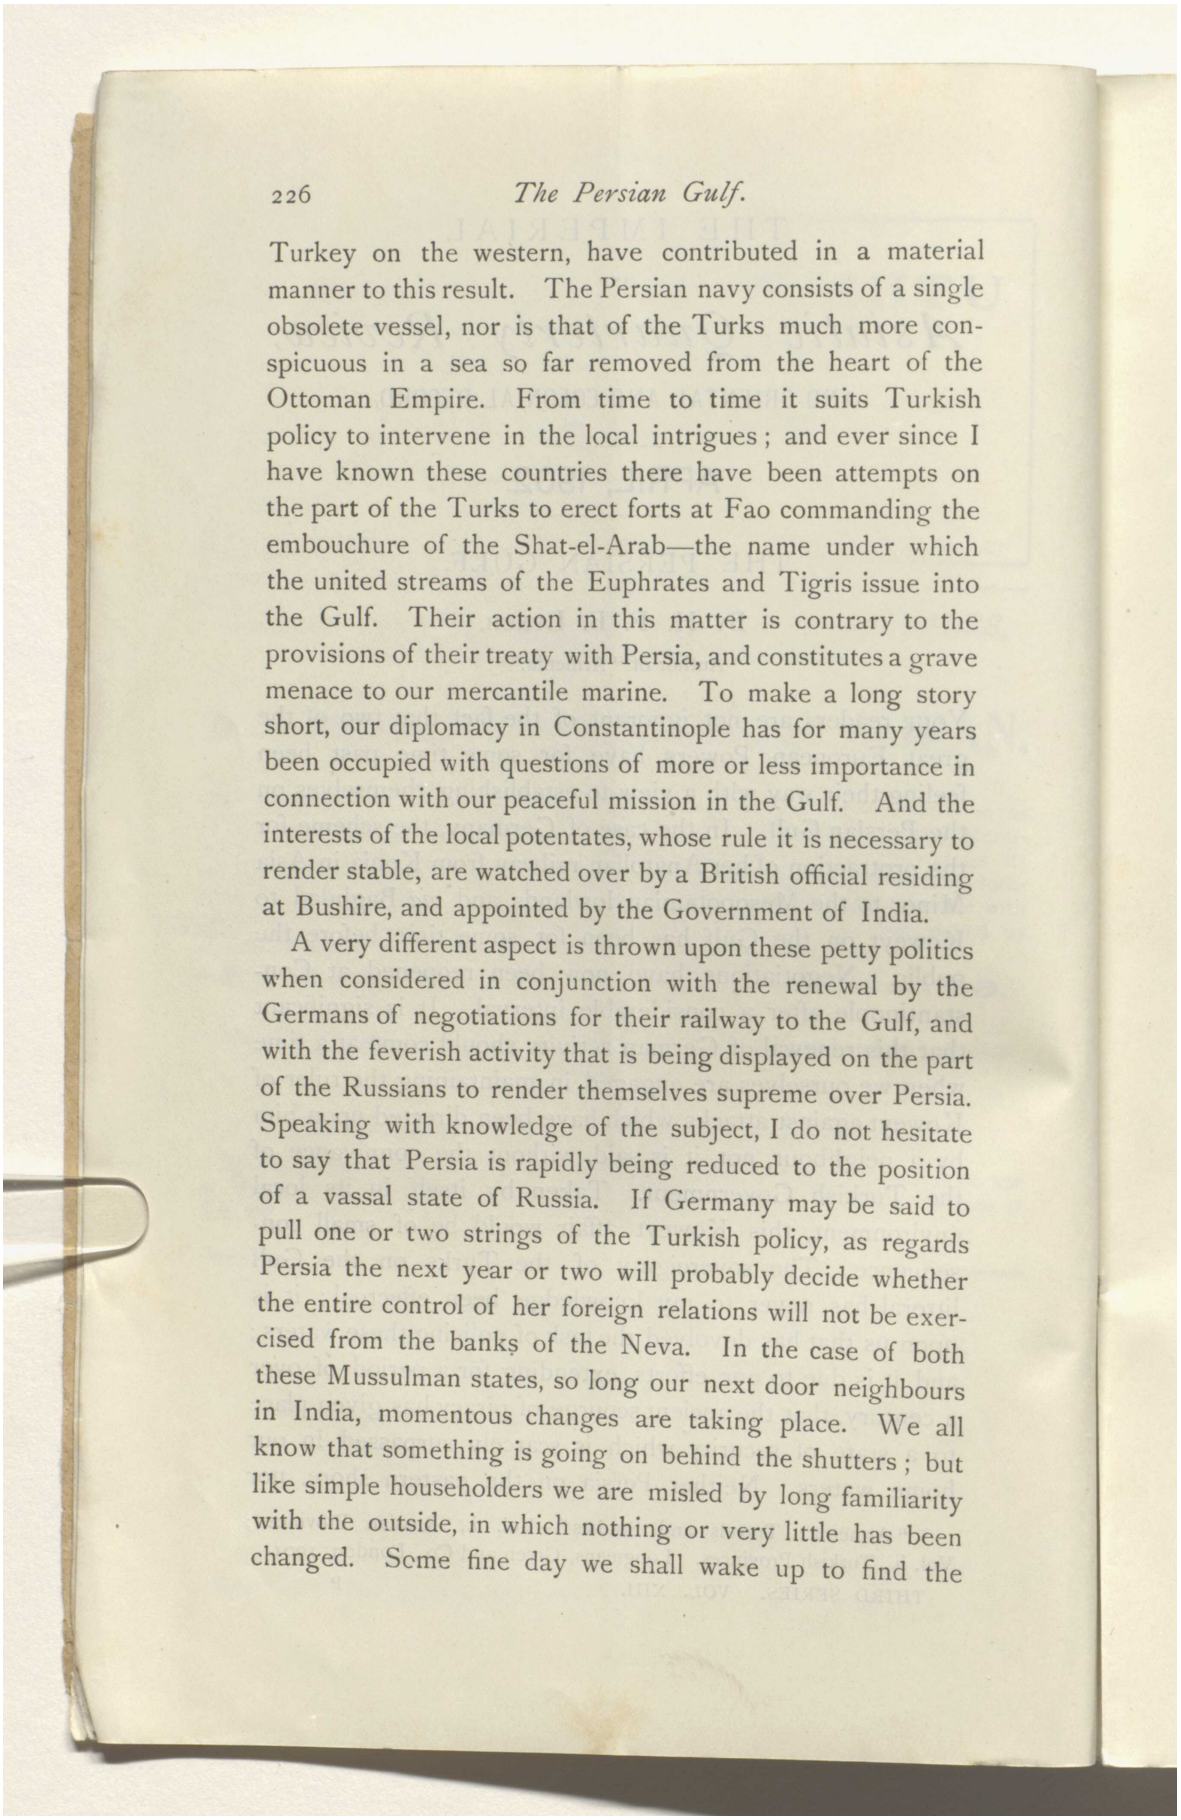
APRIL, 1902.

THE PERSIAN GULF.

By H. F. B. Lynch,
Author of "Armenia."*



Your readers are not ignorant of the fact that two of the great European Powers have for some time past been feeling their way with a view to establishing themselves on the Persian Gulf. In the case of Germany, the scheme for the protraction of her Anatolian railway from Konia in Asia Minor to the Mesopotamian lowlands and *viâ* Baghdad to Koweyt on the Gulf has been for some time before the public. Negotiations have now been reopened at Constantinople after a considerable interval. It is significant that this renewal of German activity should come at a time when we ourselves are engaged in maintaining the ruler of Koweyt against attacks which have been directed upon him by a neighbour, not, it is said, without the connivance of the Turkish Government. Taken by itself in its local environment, this Koweyt affair would be of small consequence. The sovereignty of the Turks on the Gulf littoral has never to my knowledge been effectual; it is upon us that has devolved the task of policing these waters; and it is due to our efforts, extending for a period of over a century, that the ancient scourge of piracy has given place to a state of security which is scarcely surpassed in our home waters. Neither Persia on the eastern shore, nor

Turkey on the western, have contributed in a material manner to this result. The Persian navy consists of a single obsolete vessel, nor is that of the Turks much more conspicuous in a sea so far removed from the heart of the Ottoman Empire. From time to time it suits Turkish policy to intervene in the local intrigues; and ever since I have known these countries there have been attempts on the part of the Turks to erect forts at Fao commanding the embouchure of the Shat-el-Arab—the name under which the united streams of the Euphrates and Tigris issue into the Gulf. Their action in this matter is contrary to the provisions of their treaty with Persia, and constitutes a grave menace to our mercantile marine. To make a long story short, our diplomacy in Constantinople has for many years been occupied with questions of more or less importance in connection with our peaceful mission in the Gulf. And the interests of the local potentates, whose rule it is necessary to render stable, are watched over by a British official residing at Bushire, and appointed by the Government of India.

A very different aspect is thrown upon these petty politics when considered in conjunction with the renewal by the Germans of negotiations for their railway to the Gulf, and with the feverish activity that is being displayed on the part of the Russians to render themselves supreme over Persia. Speaking with knowledge of the subject, I do not hesitate to say that Persia is rapidly being reduced to the position of a vassal state of Russia. If Germany may be said to pull one or two strings of the Turkish policy, as regards Persia the next year or two will probably decide whether the entire control of her foreign relations will not be exercised from the banks of the Neva. In the case of both these Mussulman states, so long our next door neighbours in India, momentous changes are taking place. We all know that something is going on behind the shutters; but like simple householders we are misled by long familiarity with the outside, in which nothing or very little has been changed. Some fine day we shall wake up to find the

BRITISH LIBRARY

ancient Oriental lattices vanished from the window frames, and in their place smug plate-glass and polished knockers. We shall then discover that two of the biggest and most clamorous of our neighbours in Europe have come down upon our seclusion in India by different routes for change of air.

Yes, but like most similes, this one is only partial. We of the Central Asian Society have not confined ourselves, whether as travellers or as thinkers, to the purely scientific and academic side of our subjects. Our labours have lain in the countries surrounding or adjacent to India; and none of us have been able, even had we been willing, to divert and divorce our attention from the momentous political problems which are forced upon us in those lands. The truth is that all these countries have constituted up to the present time a kind of No-man's-land. And in the case of the vast territories bordering upon the Persian Gulf, it is alone due to the long and persistent efforts of our countrymen that they enjoy the blessings of uninterrupted communication with the great markets of Europe, of which the wares have reached them under the protection of the British flag, to be spread into their inmost recesses by land avenues that have been opened up by the pioneer enterprise of British merchants. We have therefore acquired vested interests in the property of our neighbours, as well as the right to demand, and, if necessary, to require that they shall not alienate their estates, in however veiled and tentative a manner, without obtaining our consent. Our case is strengthened by the fact that already on two occasions our arms have been employed in defending these rights.

I have spoken of our trade-routes from the Gulf to the interior; let me now endeavour to group them under convenient categories. The first includes the various avenues ramifying from ports on the Persian littoral, of which the objective are the cities of Southern Persia—Kerman, Yezd, Shiraz, Isfahan. A separate place may be assigned to the newly-developed Seistan route, which,

BRITISH LIBRARY

starting from Quetta, within British territory, makes its way through Beluchistan to Eastern Persia. A third artery follows the course of the Karun River as far as the towns of Ahwaz and Shushter, the latter situated at the foot of the mountains in which it has its source. A caravan road with steel bridges has been constructed across those mountains by the British company navigating the Karun. Starting from Ahwaz on the Karun, it ends at the city of Isfahan—a distance of 250 miles. The fourth category will comprise the valley of the Tigris, which has been navigated by British steamers as far as Baghdad for a period of nearly half a century. The goods which they convey supply the Mesopotamian markets and find their way into Central Persia. I have said nothing of that great trade route between the Black Sea and Northern Persia which owes its existence to British initiative and persistent energy. It lies somewhat outside the scope of this paper, but it enables the products of Manchester still to compete with Russian merchandise in some of the markets of Northern Persia. The extent of our commercial interests in the Persian Gulf itself may be gauged by the shipping statistics. The last year for which they are published is 1900. Out of a total tonnage, entering and clearing at the principal ports, of 963,000 tons, no less than 766,000 tons, or more than three-quarters of the whole, was British. Neither the Russians nor the Germans are represented at all.

There have appeared quite lately in certain organs of the press in England a number of articles and letters designed to familiarize us with the idea of an occupation by Russia of a port on the Persian Gulf. From familiarity to acceptance the road is not long, if once you can be induced to enter the path. At the same time a Russian vessel of war has put in an appearance, following with her searchlights the movements of our small police-fleet in these waters. We are naïvely told that if we could see our way to make Russia this concession—"this supremely valuable concession" are, I believe, the words—there would no longer

BRITISH LIBRARY

exist a cause of disagreement between us, the Russians having no thoughts of invading India. Would there remain, then, no issues with her in Central Asia, to say nothing of Asiatic Turkey and the Far East? Would the pressure become less felt because more near?

For my own part I refuse to believe in the efficacy of any such concession, whether it be made to Russia or to Germany. I have no doubt both Powers would like to repeat on the Persian Gulf their procedure within quite recent times in the Gulf of Pechili. Kiaou-Chaou and Port Arthur are very useful precedents for the seizures of Koweyt and Bunder Abbas or Chahbar. The main argument of the advocates of this "concession" to Russia is that with her assistance we would succeed in keeping Germany out of the field. Did ever notion more fatuous enter the brain of the political schemer? On what grounds could we refuse a German demand for equal measure? No! We must either resist any infringement of the *status quo* as contrary to our vital interests, or we must be prepared sooner or later to see both Powers established on the confines of our Indian Empire.

I say "established," for is there anyone sufficiently ingenuous to credit the hypothesis that the lease or acquisition by either Power of a port on the Gulf would bring us to the end of the matter? To be of any use in these little governed countries, the possession of a port would entail the control of the territories behind; and the political importance and potential resources of these countries combine with their vast extent and scanty population to render them a prize well worthy of a Great Power, and one which is free from the difficulties besetting similar enterprises in China. Germany in Mesopotamia, and Russia in Southern Persia, would be much more likely to come together and squeeze the Englishman out of Asia than we to secure, at all events for any length of time, the assistance of the one against the other. I am now brought to the very kernel of my subject. The interests of the British Empire are so

BRITISH LIBRARY

world-wide and complex that a British statesman has the right to ask whether he is justified by the stake at issue to commit his country to a policy which, if challenged, will have to be vindicated by force, and from which, once adopted, there must be no going back.

I put aside the magnitude of our commercial interests in these countries, which would be sacrificed were they occupied or controlled by a Protectionist Power. My desire is to consider the eventuality of such an occupation as it would be likely to affect our hold upon India and the security of our communications with the Far East. Am I, are we English, too near our subject to see it clearly, in just perspective, so to speak? I turn to the pages of an American writer, whose surveys of world-movements have been studied in this country, and whose name is known to all with respect. In a book not long ago published, and called "The Problem of Asia," Captain Mahan, of the American Navy, has devoted much of his attention to this question of the Persian Gulf and adjacent countries. He bids us suppose for the sake of discussion that the various territories known as Turkey in Asia, instead of composing, as at present, a flabby body, enfeebled by centuries of misrule, were to be braced together into a highly organized modern state. Stretching from the Black Sea and the Mediterranean to the Persian Gulf and the Red Sea, this hypothetical state would control the communications between Europe and Asia, and play in the Eastern Mediterranean the part played by France in the Western. Egypt would be at her mercy just as, during the prevalence of analogous conditions, the valley of the Nile became incorporated into the vigorous Ottoman Empire. He proceeds to draw a most instructive comparison between the relative importance in modern world-movements between China on the one hand, and, on the other, Persia and the territories component of Asiatic Turkey. In the case of China it is her wealth, both actual and potential, that attracts the nations to her gates. One is anxious to come down into these favoured regions; while

BRITISH LIBRARY

others, more remote, have established, or are engaged in establishing, a lucrative commerce and profitable enterprises. A much more important rôle is rightly assigned by Captain Mahan to the countries between the Mediterranean and the Persian Gulf. If their resources, as yet so very little developed, be indeed less than those of China, they are nevertheless sufficiently vast to satisfy the loftiest ambitions. Unlike China, their populations are susceptible of Western culture, and are among the most easily governed in the world. And, while China may be compared to a land upon which the roads converge, forming the goal towards which they tend, these countries—Persia, Mesopotamia, and Asia Minor—lie on the principal highway to that goal. The American naval writer discusses at some length the alternative of the long circumnavigation by the Cape of Good Hope. He rejects it in a weighty argument with which he mingles a little scorn. He regards the canal of Suez, and the proposed canal across the isthmus of Central America, as the main pivots round which the politics of the Old and the New Worlds are destined to revolve. Directing his vision to the struggle between Great Britain and Russia in Asia, he warns us against the dangers of a Russian advance to the Persian Gulf. On the Gulf, Russia outflanks the Afghanistan position and places herself upon our main line of communications with India and the Far East. Such an advance would, in his opinion, materially improve her prospects both of initiating and of sustaining operations in India. We should have her on the flank of our great dependency, controlling the issue of any railway from the Mediterranean through Mesopotamia, and barring the way to its prolongation towards India. It is a consummation which would carry with it—I quote his actual words—"a perpetual menace in war." It would entail on our part the maintenance in Indian waters of a large and costly fleet. To lock her up in the Gulf would involve an exhausting effort to Great Britain and her natural allies. I would add myself that the presence of Russia on the Persian Gulf would go

BRITISH LIBRARY

far towards counterbalancing our occupation of Egypt. "There is no motive," he goes on to say, "in the good of Russia for the other states to consent to an arrangement which carries with it hazard to them." To this statement it may be useful to append the vigorous sentence in which Lord Curzon has summed up the conclusions he arrived at after study on the spot: "I should regard the concession of a port upon the Persian Gulf to Russia by any power as a deliberate insult to Great Britain, as a wanton rupture of the *status quo*, and as an intentional provocation to war; and I should impeach the British Minister who was guilty of acquiescing in such a surrender as a traitor to his country."*

This is all very forcible and clear; but your readers may ask me for a constructive policy. What are my conclusions, as a traveller in most of these countries west of India, as to the part which we should play? Not, certainly, the part of the dog in the manger. We do not desire, we have shrunk from acquiring, even during our war with Persia, when we were in possession, territory on the Persian Gulf. Moreover our commercial policy, for which our persistent practice in all parts of the world is a sufficient guarantee, is a policy of the door open to all comers. What we should endeavour to prevent with all the means at our disposal is the establishment on the Gulf of any European Power. And, as regards the vast land areas which give access to these waters, our policy should be frankly one of spheres of influence†—the only policy which is any longer possible in Persia, and which seems to be dictated by the counsels of ordinary prudence in the case of Asiatic Turkey.

It is fortunate for us—though it is a fact which would appear to be all but unknown to our statesmen—that Nature has herself determined these spheres. In relation to Russia, the natural division between her sphere and ours is formed in Persia by that broad zone of saline and scarcely passable

* "Persia and the Persian Question." London, 1892. Vol. ii., p. 465.

† These words have been misunderstood in one or two quarters. They are not intended to convey the meaning that we should abandon our traditional policy of maintaining the integrity and independence of Persia.

desert which extends on the tableland from the confines of Afghanistan all the way to the neighbourhood of the capital of Persia, Tehran. North of this zone lie the mountains and fertile Persian province of Khorasan with the great Persian cities, Meshed, Nishapur. The trade of Russia is already supreme in this region, to which she has secured ready access by means of her Transcaspian Railway. South of the desert is situated a companion fertile country, comprising the mountains which buttress up the tableland on the side of the Persian Gulf and the Mesopotamian lowlands. This country must continue to be threaded by our commercial arteries, of which the objective are the Persian cities of Kerman and Yezd, of Shiraz, Isfahan and Kum. Our old-established hold upon all these markets must be quickly tightened by improved communications. All attempts on the part of Russia to wrest our predominance in these regions by means of political pressure at the capital must be strenuously resisted. And any "understanding" with her in relation to Persia should be based on a frank recognition of these spheres.

The case of Central Persia and of Asiatic Turkey may be dealt with on similar natural principles. The belt of mountains buttressing the tableland of Persia bends round at the head of the alluvial plains of Mesopotamia, performing the same function for the highlands of Armenia, and, further west, for those of Asia Minor. The ridges sink into the waters of the Mediterranean at the head of Syria, adjoining Cyprus. The lowlands which they confine at their southern extremities should be preserved at all hazards from a foreign occupation, intimately connected as they are with the Persian Gulf. They are threaded from end to end by two magnificent navigable rivers, Euphrates and Tigris. They already form a lucrative field for our trade, which is practically supreme. We must be on our guard against assisting the Germans in constructing a railway across this, our sphere, by consenting to any increase of the tax upon our imports, in order to find the funds for a kilometric guarantee. As

BRITISH LIBRARY

it is our trade that in the main will pay the bill, we should first secure that the projected railway shall be of real use to our communications. This would not necessarily conflict with Turkish requirements. We ought also to obtain a predominant voice in the management of the Mesopotamian section.

Whether the ends which we should have in view can best be obtained by the declaration of a Protectorate over certain portions of the littoral of the Persian Gulf, is a question which must be left for decision on its merits according to circumstances. But I am certain that the general lines of the policy I have ventured to commend to your readers' attention do not involve any obstruction to the legitimate aspirations of either of the new-comers, Germany and Russia. Germany in Asia Minor—by which I mean, of course, the highlands—and Russia in Northern Persia and Armenia have enough to accomplish to provide them with useful occupation for at least a century. No German colonist could bring up his family in Mesopotamia or Southern Persia, and the case is the same for the Russians. This clamour on the part of Russia for outlets for her population in Western Asia is nothing but a herring drawn across the scent. On the other hand, I am equally confident that this policy is vital for England, and that it must be taken in hand before it be too late. If we pursue it, we not only safeguard our communications with India and the Far East, but we maintain and increase our intercourse with markets which will grow in importance as those of China commence to feel the pressure of American competition, assisted, as it will be, by the completion of the canal across the Central American isthmus. But if in fancied security and with lordly generosity we lend our ear to insidious phrases about "understandings" and "concessions"; if we surrender, one by one, our dearly acquired markets and the outposts of our Indian Empire—sooner or later the majestic fabric which we have raised in Asia will fall in pieces to the ground.

IS STATE-AIDED EDUCATION IN ANY SHAPE SUITABLE TO THE PRESENT CIRCUMSTANCES OF INDIA?*

By Sir Roland K. Wilson, Bart.

I have been for some twenty years a member of the East India Association, have attended a fair proportion of its meetings, and have read reports, or noted the subjects, of a great many more; but I have no recollection of any single paper advocating retrenchment in any shape or form. I really think it is about time that a precedent should be created. For surely the fact that ought now to dominate all our thinking, whatever may be the subject immediately under discussion, is

The Poverty of India.

In order that time may not be wasted in controversy as to the precise extent of that poverty, I shall adopt provisionally the most optimistic estimate. For the purpose of the present discussion, and for this purpose only, I shall assume that Lord Curzon is right and Mr. Digby wrong, and shall take £2 rather than 22s. 4d. as the average annual income per head of the entire population of British India. £2 per annum is 1½d. a day, and is hardly more than the weekly wage of a skilled London mechanic. This figure, officially conceded, is quite sufficient to silence for the present all boasting about the blessings of British rule. It is not in human nature to keep on blessing an earthly Providence which cannot save its votaries from going through life half-fed and less than half-clothed. The only question that it leaves open is, whether the Government has been, in regard to this matter, simply powerless for good, or an active instrument of mischief. And this brings me to the next topic bearing upon my argument, namely,

The Amount and Incidence of Taxation.

I will assume for the purpose of the present argument, and for this purpose only, that the chief cause of the general

* See the "Proceedings of the East India Association," elsewhere in this *Review*, for the discussion on this paper.

poverty is the character of the people, their ignorance and superstition, their deep divisions of caste and creed, their apathy and lack of enterprise. I not only concede, but would strongly insist, with Pope, on the relative smallness, among all the ills that men endure, of the part that Governments can—cure. "Cause or cure" are the poet's words; but it is hard to fix any limit to the evil that may be caused, not only by a malignant, but by a benevolently fussy and meddlesome Government. However that may be, no such general considerations will avail to exempt a Government from its own specific share of responsibility for acts of its own tending to aggravate the suffering of its subjects; and under this head must surely be reckoned the impoverishment of the largest, poorest, and most laborious class of taxpayers by means of the land assessment and the salt duty. Whatever else tends to produce poverty, most certainly the direct abstraction of wealth must do so, and more particularly when the money abstracted represents hard manual labour, and is a portion of what is needed for bare subsistence.

I was amazed to read lately in a special article of the *Times*, that undue leniency of assessment discourages industry. I should have thought it hardly disputable that the strength of the inducement to exertion must be diminished by every prospective defalcation from the fruits of labour. It may be otherwise where a little labour will suffice to satisfy all the felt wants of a savage; but I never yet heard of the Indian raiyat to whom that description would apply.

The assurance of the Famine Commissioners that the assessments are low or moderate everywhere except in Bombay, would be more convincing if it were not confessedly based on the selling value of the gross produce, without any reference to the cost of production. For all that appears to the contrary, this might be so great as to leave no room for any Government demand, however moderate. For the same reason one of the chief points in Lord Curzon's reply to Mr. Dutt seems irrelevant to the real issue. My argument, however, does not require me to go beyond his lordship's

BRITISH LIBRARY

own concluding pronouncement, impressing upon the revenue authorities that they must be more careful to avoid over-assessment in future. The land assessment is, of course, not the only shape in which the pressure of taxation makes itself felt. In one way or another, "the cheapest civilized Government in the world" takes from its subjects according to the lowest estimate—*i.e.*, not according to Mr. Digby, but according to the Viceroy—a slightly larger proportion of income than is taken from the far wealthier population of the United Kingdom.* The poorer the community, the more painfully will the subtraction of a tenth of its income be felt. Yet it may well be that the security which only a regular Government can afford must in the nature of things cost more proportionately to a poor country than to a rich one, just as a working man has to pay away a larger proportion of his income in house-rent than a millionaire. If so, there is all the more reason why such a Government should confine itself to its absolutely necessary functions, and should eschew all fancy expenditure.

But this is not all. A heavy burden evenly distributed can be borne more easily than a lighter one ill-adjusted. In India, as is not only admitted, but strongly insisted by so thorough-going an official apologist as Sir John Strachey, the richer classes pay much less, from which it follows that the poorer pay much more, than their proper share. The only province, for instance, which enjoys the privilege of a permanent settlement is one of those in which the settlement was made with the landlords, and not with the cultivators. Here again it may be that as an alien Government we simply cannot afford to quarrel with the well-to-do classes who now get off too easily, for the sake of the overtaxed masses who are too ignorant and apathetic to give us effective support. Or it may be, on the other hand, that we are unconsciously biassed by the fact that the financial system

* Approximately ten as against 9½ per cent., taking £2 and £35 respectively as the average incomes per head, and comparing the combined receipts from taxes and local rates for 1899, 1900.

BRITISH LIBRARY

which favours the well-to-do native favours *a fortiori* the still richer and more influential Anglo-Indian. On either view we have to take account of the fact that the pressure of taxation is more severely felt, owing to its inequitable adjustment, than would appear from the bare statement of its ratio to average income; consequently the need for retrenchment is so much the more urgent.

My next point is that the

NEED FOR INCREASED EXPENDITURE

in certain directions is also urgent, thus further strengthening the case for abolition of superfluous departments. The "cheapest of civilized Governments" is not only not cheap, if by "cheap" is meant "unburdensome to the subject," but is also very imperfectly civilized, if by that adjective is implied that civil rights are efficiently protected and justice accessible to all who need it. We have learnt lately, on the high authority of Mr. Thorburn, that in the Punjab "the Sarkar has failed in the first duties of a Government;" that more agrarian outrages are committed in one year in certain districts of that province than in Ireland during the worst period of Land League domination; and that the civil judges are so overburdened with work that they can think of nothing but clearing their files without attempting to get at the real merits of disputes between raiyat and money-lender. Not in the Punjab only, but all over India, we should have heard less about the necessity for reactionary legislation against freedom of contract, had the simple remedy been first tried of providing a sufficiency of gratuitous, accessible, and trustworthy Small Cause Courts, so as to enable the poor and ignorant to litigate on equal terms with the rich and astute. But if this is a counsel of perfection, incompatible with the present financial straits, at least the urgency of police reform, which cannot be accomplished without money, is notorious and officially admitted.*

Then there is the work of codification at a standstill, a

* The official statistics show an increase of crime during the past decade, concurrently with increased expenditure on education.

BRITISH LIBRARY

matter to which I myself once invited the attention of the public. I showed, or tried to show, how a vast amount of domestic quarrelling and ruinous litigation might be prevented if the Legislature would only do its duty by overhauling the native family laws, and also the general family law of India, instituting systematic inquiries as to the wishes of the classes interested, and legislating accordingly.* Meanwhile, instead of money being found to strengthen the Legislative Department, the valuable time of the Legal Member of Council is being taken up with a roving Education Commission.

All these matters lie well within the first, most indisputable, and most indispensable province of Government. In the second rank of urgency, according to my estimate, in the first perhaps according to some, comes military expenditure. I place it second, because a country is not worth defending externally unless the internal conditions are tolerable; while, conversely, if the internal conditions were perfect, a prosperous and united community of 300 millions would have no need to give a thought to external defence. First or second, I submit (for reasons to be stated presently) that both must be adequately provided for before the claims of State education can be considered. When, however, we come to the question, How much ought India to pay for frontier defence? we find a divergence of views, ranging from a large increase to a very substantial decrease of the present expenditure. I am not now asking you to take sides either with Lord Curzon or with the Indian National Congress in this matter. If Lord Curzon is right, the case is so much the stronger for retrenchment in other directions; and whether right or not, his word is law for the present, and he has told us that we must look for no reduction under this head during his Viceroyalty. On the other hand the persistent demand of the Congress party for reduction of the British garrison to the very lowest point consistent with safety would be more impressive if made

simply in the interest of the taxpayer than if coupled (as it too often is) with suggestions that the money saved should go to swell the education budget. This brings me at last to the main question,

OUGHT INDIA TO HAVE AN EDUCATION BUDGET AT ALL?

Does she require it? Can she afford it?

Of course, if she requires it in the same sense in which she requires courts of justice and laws, and a police force and an army, she must afford it, and on such a scale as to be effective, though millions should have to starve in consequence. But does she require it in any such sense? Please remember that "*it*" is not education *per se*, but State aid to education. The question is not whether education is a good thing in itself, nor whether voluntary efforts for its diffusion are meritorious, but whether it is absolutely necessary to take from individuals without their consent, for the support of the particular kind of education favoured by Government, the money which they might prefer to keep and spend in some other way. The distinction is fundamental, though constantly overlooked.

The protective function of the State must in the nature of things be a monopoly. That is to say, unless there is, throughout any given area, one association, *and only one*, prepared to apply physical force to all disputants who will not listen to reason, there can be no security for honest folk. We all know what would happen if the police, judges, and soldiers throughout India were suddenly to strike work. In the words of Manu, the stronger would roast the weaker, like fish on a spit. We know what actually did happen wherever the British power was temporarily in abeyance during the great Mutiny, and what was always happening somewhere during the century of partial anarchy between the collapse of the Mogul Empire and the consolidation of the British Râj. We know that detached efforts of knights-errant, vehm-gerichts, lynching societies, etc., to supply the place of the vanished Govern-

BRITISH LIBRARY

ment, must from the nature of the case fail to afford security until some one of them succeeds in swallowing up the others, and so re-establishing the one indivisible State. And note that the same result would follow as certainly, though less immediately, from a stoppage in any one of the three departments mentioned. If the police were to strike work, the decrees of the courts would be waste paper. If the courts ceased to sit, the police would not know whom to protect and whom to arrest. If the army were to disband itself, it would not be very long before both police and judges found their commissions superseded by those of some foreign conqueror or native usurper. I need not waste time by showing how the same chain of necessary interdependence embraces also the legislative, diplomatic and financial departments of Government. And I should hardly have thought it worth while to demonstrate that it cannot be made to embrace the Education Department, were it not that the Education Commissioners of 1883 notice, without either endorsing or repudiating, the contention that the claims of this department stand exactly on the same level as those of the others.

Suppose, then, a sudden suspension of all provincial and municipal disbursements for education, the other administrative departments continuing to draw their usual remittances. Would the whole machine be paralyzed? Surely not. Everything would go on as before, except that school-managers would be compelled either to reduce their establishments, or to raise their fees, or to increase their subscription lists; and would on the other hand be free to modify their arrangements to suit the wishes of subscribers and customers without waiting for the approval of the Government Inspector. Whether this would be a change for better or for worse I will consider presently; for the moment I am only concerned to insist that, at all events, the consequences would not be so appalling as to silence all pleadings for economy.

Look at the same matter from the taxpayer's point of

BRITISH LIBRARY

view. In so far as he knows that the money is required for the protective work of Government, the usual compulsory processes, though doubtless convenient, are not really necessary; a threat to exclude him from the corresponding benefit—in other words, to outlaw him—would be quite as effective, at all events in the case of anyone who had more to gain by justice than by injustice. The commodity for which he is asked to pay is one which he can by no possibility obtain by his own exertions or from any other shop. But if an education rate were demanded separately (I do not know whether this ever actually happens in India), he would not be in the least frightened by the threat to exclude his children from the Board school in case of refusal, even if he happened to have any of school-going age. He would coolly compare the bargain offered by the State with the terms obtainable elsewhere, or with the advantage of keeping the children at home, and decide accordingly.

In short, the State has a natural monopoly of protection and justice. It has no such natural monopoly of education. Its right to create an artificial monopoly would be extremely hard to prove, and is, happily, not yet asserted in India. Its comparatively modest claim at present is not to supplant, but to supplement private enterprise. To this claim, standing as it does on a wholly different level from that of the departments to which private enterprise is inapplicable, the objection is, I submit, a legitimate one that the present financial situation does not justify expenditure on superfluities.

It may be argued that the present State expenditure on education is too small to be felt as an extra burden, or to be worth contending about. A million and a quarter sterling may be regarded as a mere flea-bite; but it is in reality more like the first bite of a leech, which, if left to itself, will go on sucking till it is gorged to repletion, or till the life-blood of the victim is exhausted. Widely as educational experts differ as to the way in which the money

BRITISH LIBRARY

should be spent, there is absolute agreement as to the necessity for spending much more than at present if any real good is to be done, and nowhere have I seen suggested any figure, however large, on attaining which they will cease to ask for more. There was, indeed, some appearance of finality in the original aim of the founders of State education in India. It was to impart to the limited class of natives who would have been employed in administrative work under a native Government so much of Western learning as they could be induced to receive, in order to fit them for co-operating with Europeans in the same kind of work. It might reasonably be expected that when once the money value of the new knowledge came to be understood, it would be spontaneously sought and paid for, so that the institutions for higher education would in time become self-supporting; and it was hoped that then the wisdom of the few would in some natural way filter down among the masses. But the case was entirely altered when the Despatch of 1854 proclaimed "the importance of placing the means of acquiring useful and practical knowledge within the reach of the great mass of the people."

As a matter of fact, no public money has been saved even on higher education since that date, in spite of a largely increased income from fees and voluntary contributions, and in spite of a gradual change from the method of direct management to that of "grants-in-aid." But if there had been any saving under this head, it would have been sunk, with all other surplus revenue, in the bottomless morass of what we are pleased to call education of the masses. The Commissioners of 1883 actually speak of "protecting the *right* of the masses to receive primary education, not only against the encroachments of expenditure upon public works and other demands which local boards have to meet, but also against those demands which fall upon provincial revenues." If it is the "right" of every child of school-going age to receive a benefit, which only one in twelve is at present actually receiving, the prospect

Reference: Mss Eur F111/393. Copyright for this page: Public Domain

is remote indeed of relief to the taxpayer from any conceivable curtailments of home charges, however pacific may be our foreign policy, however restricted our employment of Europeans. Every pice that can be saved in other departments must go for many a long year to come in discharge of this alleged outstanding debt to eleven out of every twelve children—say fifty-four or fifty-five millions. Does the debt also include the feeding and clothing of those who would otherwise not be in a fit state to receive instruction? As these will presumably be found among the eleven-twelfths who have not yet been reached, the question is not so immediately pressing as that of the

QUALITY OF THE INSTRUCTION

imparted to the favoured one-twelfth.

For it is unfortunately not a simple case of the proverbial half-loaf, it being well known that bad teaching is worse for a child than none at all. It gives him a lot to unlearn, and intensifies his natural aversion to study of any kind. But in the administration of public funds there is the further danger of arousing discontent by unfair distribution of a benefit, even if the benefit is real to the actual recipients. Thus a poor Government, setting itself to diffuse education among a vast and poor population, is between Scylla and Charybdis. If it spends its small income in maintaining a few good schools at important centres, those who live near those centres must be unduly favoured at the expense of other taxpayers. If, on the other hand, it aims at planting a school of some sort within reach of every child, it is certain that, long before that result is achieved, the quality of the instruction will have fallen (so to speak) below zero. The course actually pursued, of departmental grants-in-aid, combined with a system of partly permissive local rating, presents on paper the appearance of judicious compromise, but in practice steers dangerously near the Charybdis of general inefficiency. The tests by which the grants are apportioned are different in different

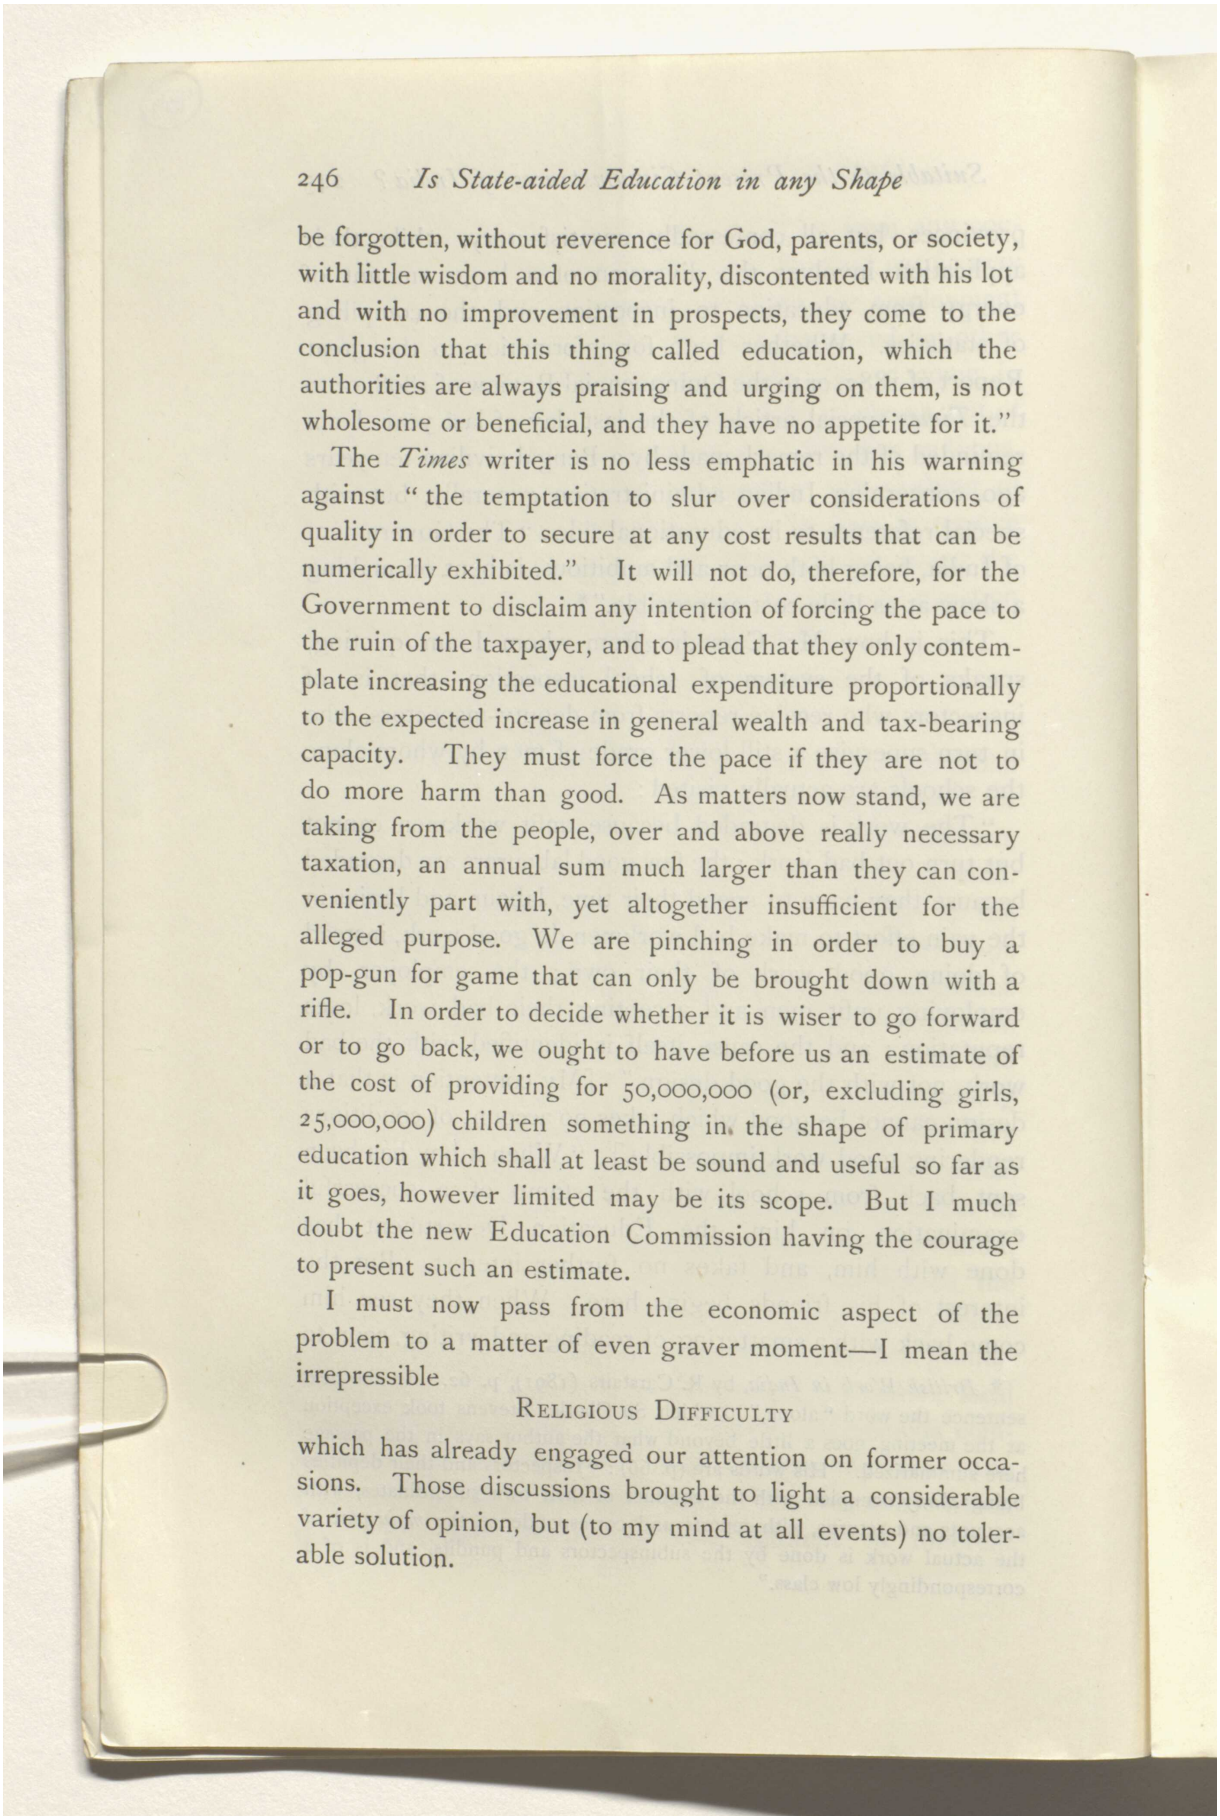
BRITISH LIBRARY

provinces, but all confessedly unsatisfactory, while their application involves the diversion of a large amount of energy from education to inspection and the compiling of statistics. Whether I go for information to the great Report of 1883, or to the Quinquennial Review of 1898, or to the *Times* special article of the last day of last year, I am reminded of the remark made by a Bengal civilian ten years ago, concerning Indian administration generally, but with special reference to its educational side: "The Government of India, being both poor and ambitious, is bent on making a show at as little cost as possible."*

This is how Mr. Carstairs, from whom I am quoting, speaks of the system of school inspection—that is, of inspectors who receive reports from deputy-inspectors, who in turn supervise a still lower grade of men by whom alone the schools are actually visited:



"The work is degraded because unfit workmen cannot but turn out bad work; the few good labourers are degraded because they have to spend their time, labour and brains in the vain effort to make bad workmen do good work, instead of doing good work of their own; the employer, by employing unfit men and accepting their bad work, loses reputation; and the cause itself is identified with the bad work, not with the good design." [My contention is that a design cannot be good which takes no account of conditions rendering good work impossible.] "When a boy has been sent back from school with the stamp of a successful examination on him, the Education Department has done with him, and takes no further interest. But the interest of his friends begins here. When they see him come back with a smattering of reading and writing, soon to

* *British Work in India*, by R. Carstairs (1891), p. 62. In the next sentence the word "alone," to which Sir Charles Stevens took exception at the meeting, goes a little beyond what the author says in the passage here summarized. His words are (p. 66): "Inspectors and their deputies being *chiefly* occupied with the conduct of their own subordinates, with accounts and returns, with reports and correspondence, the *main* part of the actual work is done by the subinspectors and pundits, and is of a correspondingly low class."

be forgotten, without reverence for God, parents, or society, with little wisdom and no morality, discontented with his lot and with no improvement in prospects, they come to the conclusion that this thing called education, which the authorities are always praising and urging on them, is not wholesome or beneficial, and they have no appetite for it."

The *Times* writer is no less emphatic in his warning against "the temptation to slur over considerations of quality in order to secure at any cost results that can be numerically exhibited." It will not do, therefore, for the Government to disclaim any intention of forcing the pace to the ruin of the taxpayer, and to plead that they only contemplate increasing the educational expenditure proportionally to the expected increase in general wealth and tax-bearing capacity. They must force the pace if they are not to do more harm than good. As matters now stand, we are taking from the people, over and above really necessary taxation, an annual sum much larger than they can conveniently part with, yet altogether insufficient for the alleged purpose. We are pinching in order to buy a pop-gun for game that can only be brought down with a rifle. In order to decide whether it is wiser to go forward or to go back, we ought to have before us an estimate of the cost of providing for 50,000,000 (or, excluding girls, 25,000,000) children something in the shape of primary education which shall at least be sound and useful so far as it goes, however limited may be its scope. But I much doubt the new Education Commission having the courage to present such an estimate.

I must now pass from the economic aspect of the problem to a matter of even graver moment—I mean the irrepressible

Religious Difficulty

which has already engaged our attention on former occasions. Those discussions brought to light a considerable variety of opinion, but (to my mind at all events) no tolerable solution.

Dr. Duncan was completely successful as against both Mr. Maconachie and the bishops, in showing that the reasons for strict neutrality on the part of the Government are as strong now as they ever were.* I fail to see that he (or anyone else) has succeeded in rebutting the presumption that a body which is debarred from meddling with religion must be unfit to control education. The distinction thus forced into prominence between secular and religious subjects is very modern, highly artificial, and probably ephemeral even in the West; it is still more difficult to imagine its taking root in the East. An uneasy consciousness of this incongruity has been undoubtedly one of the motives for the gradual extension of the grant-in-aid system in substitution for institutions directly managed by Government. Dr. Duncan laid stress on the point, as proving that the alleged moral failure of the system as a whole cannot be due to exclusion of religious teaching, that in 85 per cent. of the schools, comprising more than two-thirds of the pupils, the religious teacher has a free hand. *But has he?* Let Dr. Duncan himself answer the question. He says:

"Of the extent to which teachers in non-Government schools take advantage of their freedom it is impossible to speak otherwise than in general terms. On all except private schools the pressure of the secular subjects is felt to be heavy."

He goes on to remark that in missionary and non-mission schools alike all earnest-minded teachers "feel the difficulty, but at the same time the necessity, of striving against the engrossing pursuit of those immediate and tangible results that aid directly in the struggle for existence." My complaint is that this natural and universal difficulty is aggravated, instead of being relieved, by the conditions of State aid. To the same effect is the testimony of an earnest-minded Hindu in the Calcutta weekly called *New India*:

"It is the cultivation of memory alone that is the aim of

* See this *Review* for January last, pp. 1-20.

the Indian educational system. . . . And the result has been that our teaching manufactories have been turning out graduates who are generally more or less ignorant of all true culture."

The grant-in-aid system is no more a solution of the difficulty in India than it is in England. The money grant is more eloquent than the finest Viceregal oration, and it declares unmistakably to all concerned that the studies inspected and paid for are, in the opinion of the State, the essentials of good education, and that the studies ignored are unimportant extras. For this reason I maintain that if there is any Government in the world fit to control so sacred and personal a business as education, it is certainly not one pledged to religious neutrality. Still more unfit, of course, would be a Government identified with the religion of an insignificant minority of its subjects; which, however, I do not understand to be the present position of the Government of India, notwithstanding a sentence in the Queen's Proclamation of 1858 which might be so interpreted.

Moral and Political Difficulties.

Until recently the Government concerned itself almost as little about moral as about religious training, and it is quite an open question whether it has strengthened or still further weakened its position by abandoning that attitude, and (among other things) bestowing its *imprimatur* on untheological moral text-books, compiled expressly for school use. I do not gather that these text-books have been received with much enthusiasm, but cannot speak of them from personal knowledge. There is, however, one officially recognised text-book, dealing with that special branch or offshoot of ethics commonly known as politics, which I have read, and about which I have something to say. I refer to Sir William Lee-Warner's "Citizen of India."

I observe that it has been recommended for school use in all parts of British India, and is even supplemented by an "Authorized Guide" for examination purposes.

Concurring in the general appreciation of the versatility of Sir William's genius, and of the excellence of his intentions, I must yet pronounce the official adoption of his book by the Indian educational authorities a grave political indiscretion. I am not quite sure that the permanent mischief would have been greater, though, of course, there would have been more outcry at the moment, if Bishop Welldon's aspiration for the close of the present century had been realized at its commencement, and the Bible had been ordered to be read in all Government schools. For it amounts, in effect, to imposing a political test on all managers and teachers of State-aided institutions. The little book bristles with dogmatic assertions about matters that are keenly debated, all tending to the glorification of the British Government as it was and is. The title is a misnomer, suggesting, as it does, the possession of those political rights which are, as we all know, withheld for the present from the people of India. It is brightly written, and might pass well enough as a private venture; as a text-book officially prescribed it cannot fail to be a source of irritation and embarrassment to well-informed and conscientious teachers. The *Times* writer already quoted tells us that the profession of teaching as a career is a byword among educated natives; it is not likely to gain in dignity when the teacher is required not only to restrain the expression of his political views, but to be *ex officio* an apologist of things as they are.

And yet it is difficult to see how trouble of this sort is to be avoided if we once grant the assumptions that it is the duty of the State to undertake the moral education of the people, and that politics are a branch of morals. Sir Henry Maine, himself a very eminent Indian official, once remarked that the official mind does not love criticism; which is, after all, not saying much more than that officials are human. If the Government of the day is entrusted with the task of moulding young minds, what else can we expect but that they will be moulded according

BRITISH LIBRARY

to the Government pattern? unless, indeed, they are driven by a natural reaction into Nihilism.

The answer to all these objections will, no doubt be that it is worth while to encounter every sort of difficulty, economic, religious, or political, rather than that the people should remain uneducated. The small residue of my time must, therefore, be devoted to satisfying you, if I can, that there is no such dilemma.

What would Happen if State Aid were Withdrawn?

In their dread of losing the very meagre State aid that they now receive, Indian educationists are like the man in the story who clung agonized to a rope till he died of fright, thinking that he was hanging over a precipice, when his feet were actually almost touching the ground. I have pointed out already what would happen if the rope were to be cut—in other words, if all educational grants were suddenly to cease. School managers of all kinds would have to look about for voluntary support, and would have to put up the shutters if they failed to obtain it. That a good many existing institutions would have to do this I have no doubt; but I also very much doubt its being a matter for regret.

Complaints are rife in France just now that the country is suffering from a superfluity of doctors without patients, lawyers without clients, and disappointed candidates for Government employment, and there is a good deal of evidence that in India also the supply of the sort of educated youth turned out by Government schools and colleges is considerably in excess of the demand. As regards primary education, there is not much substance in the argument that the *raiyat* must be taught to read and write and calculate in order to save him from being cheated by the *banya*. Not long ago a highly-educated Indian lady, wife of a learned professor, told me that a village belonging to her husband was left entirely to the management of his aunt, a Hindu widow of the old school,

who could neither read nor write, but who managed it perfectly, and that when this lady came to visit her she found herself quite taken out of her depth among the technicalities of revenue law with which her illiterate relative seemed perfectly familiar. Moreover, English experience goes to show that the "three R.'s" cannot be effectively taught except as a part of a good all-round training, which the present schools are quite unable to supply. On the whole, considering the many other urgent demands on the average income of 1½d. a day, I can well believe that general social progress might benefit in the long-run by some temporary contraction of scholastic expenditure. But, considering how deeply respect for learning is rooted in the traditions of both Hindus and Muhammadans, I see no reason to apprehend that the voluntary support of education would fall below a standard fairly corresponding to the actual resources of the population; and I see a good deal of reason for supposing that the kinds of education supported would be more closely adapted than at present to actual needs.

Of the institutions that survived the loss of State aid, some would do so by working on strictly commercial lines, supplying only those kinds of instruction in which teaching could be had cheap, or for which parents would be able and willing to pay high fees. And in this connection I may observe that a powerful stimulus would be applied to private educational enterprise were the Government at last to consent to the holding of examinations in India for the higher Civil Service. Other schools and colleges would appeal for public support on non-commercial lines.

The great missionary societies, for instance, no longer lured aside from their professed aim by the bait of Government grants, would cease to fill their schools with non-Christian children under non-Christian teachers in the strange fashion described to us the other day by Dr. Duncan and the speakers who followed him; would concentrate their attention on the conversion of parents, and

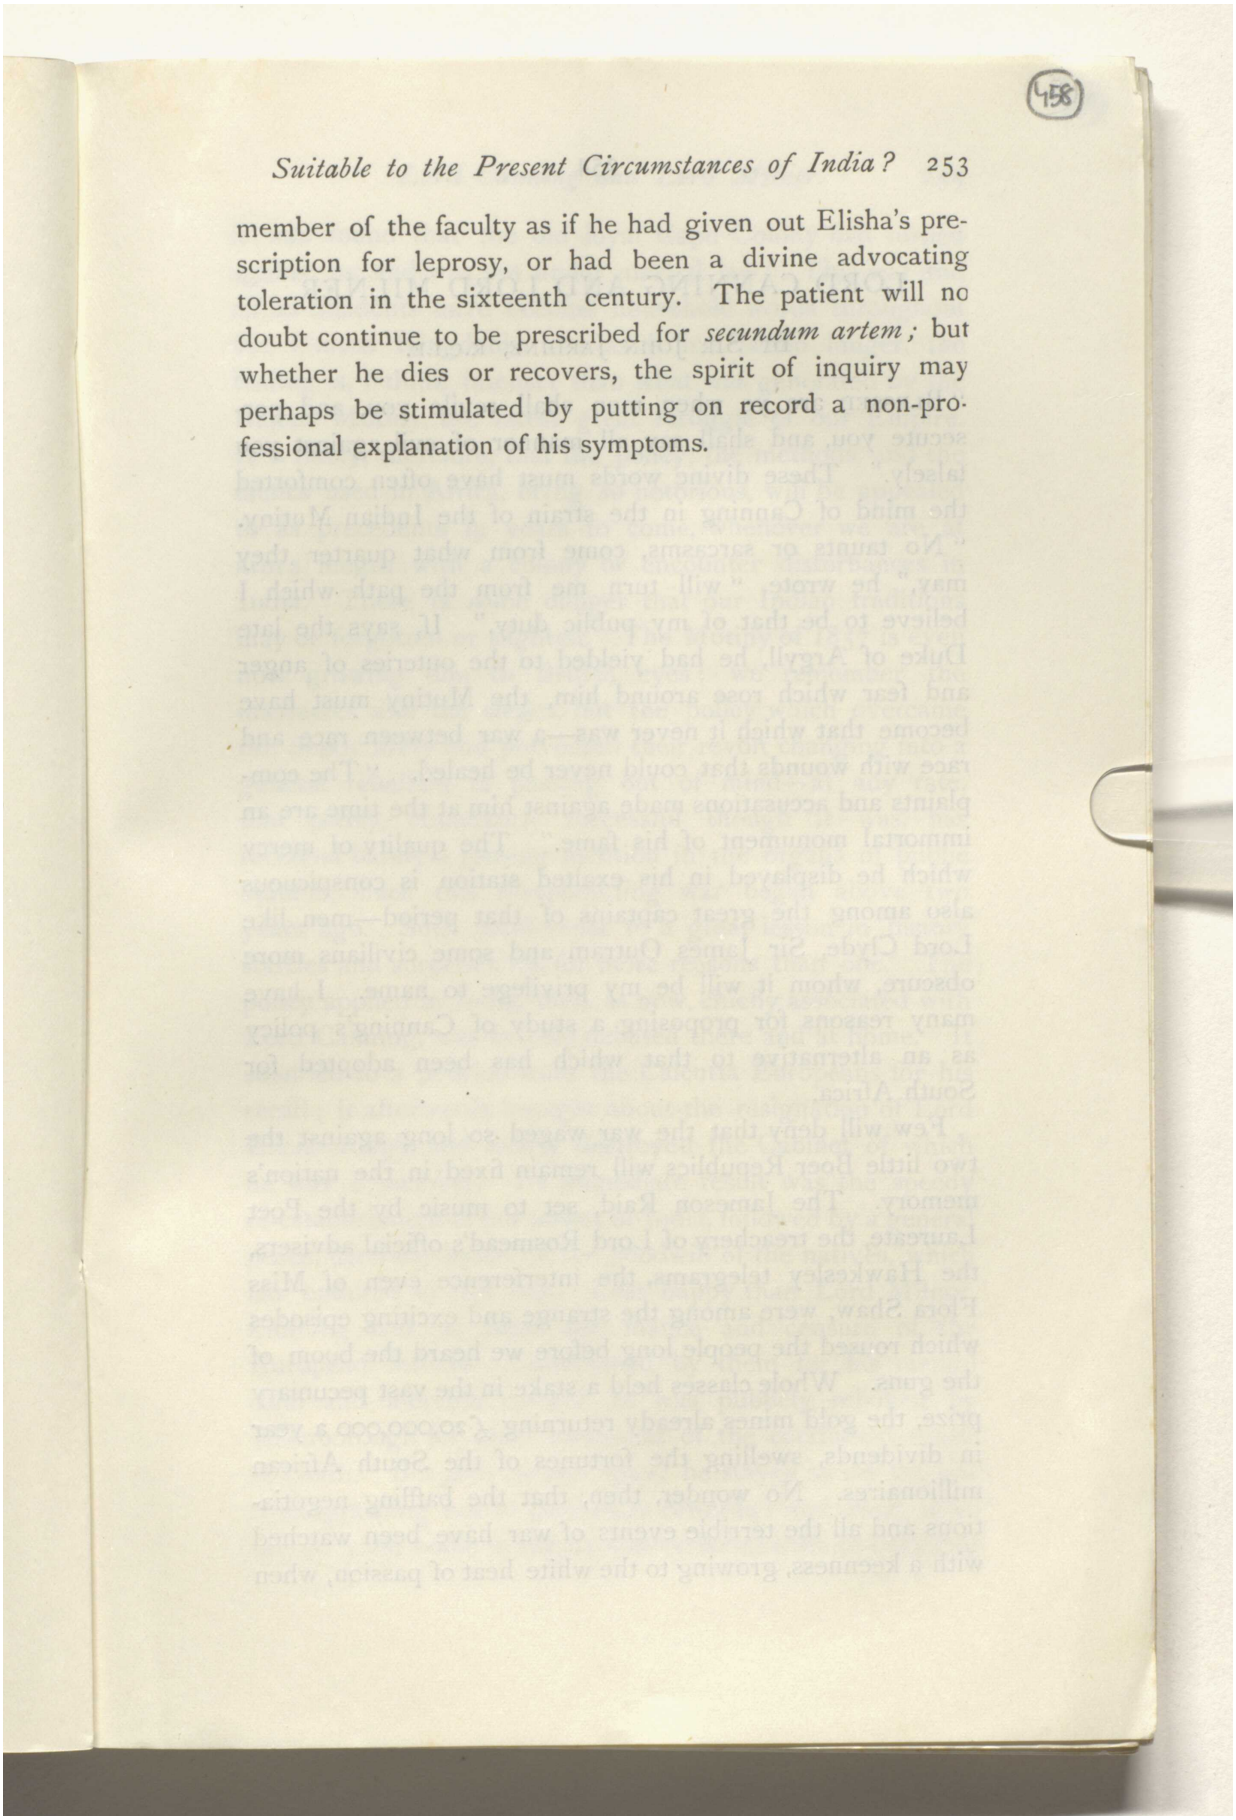
BRITISH LIBRARY



on making model Christians of the children entrusted to their care as Christians, and would be able to ground their appeals to their wealthy co-religionists at home on a more intelligible basis. If, on the other hand, the plan of purely secular education, now pursued of necessity in Government schools, should happen to commend itself in principle to any considerable number of persons, they would combine to take over from the State the financial responsibility for these institutions. Similarly, those who desire with Mr. Maconachie to connect all teaching with a profession of theistic belief would be free to enlist what support they could in favour of institutions on that basis. Personally, I should expect and welcome a great increase of activity on the part of the Brahmo Somaj and kindred bodies, which aim at disengaging the purer from the baser elements of Hinduism; and if the orthodox Hindus and Muhammadans were to be goaded thereby into educational rivalry, so much the better. The Dayanand Anglo-Vedic College, under the management of the Arya Somaj, shows what may be done in this way. All that is really alive in native society would show quite another sort of energy when relieved from the enervating influence of official patronage and control, and at the same time from the fiscal oppression which is the obverse of the same phenomenon; while the Government, no longer hampered by inconsistent pledges, and discredited by poor performance after large promises, would be vastly stronger for its proper work. It might then educate by example more effectively than now by precept.

All this, however, is purely hypothetical; what might have been, what possibly might be even now, if home public opinion were other than it is. Though I spoke at the commencement of "advocating" retrenchment, my task has really been one of diagnosis rather than of prescription. I do not need to be told that the physician who in these days should prescribe a plain diet of voluntaryism for India or any other over-governed community would have as little chance of being met in consultation by any self-respecting

LORD CANNING AND LORD MILNER.

By Sir John Jardine, K.C.I.E.

"Blessed are ye when men shall revile you, and persecute you, and shall say all manner of evil against you falsely." These divine words must have often comforted the mind of Canning in the strain of the Indian Mutiny. "No taunts or sarcasms, come from what quarter they may," he wrote, "will turn me from the path which I believe to be that of my public duty." If, says the late Duke of Argyll, he had yielded to the outcries of anger and fear which rose around him, the Mutiny must have become that which it never was—a war between race and race with wounds that could never be healed. "The complaints and accusations made against him at the time are an immortal monument of his fame." The quality of mercy which he displayed in his exalted station is conspicuous also among the great captains of that period—men like Lord Clyde, Sir James Outram and some civilians more obscure, whom it will be my privilege to name. I have many reasons for proposing a study of Canning's policy as an alternative to that which has been adopted for South Africa.

Few will deny that the war waged so long against the two little Boer Republics will remain fixed in the nation's memory. The Jameson Raid, set to music by the Poet Laureate, the treachery of Lord Rosmead's official advisers, the Hawkesley telegrams, the interference even of Miss Flora Shaw, were among the strange and exciting episodes which roused the people long before we heard the boom of the guns. Whole classes held a stake in the vast pecuniary prize, the gold mines already returning £20,000,000 a year in dividends, swelling the fortunes of the South African millionaires. No wonder, then, that the baffling negotiations and all the terrible events of war have been watched with a keenness, growing to the white heat of passion, when

it was found that the old loyal Cape Colony had turned against us, and was put under martial law! This war and all its incidents have become household words throughout the United Kingdom; and as it has lasted longer, the feeling is, I think, intenser than what was generated by the Indian Mutiny, the latest great struggle of our Empire. It is likely, therefore, that the policy, the methods, and the tactics used in Africa, being so notorious, will be appealed to as precedents in years to come, whenever we are at arm's length with a colony or encounter disturbances in India. There is some danger that our Indian traditions may be forgotten or slighted. The Mutiny of 1857 is even now growing dim to British eyes; we remember the massacres and the sieges, but the policy which overcame the Sepoy army and prevented their revolt changing into a general rebellion is passing out of mind—at any rate, that policy, abundantly successful though it was, has received barely a passing mention in the organs of public opinion, since this disappointing war began above two years ago. Such indifference to a great lesson in history startles and surprises me for more reasons than one. The policy applied in India, then, as now, chiefly associated with Lord Canning, was fiercely debated there and at home. It soon led to a petition from the Calcutta Europeans for his recall; it afterwards brought about the resignation of Lord Ellenborough, and nearly destroyed the Cabinet of which he was a member. Its immediate result was the speedy re-establishment of our power in India, followed by a general peace, carefully based on the goodwill of the natives, which has endured to this day. Less happy than Lord Milner, Canning had to bear the malice and censure of the European settlers. Condemned by them for his mental calm and merciful control, he was publicly rebuked by Ellenborough for cruel treatment of the conquered rebels of Oudh. But *finis coronat opus:* he stayed to see the war over, grasping not at premature rewards; and when, worn out, he came home to die, he was crowned with an enduring

fame. The much-abused Viceroy may be pictured in the words of Bunyan: "They saw a man clothed all in white; and two men, Prejudice and Illwill, continually casting dirt upon him. Now, behold, the dirt whatsoever they cast at him, would in a little time fall off again, and his garment would look as clear as if no dirt had been cast thereat."

The man and his methods stand out in bold contrast to Lord Milner from first to last as I intend to show; and it detracts nothing from the greatness of Canning to remark that his views were supported and often anticipated by the splendid body of Civil Servants on whom he had to depend. These were men of a different stamp to the magnates of Rhodesia and Johannesburg. Forbidden by law to trade or speculate, they were single-minded in character, straightforward in conduct. Holding high positions, in their prime of life, they kept their heads and temper; and, being fearless, they had no desire to be cruel, as Mr. Keane proves in that book of his called "Fifty-Seven," so full of examples to our younger Civil Servants. Let those who have sneered at the hunted Boers remember that many of these Anglo-Indians had an abiding faith in God, which they took no pains to hide. That excellent officer, Mr. Henry Carre Tucker, the Commissioner of Benares, wrote in reply to the Governor-General that the stand-by of his little band in those dreadful times was 2 Samuel xxii., a fine use of holy texts like these: "The Lord is my rock and my fortress and my deliverer," "The sorrows of hell compassed me about: the snares of death prevented me. In my distress I called upon the Lord and cried unto my God." Nor was his trust in vain. Cool and brave, he used to ride about with his daughter in the most exposed places; and when peace came back he might have boasted with David: "Thou hast given me the necks of mine enemies that I might destroy them that hate me." But revenge was no motive of his. He tried to save innocent natives from that wild justice; and he urged Lord Canning to confer powers of life and death on the Civil Servants as being better judges

of evidence than regimental officers. His brother, the judge of Futtehpore, who was killed bravely fighting on the top of his Court-house, lived under the same religious influences. He it was who set up at the entrance of that station the four pillars of stone, engraved in Persian and Hindee, with our Ten Commandments. I have only instanced two of the many religious men of that time, whose wisdom and bravery in the awful months of trial were only equalled by the generous and merciful spirit they displayed to the beaten enemy. Seldom in history do we find such simple following of the Christian doctrine about forgiveness. Others there were, like Colonel Neill, who justified out of the Old Testament what Sir J. Kaye calls "the indiscriminate ferocity of military men." Many of these soldiers, however, were just and gentle; unselfish, conscientious leaders like Sir James Outram, who silenced a fire-eater with the remark that officers who boast most loudly of bloodshed are often the least courageous in the battle. The moral courage, born of religious conviction, appears as constantly in the civil and military services of that time as does their calm valour; the intense belief in the moral law, in the profound gulf between right and wrong, pervades the memoirs and private letters as well as the official despatches sent to Lord Canning by his district officers. Their high sense of duty enabled them to brave unpopularity in withstanding the outcries raised by fear and revengeful passions.

Lord Canning's enemies forgot the dangers he had to meet when he assumed office at Calcutta in March, 1857—I mean the want of discipline in the Bengal army and the unrest in Oudh. To abate the first, he promptly asked for more officers for each British and native regiment, but was overruled. Lord Dalhousie had protested strongly, but vainly, when two European regiments were, in 1854, taken away to the Crimean War, urging that such withdrawals loosened our hold on India; and certainly the repetition of this policy, which has greatly weakened the British garrison

of India to supply troops for South Africa, is as serious a matter now as it was then. In 1856 more British regiments were sent away to Persia, so that when the Mutiny began there was only one European battalion left in the 750 miles which lie between Barrackpur and Agra, and only one within 100 miles radius of the fortress of Allahabad. With the kingdom of Oudh, which we had annexed and occupied about fourteen months before, 25,000 square miles and 5,000,000 of inhabitants had passed from their native prince to the Queen. Here was a new and heavy responsibility to be faced with a reduced British force. The Directors of the East India Company exulted that this conquest had been made "without the expense of a drop of blood, and almost without a murmur." They treated the acquiescence of the natives as evidence that no attachment existed to the old Government. It was known, however, that Oudh contained 60,000 men of the native king's disbanded army, while its warlike people supplied most of our own rank and file, every peasant household sending one member at least to enlist under the Company's flag. Canning, as we have seen, did what he could to make the annexation effective; but with vast increases of territory he was forced, as Lord Curzon is now, to hold India with a smaller European force, a state of things which is soon known and noted in all the bazaars.

In times of danger and excitement there are always some who wish to dictate to the responsible authorities. Such were the Europeans in Calcutta. Soon after the outbreak at Meerut, on May 10, 1857, Lord Canning called his Parliament together and passed a series of Acts for the prompt punishment of mutiny, rebellion, and lawless crimes, and these new laws were put in force in the Mofussil of Bengal. The Calcutta people demanded that martial law should be applied to that capital and port. Lord Canning refused so to do on the ground that there was not the smallest inclination to disaffection on the part of the inhabitants. He recognised the distinction which our ancient

BRITISH LIBRARY

common law has always made between places in the hands of the rebels or enemies and those where the ordinary courts continue to perform their functions in peace. Under Lord Canning the appalling constitutional result of the Marais case in Cape Colony could never have occurred. He replied to C. Williams and other petitioners as follows: "As respects Calcutta, where English law prevails, the direct effect of proclaiming martial law would be to suspend the functions of the ordinary Courts of Judicature. This is a proposal which the Governor-General in Council cannot entertain. To substitute the jurisdiction of courts martial for that of the Supreme Court would infallibly be accompanied by much private inconvenience, uncertainty, and hardship in a community such as that of Calcutta; and his Lordship is not aware of any commensurate public gain which, in the present state of affairs, would be derived from the change. The military authorities are already empowered to try by court-martial, and by a process more summary than that ordinarily recognised, all military offenders and all persons exciting soldiers to mutiny." This cool answer is compared by the late Duke of Argyll to a single voice of command and self-control, in the midst of a raging crowd, swayed by anger and fear. It did something to allay the panic, which, however, extended to England, where Canning became the subject of much abuse in the newspapers and censures in Parliament.

As disloyalty has spread over Cape Colony *pari passu* with the infliction of martial law over peaceable districts, it is very interesting to compare the vigorous measures of repression employed by Canning and his lieutenants in countries in open rebellion and the prompt but judicious and humane procedure they enforced in districts where the ordinary law prevailed, or had been re-established. This latter procedure contrasts at all points with the despotism at the Cape, where the Parliament is abolished; and the courts, although sitting, are practically subservient to the orders of the general and his colonels and captains.

BRITISH LIBRARY

Now, Lord Canning challenged his detractors by the success of his methods, a success quickly attained and lasting till this day. It is pleasing to find his principles followed long after when the Kuka insurrection disturbed the Punjab; Lord Mayo then proclaimed anew the doctrine of our law that rebels in arms must be vigorously attacked by force, but added that on the return of quiet, no illegal, unnecessary or barbarous retaliation would be allowed—for example, no cold-blooded slaughter of prisoners awaiting trial in the gaols at the next assizes—by due course of civil law. It is noteworthy that in Lower Bengal, where we had only 2,400 British troops among 29,000 Sepoys, the Mutiny never assumed dangerous proportions. The prompt but measured justice applied by Canning to the Barrackpur regiment is strongly contrasted by Sir Henry Cunningham with the severe and degrading punishment of the troopers at Meerut, followed at once by the massacre and the march to Delhi. The late Duke of Argyll's verdict is that if the military tribunals at Meerut had shown the same gentleness and firmness as Canning used in Bengal, as Sir Henry Lawrence, depending on his one European regiment, used at Lucknow, the danger of general mutiny over the matter of greased cartridges might have passed away.

To enable the Ministry at home to support him against his accusers, the Governor-General, after some months had passed, wrote to explain his policy, its motives, and results. In one despatch of December 11, 1857, I find something like a history of his methods, which is full of interest, especially in the light of the literature and correspondence of those eventful years. The Indian Government deals far more fully with the question of martial law than has ever been vouchsafed as regards Cape Colony. The moment the local ruler received news of the outbreaks at Meerut and Delhi, he proclaimed martial law in all the revolted districts. The same thing was done in the countries lower down the Ganges as the rebellion extended. No time was lost in the Punjab and Oudh. But because of a peculiarity

BRITISH LIBRARY

in the Indian regulations, the statutes about martial law, more stringent and judicious methods were found necessary. Lord Canning's Cabinet explains what martial law in India is not. "You cannot call it," he says, "no law at all—the mere will of the general," as it is at the Cape. It was merely a statutable means of empowering courts-martial to hold summary trial of civilians, but only of such as might be caught using arms for rebellion, or in overt acts of rebellion, or openly abetting the enemy. Canning thought that summary trial and the sentence of death should be made applicable also to other heinous offences in proclaimed areas, where arson, pillage, and grievous hurts grew common in the dissolution of all order. While he increased the effective capacity of the courts-martial, he felt that the military officer is best used as a fighting man, and that the severe and summary justice would be better dispensed by civilians, especially by the judges and magistrates of the Civil Service and some of the planting community in whom the natives had confidence. By a series of five Acts, rapidly passed after the Meerut massacre, with the advice of Chief Justice Peacock, the Government of India made a new kind of martial law, enforcible in districts where we had no troops. The civilian classes I have named, or, rather, selected members thereof, were given powers to hold trial and hang on the spot without appeal. In this way the soldier was set free to use his sword whenever the civilians returned to their judicial duty. Mr. H. C. Tucker, of Benares, urged this method on the obvious ground that the Civil Servants were experienced officers of justice. In January, 1858, Lord Canning marched to Allahabad to control the neighbouring country directly. But months before, indeed, as early as July, he had heard from high Civil Servants and stalwart non-officials that some men were abusing their tremendous powers and turning against us the hearts of the few natives who had remained loyal or neutral. I find Mr. H. C. Tucker, on July 16, 1857, warning the Collector of Mirzapore that as our military power had now been proved, we must show our moderation

by letting by-gones be by-gones, and inducing the population to return to their rural pursuits. Unless they did that, he added, famine and pestilence will follow the curse of the sword. With the same clearness of vision Mr. Gubbins, who knew Oudh well, saw that the predatory tribes, the Goojars and Meywatties, who robbed both British and mutineer convoys and caravans, were more strictly common rogues than political offenders.

In an old *Calcutta Review* I have before me a vivid account of the state of Allahabad, written evidently by a learned and thoughtful Civil Servant on duty there. He says every line of the Five Acts is written in blood. "Two private individuals and the civil surgeons (Heaven save the mark!) were invested with this awful authority—gentlemen who had seen their houses plundered and burnt, and likely to look on every *black* man as an enemy to themselves, their country, and their religion." The powers of these three men were soon revoked, but not before they had sent 178 persons to the gallows. The official record seems to me to confirm these statements. I find one assistant-surgeon stringing men up for larceny and on mere suspicions that some money or cloth found on them had been stolen. How different from the rule laid down by Mr. Farquharson, Judge, of Patna, that as God alone knows the hearts of men, he would only convict for overt acts and on unmistakable inference. The cruel impolicy of bloodshed is more startling when the Civil Servant tells us that no sign of attachment to the British or their institutions was visible when the Mutiny began. "How distasteful our rule must be to the natives when, after fifty years of peace, they prefer a yoke which was infamous for rapine and misgovernment, but which still had a hold on the affections of the people of Oudh." No wonder that Clyde and Canning began to fear that the excesses of some of these special tribunals might induce the people to band together against us to save their own lives, thus changing a mutiny of troops into a civil rebellion, and making it

impossible for the British and the natives to settle down together at the end of the war! One evil result was a growing belief that our Government intended a general and bloody prosecution of both Hindus and Mussalmans. While they feared that innocent people had been killed by the revengeful European and rapacious loyal Sepoy soldiery, the Indian Government promptly, by order of July 31, 1857, checked the abuse of power by the civilians. The despatch speaks of the spirit of bitterness and hatred rapidly seizing every class and race. "With time and returning calm the acts of Government are reviewed, and the Government which has punished blindly and revengefully will have lost its chief title to the respect of its subjects." "The settlement will be spoilt by the remembrance of needless bloodshed." It appeared that Sepoys who had risked all to save their officers' lives were in danger of their necks from some of the unjust tribunals. The Lieutenant-Governor of Bengal urged Canning to publish the records of those shameful trials by way of defence of his action. "No," he said, "I will not so terribly disgrace my countrymen." A quick stop was put to the wanton burning of farms and villages. Where all the villagers had joined in some grave outrage an example might be necessary, but no such devastation was to take place as would confound the innocent with the guilty. As the Allahabad civilian writes, when a village was surrounded at night to secure the males and fired, the women and children were burnt in the confusion. The result of Lord Canning's action was that the peasantry soon returned and resumed tillage quietly, as if no war was going on.

Constantly advised by the best officers and the most trusted planters, Canning's influence extended to many details. With generous scorn, he refused to keep the wives of rebels as hostages. He forbade offers of rewards for mutineers and rebels, "dead or alive." In all this he was rowing against the stream. "Not one man in ten," he wrote to the Queen, "seems to think that the hanging and shooting of 40,000 or 50,000 men can be otherwise than practicable

and right." The thoughtful official from Allahabad said despondingly: "No longer are we to dwell among the people like parents among their children. They have all —we have all—tasted blood. We hate them, and they hate us to the death." We see now that it was Lord Canning's calmness and justice which has falsified this augury.

Lest I should seem too partial to the civilians, I gladly turn to the generous prompting which Canning received from the Commander-in-Chief, that great soldier, Lord Clyde, then Sir Colin Campbell. His views were as prudent as they were merciful; and as our policy in South Africa has been so different, I will give Clyde's counsels in his own words. In a letter of December 22, 1857, to Canning, he told him that our British regiments, engaged in fighting ever since the hot months of May and June, were "reduced to skeletons, and the men are in much need of rest." Again on March 17, 1858, the day after he had recaptured Lucknow, with the loss of 1,100 men, he urged the Viceroy to save his forces from the effects of the burning winds, pressing him "that some notice should issue to the Sepoys, which may have the effect of dissolving the confederacy between the mutinous regiments," in order to prevent "a serious business all through the hot weather, which would break down our troops and be never-ending." He saw clearly that, if we went on executing every rebel Sepoy we caught, the area of the war would increase; the mutineers had no choice but to cling together, because if they went home to their villages they would be caught and hanged. In a letter of July 24, 1858, to the Duke of Cambridge, Clyde wrote as follows: "It appears to me that if these wretched criminals be not reassured, guilty though they be, it will be impossible to predict any term to the general struggle, which has already assumed formidable proportions in a very wide area, and may be extended indefinitely, viz., wherever the mutineers may be driven to carry fire and sword with them. It therefore seems to me

to be not merely a question of clemency and mercy, but of policy as regards the cessation of this war. Now, if it were desirable, we cannot look for extermination of the entire remnant of the Sepoy army. According to the terms on which we are now with that remnant, they look for nothing else than extermination, and we propose nothing else. What then can be the sequel but a most protracted contest, in which vast sections of the population will take part against us under the disbanded Sepoys?" No despatches of this sort have yet come from South Africa. It required high courage on Clyde's part to unite in policy with Canning, whose general amnesty, proclaimed on November 1, 1858, roused the European community to denounce him as ignorant, stupid, cowardly and treacherous, until the general peace which ensued over all India about six months later proved the wisdom of Canning and Clyde.

In the autumn of 1859 Canning went in great state to the scenes of the massacres, meeting the native princes and nobility at Durbars in Cawnpur, Agra, and Lucknow, the capital of Oudh. To me it seems wonderful that so new and warlike a province, the birth-place of a revolted army, which had 12,000 native artillery in its ranks, should have been pacified so soon. The contrast with Cape Colony under Lord Milner is obvious but painful. I have already described the orders which drew down on the Governor-General the taunting name of "Clemency Canning." I must now deal with his famous Oudh proclamation of March 3, 1858, sent to General Sir James Outram to issue to the civil population as soon as we had recaptured Lucknow, which was effected between the 2nd and 22nd March, by defeating the army of 100,000 which Outram had been watching, with 4,000, for six months. Canning's action was immediately branded as both cruel and impolitic. Every leading soldier in our camp objected to our confiscating the lands of a whole nation, still armed, still in the field. The *Times* correspondent, Dr. Russell, says he heard no voice in its defence. Outram protested

strongly in a letter of March 8. The lairds of Oudh, he said, would not be content with the mere offer of life and freedom from prison. He had been Governor before the rebellion: he thought they had great grievances caused by our land laws; only at the last moment did they side against us. "They ought hardly to be considered as rebels, but rather as honourable enemies." If not, they would make a desperate and prolonged resistance, forcing us into "a new guerilla war, for the extirpation, root and branch, of this class of men, which will involve the loss of thousands of Europeans by battle, disease, and exposure." Lord Canning readily agreed in a couple of days to add a saving clause, practically promising immunity to those who would submit and help us. Outram had let him know that there were not a dozen landlords who had not fought against us or helped the rebels. Many later despatches and the judgment of the historians combine to show that there was no real difference of principle between the clement Canning and the generous Outram. The tone of the secret despatch, dated April 18, 1858, written and rather recklessly published by Lord Ellenborough, a former Governor-General, and at that time the member of the Cabinet who controlled India, may therefore be censured for the serious reasons stated by Canning. Impolitic it may have been to question the justice of the annexation of Oudh against the people's wishes and to censure the land settlement which had set the lairds against us. Nevertheless, Ellenborough's stately periods express much the same views as Outram's; and there is nothing like them in the speeches of Lord Milner or the despatches of Mr. Chamberlain. They breathe magnanimity as well as magniloquence. "We must admit that, under the circumstances, the hostilities which have been carried on in Oudh have rather the character of legitimate war than that of rebellion, and that the people of Oudh should rather be regarded with indulgent consideration than made the objects of a penalty, exceeding in extent and in severity almost any which has been recorded in history as inflicted

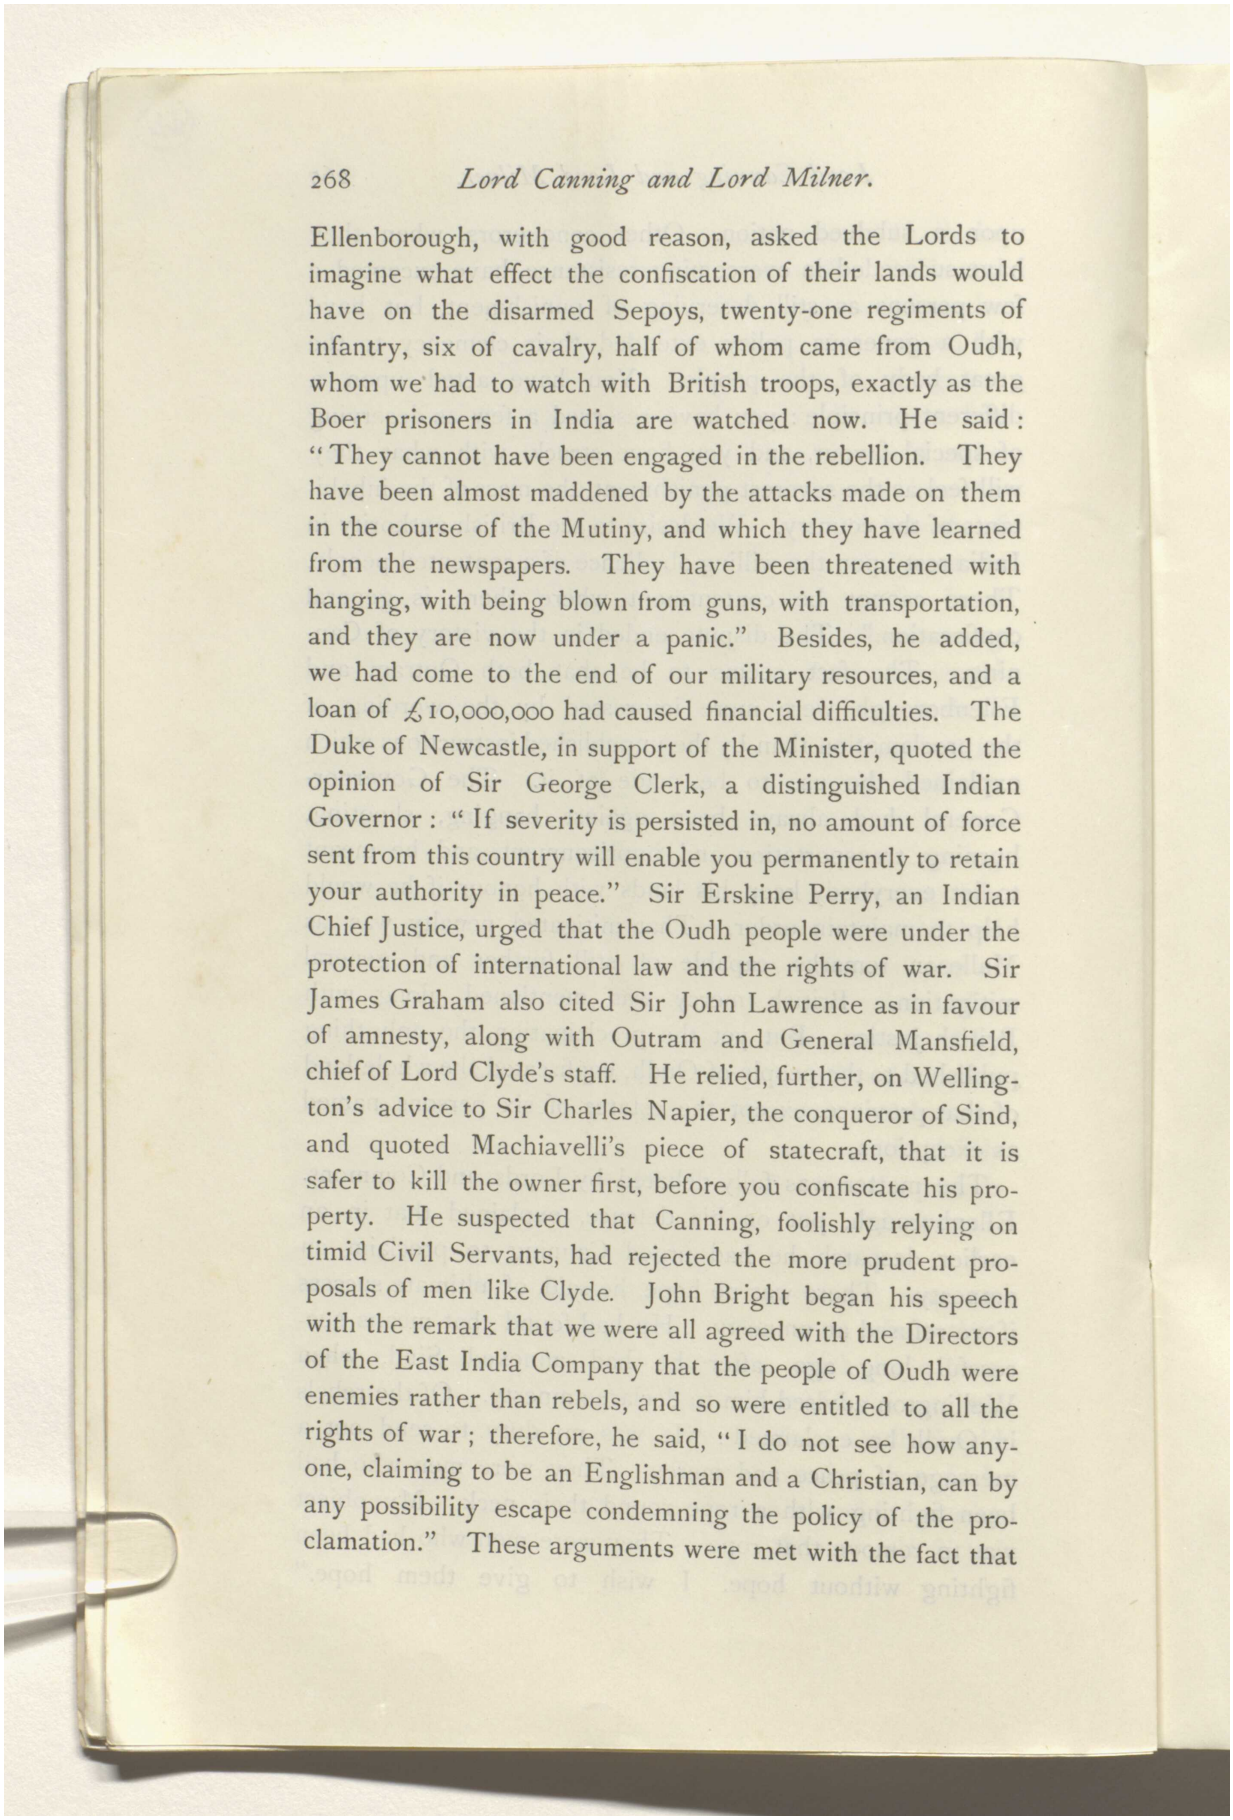
BRITISH LIBRARY



upon a subdued nation. Other conquerors, when they have succeeded in overcoming resistance, have excepted a few persons as still deserving of punishment, but have with a generous policy extended their clemency to the great body of the people. You have acted upon a different principle: you have reserved a few as deserving of special favour, and you have struck, with what they will feel as the severest punishment, the mass of the inhabitants of the country. We desire to see British authority in India rest upon the willing obedience of a contented people. There cannot be contentment where there is general confiscation." The dispute ended in the victory of Canning. The fact seems to be that both Outram and Ellenborough were more impressed by the wording of the proclamation than by the unpublished instructions which explained the use to be made of it. The Governor-General had always been against hanging, shooting, burning, transportation and imprisonment, and he meant to let everybody keep his lands with honour if he would help to maintain order. That mitigated penalty was, as Malleson remarks, capable of still further and general mitigation. British mercy was mentioned along with British justice. But yet the proclamation, the only thing published to the people of Oudh, confiscated the whole land of that province, except the estates of six persons, named as exceptions.

The matter was fully debated by Lords and Commons. Ellenborough, put on his defence, explained that in an earlier despatch he had urged Canning to proclaim an amnesty. There was no hope, he said, of ultimate success if we refused an amnesty. He had found that means successful long ago after he had annexed Sind, when Wellington advised him to declare amnesty. Of the rebels in Oudh he exclaimed: "It was my duty to send out a message of peace and mercy. They were men who had been fighting with a rope round their neck. My object was to remove that rope. They were men who had been fighting without hope. I wish to give them hope."

Ellenborough, with good reason, asked the Lords to imagine what effect the confiscation of their lands would have on the disarmed Sepoys, twenty-one regiments of infantry, six of cavalry, half of whom came from Oudh, whom we had to watch with British troops, exactly as the Boer prisoners in India are watched now. He said: "They cannot have been engaged in the rebellion. They have been almost maddened by the attacks made on them in the course of the Mutiny, and which they have learned from the newspapers. They have been threatened with hanging, with being blown from guns, with transportation, and they are now under a panic." Besides, he added, we had come to the end of our military resources, and a loan of £10,000,000 had caused financial difficulties. The Duke of Newcastle, in support of the Minister, quoted the opinion of Sir George Clerk, a distinguished Indian Governor: "If severity is persisted in, no amount of force sent from this country will enable you permanently to retain your authority in peace." Sir Erskine Perry, an Indian Chief Justice, urged that the Oudh people were under the protection of international law and the rights of war. Sir James Graham also cited Sir John Lawrence as in favour of amnesty, along with Outram and General Mansfield, chief of Lord Clyde's staff. He relied, further, on Wellington's advice to Sir Charles Napier, the conqueror of Sind, and quoted Machiavelli's piece of statecraft, that it is safer to kill the owner first, before you confiscate his property. He suspected that Canning, foolishly relying on timid Civil Servants, had rejected the more prudent proposals of men like Clyde. John Bright began his speech with the remark that we were all agreed with the Directors of the East India Company that the people of Oudh were enemies rather than rebels, and so were entitled to all the rights of war; therefore, he said, "I do not see how anyone, claiming to be an Englishman and a Christian, can by any possibility escape condemning the policy of the proclamation." These arguments were met with the fact that

BRITISH LIBRARY

Lord Canning was known to be altogether in favour of clemency, however he might have expressed the conditions. The result was a general agreement on policy, and whatever sting there was in it was taken out of the proclamation in its practical working.

About a year afterwards Lord Canning wrote a minute on its wonderful success. It never became an engine of confiscation. Strangely enough, it led to a new agrarian law. It was used as a lever to establish a tenant-right for the peasant farmers exposed to the rack-renting of the war-like lords. The forfeiture was enforced altogether against only fourteen of the latter; partial escheats occurred in the cases of a few less persistent rebels. The result was to restore the old relations between landlord and tenant existing before we dethroned the King of Oudh. The lairds were glad enough to find that we let them keep their estates. The Sepoys, who belonged to the tenant farmer families, found themselves not only safe from the gallows, but endowed also with something like Irish tenant right, at the expense of the rebel landlords. By this time the pacification had gone on apace; 756 out of the 1,100 forts were level with the ground, and Sir Robert Montgomery, the new Civil Governor, expected to collect a weapon from each of the 2,000,000 inhabitants capable of bearing arms. Patient forbearance was extended to the most refractory; the rebels began to believe in our mercy, and Sir Robert reported that in the Province of Oudh, "which little more than four months ago was a surging sea of rebellion and strife, profound peace and perfect safety everywhere prevail." These blessings have remained to this day. Surely this is reason enough for pressing Lord Canning's methods on the attention of the Colonial Office now that the burning of farms, the removal of women, the concentration camps, the deaths therein of 14,000 Boer children, the banishments and the executions, have only inflamed race hatreds and spread this three years' war into a colony that once was loyal.

THE PROGRESS OF THE MUNICIPAL IDEA IN INDIA.*

By A. Rogers.

There has been of late a frequently-repeated cuckoo cry in the mouths of those who would, whether rightly or wrongly, endeavour to pick holes in the system of British administration in India, that it has broken up the village communities or interfered with the village constitution. Such glibly sententious phrases are nice, rounded mouthfuls to produce for the delectation of an ignorant and superficial public which delights in nothing so much as an easily-uttered shibboleth that sounds well, but really conveys no intelligible sense, and it is time that the bubble should be pricked and the gas in it let out. It is time that the question should be examined in detail, and what has been done clearly set forth. For this it is indispensable that the constitution of village communities as they originally existed should be understood, how they came into existence, how they continued, and what functions they exercised. The first idea to grasp is that there was nowhere any central administration worthy of the name. There was no centre like that of the spider's nest connected with the furthest limits of its domain by delicate webs through which sensation could be conveyed outwardly instantaneously by movements of the creature's feet, or *vice versâ* to the centre by the impact of some foreign substance at the most distant point, and communication be thus established between the centre and the extremities. The Peishvá had his head-quarters at Poona, where his Court had to be maintained by the contributions of revenue sent in to it by the *Sir-súbbhás* or other local officers stationed in various provinces, but took no direct part in the local administration by which that revenue was collected, and found it accordingly to be the

* See the Proceedings of the East India Association elsewhere in this *Review* for the discussion on this paper.

BRITISH LIBRARY

easiest plan to let out the right to collect that revenue sometimes to the highest bidder, and at others to some Court favourite or other person with whom he could make the best terms. This person within his own particular range followed suit and got the most he could out of it in order to maintain his own position or fill his own coffers. It was a matter of indifference to him how or under what system of administration the revenue was collected, and the less trouble and expense he was put to in realizing it, the better. The leading man or men in each village or group of villages that formed, according to hereditary custom, the unit of collection modified or maintained their ancient usages with the consent or acquiescence of those who assisted in making up the revenue, for they were as a rule mere *pari inter pares*, and contributed each his share towards the general fund required, not scrupling on occasion to sell or mortgage for the purpose land from which payment to the State was due, to take possession of the best land for their own purposes, or redistribute it as appeared most convenient or best for the common benefit, or hold it in common. Each village as a rule had its own artisans, its carpenter, its blacksmith, its potter, and others, its village priest and its astrologer, and was thus self-contained. Its own police, paid by the enjoyment of rent-free land within its own borders, kept internal order, petty crimes being dealt with by the heads of the community (the Múkh or Múkhi Patels), and all more serious offences by the Sir-súbhá or other officer of the Central Government. This state of affairs tended to disintegrate itself. As the communications of the country were opened up, and the inhabitants of such isolated and self-contained villages began through more continued intercourse with their neighbours to acquire wider connections, that cohesion which had held them together and enabled them to combine in order to further common village interests became gradually loosened, and each individual began to stand on his own feet. This state of matters necessitated the introduction of Government

BRITISH LIBRARY

officers into some parts of the country to look after the collection of the revenue from individuals. Where such has not been the case, where the cohesion among the original proprietors or coparceners of a village has been sufficiently powerful to enable them to hold together and satisfactorily perform the functions of village heads, they still remain in their original position, and the effects of the two systems can be contrasted. Is the continuation of the old one so much in favour of the people as the *laudatores temporis acti* choose to maintain?

In considering this question in the abstract, one point must be constantly borne in mind. Time does not and cannot stand still, and it may be safely said that under the old régime there was no progress. Everything stagnated, and, if the object of administration were merely to keep things going, it did not answer its purpose badly. But there must come a time, a time which has in many cases actually arrived, when in consequence of the increase of population alone things must outgrow themselves and necessitate changes. Greater and greater subdivision of land among an increasing number of people must force them to pass beyond its boundaries, and bring back new ideas with them from outside incompatible with the continuance of the old state of affairs. Now, what has been done, and what was it possible to do to meet these circumstances? All experience proves that to provide an inefficient machinery for the purpose would not only be useless, but would be positively harmful. The Indian Governments have, therefore, merely looked about to ascertain whether there might be anything in the ancient native organization of society that showed in it an aptitude for carrying out any particular branch of the public administration, and found it in the ability to execute public works. Towards this, then, much attention has been directed in all parts of the country, and laws have been passed with a view to foster municipal institutions in every province. Thus it was hoped, and not unreasonably, that a vent would be found for the useful employment of any superfluous local energy that

BRITISH LIBRARY

might be found to exist in a manner beneficial to itself as well as to others. Those who were not immediately required for agricultural operations in the villages, or who through the education provided for them by the State had assimilated the idea that there were other methods for employing their minds, were thus to be afforded their opportunity in the conduct of municipal institutions, which were accordingly organized by various Acts of the Legislature. This it was, of course, impossible to carry out at once in such a vast country as British India, nor was it possible to hit off without experience of their working the subsidiary provisions that were necessary to suit the peculiarities of different localities inhabited by races having various customs; but the system has at all events been established, and is working, however imperfectly. It will now be our task to ascertain to what extent these institutions, to use a common phrase, have caught on and are being utilized by those for whom they are intended, and we are bound to express a considerable feeling of disappointment at the general result of the experiment. It would run an ordinary paper to an inordinate length were we to attempt to do this for the whole of the country, and we therefore propose to confine our attention to the Presidencies of Madras and Bombay, the reports for which for the year 1899-1900, as well as the resolutions of the two Governments on those reports, are now before us. The verdict of the former is that out of sixty municipalities the administration in two was unsatisfactory, in nine it was not efficient, in thirty-three it was fairly satisfactory, and in sixteen good. In Bombay the general conclusion is that there was nothing new in the reports as to the efficiency of the municipalities; there could be no doubt that on the whole they were doing useful work. Two municipalities, viz., those of Bassein and Alibágh, had been superseded for maladministration and incompetency. The number of meetings held was generally satisfactory except in the case of a few Boards in the Central and Southern Divisions, where also the average attendance was smaller than it should

have been. The total number of municipalities was 165,* inclusive of the four in the towns of Karáchi, Hyderábád, Shikárpur, and Sukkur in Sind, as in the previous year.

It would be foreign to our purpose to go into the details of the taxation by which the necessary funds for the support of these institutions were raised, or the incidence of that taxation in the several municipalities, our object being to show how far the opportunity for assisting in local self-government in different localities has been made use of by the amount of attention devoted to the subject by individual members of the municipal committees.

We are glad to see that encouragement is given in the Bombay resolution to the Presidents and Vice-Presidents of those municipalities who have distinguished themselves by their exertions during the year by the publication of their names as an example to others: this was in the municipalities of Broach, Poona, Igatpuri, Lonáula, Dhárwar, and Bijápur. It would be as well if the Government of Madras would do the same, and services of this nature would be cheaply rewarded by the bestowal on those worthy of it of the new Order of Merit recently instituted for service in India. To come to particulars: In the twenty-one Madras municipalities there were altogether 1,735 meetings held; of these (or possibly exclusively of these, for the returns are not clear), meetings to the total number of 166 had to be adjourned for want of the attendance of a quorum. Among these, the chief offenders were the municipalities of Mangalore, Vellore, and Cuddapah, which figure respectively for nineteen, fifteen, and fourteen occasions.

In Bombay the returns are given in different forms for the different divisions. In the Northern Division, out of 357 quarterly and special meetings held, thirty-three had to be adjourned for want of a quorum, and 182 out of 536 Commissioners or Councillors did not attend at two-thirds. In the Central Division, out of 556 meetings, 158 had to be adjourned; but whether in the absence of a quorum or for

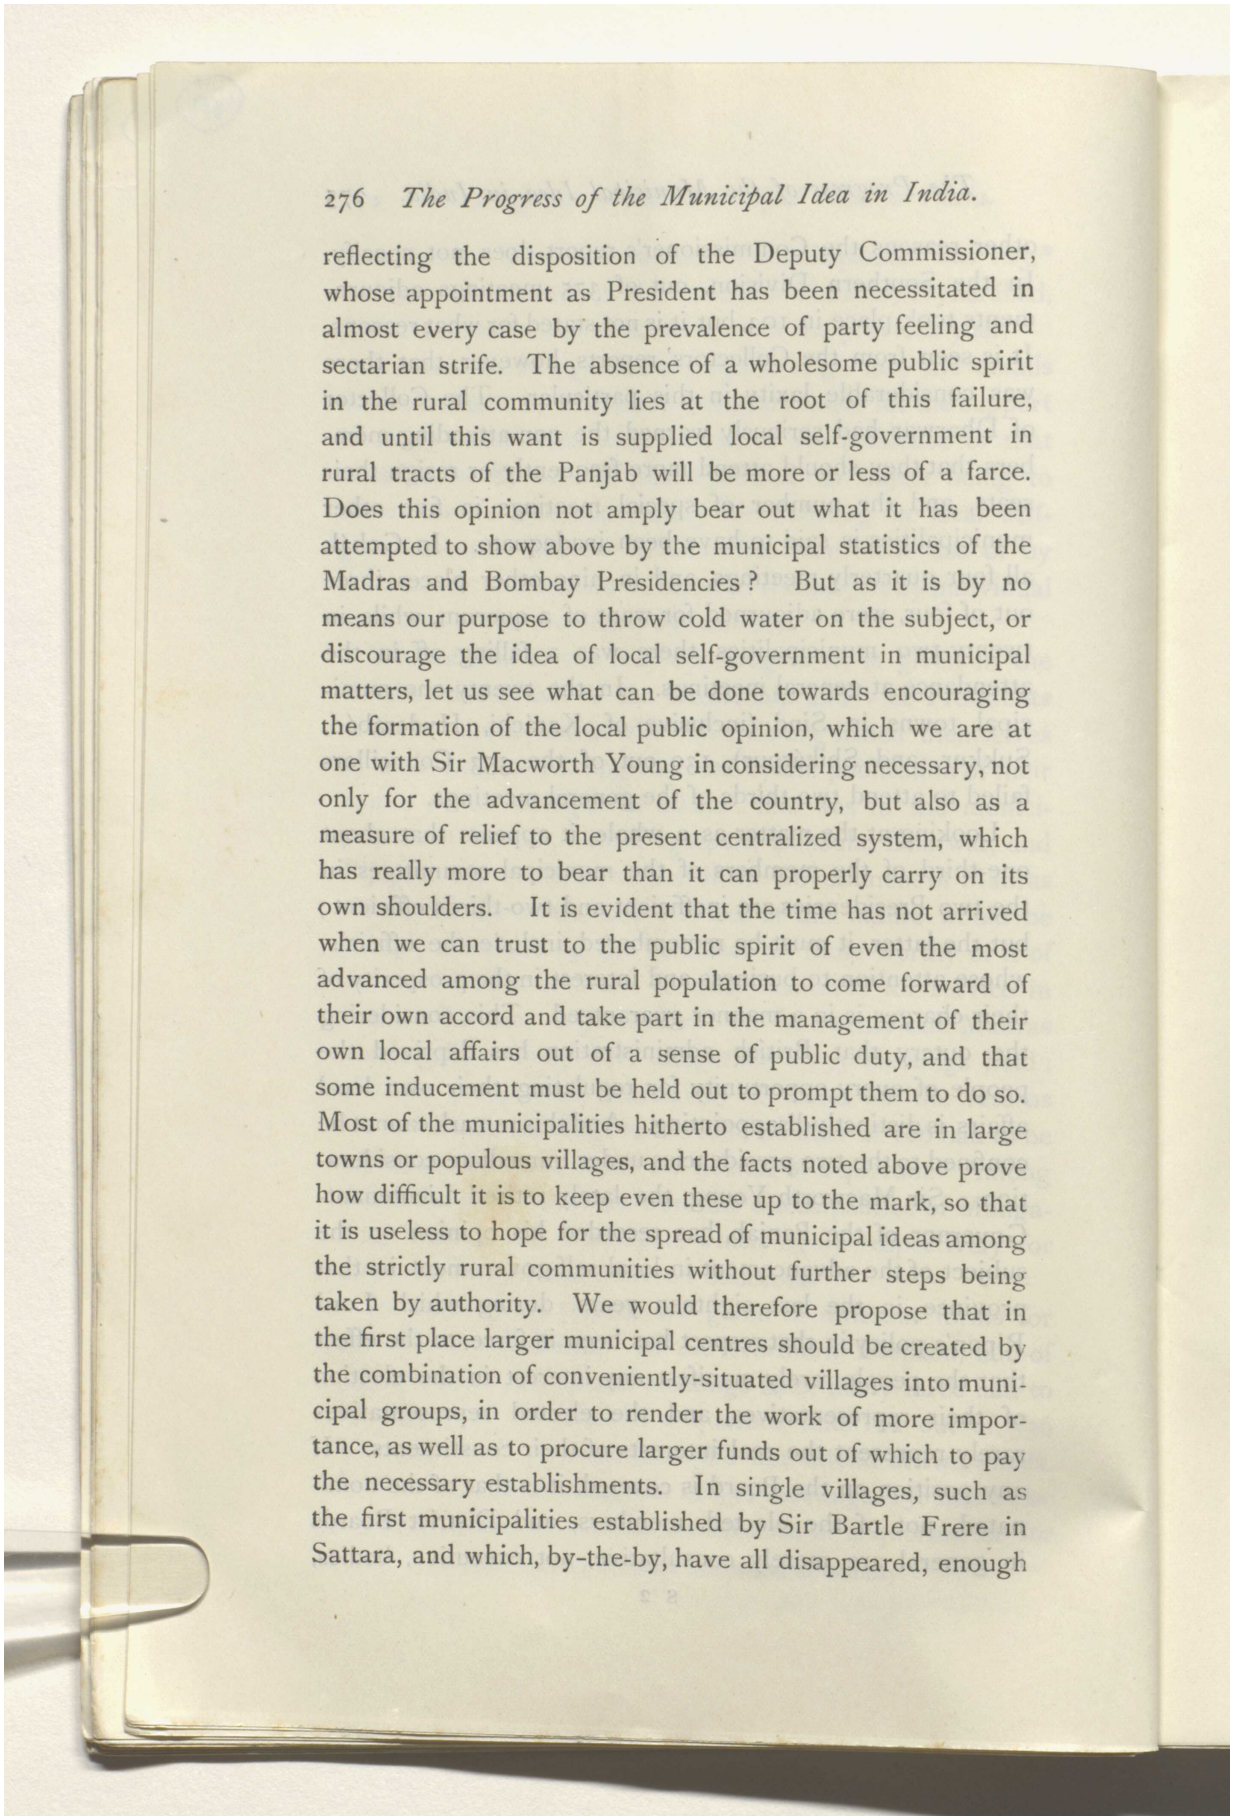
BRITISH LIBRARY



other reasons the Commissioner's report does not specify. In the Southern Division, out of 375 meetings adjournments took place in 103, but it is not stated for what reasons. It is seen from the Collectors' reports, however, that there was considerable laxity in this particular. The Collector of Dharwar had seriously warned the non-attending members that they should attend more frequently or resign their seats, and the number of special meetings in five other municipalities is said to have been inadequate. In Gokák all four quarterly meetings, and in nine other places three out of four, were adjourned for want of a quorum, while in twenty-two municipalities there was a falling off in the attendance at general meetings. In the twenty-one municipal towns in Sind (inclusive of Karáchi, Hyderábád, Sukkur, and Shikárpur), 139 out of the 353 Councillors failed to attend two-thirds of the general meetings.

Looking at the matter as a whole, it appears that about one-third of the members of the municipal committees in the two Presidencies are inefficient and two-thirds efficient; but the latter, it must be remembered, include the officials, whose attention to business and interest in the prosperity of their charges is in a manner guaranteed. This, considering the outcry that British administration has deprived the people of every opportunity for regulating their own local affairs, is distinctly disappointing. And this remark cannot be confined to the two presidencies under immediate consideration. Sir Macworth Young, the lately retired Lieutenant-Governor of the Panjab, has recorded his opinion on the subject of the advancement in local self-government in that province in the last eighteen years, during which Lord Ripon's policy in that respect has been in force, to the effect that the people rarely manifest any interest in the election of their representatives, and the elected representatives rarely represent the real interests of their constituents. If any position on the Board is coveted, it is that of the nominated, not of the elected, members, and District Boards in general are merely consultative, not executive, bodies,

BRITISH LIBRARY

reflecting the disposition of the Deputy Commissioner, whose appointment as President has been necessitated in almost every case by the prevalence of party feeling and sectarian strife. The absence of a wholesome public spirit in the rural community lies at the root of this failure, and until this want is supplied local self-government in rural tracts of the Panjab will be more or less of a farce. Does this opinion not amply bear out what it has been attempted to show above by the municipal statistics of the Madras and Bombay Presidencies? But as it is by no means our purpose to throw cold water on the subject, or discourage the idea of local self-government in municipal matters, let us see what can be done towards encouraging the formation of the local public opinion, which we are at one with Sir Macworth Young in considering necessary, not only for the advancement of the country, but also as a measure of relief to the present centralized system, which has really more to bear than it can properly carry on its own shoulders. It is evident that the time has not arrived when we can trust to the public spirit of even the most advanced among the rural population to come forward of their own accord and take part in the management of their own local affairs out of a sense of public duty, and that some inducement must be held out to prompt them to do so. Most of the municipalities hitherto established are in large towns or populous villages, and the facts noted above prove how difficult it is to keep even these up to the mark, so that it is useless to hope for the spread of municipal ideas among the strictly rural communities without further steps being taken by authority. We would therefore propose that in the first place larger municipal centres should be created by the combination of conveniently-situated villages into municipal groups, in order to render the work of more importance, as well as to procure larger funds out of which to pay the necessary establishments. In single villages, such as the first municipalities established by Sir Bartle Frere in Sattara, and which, by-the-by, have all disappeared, enough

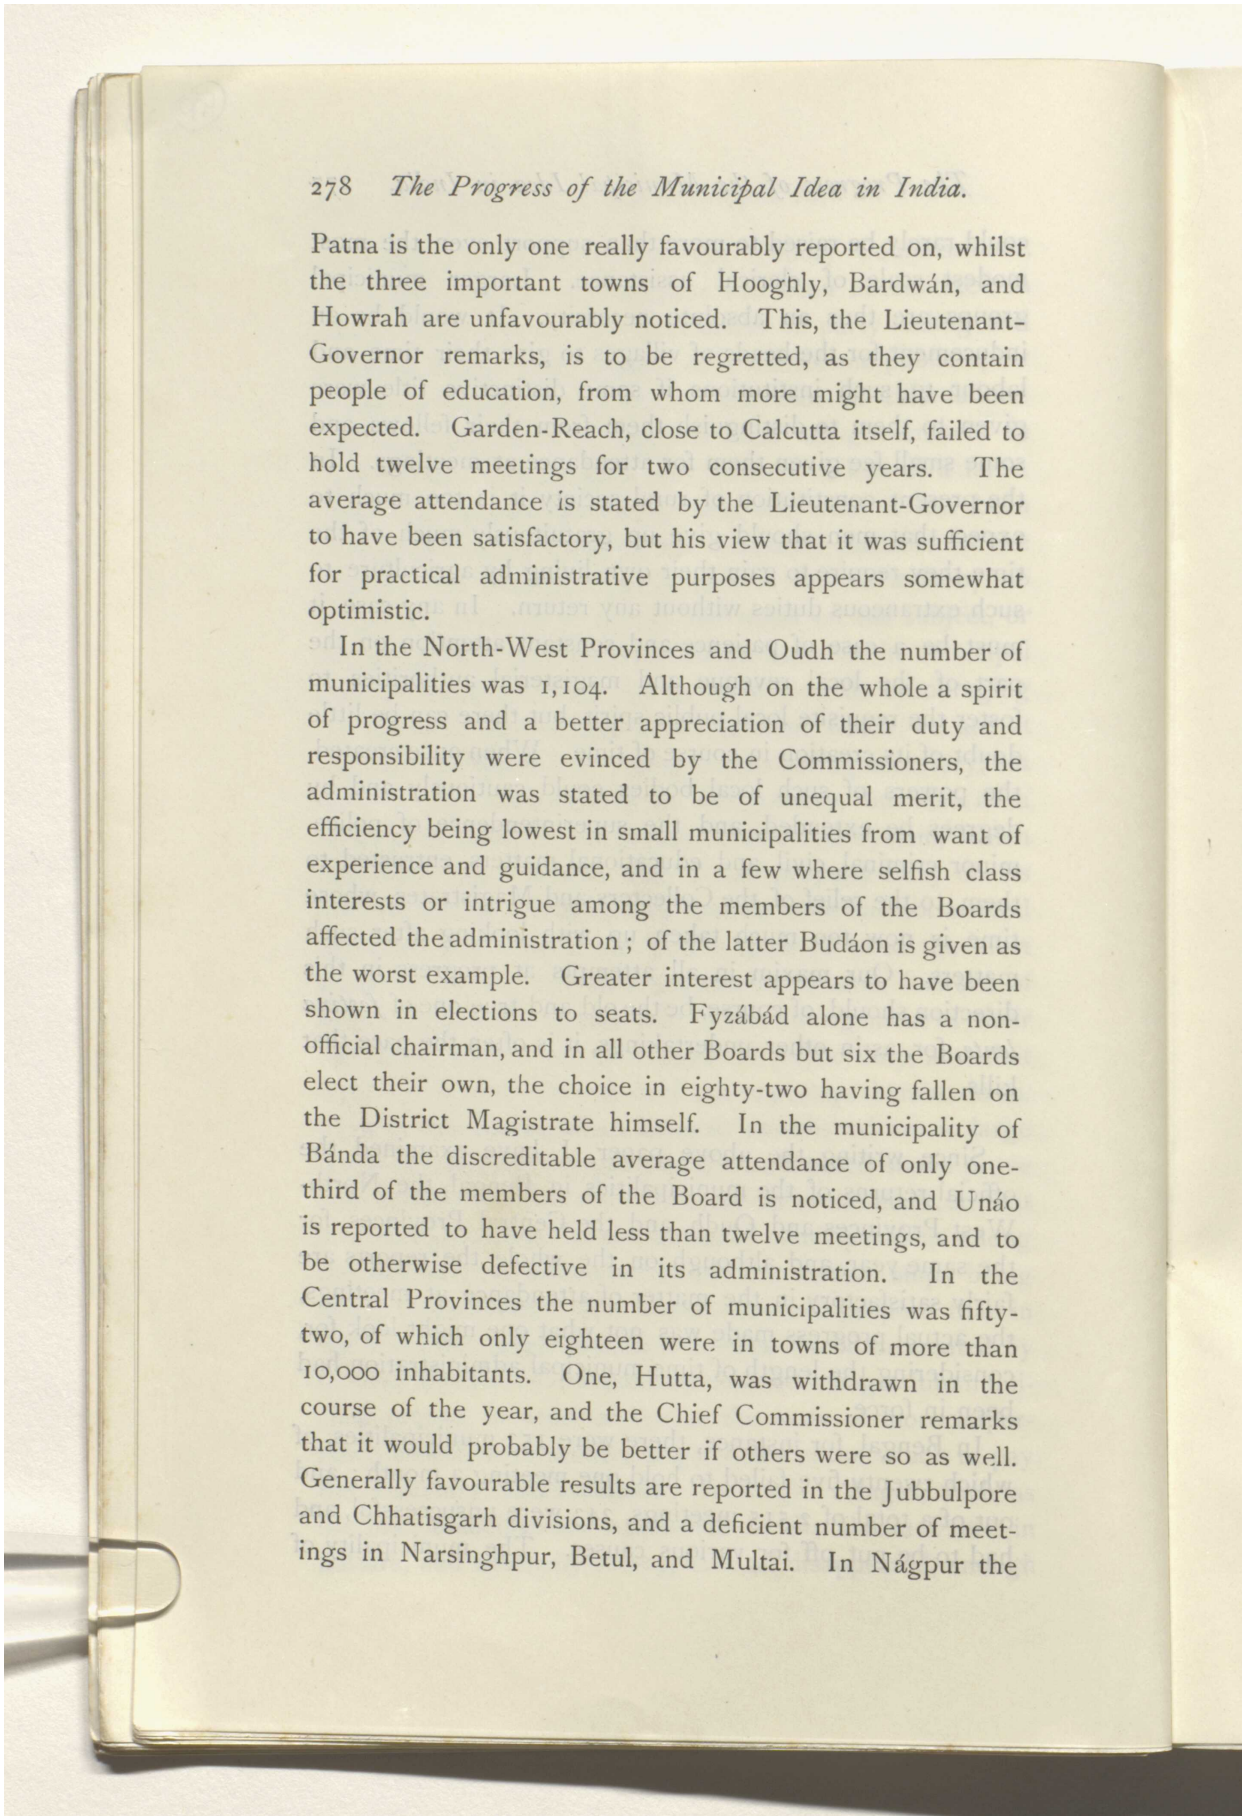
could rarely be raised to more than support even the most modest scale of clerical assistance. Larger municipal groups are thus an absolute necessity. It would be an inducement for the heads of villages to give their time and labour to such institutions if some distinctive title were given to them to distinguish them from their fellows, and some small fee given them for attendance at meetings. In the present constitution of rural society it is too much to expect that men should give up gratuitously much of the time they require to gain their own living by agriculture to such extraneous duties without any return. In any case, it must be a case of patience and constant attention on the part of the local revenue and magisterial authorities to foster the requisite local public spirit, but there can be little doubt of its creation in course of time. When once created, the powers of such local bodies could cautiously and by degrees be extended, and the superintendence of police, minor criminal, civil, and educational matters, entrusted to them, to the relief of the Collectors and Magistrates, whose time is now too much taken up with looking after such matters. Our maxim in all attempts at progress in this direction should, of course, be the old and true one of *festina lente*, for, as in other undertakings, it is often the pace that kills.



Since writing the above paper, I have examined the official returns of the municipalities in Bengal, the North-West Provinces and Oudh, and the Central Provinces, for the same year, and although on the whole the reports are fairly satisfactory in the matter of attendance at meetings, the actual progress made was not what one might look for, considering the length of time municipal administration had been in force.

In Bengal, for instance, there were 153 municipalities, of which twenty-five failed to hold one meeting a month; and out of a total of 2,515 meetings, 243 were unsuccessful, and had to be put off for various causes. The municipality of

Patna is the only one really favourably reported on, whilst the three important towns of Hooghly, Bardwán, and Howrah are unfavourably noticed. This, the Lieutenant-Governor remarks, is to be regretted, as they contain people of education, from whom more might have been expected. Garden-Reach, close to Calcutta itself, failed to hold twelve meetings for two consecutive years. The average attendance is stated by the Lieutenant-Governor to have been satisfactory, but his view that it was sufficient for practical administrative purposes appears somewhat optimistic.

In the North-West Provinces and Oudh the number of municipalities was 1,104. Although on the whole a spirit of progress and a better appreciation of their duty and responsibility were evinced by the Commissioners, the administration was stated to be of unequal merit, the efficiency being lowest in small municipalities from want of experience and guidance, and in a few where selfish class interests or intrigue among the members of the Boards affected the administration; of the latter Budáon is given as the worst example. Greater interest appears to have been shown in elections to seats. Fyzábád alone has a non-official chairman, and in all other Boards but six the Boards elect their own, the choice in eighty-two having fallen on the District Magistrate himself. In the municipality of Bánda the discreditable average attendance of only one-third of the members of the Board is noticed, and Unáo is reported to have held less than twelve meetings, and to be otherwise defective in its administration. In the Central Provinces the number of municipalities was fifty-two, of which only eighteen were in towns of more than 10,000 inhabitants. One, Hutta, was withdrawn in the course of the year, and the Chief Commissioner remarks that it would probably be better if others were so as well. Generally favourable results are reported in the Jubbulpore and Chhatisgarh divisions, and a deficient number of meetings in Narsinghpur, Betul, and Multai. In Nágpur the

BRITISH LIBRARY

Commissioners are said to be habitually unpunctual, so that only three meetings were held with a full number. A few members were reported by the Deputy Commissioners for zeal and energy, and administration on the whole is said to have been satisfactory.

The impression conveyed by the working of municipal institutions in these three provinces is pretty much the same as that in those already noticed, and points clearly to the necessity, if they are to be a real success, of the adoption of some such measures as those recommended in this paper to give the requisite stimulus to the idea of local self-government in India.

THE INDIAN CIVIL SERVICE AND THE FURTHER ADMISSION OF NATIVES OF INDIA.*

By J. B. Pennington.

Nearly eleven years ago Mr. Connell read a very excellent and exhaustive paper on the above subject, and came to the conclusion that we "could not then foresee the time when it will cease to be necessary in all the higher branches of the administration that a *large proportion* of appointments should be held by members of the covenanted Civil Service, or that this *corps d'élite* should be mainly European."

What I wish this meeting to consider is, whether we have now reached that time; or, at any rate, whether it is possible to materially decrease the proportion of appointments to be held by members of the Civil Service, and to decrease the proportion of Europeans in that service. Before going further, I think it desirable to say that I quite accept the view expressed by Sir Richard Meade, chairman of Mr. Connell's meeting, that "it is the wish at the present time (1891) of all the best officers in India to do everything that is possible to advance the natives, and to give them a fair share in the administration of their country," and I am quite satisfied that it is the *bonâ fide* policy of the English people—so far as they can be said to have any policy on the subject—to so educate and train the natives of India that they may become fit to manage their own affairs if, like the Romans in Britain, we should at any time find it convenient to leave. If we are driven out of the country by superior force, we should naturally have no responsibility for the consequences; but if at any time the English democracy should make up its mind to retire voluntarily, and we had not so prepared the natives that

BRITISH LIBRARY

they would have a reasonable prospect of carrying on the government, we should, in my opinion, be everlastingly disgraced. I do not profess to know enough of the views of the democracy to say whether such a contingency ought to be provided for; but, if it is at all within the bounds of possibility, it is clear that it ought to be our endeavour to constantly reduce the proportion of Europeans in the service of the Government, and that we ought systematically to keep the number of Europeans down to the very minimum absolutely necessary to carry on the government on the present system.

I should also like to point out that if, as even Mr. Dadabhai seems to admit, a certain number of Europeans in the Civil Service are still indispensable, the present system of entirely open competition is very illogical, and even ludicrous; because it is quite on the cards, however improbable, that a sufficient number of native candidates *might* appear in any year and succeed in securing all the vacancies. We need not go far to find native gentlemen who have come out very high in the list of successful candidates—my friend Mr. Dutt is a most conspicuous example—and it is quite within the bounds of possibility that, if a sufficient number were in a position to undertake such an expensive and abhorrent voyage, they *might* beat all their European competitors. Why not? There are certainly a sufficient number of clever youths in the whole of India; and when we have a Madras Brahmin coming out first in English composition, and with extremely high marks, one does not know what might happen if the conditions of the examination were such as to admit of unlimited competition from India. It is much to be regretted, I think, that those conditions are not at present either fair or reasonable. The native candidate of small means is most unfairly handicapped by having to make a long journey, the expense of which is prohibitory to all but the well-to-do, so that the number of natives competing has always been extremely limited in comparison even with the educated

مكتبة قطر الوطنية
Qatar National Library

population. I cannot bring myself to believe that it is the deliberate intention of any body of English gentlemen to put such an unfair obstacle in the way of the aspiring native. Not that I object to the competitors having to come to England. I am most strongly opposed to the farce of simultaneous examinations in India and England for many reasons, but especially because the mere journey is a test of enterprise, which is in itself an invaluable proof of fitness, and I believe that a few years' residence in this country is almost indispensable for any candidate, if only to show his superiority to antiquated caste prejudices; but to make the possession of wealth a *sine quâ non* for admission into the Civil Service is utterly destructive of the first principle of open competition. I would therefore do whatever is possible to make the competition really *fair*, subject to the conditions that the examination shall be held only in London, and that some residence at a University in this country, either before or after the examination, shall be insisted on. I do not propose to enter on the question of the fitness of natives for high office in India, because I assume that is already taken for granted under the present system of completely open competition. But before making any suggestion as to possible reform, I ought, perhaps, to refer, however briefly, to other proposals that have been made—notably, by Mr. Dadabhai Naoroji. Even he, as I said before, seems to admit—I am not quite sure whether he does or not—that a certain backing of Europeans is still indispensable, though, as far as I am aware, he has never put forth any estimate of the number he would retain. Clearly, however, he thinks the time has come when the administration should be practically in the hands of natives, and he bases his aspirations on two grounds: first, the repeated pledges of 1833 and 1858, to the effect that, "*so far as may be*, our subjects, of whatever race or creed, shall be freely and impartially appointed to offices in our service," and that "no one shall be excluded *merely* by reason of his religion, place of birth, descent, or any of

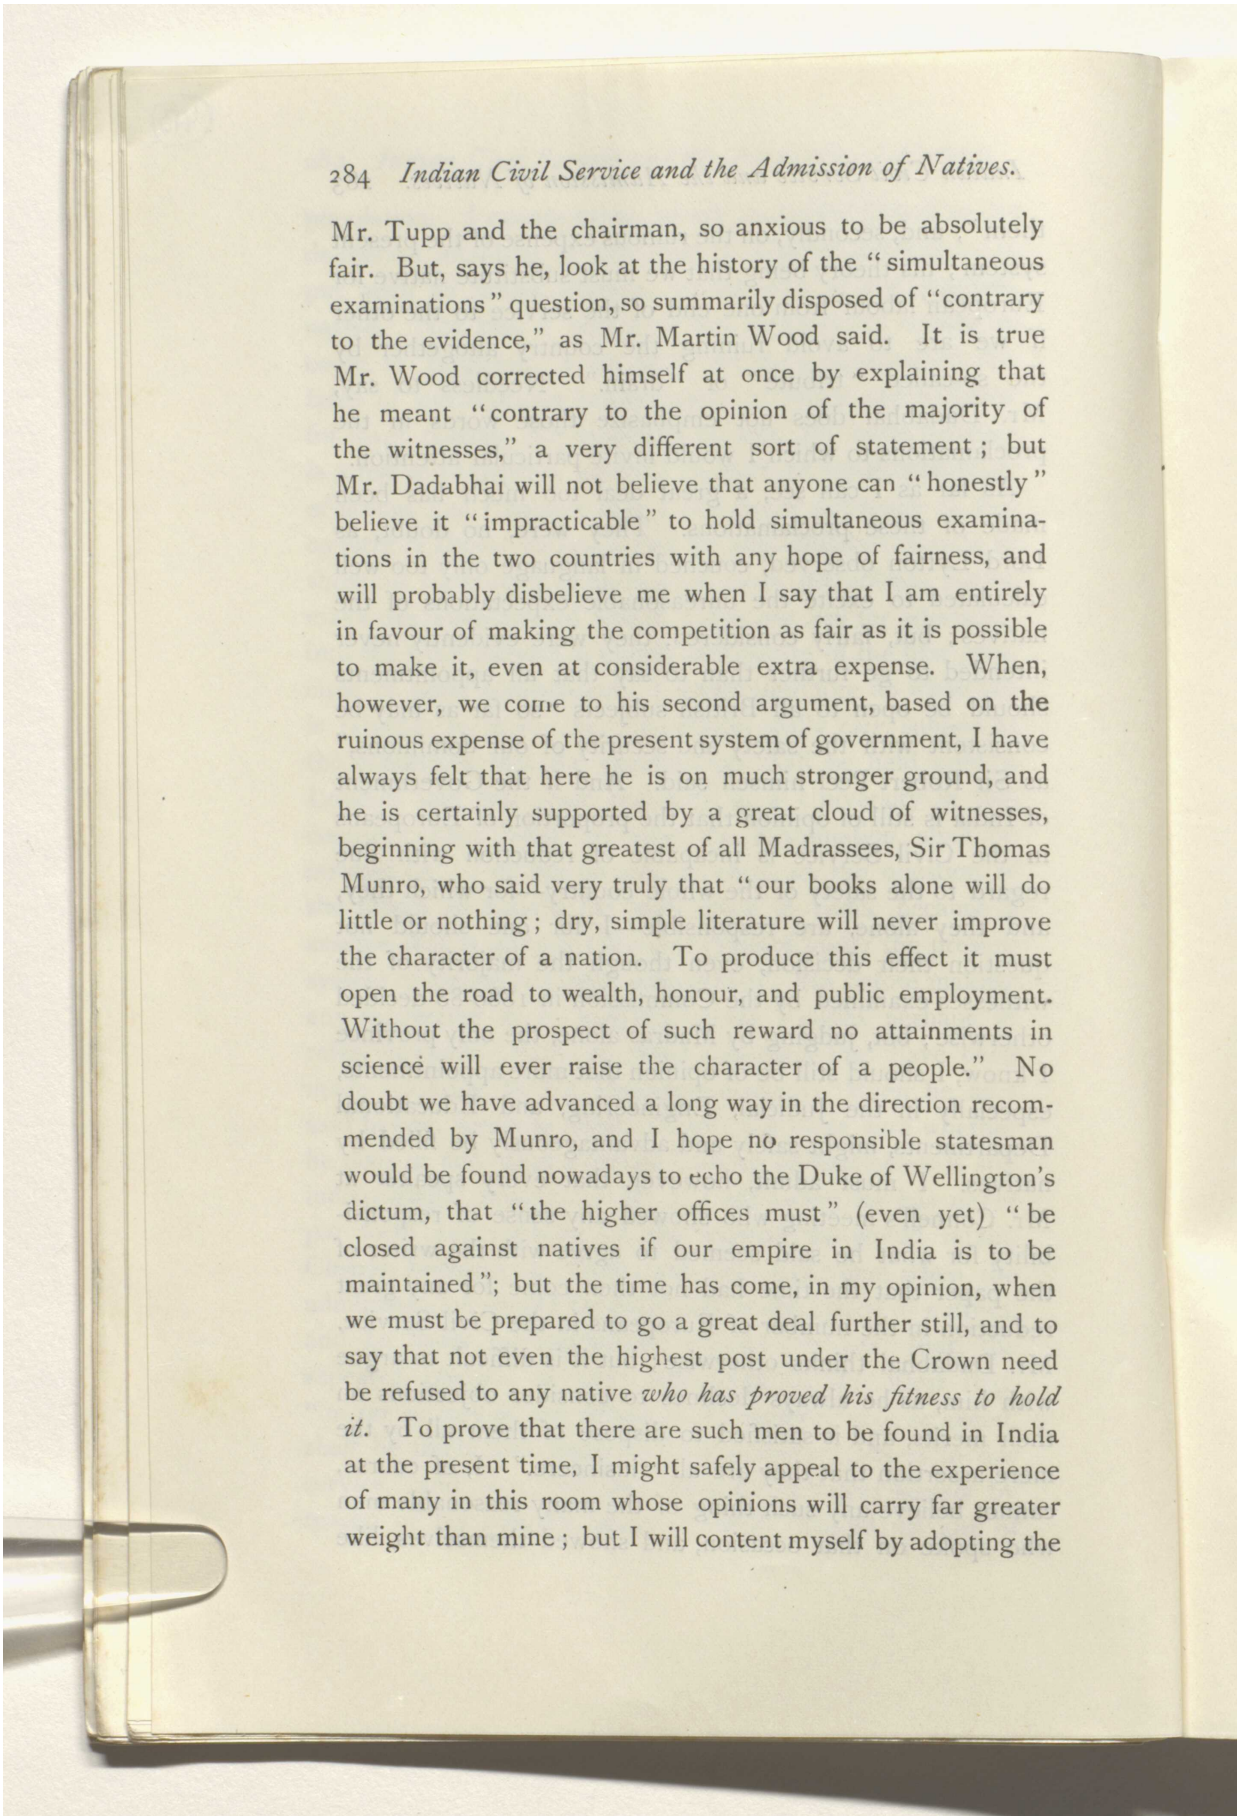
BRITISH LIBRARY



them"; and, secondly, on the ruinous expense of the present system; his theory being that we must substitute native for European labour from one end of the service to the other if we are to avoid ruining the country altogether by the so-called "tribute" or "drain." Needless to say, Mr. Dadabhai does not emphasize those words in the proclamations to which I would invite particular attention.

As far as I can see, a great deal too much has been made of these proclamations. They were, no doubt, as Lord Lytton observed, couched in language only too well calculated to excite the unreasonable expectations of the natives; but, fairly considered, they were evidently never intended to go further than to say that all appointments should be open to all British subjects "so far as may be consistent with the safety and security of our dominions," as Sir Robert Peel himself said. And if the Government of India is still of opinion that the proportion of Europeans in the Civil Service is incapable of reduction with due regard to the safety of the whole country—for which they, and they alone, are responsible—I for one should not question their decision, even though the majority of the witnesses examined by the Commission in 1886-88 decided otherwise; but, judging by Madras alone, the only province I know, I should still be of opinion that more appointments, especially in the Judicial, Engineering, and Educational Departments, might safely and advantageously be filled by natives. I must admit, however, that every speaker at Mr. Connell's meeting who showed any sense of responsibility for what he said seemed to agree with the writer of the paper that the time had not then come for any great reduction in the number of Europeans in the Civil Service. Mr. Dadabhai thinks otherwise; but it is difficult to argue with him, as he always declines to consider objections on their merits, and is satisfied to dispose of them all by the mere assertion that they are all "insincere." I, of course, cannot believe any such thing of the many reasonable men who spoke on that occasion, and showed themselves, like

BRITISH LIBRARY

Mr. Tupp and the chairman, so anxious to be absolutely fair. But, says he, look at the history of the "simultaneous examinations" question, so summarily disposed of "contrary to the evidence," as Mr. Martin Wood said. It is true Mr. Wood corrected himself at once by explaining that he meant "contrary to the opinion of the majority of the witnesses," a very different sort of statement; but Mr. Dadabhai will not believe that anyone can "honestly" believe it "impracticable" to hold simultaneous examinations in the two countries with any hope of fairness, and will probably disbelieve me when I say that I am entirely in favour of making the competition as fair as it is possible to make it, even at considerable extra expense. When, however, we come to his second argument, based on the ruinous expense of the present system of government, I have always felt that here he is on much stronger ground, and he is certainly supported by a great cloud of witnesses, beginning with that greatest of all Madrassees, Sir Thomas Munro, who said very truly that "our books alone will do little or nothing; dry, simple literature will never improve the character of a nation. To produce this effect it must open the road to wealth, honour, and public employment. Without the prospect of such reward no attainments in science will ever raise the character of a people." No doubt we have advanced a long way in the direction recommended by Munro, and I hope no responsible statesman would be found nowadays to echo the Duke of Wellington's dictum, that "the higher offices must" (even yet) "be closed against natives if our empire in India is to be maintained"; but the time has come, in my opinion, when we must be prepared to go a great deal further still, and to say that not even the highest post under the Crown need be refused to any native *who has proved his fitness to hold it*. To prove that there are such men to be found in India at the present time, I might safely appeal to the experience of many in this room whose opinions will carry far greater weight than mine; but I will content myself by adopting the

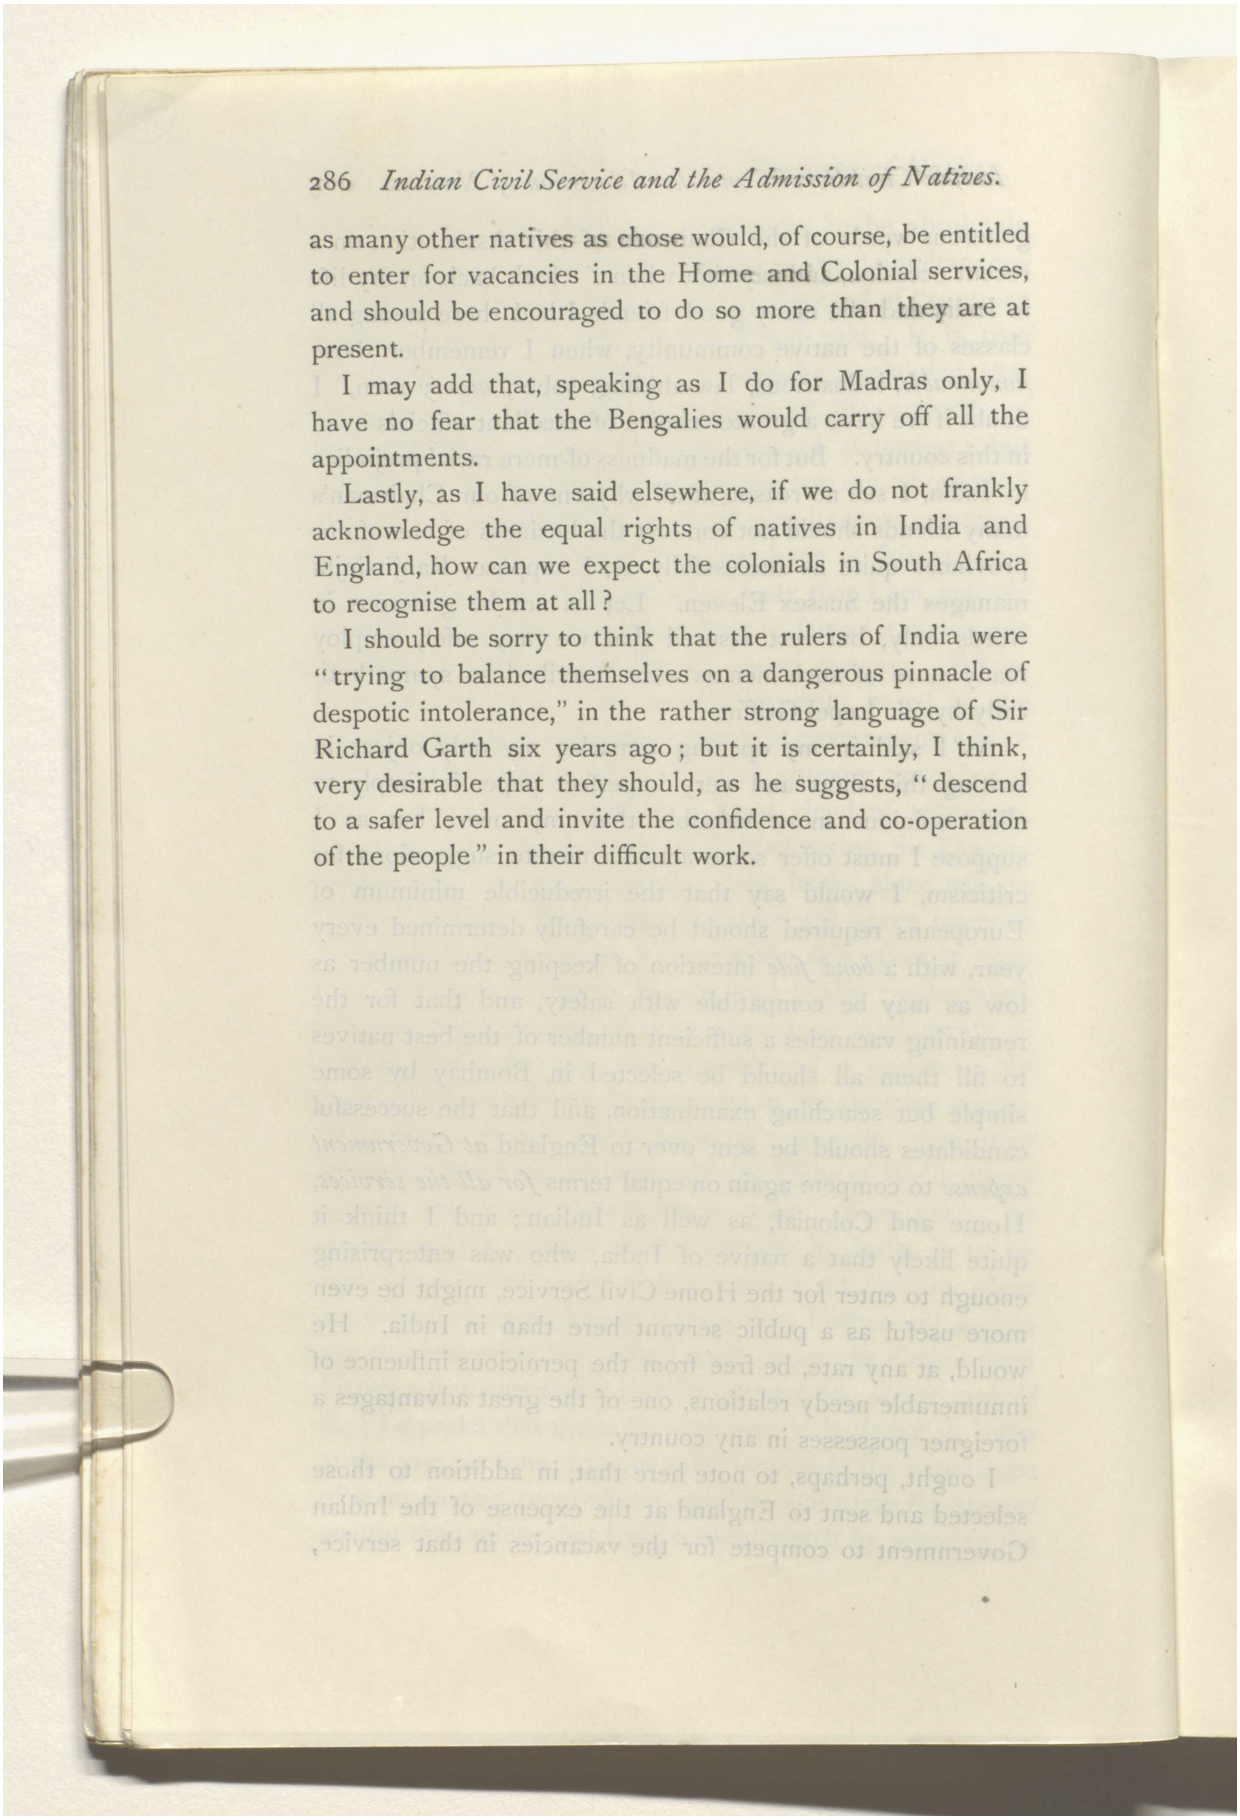
BRITISH LIBRARY

generous words of the Chairman of this Association on a recent occasion, and say that when *I* "look back on my life in India and the many good friends I had there among all classes of the native community, when I remember those *honourable*, industrious, law-abiding, sober, *manly* men," I doubt if we have a greater choice of excellent officials even in this country. But for the madness of mere racial prejudice in India, I see no reason at all why one of our Chairman's many friends should not conduct the business of one of our provinces quite as successfully as, I suppose, Ranjitsinjhi manages the Sussex Eleven. Let us not be generous in words only, but rest assured that we may safely employ many more of such men as were described so sympathetically by Sir Lepel Griffin.



As I said in my opening remarks, my only object in writing this short and very imperfect paper is simply to elicit opinions more valuable than my own; but as I suppose I must offer some actual concrete suggestions for criticism, I would say that the irreducible minimum of Europeans required should be carefully determined every year, with a *bonâ fide* intention of keeping the number as low as may be compatible with safety, and that for the remaining vacancies a sufficient number of the best natives to fill them all should be selected in Bombay by some simple but searching examination, and that the successful candidates should be sent over to England *at Government expense* to compete again on equal terms *for all the services*, Home and Colonial, as well as Indian; and I think it quite likely that a native of India, who was enterprising enough to enter for the Home Civil Service, might be even more useful as a public servant here than in India. He would, at any rate, be free from the pernicious influence of innumerable needy relations, one of the great advantages a foreigner possesses in any country.

I ought, perhaps, to note here that, in addition to those selected and sent to England at the expense of the Indian Government to compete for the vacancies in that service,

BRITISH LIBRARY

as many other natives as chose would, of course, be entitled to enter for vacancies in the Home and Colonial services, and should be encouraged to do so more than they are at present.

I may add that, speaking as I do for Madras only, I have no fear that the Bengalies would carry off all the appointments.

Lastly, as I have said elsewhere, if we do not frankly acknowledge the equal rights of natives in India and England, how can we expect the colonials in South Africa to recognise them at all?

I should be sorry to think that the rulers of India were "trying to balance themselves on a dangerous pinnacle of despotic intolerance," in the rather strong language of Sir Richard Garth six years ago; but it is certainly, I think, very desirable that they should, as he suggests, "descend to a safer level and invite the confidence and co-operation of the people" in their difficult work.

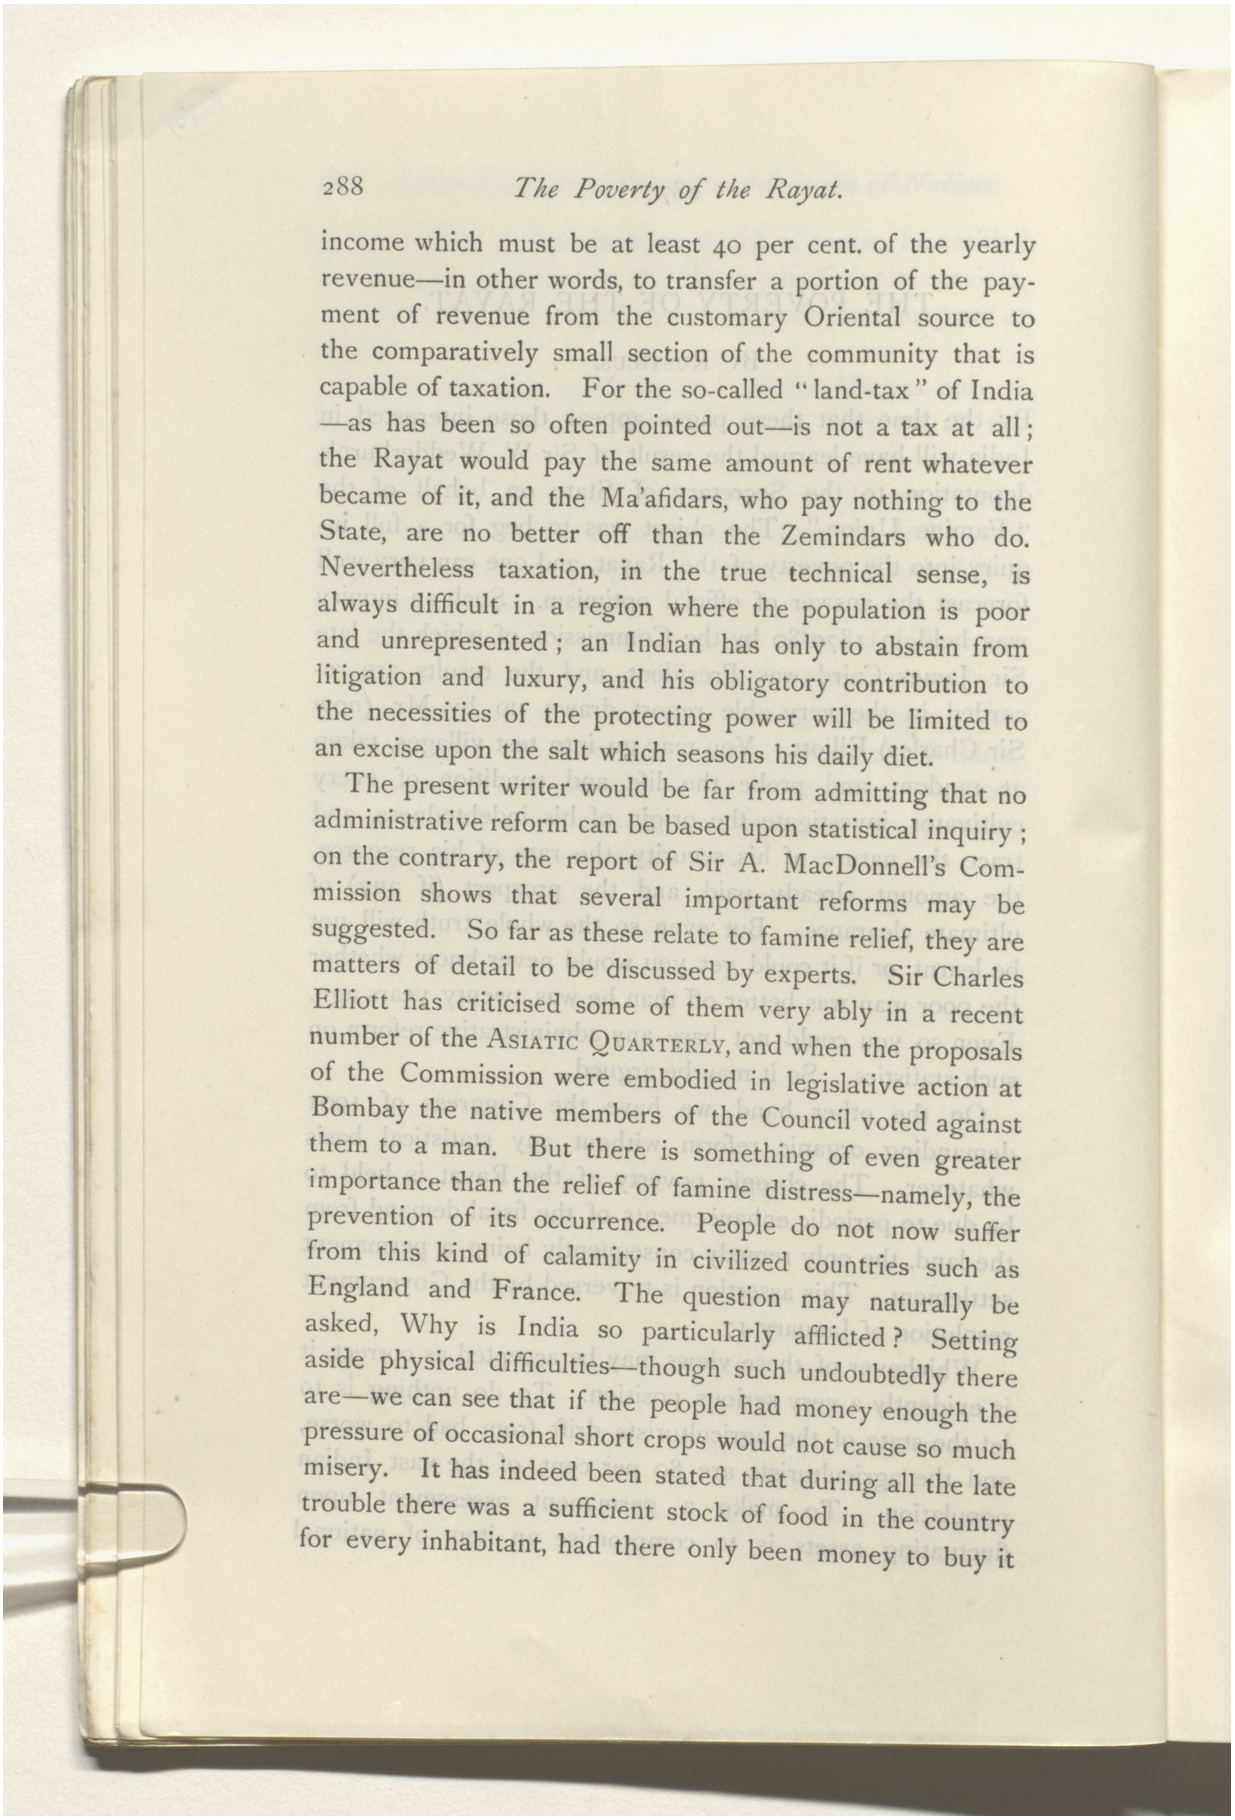
THE POVERTY OF THE RAYAT.

By Rusticus.

By the time that these pages appear those interested in India will have learned the result of Sir W. Wedderburn's deputation to the Secretary of State on behalf of the "Famine Union." The object was to beg for a full inquiry into the poverty of the Rayat, and one can very well forecast the answer of official optimism. Such an inquiry was held in 1879-80 by the Commission of which the late Sir James Caird was President, and the results are recorded in the very able report drawn up by Mr. (now Sir Charles) Elliott. You may go into test villages, taken at random, and probe the life and condition of every cultivator, investigate the origin of his indebtedness, and trace the nature of his security, the rate of his resource, the amount already paid, and the prospect (if any) of ultimate clearance. But even so the whole truth will not be learnt, or if it could yet you would never know whether the poor man was better off than he was twenty years ago. Even so you could not base any administrative reform on such statistics. So it may be argued.



On the other hand, we have the Congress of 1901 demanding organic reform without any statistical basis whatever. The chronic poverty of the Rayat is held to be due to periodic enhancements of the fiscal demand from the land, the only remedy consequently being a permanent settlement. This assertion is traversed by the Government resolution of January 17.

Whichever of these views may be accepted as correct, it is evidently a very serious position. To do nothing is to let the state of the agriculturists drift from bad to worse, and the agriculturists are 80 per cent. of the vast Indian population. To make a permanent assessment upon fluctuating assets is to compromise an item of national

BRITISH LIBRARY

income which must be at least 40 per cent. of the yearly revenue—in other words, to transfer a portion of the payment of revenue from the customary Oriental source to the comparatively small section of the community that is capable of taxation. For the so-called "land-tax" of India —as has been so often pointed out—is not a tax at all; the Rayat would pay the same amount of rent whatever became of it, and the Ma'afidars, who pay nothing to the State, are no better off than the Zemindars who do. Nevertheless taxation, in the true technical sense, is always difficult in a region where the population is poor and unrepresented; an Indian has only to abstain from litigation and luxury, and his obligatory contribution to the necessities of the protecting power will be limited to an excise upon the salt which seasons his daily diet.

The present writer would be far from admitting that no administrative reform can be based upon statistical inquiry; on the contrary, the report of Sir A. MacDonnell's Commission shows that several important reforms may be suggested. So far as these relate to famine relief, they are matters of detail to be discussed by experts. Sir Charles Elliott has criticised some of them very ably in a recent number of the ASIATIC QUARTERLY, and when the proposals of the Commission were embodied in legislative action at Bombay the native members of the Council voted against them to a man. But there is something of even greater importance than the relief of famine distress—namely, the prevention of its occurrence. People do not now suffer from this kind of calamity in civilized countries such as England and France. The question may naturally be asked, Why is India so particularly afflicted? Setting aside physical difficulties—though such undoubtedly there are—we can see that if the people had money enough the pressure of occasional short crops would not cause so much misery. It has indeed been stated that during all the late trouble there was a sufficient stock of food in the country for every inhabitant, had there only been money to buy it

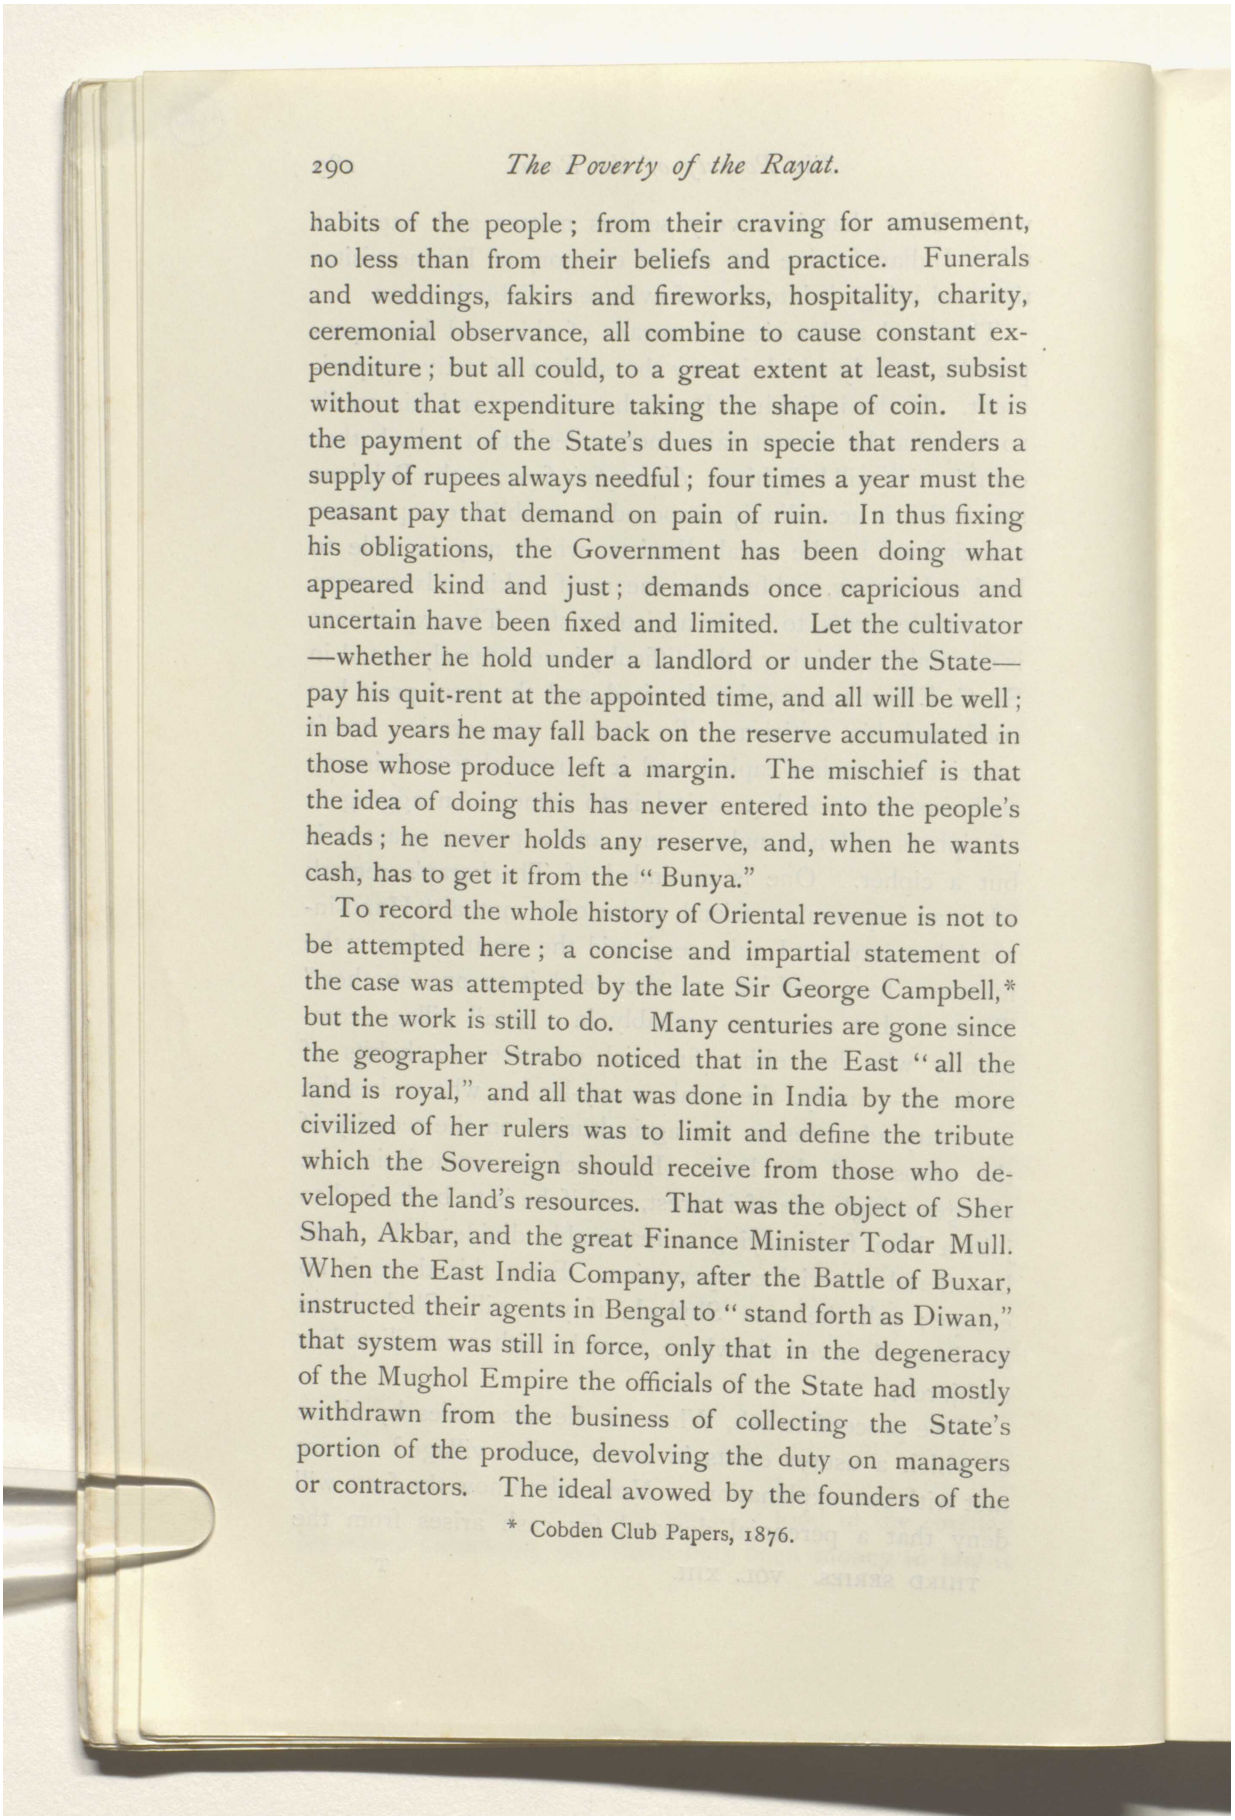
BRITISH LIBRARY

with. Now that is a very serious matter, and one that takes Indian famine out of the category of Divine visitation and brings it into that of evils remediable by man.



The local authorities are aware of this, and have proposed a remedy which is now the subject of active experiment. If the individual Rayat be so poor and his credit so low that he cannot raise money, let it be tried whether combination will help him. *Union fait force*, as the Belgians say, and it is accordingly proposed to establish co-operative associations in the rural districts, which may be able to lend and borrow, and fund the means of making advances on reasonable terms, to needy agriculturists. The experiment is certainly interesting; the difficulty is very tersely stated in Sir C. Elliott's paper already cited, and the local press has confirmed his criticism. To start a co-operative credit association requires capital, and it is natural to ask in any such case whence that capital is to come. An aggregate of ciphers will not make a sum, and a pauper peasant is but a cipher. One is reminded of Thackeray's remark when an impecunious friend spoke of a mutual "Hand-in-hand" society. "I quite see," said the great author, "the members have nothing, and they lend it to one another." There is but one man probably in a small village community who has either financial resources or habits of business—namely, the local money-lender, who makes the necessary advances to the agriculturists on the security of the crops and the land. For such accommodation he charges a high rate of interest, and if he is to be invited to join a loan fund paying a reasonable dividend, he must be offered material compensation. From this there is no escape; call the man Shylock, if you will—Shylock, as has been observed elsewhere, must be either conciliated or cashiered.

If we proceed to ask, What are the necessities by virtue of which a usurer exists in every Indian village? we are met with two explanations. None who know the facts will deny that a perennial demand for cash arises from the

BRITISH LIBRARY

habits of the people; from their craving for amusement, no less than from their beliefs and practice. Funerals and weddings, fakirs and fireworks, hospitality, charity, ceremonial observance, all combine to cause constant expenditure; but all could, to a great extent at least, subsist without that expenditure taking the shape of coin. It is the payment of the State's dues in specie that renders a supply of rupees always needful; four times a year must the peasant pay that demand on pain of ruin. In thus fixing his obligations, the Government has been doing what appeared kind and just; demands once capricious and uncertain have been fixed and limited. Let the cultivator —whether he hold under a landlord or under the State— pay his quit-rent at the appointed time, and all will be well; in bad years he may fall back on the reserve accumulated in those whose produce left a margin. The mischief is that the idea of doing this has never entered into the people's heads; he never holds any reserve, and, when he wants cash, has to get it from the "Bunya."

To record the whole history of Oriental revenue is not to be attempted here; a concise and impartial statement of the case was attempted by the late Sir George Campbell,* but the work is still to do. Many centuries are gone since the geographer Strabo noticed that in the East "all the land is royal," and all that was done in India by the more civilized of her rulers was to limit and define the tribute which the Sovereign should receive from those who developed the land's resources. That was the object of Sher Shah, Akbar, and the great Finance Minister Todar Mull. When the East India Company, after the Battle of Buxar, instructed their agents in Bengal to "stand forth as Diwan," that system was still in force, only that in the degeneracy of the Mughol Empire the officials of the State had mostly withdrawn from the business of collecting the State's portion of the produce, devolving the duty on managers or contractors. The ideal avowed by the founders of the

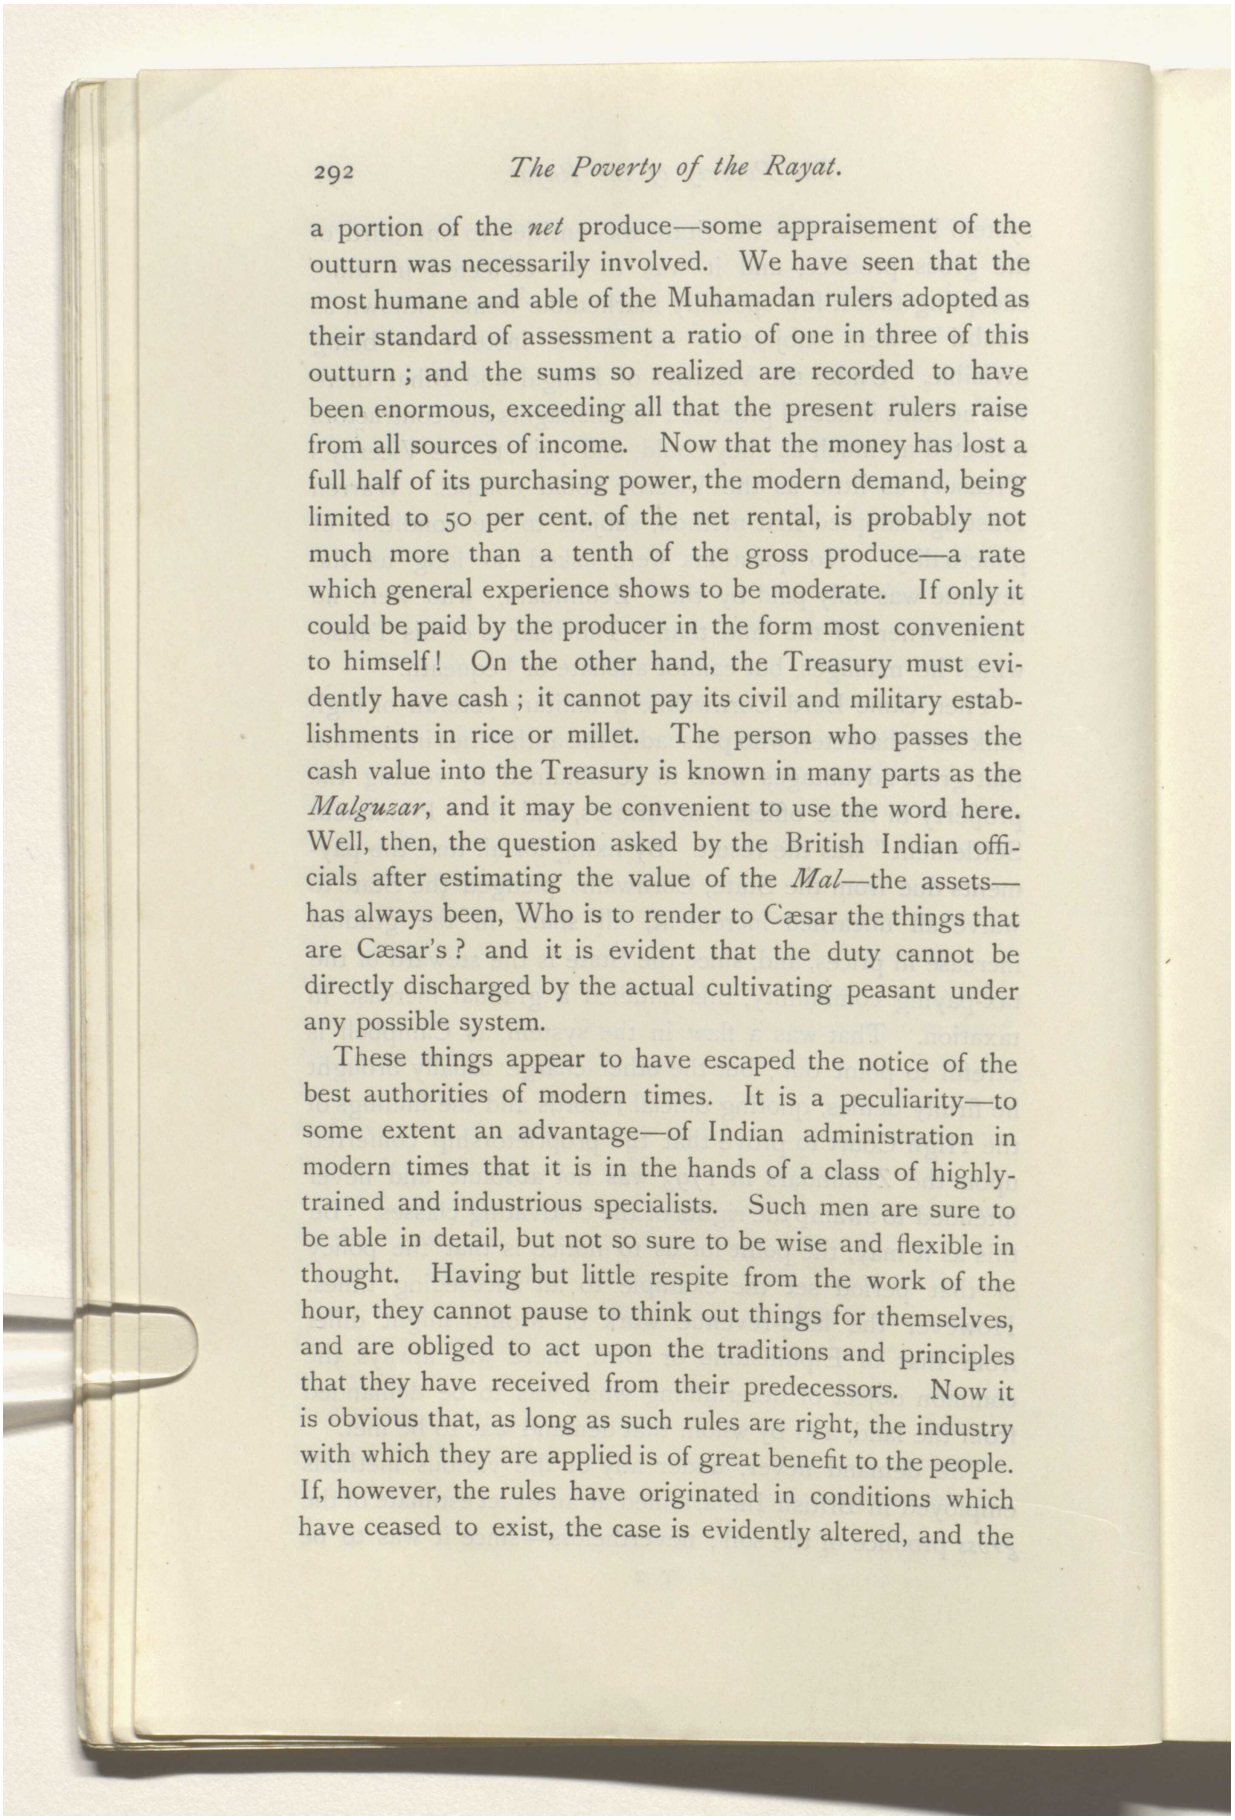
BRITISH LIBRARY

system had been that the State was entitled to one-third of the gross produce, and it was to be collected in kind, excepting that a few specially marketable items—known as "zubti"—were subject to an Excise instead of being divisible. Under the Viceroys of Bengal and Bihar there was no limit in actual practice; the managers and contractors collected as much as they could, and paid to the Viceroy's Treasury as little as the Viceroy could compel. Warren Hastings adopted that method, subject to the condition of punctuality. No questions were asked so long as the revenue was duly paid by the "Zemindars," who were no more owners of the land than a Tahsildar is of his Tahsil, which he manages, but cannot alienate or bequeath.



Then came Lord Cornwallis, a military veteran of high rank and character, who persuaded the authorities in London that great advantages were to be obtained by vesting the property in these officials or farmers, and the "Permanent Settlement" was the result. By fixing for all time the payments due from the State, Cornwallis pledged the State to waive all unearned increment, all share in the gradual increase in prices, and, since the State is the steward of the tax-paying community, this entailed a gradual increase in taxation. That was a flaw in the system, as Campbell is careful to point out; but the other charge usually brought he firmly denies, quoting official records and the findings of the High Court to prove that the proprietorship conferred upon the Zemindars in 1793 was not absolute and never intended to swamp the rights of the cultivating classes. Be this as it may, the point for us to notice is that the policy of that period set the example to all succeeding times. However the land-revenue work of Monro might differ from that of Elphinstone or Bird, there was always the common object of determining what was to be demanded from the land, and by whom that demand was to be met.

The demand never, under any of the various methods employed in British India, aimed at an exact estimate of the *gross* produce of the soil; nevertheless—since it was to be

BRITISH LIBRARY

a portion of the *net* produce—some appraisement of the outturn was necessarily involved. We have seen that the most humane and able of the Muhamadan rulers adopted as their standard of assessment a ratio of one in three of this outturn; and the sums so realized are recorded to have been enormous, exceeding all that the present rulers raise from all sources of income. Now that the money has lost a full half of its purchasing power, the modern demand, being limited to 50 per cent. of the net rental, is probably not much more than a tenth of the gross produce—a rate which general experience shows to be moderate. If only it could be paid by the producer in the form most convenient to himself! On the other hand, the Treasury must evidently have cash; it cannot pay its civil and military establishments in rice or millet. The person who passes the cash value into the Treasury is known in many parts as the *Malguzar*, and it may be convenient to use the word here. Well, then, the question asked by the British Indian officials after estimating the value of the *Mal*—the assets—has always been, Who is to render to Cæsar the things that are Cæsar's? and it is evident that the duty cannot be directly discharged by the actual cultivating peasant under any possible system.

These things appear to have escaped the notice of the best authorities of modern times. It is a peculiarity—to some extent an advantage—of Indian administration in modern times that it is in the hands of a class of highly-trained and industrious specialists. Such men are sure to be able in detail, but not so sure to be wise and flexible in thought. Having but little respite from the work of the hour, they cannot pause to think out things for themselves, and are obliged to act upon the traditions and principles that they have received from their predecessors. Now it is obvious that, as long as such rules are right, the industry with which they are applied is of great benefit to the people. If, however, the rules have originated in conditions which have ceased to exist, the case is evidently altered, and the

labour so strenuously bestowed is not merely lost, but often made an instrument of evil.

It is for this reason that the efforts of the "Union" mentioned above are to be regarded as promising of benefit to India. Under the rule of the Old East India Company, now almost passed from recollection, abuses were by no means rare, but a remedy was never far remote. Every twenty years the Company's charter lapsed, and ere it could be renewed a long discussion occurred, alike in Parliament and in the press. Were such consultations held in the present day they would be doubtless founded on a searching inquiry such as is urged by the "Union." It is impossible to predict with any certainty what the result of such an inquiry would be. It might show that all which ought to be known in regard to the condition of the Rayat was already established, and that the Government could effect nothing more for his protection against distress and debt. On the other hand, it might be shown that the Rayat was most prosperous and contented in Bengal; that the element of perpetuity in the demand was indeed the flaw that Campbell called it, and not the panacea contemplated by the Congress;* but that, apart from this, the prosperity of Bengal was attributable to the nature of the land-revenue system. Almost alone in British India, the old provinces in this lieutenancy raise their share of the rent from middlemen, and the actual cultivator is spared the trouble and anxiety involved in the office of Malguzar.

* "A financial mistake," the sometime Governor calls it, and "a sin against posterity."—(*Systems of Land-Tenure*, edited for the Cobden Club by J. W. Probyn, p. 145).

MOROCCO: THE SULTAN AND THE BASHADOURS.

By Ion Perdicaris.

The presence, in January and February, of no less than four of the representatives of the Powers at the coast town of Rabat during the temporary stay there of the young Sultan, Mulai Abd-el-Aziz, and his Court, has afforded the Ministers of England, Austria, Germany, and France the opportunity of treating directly with His Shereefian Majesty, instead of conducting negotiations from Tangier.

The object of Sir Arthur Nicolson's visit was to confirm and ratify the arrangements discussed last summer in London with the Sultan's special envoy, Sid el-Mahdi-el-Menebhi, who, it may be remembered, afterwards visited Berlin, whence he returned, suddenly, and, apparently, in disgrace, attended by Kaid Sir Harry Maclean.

Those who knew what was passing at the Shereefian Court, then at Morocco City, the southern capital of the Moorish Empire, thought, indeed, that it was only the presence of "the Kaid," together with urgent remonstrances from the English Legation at Tangier, which saved Menebhi from arrest on a serious charge of peculation. The inference was that England had suffered an awkward check, since it was evident that the old Moorish faction with Sid Fedoul Gharnit, long Minister for Foreign Affairs under the late Sultan, Mulai el Hassan, and certainly one of the most wily and adroit of Moorish Vizirs, was then in the ascendant. To-day, however, Menebhi is, more than ever, a power at Court—a circumstance which favours a radical change of policy, together with the possible reform of many old customs that "were more honoured in the breach than the observance."

Nothing, indeed, has more surprised those who best know Morocco than this sudden change of attitude on the part of the officials, in whose hands, for the moment at

BRITISH LIBRARY

least, is vested the power to dispose of the lives and fortunes of the inhabitants.

After the death, in 1894, of Mulai el Hassan, and whilst the late Grand Vizir, Ba Hamed ben Musa, a fanatical Moslim of the old type, resolute in his fixed opposition to all foreign influence, was in office, the young Sultan himself seemed but a pale effigy of authority, without policy or will of his own, an inert and uninterested spectator of events, scarcely known to his subjects except as a passive feature in state functions. No sooner, however, was the imperious Vizir dead, than Abd-el-Aziz threw off the silence and reserve which had hitherto characterized him, and awoke from his apparent lethargy. Never, perhaps, has a change so sudden or radical been seen. Eager and alert, the once immobile prince now shows the most lively interest in all that concerns his country and his people, and what is the more surprising, considering the circumstances and his education, welcomes with enthusiasm frequent innovations from abroad, and betrays the most lively curiosity concerning foreign customs and modern inventions, even to the sports in which the foreign communities take so keen a delight. Not only has he become an adept on his bicycle and with the camera (with a special predilection for the snapshot), but he has had a cement tennis court laid at Rabat for the purpose of enjoying the game with his diplomatic guests; whilst, on other occasions, discarding all his Oriental magnificence of velvet saddles embroidered in gold, he rides to the hounds on English leather and dressed like an English sportsman.

How striking such a change must seem to many of his subjects can best be realized when the fact is remembered that only fourteen years ago, when Mulai el Hassan, the late father of the present Sultan, visited Tangier, a European photographer, established in front of the legations, was stoned by the mob for venturing to photograph the Sultan as the latter rode through the main street of the town on his way to the principal mosque.

This sudden departure from the habits and even the modes of thought of former rulers of Morocco is attributed, by most observers, to the personal ascendancy and influence of El Mahdi and to the latter's intimacy with Kaid Sir Harry Maclean, the Scotch Military Instructor of His Shereefian Majesty's forces. Sid el-Mahdi-el-Menebhi has usually filled the post of Minister of War, and, although he does not always enjoy the titular rank of Grand Vizir, is, when in favour, the virtual Prime Minister of his Sovereign. These somewhat pro-English influences have been of late undoubtedly strengthened and enforced by the Sultan's personal regard and esteem for the British Minister, Sir Arthur Nicolson.

There has, however, been another and scarcely less eventful factor in the equation—viz., the fear of France, provoked by the occupation of Tuat on the south-eastern confines of Morocco, and by the advance, last summer, of French troops upon the Moorish town of Figuig.

Between these two contending forces the face of the young Sultan appears, with each succeeding month, to be set more firmly towards the reforms which he is urged to effect. Amongst these figure, in the first instance, the abandonment of the vicious system of the farming out of the collection of "the tenth," or tax upon agriculture, together with the substitution of paid officials, including Kaids and governors, in the place of the insatiable native officials now allowed to levy at pleasure upon the towns or bashalicks confided to their care.

Next in order is the removal of the innumerable barriers to trade and commerce, with a more general permission to export produce, hitherto limited to a few articles, such as beans, maize, aniseed, leather, gum, etc., and, finally, the establishment of means of communication, such as roads, bridges, railways, telegraphs, etc.—not so much in the shape of concessions to foreign companies, but as operations to be carried out directly by the Government itself.

The dangerous point in connection with these plans is

the necessity for the employment of experts, not merely to carry out administrative experiments of so novel a character, especially for such an "old-bottle" country as Morocco, one where the new wine must be poured into the ancient receptacles with more than usual care, in order to avoid a serious catastrophe to the antique skin with which the would-be reformer is condemned to deal, but experts—and who says "experts," knows that this "subject" must of necessity be qualified by the adjective "foreign," since, among the natives of this degenerate land, no experts, save in the matter of mendacity, are to be found—but experts, as has been said, must be employed when the aforementioned public works are concerned, both engineers and, more especially, financial experts, without whom it would be impossible to obtain the large sums that are required—sums larger than either the Shereefian Treasury or the Customs of the various coast towns can supply, since, unfortunately, both Menebhi, during his recent ambassadorial excursions, and his Imperial master himself, have been spending more freely of late upon toys of various descriptions than has been quite prudent—toys ranging in importance from jewels for the ladies of the harem to motor-cars, and from "bikes" for practice in the Sultan's private grounds to so costly a plaything as a hundred kilometres of rails, with a neat selection of rolling-stock—not for commercial purposes, but, like the bicycles, merely for private amusement—whilst for higher flights a balloon figures in the list of orders.

In this emergency money must be found, and it may therefore be assumed that the modest announcement vouchsafed to the press, "that England and Morocco have agreed upon a *modus vivendi*," means, in reality, that a loan in one shape or another has been, or will shortly be, negotiated; indeed, a rumour is current among the populace that England is about to assume a virtual protectorate over Morocco! In fact, a protectorate appears, not only to the natives, but to many foreign observers as well, the

only really effective means of realizing the proposed improvements.

The Sultan and his advisers are now already upon the horns of this dilemma, or they will soon be there; for it is almost certain to be a case of *no* protectorate, *no* reforms, *or* a protectorate more or less disguised, *and* trouble with France.

The Parisian press has, indeed, already spoken with no uncertain voice. The first paper to call public attention to the subject was an Opposition organ, *Le Gaulois*, which, under the heading "England at Tangier"—after alluding to the arrival at the latter town of several English *non*-commissioned officers to instruct the Sultan's troops (troops which are clad in uniform and equipment of English make), and to other real or imaginary indications of English preponderance—urges the French authorities to act while it is yet time, and before the Mediterranean has been closed by the British sentinels at Tangier, as well as at Gibraltar. Subsequently *Le Temps* and *La Patrie*, more serious journals and more Governmental in tone, take up the refrain, also advocating a vigorous policy on the part of France: nothing less than the occupation of Tafilelt, as compensation for any advantages England may obtain, either in the shape of railway concessions, or other tangible evidences of preponderating influence.

Mere newspaper bluster, if not backed up by strong national feeling, may be disregarded. Fortunately, moreover, the Waldeck Rousseau Cabinet has hitherto shown so much tact and good sense, that a policy of adventure on such insufficient ground as the confidence of the Sultan of Morocco in his English advisers, seems scarcely to be expected. Still, there are the approaching elections in France, after which Lord Salisbury, or his successor, may have to face a Government less to be depended upon to take a dispassionate view of the situation; for, of course, the mere idea of a war between France and England because Morocco favours one Power more than another is a

BRITISH LIBRARY

monstrous supposition, since all Morocco, or even ten times all Morocco, would not compensate even the victor in such an insane struggle for the tremendous losses entailed by a war between these two great Powers. Yet—and this is the never-to-be-forgotten point—nations are too apt to lose their head and be carried away by purely sentimental grievances; and it must be remembered that the scheme of a French united North African Empire, stretching from the confines of Tripoli to the Atlantic Ocean, and rounded off to the south-west by the French possessions of Senegal, to which France is persistently devoting the most strenuous efforts, is a Gallic ideal which dominates all Frenchmen with an intensity quite equal to the counter-balancing English conception of an uninterrupted right of way for England from Alexandria to Cape Town.

There is no use in shutting one's eyes to our neighbour's point of view. The intelligent statesman will, indeed, be careful to avoid so glaring a fault. It is to be hoped, therefore, that those who direct the policy of England where Morocco is concerned, may remember that the attempt to launch the latter country successfully upon the road to reform without providing against an open or masked attack by France, her nearest and most powerful neighbour, would be to act with little less than criminal cruelty towards Morocco, since the Sultan, left to himself, would be powerless to repel French aggression, in spite of the force of Moorish troops supposed to be so carefully drilled by Kaid Maclean.

This threat of the French occupation of Tafilelt could be but too easily realized, especially when the railway, for which even now material is being hurried forward, shall have been completed to Figuig. Moreover, such an occupation once effected, might of itself and alone prove fatal to the Filali dynasty in Morocco; for it is from Tafilelt that the ancestors of Abd-el-Aziz issued forth to conquer the kingdoms of Fez, of Morocco, of Sus, and of Draa, all of which provinces are now incorporated in the *Aiyala*

Sherefia, as the Sultanate of Morocco is termed by its inhabitants.

Besides, it must always be borne in mind that pretenders and aspirants for the throne are not to be sought for. Harmless they may be at present, for lack of arms and means, but these are deficiencies which could be easily supplied by France, had she any interest in rallying to the support of some nominee of her own: the mountain-tribes of non-Arab descent, the Riffs, and other branches of the Berber or Sehlha races, tribes only too disposed to revolt against any established authority, as they have been from the time of the Roman, Gothic, or Byzantine occupations down to the present day.

It would be well, therefore, for the friends of the young Sultan to be careful, lest, whilst they are teaching him to play tennis and golf, how to take snapshots and to develop negatives, or how to drive his motor-car or sit his bicycle, that he does not fall from his throne—the throne of his Filali ancestors—which has been from time immemorial the richly-caparisoned, high-peaked Moorish saddle; for from the moral effects of such a fall from the seat of power all the king's men might not be able to set the Sultan up again!

Sir Arthur Nicolson arrived off Rabat, January 21, on board H.B.M. battleship *Illustrious*. The reception of the British Minister on landing—one might almost say his triumphal entry—escorted by his own suite on horseback, and attended by El Menebhi and the other Vizirs and Court officials, was of the most cordial character. The entire force of Moorish regulars now with the Sultan at Rabat—some 6,000 men—all from the country immediately about Morocco city, arrayed in their new uniforms, being under arms to receive the Minister; whilst the Sultan's household cavalry, in their flowing garb of many colours, executed the usual *laab-el-barud*, or powder play, as they preceded the escort.

One memorable departure from established custom

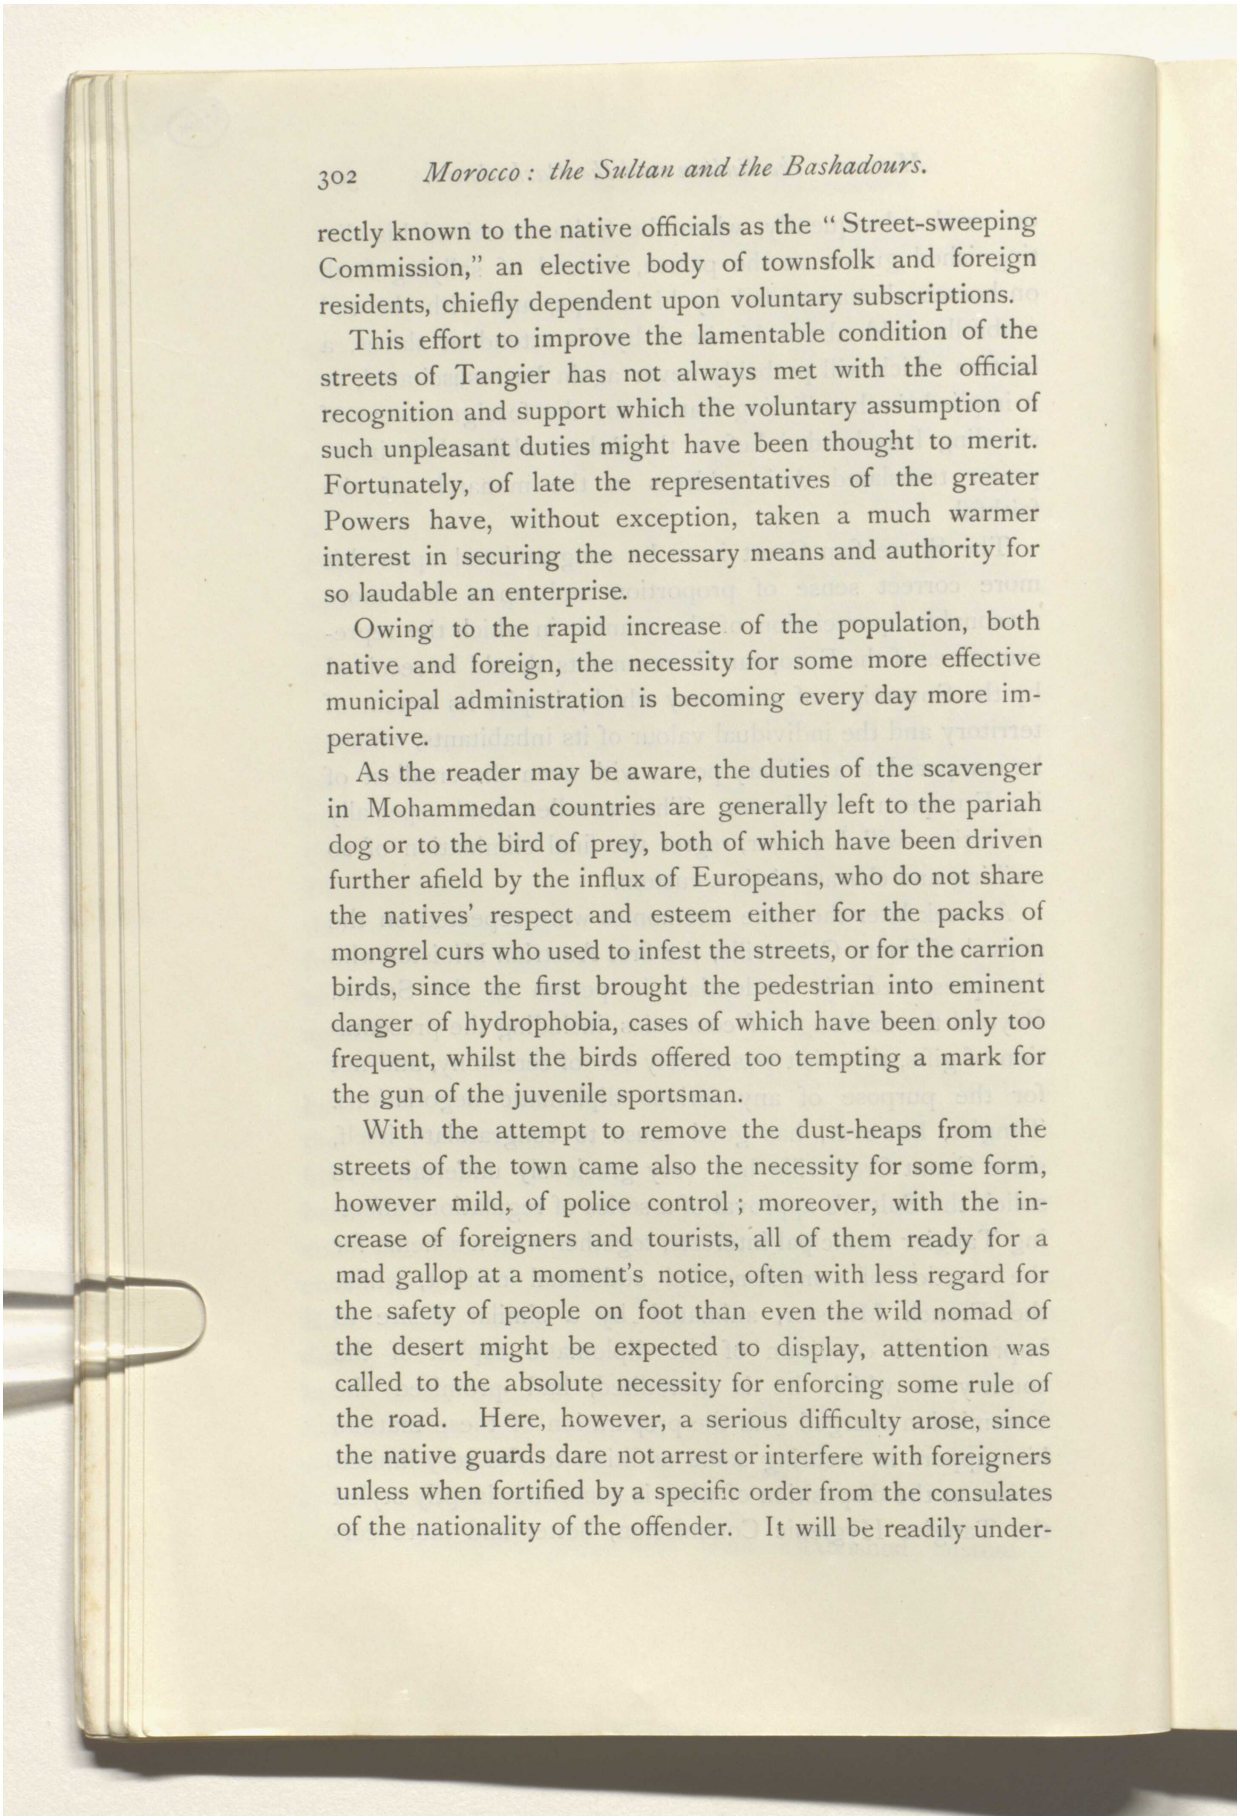
occurred subsequently, when the Sultan received his distinguished guests at the palace, instead of sallying forth on horseback surrounded by his troops, and with the red umbrella held above his head by his attendant slaves, a custom which will probably never again be resuscitated, as it implied the humiliating feature for the foreign envoys of standing bare-headed before the Sultan whilst their interpreter translated their address to the monarch of the faithful.



The Shereefian Court is to be congratulated upon this more correct sense of proportion and upon this more reasonable appreciation of the manner in which the representatives of the European Governments should be received by the Sovereign of a country which, despite its extent of territory and the individual valour of its inhabitants, cannot be compared as a military power with even the smallest of its European neighbours. The traveller—and especially the artist—will, however, regret the final elimination of so striking and characteristic a custom.

A week later the same ceremonies were repeated on the arrival of Count Crennville, the first Austrian Minister who has presented his credentials in person to the Sultan. Beyond the exchange of courtesies, including the presentation of gifts, this visit was merely one of ceremony, and not for the purpose of any serious diplomatic negotiations. Tangier, however, has good cause to congratulate itself, since Count Crennville had very graciously undertaken to solicit the Sultan's approval of a series of regulations affecting Tangier municipal interests, together with a scheme for the erection of a much-needed additional market, whilst the French Minister, animated by a similar desire to improve the condition of the diplomatic capital of the country to which he is accredited, had promised the Commission charged with the preparation of these matters his support in securing some addition to the very limited means at the disposition of what is somewhat inaptly styled the Tangier Hygienic Commission, better and more cor-

rectly known to the native officials as the "Street-sweeping Commission," an elective body of townsfolk and foreign residents, chiefly dependent upon voluntary subscriptions.

This effort to improve the lamentable condition of the streets of Tangier has not always met with the official recognition and support which the voluntary assumption of such unpleasant duties might have been thought to merit. Fortunately, of late the representatives of the greater Powers have, without exception, taken a much warmer interest in securing the necessary means and authority for so laudable an enterprise.

Owing to the rapid increase of the population, both native and foreign, the necessity for some more effective municipal administration is becoming every day more imperative.

As the reader may be aware, the duties of the scavenger in Mohammedan countries are generally left to the pariah dog or to the bird of prey, both of which have been driven further afield by the influx of Europeans, who do not share the natives' respect and esteem either for the packs of mongrel curs who used to infest the streets, or for the carrion birds, since the first brought the pedestrian into eminent danger of hydrophobia, cases of which have been only too frequent, whilst the birds offered too tempting a mark for the gun of the juvenile sportsman.

With the attempt to remove the dust-heaps from the streets of the town came also the necessity for some form, however mild, of police control; moreover, with the increase of foreigners and tourists, all of them ready for a mad gallop at a moment's notice, often with less regard for the safety of people on foot than even the wild nomad of the desert might be expected to display, attention was called to the absolute necessity for enforcing some rule of the road. Here, however, a serious difficulty arose, since the native guards dare not arrest or interfere with foreigners unless when fortified by a specific order from the consulates of the nationality of the offender. It will be readily under-

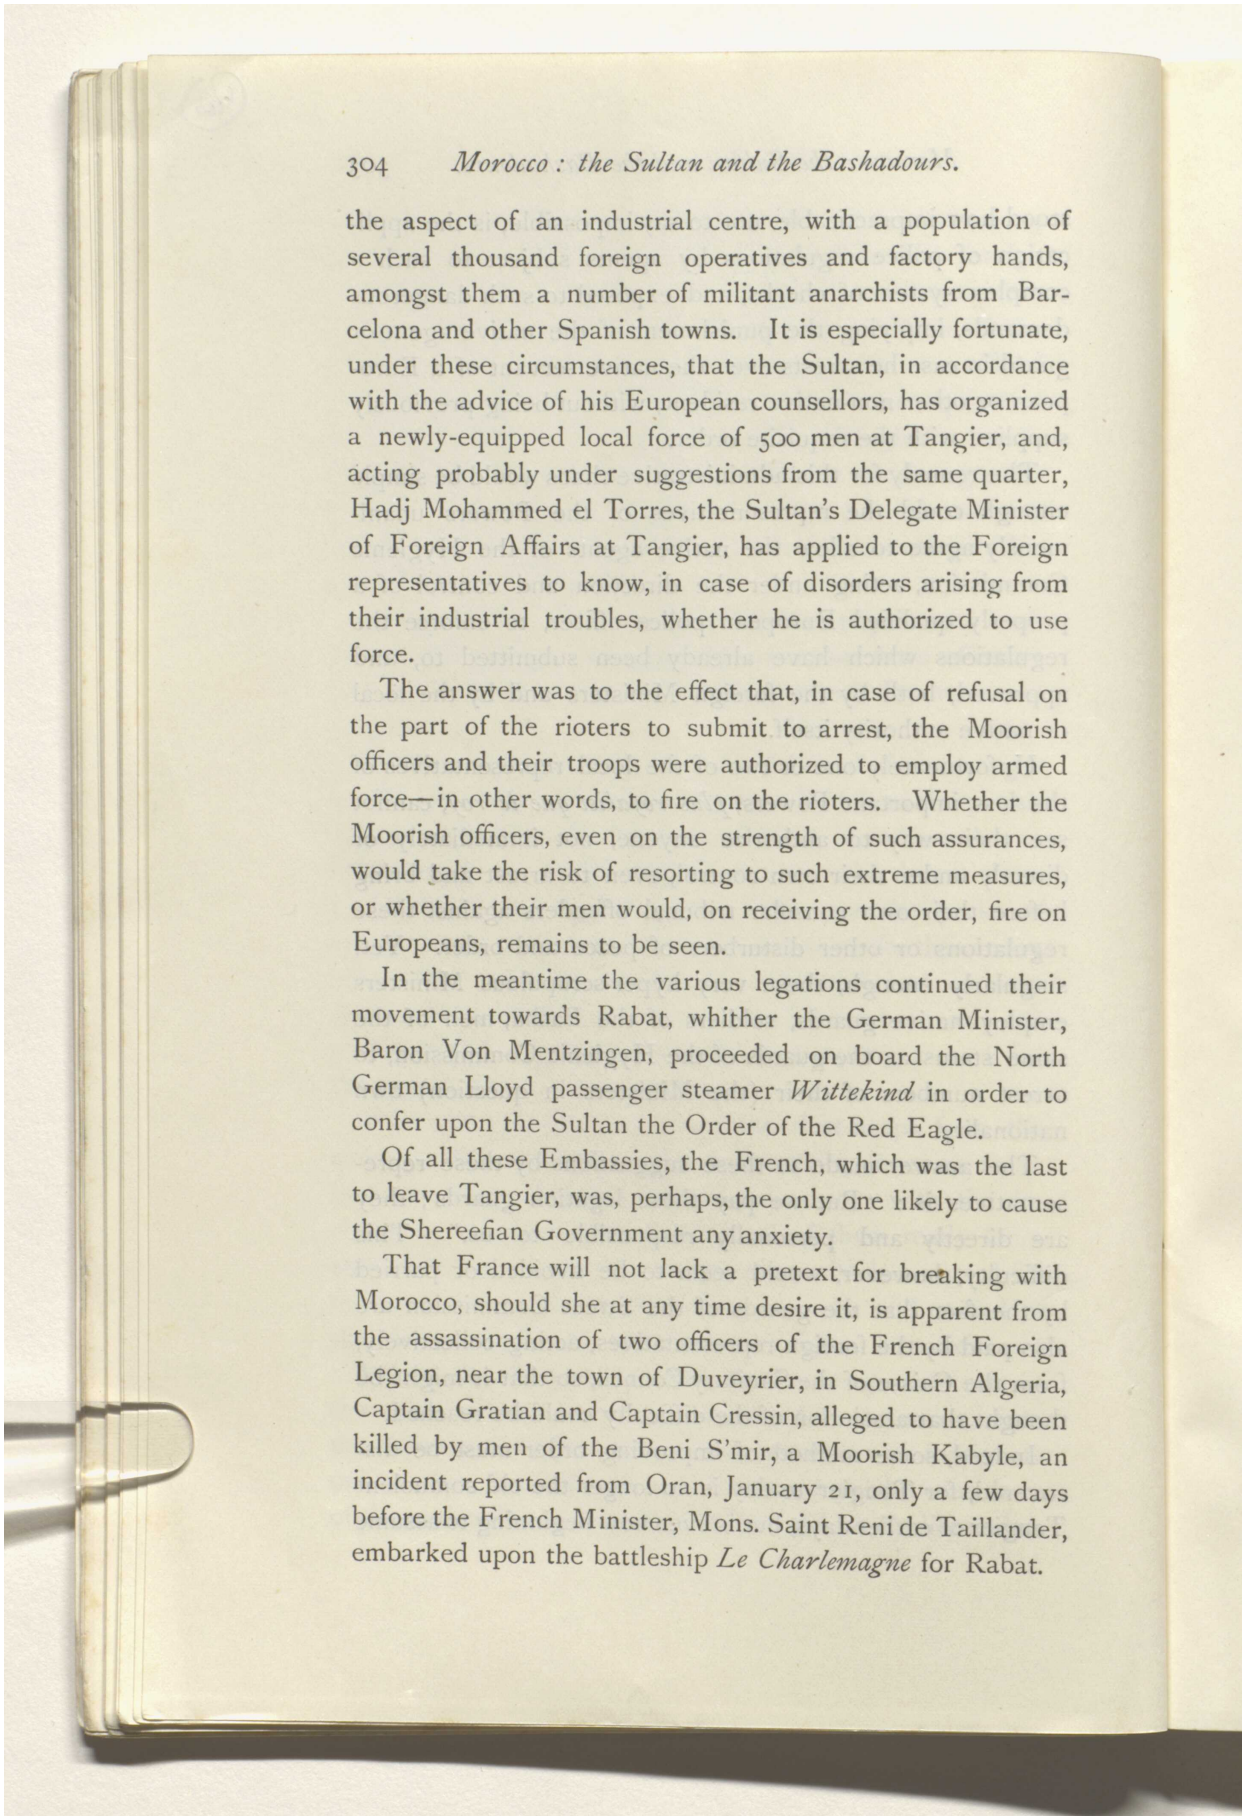
stood how impracticable, not to say impossible, is the application of police regulations by agents subject to such a complex system of checks, and exposed to such dangerous demands, implying the punishment of the native agent or guard in case he arrests even the native servant of a European or other non-native resident, without being previously supplied with the requisite order.

The remedy for this administrative chaos would be simple enough could the representatives of the Powers unanimously agree to allow the native agents of the Hygienic Commission, acting under the direction and control of a properly qualified European police officer, to enforce the regulations which have already been submitted to, and approved, both by the foreign Ministers and by the local or native authority itself.

Unfortunately one or two of the local representatives of the less important Powers, *plus royalist que le roy*, cannot see their way to authorize anyone, not immediately or directly under their own control, even to arrest and bring before their own consular tribunal offenders against these regulations or other disturbers of peace and order. Yet, singularly enough, these very hyper-scrupulous Ministers employ native guards, soldiers of the Basha, men of the same status as the guards of the Hygienic Commission, to arrest numbers of their (the Ministers in question) own nationality.



The answer made to these suggestions by these representatives is: "But we pay these legation guards; they are directly and personally responsible to us." This difficulty, however, would seem to be avoided or parried by the fact that the guards of the Street Commission are also paid by the foreign representatives, acting collectively, from the Caisse of the Sanitary Council, so that it might be thought that a solution of the difficulty could be reached.

Indeed, some method of improving order must be discovered, for Tangier to-day is no longer the old somnolent Tangier of earlier days, but is even now beginning to assume

the aspect of an industrial centre, with a population of several thousand foreign operatives and factory hands, amongst them a number of militant anarchists from Barcelona and other Spanish towns. It is especially fortunate, under these circumstances, that the Sultan, in accordance with the advice of his European counsellors, has organized a newly-equipped local force of 500 men at Tangier, and, acting probably under suggestions from the same quarter, Hadj Mohammed el Torres, the Sultan's Delegate Minister of Foreign Affairs at Tangier, has applied to the Foreign representatives to know, in case of disorders arising from their industrial troubles, whether he is authorized to use force.

The answer was to the effect that, in case of refusal on the part of the rioters to submit to arrest, the Moorish officers and their troops were authorized to employ armed force—in other words, to fire on the rioters. Whether the Moorish officers, even on the strength of such assurances, would take the risk of resorting to such extreme measures, or whether their men would, on receiving the order, fire on Europeans, remains to be seen.

In the meantime the various legations continued their movement towards Rabat, whither the German Minister, Baron Von Mentzingen, proceeded on board the North German Lloyd passenger steamer *Wittekind* in order to confer upon the Sultan the Order of the Red Eagle.

Of all these Embassies, the French, which was the last to leave Tangier, was, perhaps, the only one likely to cause the Shereefian Government any anxiety.

That France will not lack a pretext for breaking with Morocco, should she at any time desire it, is apparent from the assassination of two officers of the French Foreign Legion, near the town of Duveyrier, in Southern Algeria, Captain Gratian and Captain Cressin, alleged to have been killed by men of the Beni S'mir, a Moorish Kabyle, an incident reported from Oran, January 21, only a few days before the French Minister, Mons. Saint Reni de Taillander, embarked upon the battleship *Le Charlemagne* for Rabat.

The most important issue which the Minister will probably be empowered to discuss with the Sultan will relate to the strategic railway or railways along the Algerian-Moorish frontier, of which the town of Figuig is the immediate objective. It will be remembered that this is a Moorish town, under the Sultan's jurisdiction, and that a line from Oujdah to Figuig, would run almost its entire course on Moorish territory; and Oujdah commands the approach to Fez, whilst Figuig covers Tafilelt. However amicably and gently any approach of the French lines, for which material is being already sent forward, may be suggested, the keenest susceptibility will doubtless be aroused.

It will be some time before the result of this series of missions to the Sultan will become apparent. Undoubtedly the attention of the various chancelleries is awakened, and even incidents far removed from Morocco and its immediate neighbours—such, for instance, as the Anglo-Japanese Treaty—may exercise some counter effect on Moorish affairs, since it will certainly tend towards some more or less successful effort on the part of Russia and France to score, if possible, in Persia and Morocco, as some offset, or compensation, for the advantage achieved by England in the "Far East."

Should Spain not go to pieces altogether economically, owing to industrial and political risings, an attempt will certainly be made to induce that Power to join the Franco-Russo alliance, especially should the Sagasta Cabinet go out. To this end Silvela, who aspires to the succession of the late Conservative chief, Canovas del Castillo, published an unsigned article in one of the leading reviews of Madrid, which attracted much attention at the moment, and which has been followed lately by an article in *La Revista de Aragon* of January, by Julian Ribera, another parliamentary notability, both urgently advocating an alliance with France, eminently suggestive of a joint attack upon Gibraltar, and compensation in Morocco for English successes elsewhere.

THE PRINCE OF WALES PROFESSORSHIP OF HISTORY AT THE SOUTH AFRICAN COLLEGE.

By Professor H. E. S. Fremantle, M.A.

Several causes contribute to render the proposal to establish a Professorship of History at the South African College interesting to thoughtful men beyond the limits of Cape Colony and even of South Africa. In the first place, it is surely a matter of interest to find that South Africa is in a condition to need such a professorship, and that in such a country a young nation is springing up which has already advanced so far in the path of national development as to feel the need of further advance in the way proposed. Nor can it be without interest to those who watch the progress of events in South Africa with an eye to the future to know that it is possible at the present time not only to maintain existing institutions in full working order, but even to make such an effort as the present for this extension. In the second place, men of the greatest prominence at the Cape are supporting the movement, and thereby showing a sense of the importance of education in a practical way, which it would be difficult to induce men in a corresponding position at home to pursue with anything like the same activity or unanimity. In the third place, a proposal which promises to induce the inhabitants of the whole of South Africa to study history deals with men on so great a scale as to appeal to the imagination and expand our conceptions beyond the ordinary range. The special interest of South African history, and the importance of establishing a genuine school for its study must be obvious to all. And, finally, all these reasons have been endorsed and strengthened by the patronage which the Prince of Wales has given to the scheme, adding to it, with that discrimination and tact which is the property of the Royal Family, the dignity which belongs to an Imperial enterprise.

BRITISH LIBRARY

As a college doing university work, the South African College stands at the highest point of the educational system of South Africa, nor can the one be properly understood without understanding the other. In Cape Colony and Natal the ideal of a complete scheme of national education is being progressively realized under the powerful direction of the Superintendents General of Education, Dr. Muir and Mr. Russell. It is such a scheme as that which has already been long at work in Scotland with beneficial results which are beyond dispute, or as that which has more recently been introduced into Wales as the result of a genuine national movement in favour of education; and we may notice, in passing, the closeness of the parallel which might be drawn between the special problems of Wales and of South Africa. The ideal is to place sound elementary education within reach of all the inhabitants of the country, to establish higher schools at the great centres, to provide for the highest university education of which the country is capable, and, finally, to establish a ladder of scholarships and bursaries by which every student who is able to survive at the greater altitude may climb to the highest grade of education. This is not the place to attempt an appreciation of the success which has hitherto attended the efforts to construct a perfect scheme of national education in South Africa; it is enough to say that this ideal not only exists in many minds, but may already be said to have been realized in outline. The special point which we desire to emphasize here is that in South Africa, far more even than in Scotland or in Wales, the higher education ceases to be merely local, and the best schools and colleges of South Africa attract students from all parts of the country, as the great Public Schools or the Universities of Oxford and Cambridge do in the United Kingdom, and as the University of Paris does in France. No one can advance a step in the direction of understanding South African affairs until he has mastered the cardinal fact that, whatever its political divisions, South Africa is socially and

BRITISH LIBRARY

essentially one country. In no point does this unity more clearly manifest itself than in higher education, and in no educational institution more clearly than in the South African College. The University, which calls itself the University of the Cape of Good Hope, holds its examinations in defiance of war and rumours of war in the Transvaal and Orange River Colonies, as well as in the older Colonies and Rhodesia. The Boer prisoners in South Africa and at St. Helena have already been admitted, on their own application, to the examinations of the University, and those at Bermuda have just made a similar application to the University Council. In such schools as those attached to the South African College, and Victoria College, Stellenbosch, St. Andrew's College, Grahamstown, and the Diocesan College, Rondebosch, boys from all parts of South Africa are to be found, just as Englishmen, Welshmen, Scotchmen and Irishmen may be found in the same remove at Eton; and naturally this educational federation of South Africa shows itself even more plainly in the case of the Colleges than in that of the Schools. It is hardly an exaggeration to say that the university work of the whole of South Africa is done in or near Cape Town, and the importance of maintaining this condition of things may perhaps be inferred by those to whom it is not immediately patent from the efforts which President Kruger himself made to disturb it. *Fas est et ab hoste doceri.*

The South African College has a remarkable position in the history and in the present structure of South African education. It is the oldest educational institution in the country, having been founded in 1829; its growth has exactly corresponded to that of the educational system as a whole. Beginning as a school, it has developed into a genuine university college as such an institution has been required, and having been founded by the united efforts of all sections of the population ten years before the existence of any South African State except Cape Colony, it represents by its living traditions a golden age such as the uncritical

always place in the past and the critical in the future, the age of happy co-operation between English and Dutch, and of the undisputed union of South Africa.

It was not until 1858 that a Board of Public Examiners granting certificates was instituted, and it was not until 1873 that this developed into the University of the Cape of Good Hope, conducting school and university examinations and conferring degrees. The South African College has naturally, therefore, maintained from the first a strong influence over the University. The new offices of the University will almost adjoin the buildings of the College, and apart from the special functions which the College has to perform as a college—that is, as offering the means of the highest education, and so standing in the highest grade of the scheme of national education—it naturally exercises, through the University, an influence over the whole system of which it is itself a part.

The College has greatly developed of late years, and even during the course of the war. In 1900 it finally got rid of the last trace of its origin as a school by handing over the class studying for the matriculation examination at the University to the School which is attached to it. In this it has been followed by the Victoria College, Stellenbosch. The two Colleges have thus definitely taken their places as University Colleges. The position which the two taken together at present occupy may perhaps be gauged by the fact that in the list of honours gained at the last B.A. examination exactly five-sixths of the places—fifteen out of eighteen, leaving out of account the successes gained by the excellent Women's College at Wellington, which of course stands on somewhat different ground—were occupied by students of one or other of the two Colleges; and the position of the South African College by the fact that two-thirds of these (ten out of fifteen, including the first of the year both in literature and in science) were South African College students; and the further fact that in the eighteen years during which the

Qatar National Library

University has held honours examinations for the B.A. degree in literature and science, the first place in each department has thirteen times fallen to a student of the College.

We have now attempted to determine the position which the South African College occupies in the system of the national education of South Africa. We shall next endeavour to indicate the extent and nature of the work which, as occupying this position, it is called upon to do for the country. Of the extent of this work we can form some estimate by a merely mechanical reference to the numbers of its students. During the last session there were 236 students at the College. As the white population of South Africa, including Boer and Colonial belligerents and deported prisoners of war, is probably less than 800,000, it follows that about 1 in 3,000 is a student at the College. Reckoning thirty years for a generation—probably forty would be an under-estimate—it follows that about 1 in every 100 of the inhabitants of South Africa is a present or past student at the College. It is difficult to compare this with the position of universities at home. It is important to notice that there are in the United Kingdom two grades of universities; on the one hand, those which, like the Scotch, Welsh, and provincial universities, do the general work of university education for all classes of the community, and are accordingly more or less local in their operation; and on the other hand, the Universities of Oxford and Cambridge, which do the university work for the social and intellectual aristocracy of the whole kingdom. It is important to notice this for two reasons, the first and greater of which is only indirectly connected with the immediate question. It is the need, and the possibility arising from a general sense of the need, of the older universities rising to their position as educators of the real aristocracy of the whole Empire, and acting, if we may use the expression, as universities of appeal not only for the three kingdoms, but also for the great colonies. The other reason is that the South African College cannot

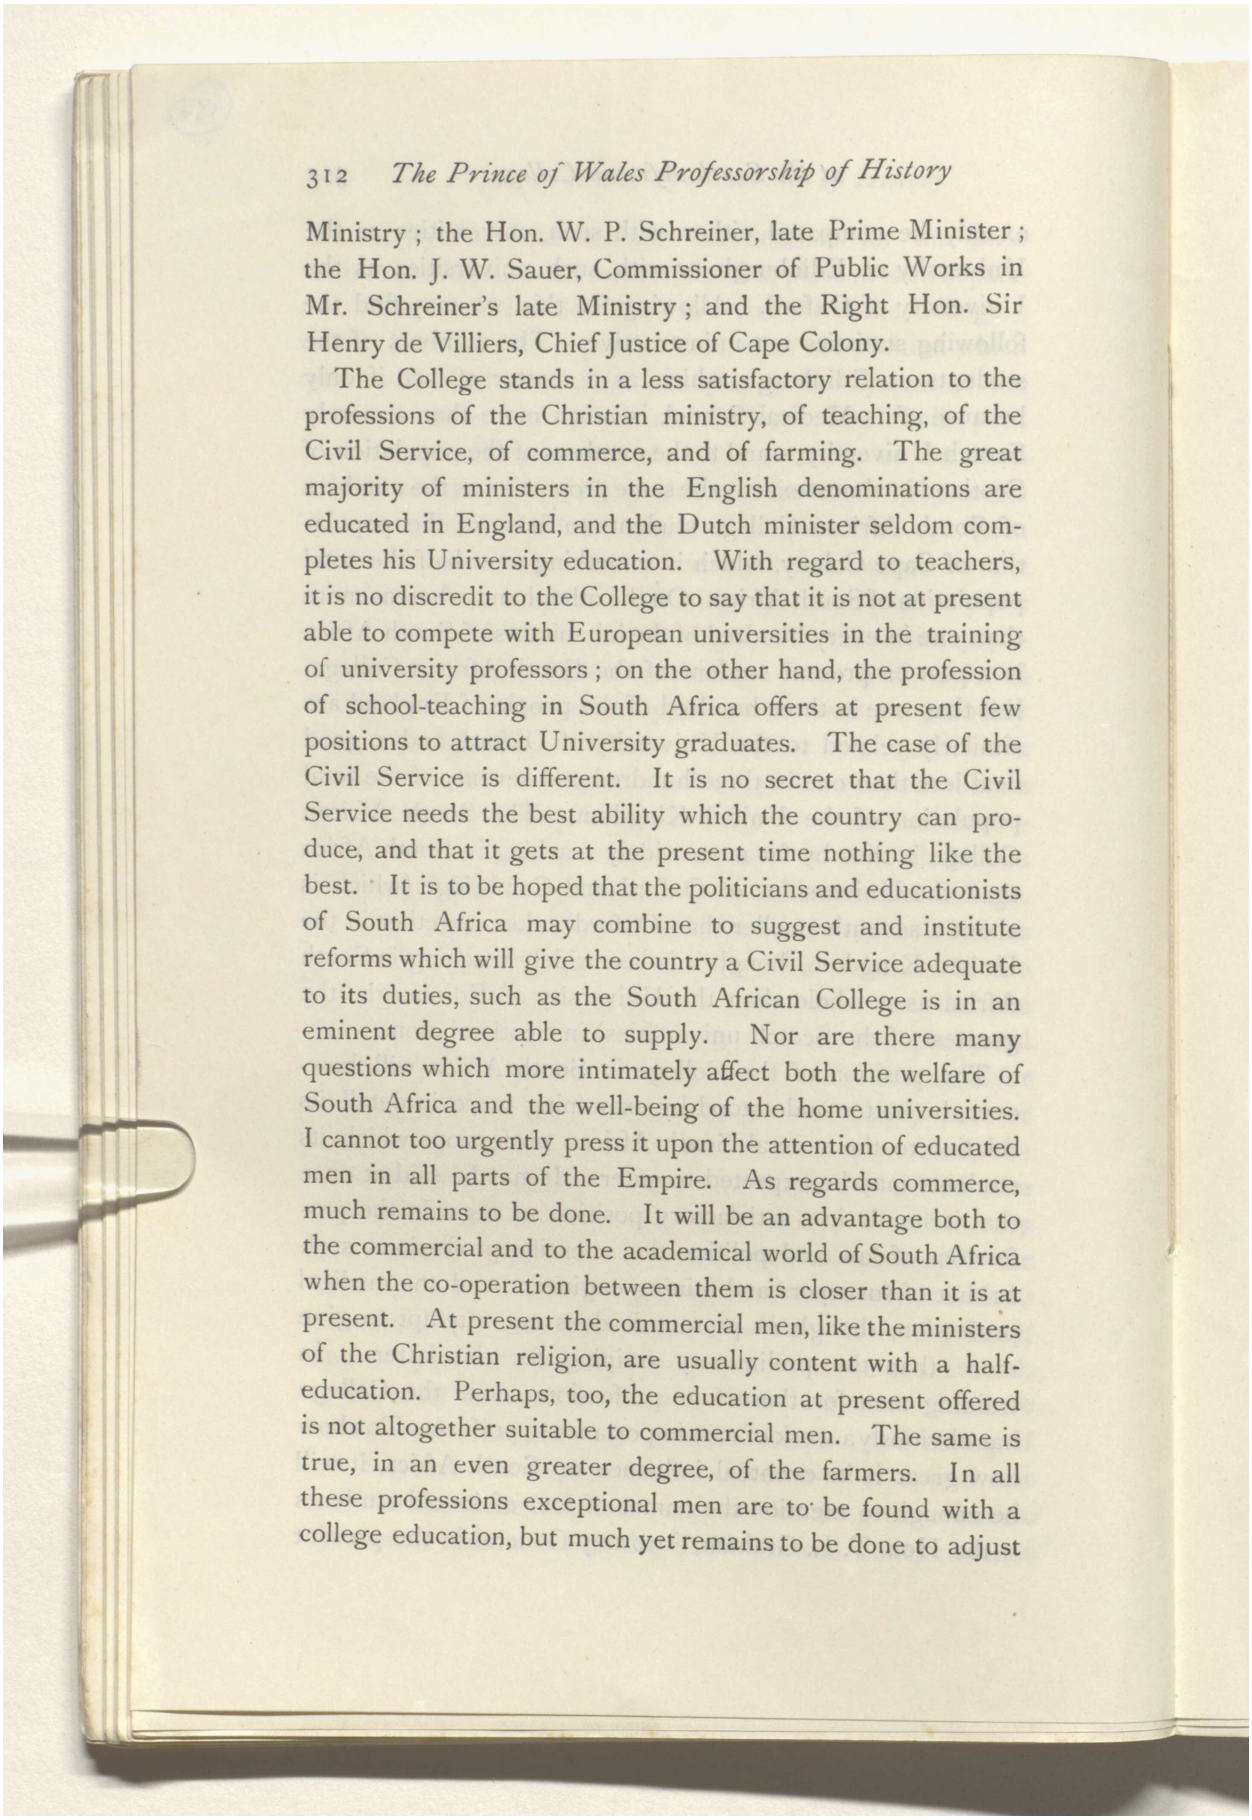
BRITISH LIBRARY



exactly be compared either with such universities as the University of Edinburgh or with such universities as the University of Oxford. Allowing for this, we may find the following statistics not uninstructive. The numbers of the students at Edinburgh, which, as a matter of fact, if only because of its Medical School, is much more than a merely Scotch University, stand to the numbers of the population of Scotland in almostexactly the same proportion as the numbers of South African College students to those of the population of Cape Colony, which is something over half the total population of South Africa. On the other hand, whereas more than one in every hundred of the inhabitants of South Africa is a past or present student of the South African College, less than one in three hundred of the people of England are similarly related to the University of Oxford, and a good deal less than one in three hundred and seventy of the total population of the United Kingdom. The South African College is thus by far more widely reaching in South Africa than the Universities of Oxford and Cambridge (which is about a seventh smaller than Oxford) taken together in the United Kingdom, though it is less widely reaching in South Africa as a whole than the University of Edinburgh (the greatest of the Scotch universities) in Scotland alone.

The position of the College in South Africa will, however, be better understood by examining more in detail its relation to the several South African professions which its students may be expected to enter. It may be said at once that it stands in a satisfactory position as regards the professions of law and politics, the scientific professions, such as that of surveyors and mining engineers, and the medical profession, though at present it does not attempt to give more than the preliminary training for the latter. In training men for these four professions alone the College has obviously a work of vast importance to perform. To show how great is its eventual influence on South Africa, it will be enough to mention the names of four of its old students —the Hon. T. L. Graham, Attorney-General in the present

Ministry; the Hon. W. P. Schreiner, late Prime Minister; the Hon. J. W. Sauer, Commissioner of Public Works in Mr. Schreiner's late Ministry; and the Right Hon. Sir Henry de Villiers, Chief Justice of Cape Colony.

The College stands in a less satisfactory relation to the professions of the Christian ministry, of teaching, of the Civil Service, of commerce, and of farming. The great majority of ministers in the English denominations are educated in England, and the Dutch minister seldom completes his University education. With regard to teachers, it is no discredit to the College to say that it is not at present able to compete with European universities in the training of university professors; on the other hand, the profession of school-teaching in South Africa offers at present few positions to attract University graduates. The case of the Civil Service is different. It is no secret that the Civil Service needs the best ability which the country can produce, and that it gets at the present time nothing like the best. It is to be hoped that the politicians and educationists of South Africa may combine to suggest and institute reforms which will give the country a Civil Service adequate to its duties, such as the South African College is in an eminent degree able to supply. Nor are there many questions which more intimately affect both the welfare of South Africa and the well-being of the home universities. I cannot too urgently press it upon the attention of educated men in all parts of the Empire. As regards commerce, much remains to be done. It will be an advantage both to the commercial and to the academical world of South Africa when the co-operation between them is closer than it is at present. At present the commercial men, like the ministers of the Christian religion, are usually content with a half-education. Perhaps, too, the education at present offered is not altogether suitable to commercial men. The same is true, in an even greater degree, of the farmers. In all these professions exceptional men are to be found with a college education, but much yet remains to be done to adjust

مكتبة قطر الوطنية
Qatar National Library

the relation between these professions and the College, and to put the latter into its proper position as a training school for them.

It remains to be shown how the South African College is being enabled to carry out the duties which we have sketched. It is to be noted that its position in the Gardens at Cape Town is particularly advantageous. It has all the advantages, and as few as possible of the disadvantages, of town life. It has a considerable cricket-field, besides tennis-courts on its own grounds, and at the same time it is close to Government House, the Parliament buildings, the Law Courts, the Public Offices, and also to the Libraries, the Art Gallery, the Museum, and the Botanical Gardens. One advantage of this is that Professors at the College are able to carry on original investigations with the greatest facility possible in South Africa; another, following from the first, is that it is possible to combine some public scientific office with a professorship at the College. This was done some years ago in connection with the establishment of a Professorship of Botany, which has unfortunately been allowed to lapse, and which an effort is now being made to re-establish. A similar arrangement, in 1895, made it possible to successfully establish a Professorship of Geology, the holder of which is head of the Geological Survey. From this double office much has already been gained, and much more is to be expected in the future.

The College has many needs which must be fulfilled before there is any institution in South Africa capable of doing the work of University education satisfactorily. Omitting everything but bare necessities, at least six professorships are still needed. The professorships of English and Philosophy and of Modern Languages should be divided; the existing professorships of Law should be properly endowed and regulated, and professorships of Botany, Zoology and History should be established. The Cape Government already contributes liberally to Professors' salaries; nor is it easy to imagine a more desirable

مكتبة قطر الوطنية
Qatar National Library

form in which a rich man could secure himself immortality than by offering the £8,000 or £10,000 which would be sufficient, with the co-operation of the Government, to establish any one of these chairs.

None of them is it more important to create than the Professorship of History, nor is it possible to conceive a time when it would be more desirable to create it than the present. A Professor of Philosophy or of Languages may, no doubt, exercise a political influence by his lectures and writings, but a Professor of History alone is definitely called upon to do so, and his influence will be one which it would be most desirable to have exerted as soon as possible, and by all means before the people of South Africa begin to settle down after the close of the present war. This is felt, and has been openly expressed, by all the responsible statesmen, by the chief educationists, and by the general public at the Cape. Their judgment has been approved by the Prince of Wales, looking from the commanding standpoint which he has learnt to adorn, and by such men as Mr. Chamberlain, Mr. Asquith, and Mr. Lecky. It will not, therefore, be necessary to repeat what the present writer has already said elsewhere with regard to the scientific, the educational, and the political advantages to be expected from the institution of the professorship. He may, however, be allowed to call attention to two special points. In the first place, it is already well known that there is much to do with regard to the collection and co-ordination of facts bearing on the various native questions in South Africa. But it is not so well known that there now exists at the Cape an office specially dealing with native affairs, controlled by the Prime Minister of the Colony. Nor is it generally known that the late Sir Bartle Frere sketched out a system for the careful and exact study of native affairs throughout the country, emphasizing the scientific and political importance of the questions involved. In the second place, it can hardly be altogether realized in England how greatly certain ideals, such as that of Republicanism, have

Reference: Mss Eur F111/393. Copyright for this page: Public Domain

BRITISH LIBRARY

influenced the minds of people in South Africa. Whether we are Republicans or not, we can hardly fail to realize that a popular Republicanism founded on ignorance both of South Africa and of general history is likely to be a rickety and ruinous structure which no nation can inhabit with security.

In conclusion, it remains to say something of the prospects of the Endowment Fund, and of the probability of obtaining a suitable occupant of the proposed professorship. It is satisfactory to find that, with few exceptions, the great commercial firms connected with South Africa have realized the importance of the present proposal. At least £7,500 is required to establish the professorship at all. It could be established and the first Professor appointed within a few months of the time when this sum should be obtained. Over £1,800 has already been contributed in London alone, and subscriptions have not yet been invited at all elsewhere. Judging from the temper evinced by the press at the Cape, it may be hoped that the scheme will not be allowed to fail for want of financial support. But it is much to be desired that the success of the project should not be delayed, and as long as the fund is open it will offer an opportunity to all of testifying in a practical way an intelligent interest in the progress and consolidation of the Empire.

As to the prospects of obtaining a suitable man for the post, it is not, of course, as yet possible to speak definitely. We may, however, notice the extremely satisfactory way in which the proposal has been taken up by the academical world, and especially by the historians. Among those who have lent the movement the support of their expressed approval we may notice with special gratification Sir William Anson and Sir Richard Jebb, Members of Parliament for the Universities of Oxford and Cambridge; Dr. Prothero, President of the Royal Historical Society; Professor York Powell, Regius Professor of Modern History at Oxford; and Principal Roberts, Vice-Chancellor

BRITISH LIBRARY

of the University of Wales. We may fairly argue that the adhesion of such men as these shows that the academical world is fully sensible of the importance of the proposal. If this is so, we may rest assured that the great advantages and commanding and unequalled opportunities offered to a well-trained student endowed with energy and organizing power will not fail to be recognised and will suffice to attract candidates possessed of the highest capabilities. It is not difficult to be impartial in South Africa, nor need politicians who have confidence in the justice of their cause fear that the professorship will be occupied by a partisan of an opposite cause. It is not to be supposed that a man with so little sympathy with imperialism as to be blinded by a prejudice in favour of the Empire's antagonists will wish to expatriate himself from England, nor will any man be willing to devote his life to the study of South African history who has not enough sympathy with the Boers to do them justice. If an able man with neither of the above disqualifications takes up the work of the new professorship Wisdom will be justified of one more of her children; and if rich men assist in creating such opportunities for such a man they will not easily find another investment of which they will have greater reason to be proud.

NOTE.—Subscriptions for the South African College Professorship of History Fund are received and acknowledged by the Standard Bank, 10, Clement's Lane, Lombard Street, London, E.C. Cheques should be made out to "The Standard Bank of South Africa, for the South African College Professorship of History Fund."—ED.

BRITISH LIBRARY

QUARTERLY REPORT ON SEMITIC STUDIES AND ORIENTALISM.

By Professor Dr. Edward Montet.

GENERAL OBSERVATIONS—ASSYRIOLOGY.

We shall note, at the outset, the "Actes du premier Congrès international d'histoire des religions, Paris, 1900," the first part of which (the report of general meetings) has only appeared.* This very interesting volume contains the *procès-verbaux* of the sittings, discussions, and papers read at the general meetings. The most important of these papers are the following: "Buddhism and Yoga," by Senart; "Biblical Criticism and the History of Religions," by A. Sabatier; "Islamism and Parsiism," by Goldziher; "The Historical Relation between Religion and Morality," by Goblet d'Alviella; "The Present State of Instruction in the History of Religions," by Jean Rèville; "An Historical Sketch of the Congress of Religions at Chicago in 1893," by C. Carroll Bonney.

Since our last Report, there has appeared the continuation of the "History of Religions in Ancient Times,"† by the lamented Tiele, whose recent demise has plunged into grief all who knew the eminent professor. The volume treats of Mazdeism and the Avesta.

Under the title of "Die geistige Kultur der semitischen Völker,"‡ J. Köberle has published an interesting and judicious lecture on the nature of the civilization and spiritual development of Semitic peoples, more particularly the Arabs. The author lays stress, and rightly, on Semitic individualism. In their language, their conception of nature, their style of expressing and solving the problems of a moral and spiritual order, the Semites have the tendency to assign everything to *self*. The Semites have the gift of observing details, bnt they lack that of synthesis and generalization. The author, after sketching a bright picture of the civilization of the Arabs in the Middle Ages, concludes by saying that, notwithstanding this glory of former times, humanity owes more in a spiritual sense to the humble Israelite than to the great Arab race, whose civilization disappeared as rapidly as it appeared with so much ostentation.

On the subject of Assyriology we may first mention the publication of a new fascicule of the Assyrian-English-German Dictionary, by Muss-Arnolt ;§ it is a long time since we had occasion to refer to it.

The "Keilinschriftliche Bibliothek," published by Schrader, has been enriched by two new and important parts, which complete the sixth volume —"Assyrisch-babylonische Mythen und Epen," of Jensen.‖

BRITISH LIBRARY

THE OLD TESTAMENT—HEBRAIC AND ARAMEAN LANGUAGES—TALMUD.

Under the title of "Hebraisches Vokabular,"* Kraetzschmar has published for the use of students an excellent alphabetical index (Hebrew-German) of the roots and words of the Old Testament. This work, which is very clear and compact, is well executed. Words and roots are arranged in the logical style of grammar: pronouns, nouns with unchangeable vowels, hard triliteral verbs, guttural verbs, נ פ verbs, etc., masculine nouns with changeable vowels on the penultimate, etc., feminine nouns, with changeable vowels on the penultimate, etc., irregular nouns (called primitive), nouns of number, and particles. The work, which is a very practical one, deserves to be recommended.

We note a third edition, revised, of the biblical Aramean grammar, by Strack,† which we noticed when it first appeared.

Bacher has published a curious Hebrew-Persian dictionary of the fourteenth century,‡ the vocabulary of which is taken from the Bible, Targum, Talmud and Midrash. The author who spoke a Jewish-Persian jargon, has made use of Persian and Aramean, and sometimes of Arabic and Turkish for his explanations of Hebrew and Aramean terms.

My trip to Morocco prevented my calling attention to two publications of very great value, both published in England.

The first, edited by Carpenter and Harford-Battersby is entitled: "The Hexateuch according to the Revised Version, arranged in its constituent documents."§ The aim of the work is to introduce to the English public the principal results of modern criticism on the Pentateuch and Joshua. The first volume treats of the construction of the Hexateuch, the second contains the text with notes. It is a very remarkable work.

The second is "An Introduction to the Old Testament in Greek" by H. Barclay Swete.‖ For a long time the publication of a complete and scientific treatise on the Version of the Septuagint has been a desideratum. The work of Swete rewards the patience of scholars. It is divided into three parts: (1) the history of the Greek Old Testament, and of its transmission (the Alexandrian Greek Version, later Greek Versions, the Hexapla, ancient versions based upon the Septuagint, manuscripts and printed texts of the Septuagint); (2) the contents of the Alexandrian Old Testament; (3) literary use, value, and textual condition of the Greek Old Testament (Appendix: the letter of Pseudo Aristeas). The version of the Septuagint is of great utility for the study of the Old Testament, and for the reconstruction of the Hebrew text, so often obscure and mutilated. As Swete so well puts it, "as the oldest version of the Hebrew Bible, the Septuagint claims special attention from Old Testament scholars. It represents a text, and to some extent, an interpretation earlier than any which can be obtained

* Tübingen und Leipzig, Mohr, 1902.
† "Grammatik des Biblisch-Aramäischen, Leipzig, Hinrichs, 1901.
‡ Strassburg, Trübner, 1900.
§ Two vols. gr. in 8vo., London, Longmans, 1900.
‖ Cambridge, University Press, 1900.

BRITISH LIBRARY

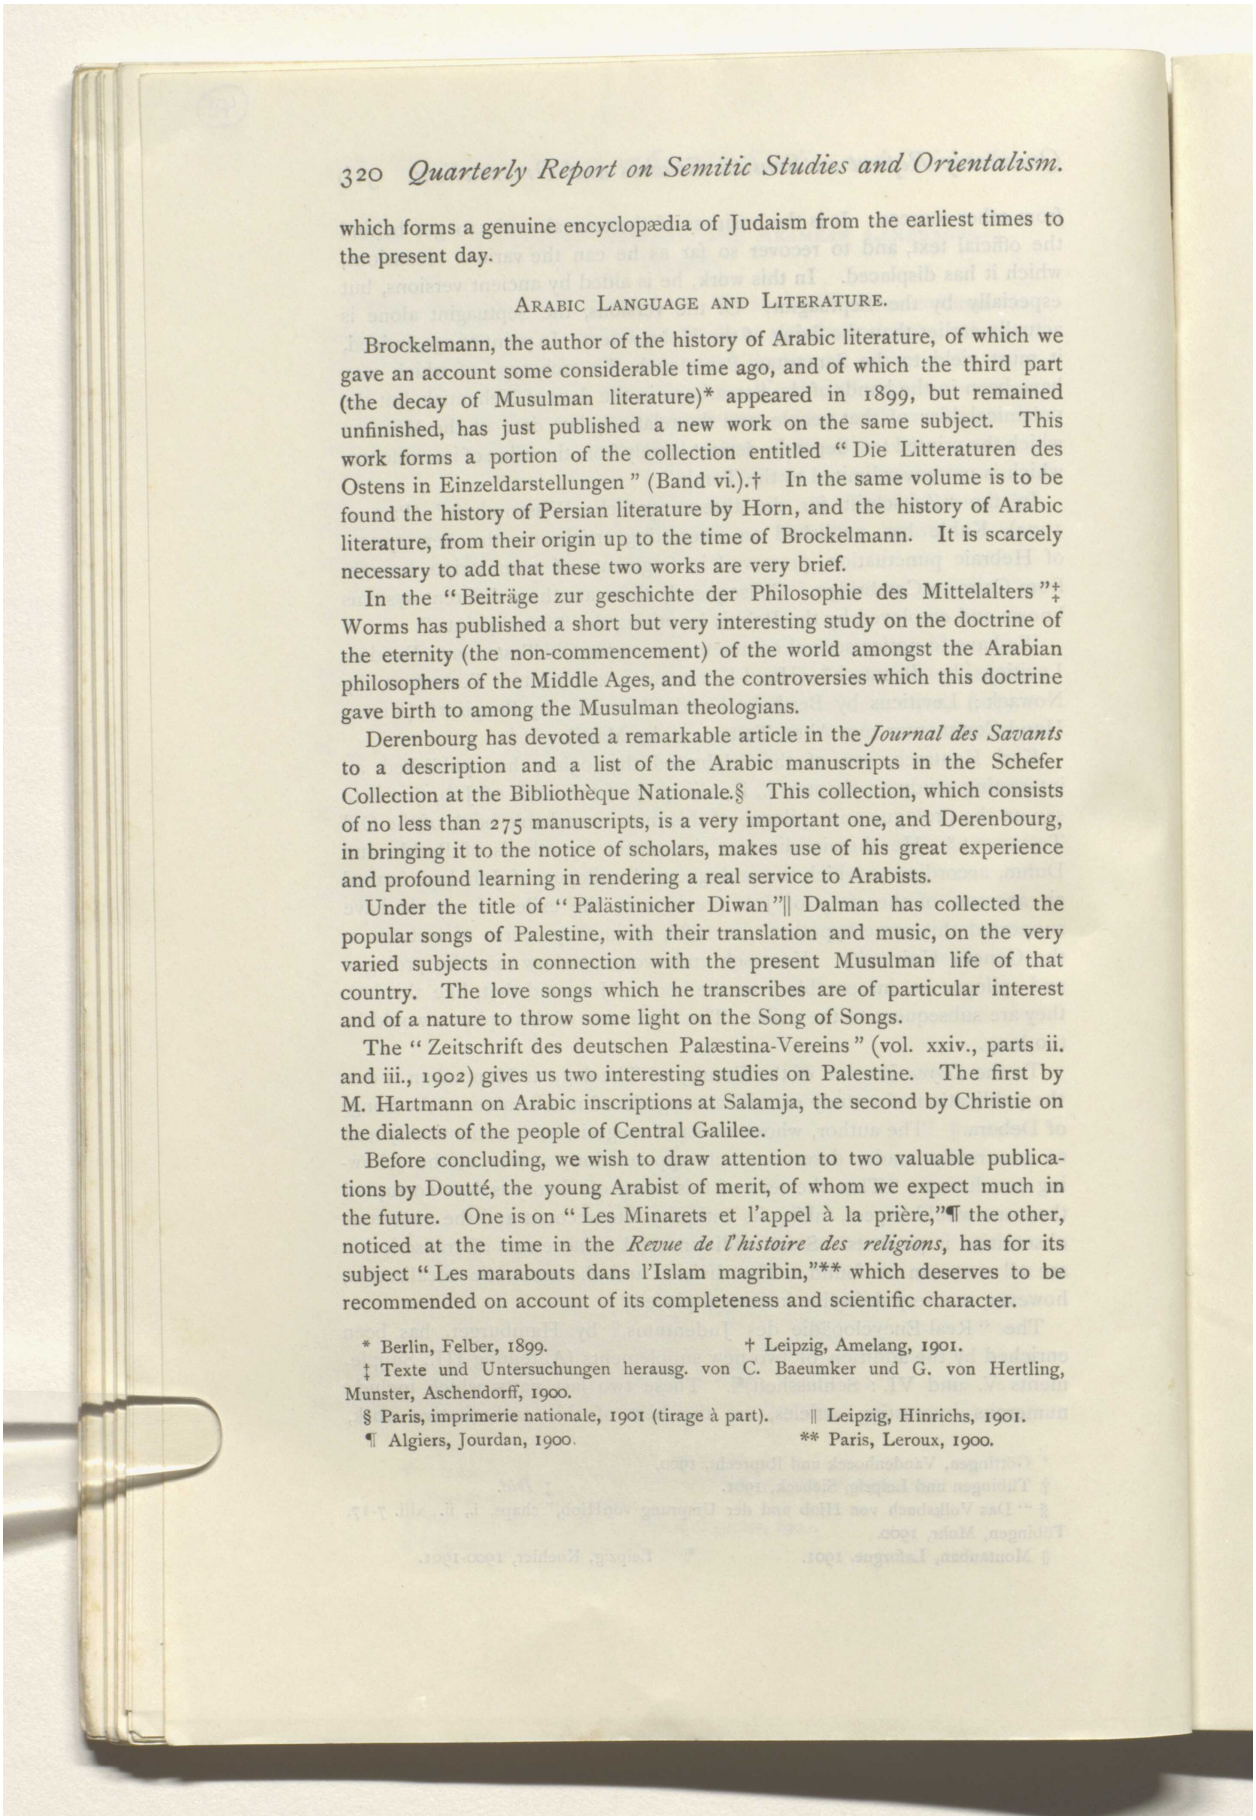
from other sources. It is the business of the textual critic to get behind the official text, and to recover so far as he can the various recensions, which it has displaced. In this work, he is aided by ancient versions, but especially by the Septuagint. Of the versions, the Septuagint alone is actually earlier than the fixing of the Hebrew text. In point of age, indeed, it must yield to the Samaritan Pentateuch, the archetype of which may have been in the hands of the Samaritans in the days of Nehemiah, but the polemical bias of that people, and the relatively late date of the MSS. on which the printed text depends, detract largely from the value of its evidence, which is moreover limited to the Torah."

In the "Zeitschrift für die alttestamentliche Wissenschaft" (Part 2, 1902), Kahle has published an interesting article on the new system of Hebraic punctuation, preserved in fragments of manuscripts brought from Cairo to Cambridge. Consequently there are three different systems known and employed by the Rabbis in writing the "vowel-points."

We have to notice several commentaries on the Old Testament: Exodus-Leviticus by Baentsch* (Hand-Kommentar zum Alten Testament, by Nowack;) Leviticus by Bertholet,† and Chronicles by Bengizer‡ (Kurzer Hand-Commentar zum Alten Testament, by Marti).

Karl Kautzsch, son of the celebrated theologian, has published an interesting study on chapters i., ii., xlii. 7-17 of the book of Job, that is to say on the prologue and epilogue of this most remarkable book of the Old Testament.§ He therein disputes the recent hypothesis of Budde and Duhm, according to which the prologue and epilogue of Job had formed an account of the story of Job previous to the exile. I myself have supported this same hypothesis, in 1886, during my course of lectures at the Geneva University. Kautzsch endeavours to show that the prologue and epilogue are inseparable from the book of Job, and that, like this last, they are subsequent to the exile. The discussion of this opinion would be too long.

To the *Doyen* Bruston of the Faculty of Theology at Montauban is due the publication of a study of critical exegesis of much value on the Songs of Debora.‖ The author, whose works of exegesis, so conscientiously and so accurately made, deserve much appreciation, arrives at the following conclusion: "That the text of this song of victory is less corrupted than one would expect, taking its antiquity into account and the numerous obscurities it presents. Some additions and some errors of transcription are all that can be found. The division and the masoretic vocalization, however, are very defective in several places."



The "Real-Encyclopädie des Judentums," by Hamburger, has been enriched by the addition of two new supplements (Abteilung III., Supplements V. und VI.: Schlussheft)¶. These two last parts, which include numerous interesting articles, are the best of this authoritative work,

BRITISH LIBRARY

which forms a genuine encyclopædia of Judaism from the earliest times to the present day.

Arabic Language and Literature.

Brockelmann, the author of the history of Arabic literature, of which we gave an account some considerable time ago, and of which the third part (the decay of Musulman literature)* appeared in 1899, but remained unfinished, has just published a new work on the same subject. This work forms a portion of the collection entitled "Die Litteraturen des Ostens in Einzeldarstellungen" (Band vi.).† In the same volume is to be found the history of Persian literature by Horn, and the history of Arabic literature, from their origin up to the time of Brockelmann. It is scarcely necessary to add that these two works are very brief.

In the "Beiträge zur geschichte der Philosophie des Mittelalters"‡ Worms has published a short but very interesting study on the doctrine of the eternity (the non-commencement) of the world amongst the Arabian philosophers of the Middle Ages, and the controversies which this doctrine gave birth to among the Musulman theologians.

Derenbourg has devoted a remarkable article in the *Journal des Savants* to a description and a list of the Arabic manuscripts in the Schefer Collection at the Bibliothèque Nationale.§ This collection, which consists of no less than 275 manuscripts, is a very important one, and Derenbourg, in bringing it to the notice of scholars, makes use of his great experience and profound learning in rendering a real service to Arabists.

Under the title of "Palästinicher Diwan"‖ Dalman has collected the popular songs of Palestine, with their translation and music, on the very varied subjects in connection with the present Musulman life of that country. The love songs which he transcribes are of particular interest and of a nature to throw some light on the Song of Songs.

The "Zeitschrift des deutschen Palæstina-Vereins" (vol. xxiv., parts ii. and iii., 1902) gives us two interesting studies on Palestine. The first by M. Hartmann on Arabic inscriptions at Salamja, the second by Christie on the dialects of the people of Central Galilee.

Before concluding, we wish to draw attention to two valuable publications by Doutté, the young Arabist of merit, of whom we expect much in the future. One is on "Les Minarets et l'appel à la prière,"¶ the other, noticed at the time in the *Revue de l'histoire des religions*, has for its subject "Les marabouts dans l'Islam magribin,"** which deserves to be recommended on account of its completeness and scientific character.

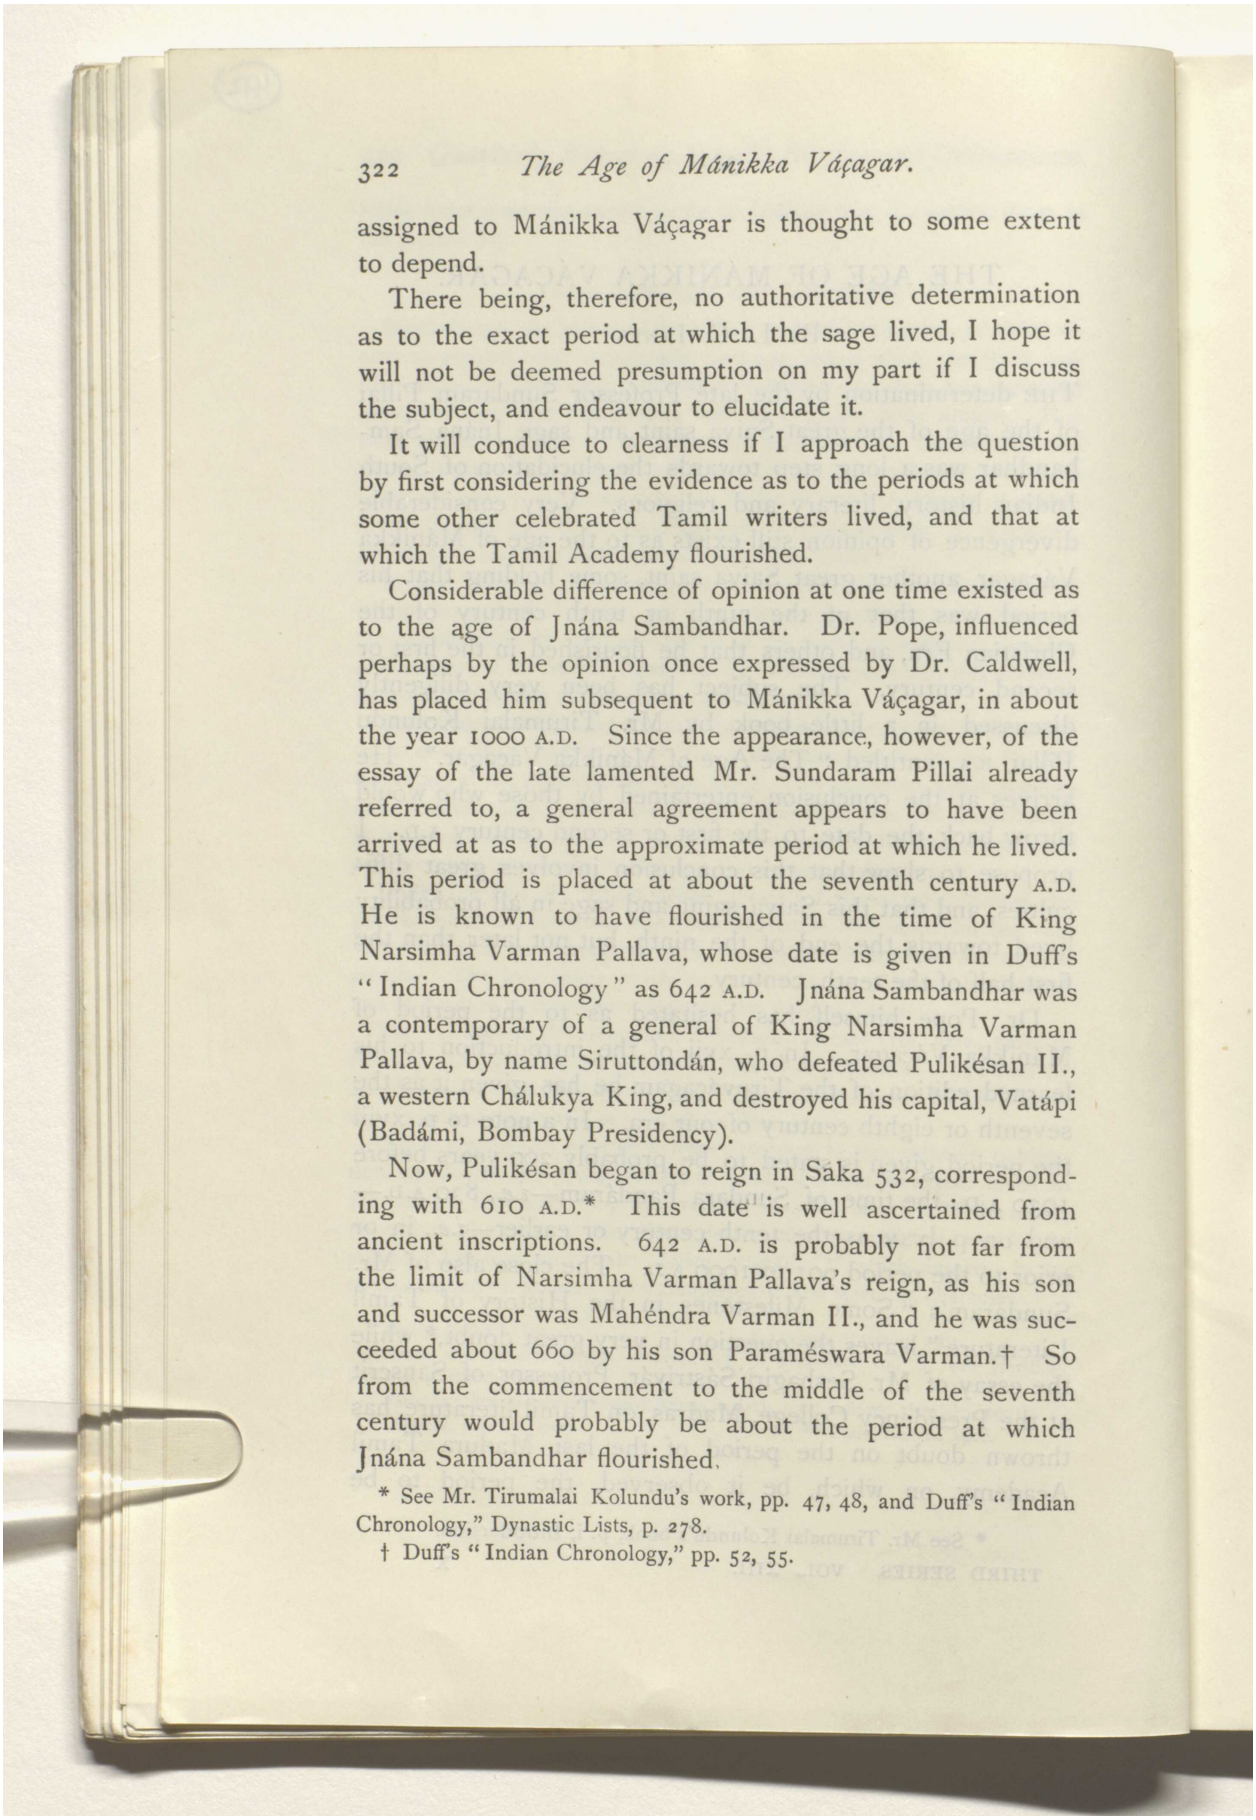
THE AGE OF MÁNIKKA VÁÇAGAR.

By L. C. Innes.

The determination by the late Professor Sundaram Pillai of the age of the great Saiva saint and sage Jnána Sambandhar was a long step towards the elucidation of South Indian history, literary and religious. Very considerable divergence of opinion still exists as to the age of Mánikka Váçagar, another great Saiva saint, some holding that his period was that of the ninth or tenth century of the Christian Era, and others that he flourished in the first or second century. The subject has been very diligently discussed in a little book by Mr. Tirumalai Kolundu Pillai, B.A., entitled "The Age of Mánikka Váçagar." He arrives at the conclusion entertained by those who would throw back the date to the first or second century A.D. I propose to show that this conclusion involves great difficulties, and that this Saiva saint and sage in all probability lived towards the end of the ninth, but not later than the first half of the tenth, century.



Dr. Pope himself has hesitated as to the period of Mánikka Váçagar. In p. xvii of the introduction to his learned edition of the Tiruváçagam he has given it as the seventh or eighth century of our era. In a note to p. xviii the period given is stated to be probably 200 years before 1030 A.D., the time of Sundara Pandáram—*i.e.*, 830 A.D.—and on p. lxxv as the tenth century or earlier—*i.e.*, in or prior to the period 901 to 1000 A.D. The close also of Mr. Sundaram's "Some Milestones in the History of Tamil Literature" leaves the question in very great doubt,* while the essay of Mr. Seshagiri Sástriyár, Professor of Sanscrit at the Presidency College, Madras, on Tamil literature, has thrown doubt on the period of the last Madura Tamil Academy, on which, be it observed, the period to be

* See Mr. Tirumalai Kolundu's book, p. i, Introduction.

BRITISH LIBRARY

assigned to Mánikka Váçagar is thought to some extent to depend.

There being, therefore, no authoritative determination as to the exact period at which the sage lived, I hope it will not be deemed presumption on my part if I discuss the subject, and endeavour to elucidate it.

It will conduce to clearness if I approach the question by first considering the evidence as to the periods at which some other celebrated Tamil writers lived, and that at which the Tamil Academy flourished.

Considerable difference of opinion at one time existed as to the age of Jnána Sambandhar. Dr. Pope, influenced perhaps by the opinion once expressed by Dr. Caldwell, has placed him subsequent to Mánikka Váçagar, in about the year 1000 A.D. Since the appearance, however, of the essay of the late lamented Mr. Sundaram Pillai already referred to, a general agreement appears to have been arrived at as to the approximate period at which he lived. This period is placed at about the seventh century A.D. He is known to have flourished in the time of King Narsimha Varman Pallava, whose date is given in Duff's "Indian Chronology" as 642 A.D. Jnána Sambandhar was a contemporary of a general of King Narsimha Varman Pallava, by name Siruttondán, who defeated Pulikésan II., a western Chálukya King, and destroyed his capital, Vatápi (Badámi, Bombay Presidency).

Now, Pulikésan began to reign in Saka 532, corresponding with 610 A.D.* This date is well ascertained from ancient inscriptions. 642 A.D. is probably not far from the limit of Narsimha Varman Pallava's reign, as his son and successor was Mahéndra Varman II., and he was succeeded about 660 by his son Paraméswara Varman.† So from the commencement to the middle of the seventh century would probably be about the period at which Jnána Sambandhar flourished.

* See Mr. Tirumalai Kolundu's work, pp. 47, 48, and Duff's "Indian Chronology," Dynastic Lists, p. 278.

He and two other well-known and venerated persons, Tirunávukkaraiyar (otherwise called Appár) and Sundara Múrti Náyanár, compiled the Deváram, a collection of Tamil hymns.

An inscription of the time of Rája Rája Déva Chóla, Emperor (984 A.D.), shows that at that time the three compilers of the Deváram had come to be regarded as objects of worship. Dr. Caldwell's view before the discovery of this inscription was that the Deváram, and consequently the age of Jnána Sambandhar, should be brought down to the thirteenth century; but not only is this opinion thus shown to be untenable, but the age of Jnána Sambandhar, as is now generally accepted, may be thrown back with tolerable certainty, on the grounds mentioned, to the seventh century A.D.

The great Vaishnava reformer Rámánuja lived in the end of the eleventh and beginning of the twelfth century. He was persecuted by a Chola Prince named Karikála,* and fled from his persecutions to the court of Biṭṭi Déva, the Bellála King of Dorasamudra (Dwárasamudra), whom he converted from the Jaina to the Vaishnava faith. The King on his conversion took the name of Vishnu Vardhana,† and this event has always been placed in the beginning of the twelfth century. Rice in his "Mysore Inscriptions" places it at 1117 A.D.‡

Now, Kambar, the great Tamil poet, in one of his poems§ refers to Rámánuja by name. It was at one time assumed from the memorial verse prefixed to his Rámáyanam, which gives a date corresponding to 886 A.D., that the period of Kambar was much earlier. But since the period of Rámánuja has been placed beyond a doubt, it has become clear that the date given in the memorial verse

* See as to Karikála Chola Caldwell's "History of Tinnivelly," p. 29. He must have been born before, and reigned in the twelfth century.

as that of the poem cannot have been written by Kambar himself, but must be an unwarranted addition, and that Kambar must have lived in the early part of the twelfth century. The importance of this will presently appear.

Another period which has been the subject of great discussion is that of the third and last Sangam, or collegiate existence of the Academy of Tamil literature in Madura, at which, as tradition affirms, Tiruvaḷḷuvar presented himself with his surpassing work, the Kuṛaḷ, a monument of ethics and diction and exquisite verse. Many learned men would date this Sangam as of the earliest century of the Christian Era, or perhaps the second century. Others would bring it down to the eleventh or twelfth century, while others—and among them Mr. Séshagiri Sástriyár, in his learned essay already referred to, under pressure, perhaps, of the difficulty of reconciling conflicting views—have gone the length of doubting if there were ever an actually existing academy, or whether its existence were not simply legendary.* Mr. Séshagiri Sástriyár has shown a very substantial foundation for his doubts, and certainly no mind with an historical sense can accept the accounts of the first and second Sangams as other than legendary.

Mr. Tirumalai Kolundu, after a considerable discussion on the subject in his little book, "The Age of Mánikka Váçagar," arrives at the conclusion that the beginning of the second century A.D., or thereabouts, was the period of the third Sangam.

Assuming that this so-called third academy had a real historical existence, it appears to me, for the reasons I am about to adduce, that a much later date must be assigned to it.

There is a celebrated Tamil poem called the Silappadhikáram, or "The Epic of the Anklet," by Iḷangóvaḍiáḷ. He was a brother of the Chéra King Senguttavan, at whose court was a poet and critic named Síttalai Sáttanár,

who was a noted member of the so-called third and last Sangam.

This poem, therefore, was of that period, and in it Tiruvaḷḷuvar is quoted. This affords confirmation of the tradition that Tiruvaḷḷuvar's period was not later than the last Sangam.

Now as to the date of this Sangam. There were, as appears from the Mahawansa, the great chronicle of Ceylon history, two Ceylon Kings of the name of Gajabáhu, one of the date of 113 A.D. and the other of the date of 1142 A.D.* Now it is said in the Mahawansa that Gajabáhu (the King of Ceylon who was a contemporary of Senguttavan Chéra, and was present on one occasion at his court, as is mentioned in the Silappadhikáram)† invaded the Chóla Kingdom in revenge for the Chólas having invaded Ceylon. Mr. Tirumalai Kolundu considers that this event must have occurred in the reign of the earlier Gajabáhu (113 A.D.), as, if we adopt the later date, we should have to place Kambar, the great Tamil epic poet, already referred to, before the period of the last Sangam, whereas he is known to have lived later.‡ He therefore places the Sangam in about the second century.

Mr. Seshagiri Sástriyár had arrived at the same conclusion as Mr. Tirumalai Kolundu Pillai, that the period of the Sangam, if it had an actual existence, coincided with the reign of the earlier Gajabáhu, and for this view the following reasons are assigned: Ilangóvadiál, the author of the Silappadhikáram, and Karikála Chóla, and one of the two Kings of Ceylon, named Gajabáhu, were all contemporaries. Mr. Seshagiri Sástriyár assumes, on the authority of the "Madras Archæological Reports," vol. iv., that the first Karikála Chóla preceded Kulatonga Chóla (1064 to 1113)

* Not 1127 A.D., as stated p. 101 of Tirumalai Kolundu's work. The King of Ceylon in 1127 A.D. was "Jayabáhu." The second Gajabáhu reigned 1142 A.D. See Duff's "Indian Chronology," p. 321.

by many centuries. He could not therefore have lived so late as the later Gajabáhu (1142). There is only one Karikála Chóla, he says, known to Tamil literature, and therefore the King of Ceylon with whom the King of that name was contemporary must be, he considers, the first Gajabáhu of 113 A.D.

I regret that I cannot follow the argument. It seems to me that the Karikála Chóla of Tamil literature need not have been the earliest Karikála.

Mr. Tirumalai Kolundu appears to have been misled by a consideration of the memorial verse prefixed to Kambar's Rámáyanam, which we have already seen is not genuine, and does not contain an authentic statement of the date of the poem or the age of Kambar.

We seem to be tied down to one of two dates (113 A.D. or 1142 A.D.) for the invasion of the Ceylon King Gajabáhu. The expedition was to revenge an invasion of Ceylon by the Chólas. In the Dynastic Lists compiled from the Mahawansa we find that from 103 B.C. to 90 B.C. there were Tamil usurpers in Ceylon. But the close of this period is 203 years prior to 113 A.D. Could the desire for reprisals have continued so long? It seems very improbable that it should. But apart from this there is the further consideration: Could the Chóla kings have invaded Ceylon at this early date? It is scarcely conceivable that they could have undertaken ar invasion of Ceylon until they had absorbed the Pándya country. To invade Ceylon they would probably have to pass through the Pándya territory, and they would certainly have to denude their own territory of a vast number of troops, and so lay it open to attack by their powerful Pándya neighbours, who were their inveterate and ever-watchful enemies.

In connection with this question it is necessary to remember that the Ceylon chronicle had no existence before about 460 A.D.,* so that in its very commencement it

* The Mahávansa, the earliest chronicle of Ceylon, was commenced by one Mahánáma between 457 and 477 A.D.

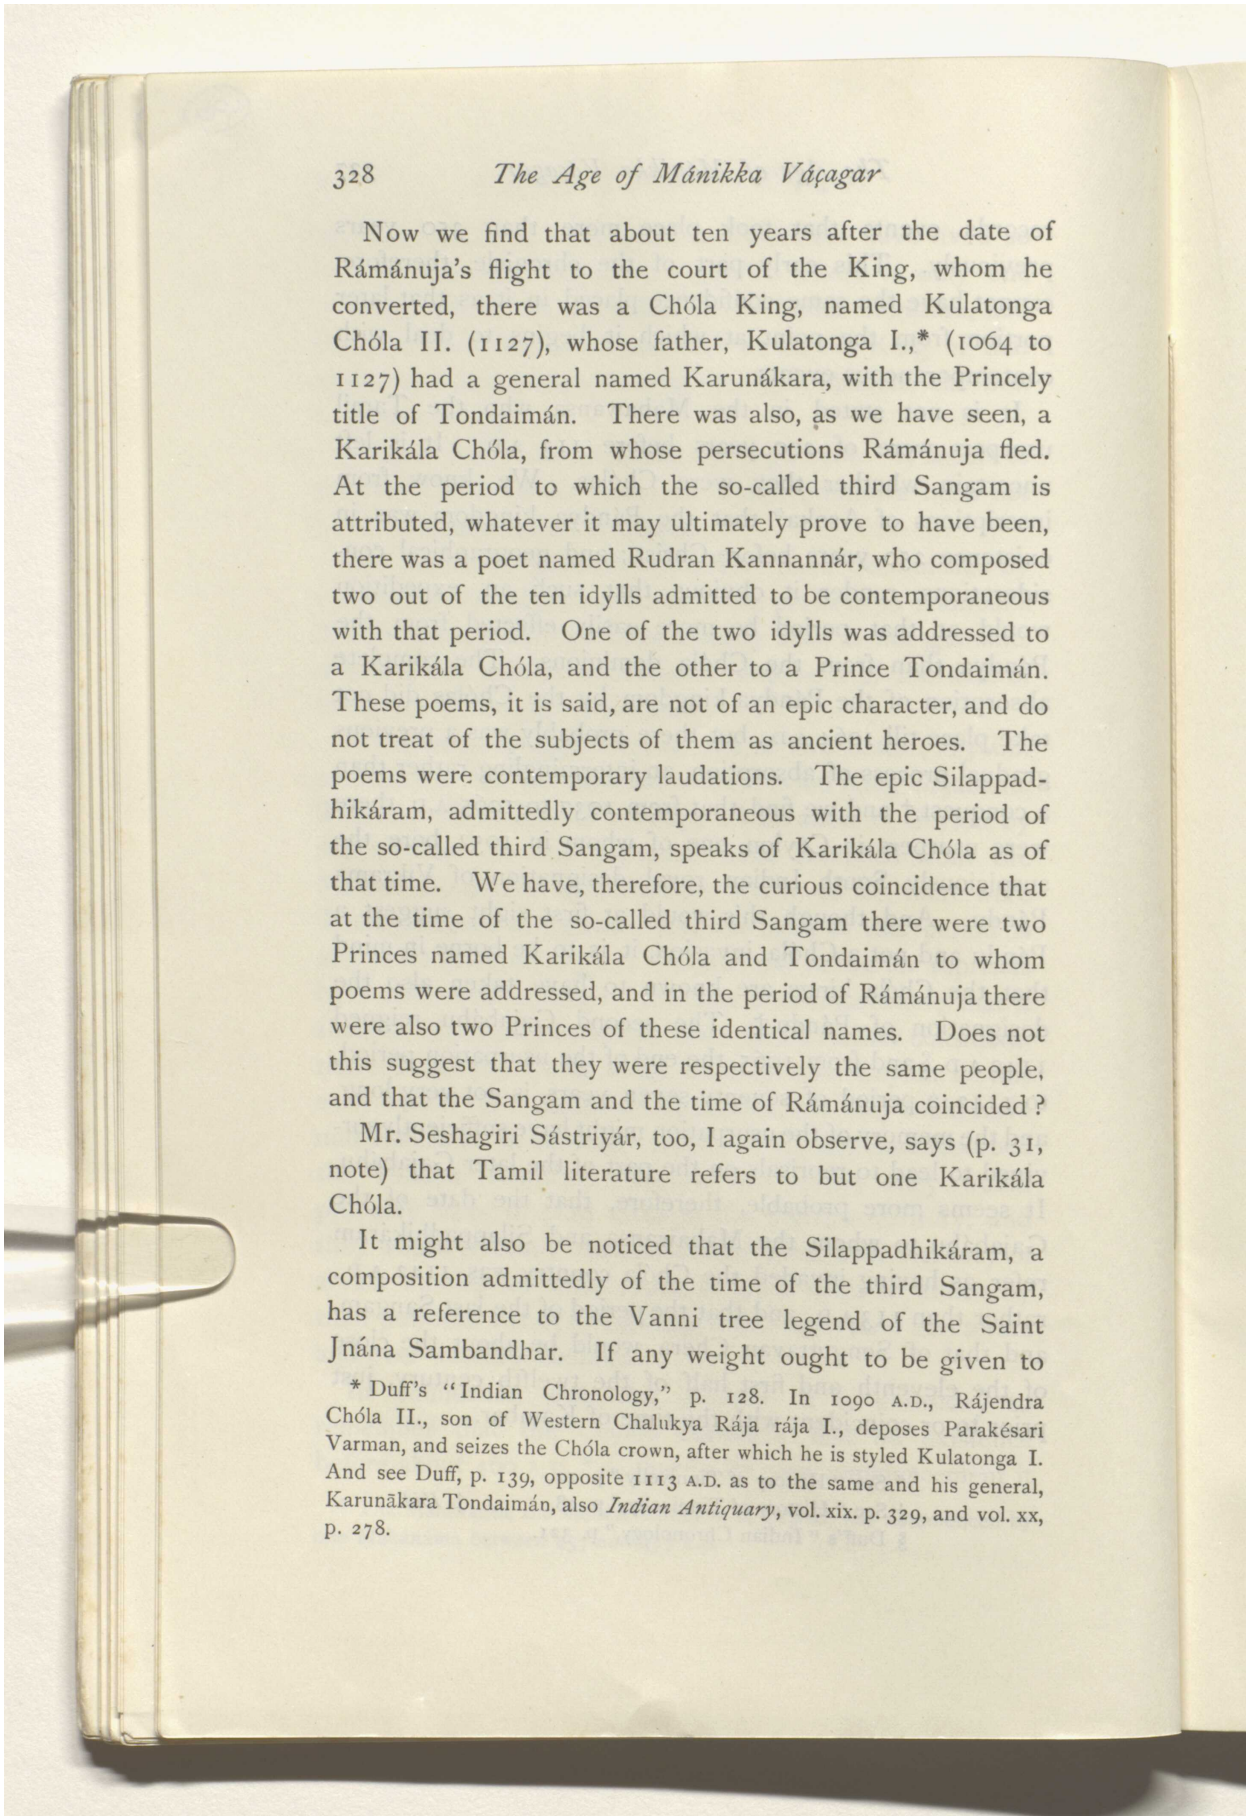
BRITISH LIBRARY

records events that took place more than 350 years previously. This early part of the chronicle, therefore, cannot have the same confidence placed in it as that later portion from the point at which it begins to deal with contemporaneous events.



It is not stated in the Mahawansa who the Tamil usurpers were of 200 years before 113 A.D. It is left uncertain whether they were Chólas. We know from inscriptions of Asoka* that the Pándya kingdom was in existence 250 years before Christ; and geographical considerations render it obvious that such an expedition would at that period be more easily effected from the Pándya than from the Chóla dominions. The complete absorption of the Pándya kingdom by the Chólas did not take place till 1064 A.D., but there probably was a previous gradual process of absorption, an intermingling rather than a conquest,† and we find that from 1037 to 1065 A.D. there were usurpers in Ceylon, one of whom in 1052 bore the suspiciously South Indian royal designation of Vikrama Pándu. And though this would at first sight suggest a Pándu and not a Chóla invasion, it is to be borne in mind that the Chóla kings are known to have taken also the designation of Pándu.‡ The second Gajabáhu reigned 1142 A.D.,§ and from 1065, the end of the usurpation period, to 1142, a period of seventy-seven years, is not very long, and the memory of the usurpation might have sufficiently survived to lead to reprisals on the part of the later Gajabáhu. It seems more probable, therefore, that the date of the Gajabáhu to whom the Mahawansa and Silappadhikáram refer as having invaded the Chóla country was 1142 A.D., rather than 113 A.D., and that the period of the last Sangam, and that of Senguttavan Chera, would be about the close of the eleventh and first half of the twelfth century, just prior to or coincident with the time of Kambar.

BRITISH LIBRARY

Now we find that about ten years after the date of Rámánuja's flight to the court of the King, whom he converted, there was a Chóla King, named Kulatonga Chóla II. (1127), whose father, Kulatonga I.,* (1064 to 1127) had a general named Karunákara, with the Princely title of Tondaimán. There was also, as we have seen, a Karikála Chóla, from whose persecutions Rámánuja fled. At the period to which the so-called third Sangam is attributed, whatever it may ultimately prove to have been, there was a poet named Rudran Kannannár, who composed two out of the ten idylls admitted to be contemporaneous with that period. One of the two idylls was addressed to a Karikála Chóla, and the other to a Prince Tondaimán. These poems, it is said, are not of an epic character, and do not treat of the subjects of them as ancient heroes. The poems were contemporary laudations. The epic Silappadhikáram, admittedly contemporaneous with the period of the so-called third Sangam, speaks of Karikála Chóla as of that time. We have, therefore, the curious coincidence that at the time of the so-called third Sangam there were two Princes named Karikála Chóla and Tondaimán to whom poems were addressed, and in the period of Rámánuja there were also two Princes of these identical names. Does not this suggest that they were respectively the same people, and that the Sangam and the time of Rámánuja coincided?

Mr. Seshagiri Sástriyár, too, I again observe, says (p. 31, note) that Tamil literature refers to but one Karikála Chóla.

It might also be noticed that the Silappadhikáram, a composition admittedly of the time of the third Sangam, has a reference to the Vanni tree legend of the Saint Jnána Sambandhar. If any weight ought to be given to

* Duff's "Indian Chronology," p. 128. In 1090 A.D., Rájendra Chóla II., son of Western Chalukya Rája rája I., deposes Parakésari Varman, and seizes the Chóla crown, after which he is styled Kulatonga I. And see Duff, p. 139, opposite 1113 A.D. as to the same and his general, Karunākara Tondaimán, also *Indian Antiquary*, vol. xix. p. 329, and vol. xx, p. 278.

BRITISH LIBRARY

this circumstance, it would favour my view in bringing down the period of the Sangam later than the time of Jnána Sambandhar. But I prefer to give no weight to it. There is no distinct connection of Jnána Sambandhar with the narrative, and the legend of the Vanni tree may have existed long before, and quite independently of, the saint, as suggested by Mr. Tirumalai Kolundu Pillai.*

We now come to a consideration of the period of Mánikka Váçagar. One great difficulty in ascertaining the relative age of Tamil literary productions is said to be that from the earliest ages the Tamil language has undergone scarcely any change. The action of the Academy in scrutinizing and regulating grammatical accuracy and attention to fixed rules, while it may have checked the development of the language, preserved it, it is claimed, from alteration, so that there is not much scope for distinguishing the productions of one age from those of another.† But possibly the explanation of this may be that none of the existing literature is as ancient as has been assumed. Another difficulty is the want of history and of historical‡ landmarks which characterizes all the literary works of Southern India. Occasionally the connection of a writer with some conspicuous public character whose period may be ascertained from an inscription gives a clue to the date at which he wrote, but such signposts are rare. In the case of Mánikka Váçagar there is nothing of the kind to guide us. His hymns are generally credited with an age of several centuries, but neither from the language, nor the style, nor from the allusions can we find any certain indications of their position in literary history relatively to other Tamil writings of a respectable antiquity now in existence.

* Tirumalai Kolundu, p. 33.

† Tirumalai Kolundu, pp. 80, 81, and Dr. Caldwell's "Dravidian Grammar," p. 89, edit. i.

‡ It may be said once for all that the Tiruviḷaiyáḍal Puránam, by Paranjoti Munivar, cannot pretend to be historical. Its date is 1051 A.D. See Duff's "Indian Chronology," p. 123, and Mr. Tirumalai Kolundu p. 50, as to this.

مكتبة قطر الوطنية
Qatar National Library

There are, however, inferences to be drawn from the silence of writers as to the hymns of Mánikka Váçagar. He was no obscure person, and, according to general belief, his hymns have enjoyed an extraordinary popularity for centuries, being mingled with the daily worship in every Siva temple throughout the Tamil country. This being so, we might confidently expect to find some mention or allusion to them in literary works of a subsequent date, when occasion arose to refer to such writings.

Now, about 600 to 640 A.D. the collection of hymns that goes by the name of Devâram was compiled by the three saintly persons already referred to, but neither do the hymns nor the other writings of the compilers contain any reference to Mánikka Vácagar.

In the Saiva Bible of the Tamils — a collection of sacred books upon the Saiva religion compiled by Nambi Ándar Nambi in the time of Rája Rája Déva, about 984 A.D.—out of twelve sets of poems included, Jnána Sambandhar's works have the first three places, then Appár has the next three, Sundara Múrti Náyanar the seventh, and Mánikka Váçagar the eighth place. Thus, the three compilers of the Devâram have the prior position. Gandaráditya Chóla, a King who was in being before 940, and succeeded his brother Rájáditya Chóla in 949, is given the ninth place, and Yogi Tirumúlar the tenth. The eleventh place is occupied by miscellaneous compositions, and the twelfth by the Periya Puránam of Sékkilár. Those who contend for the priority of Mánikka Váçagar to Jnána Sambandhar of the seventh century suggest that the Devâram is only an incomplete collection, and account for the omission of all mention of Mánikka on this ground.*

This reason, however, when we consider the eminent position of Mánikka Váçagar's writings in the hymnology of the country, seems hardly satisfactory.

In regard to Mánikka Vaçagar's position of eighth in the Saiva Tamil Bible collection, those who are in favour of his

* Tirumalai Kolundu, p. 24.

BRITISH LIBRARY

priority to Jnána Sambandhar suggest that the works are not set out in the order of time, but only in the order of preference, either for the devotees themselves in relation to their superhuman powers, or for the exceptional musical charms of their compositions.* It is to be noticed, however, that Gandaráditya, the ninth and last but three, is of the period 940 to 950 A.D., or not far from the time of the compiler, 984. This circumstance, combined with the fact that those included in the first seven numbers were undoubtedly of the period 610 to 640, is in some degree suggestive of chronological order.

Another reason suggested is that Mánikka is placed later on account of the superior importance of his works.† This reason is inconsistent with the position given him in respect of the ninth, eleventh, and twelfth places, as he will be universally admitted to be superior to the persons to whom those places were assigned.

On the whole, these reasons do not satisfactorily account for Mánikka's works being placed in posterior order to those of the Devaram compilers, if he was prior in time.

There is, further, the Tiruttondaittogai, or Catalogue of Saints, drawn up by Sundara Múrti Náyanar, the third of the Devaram hymners in the seventh century. From this Mánikka Váçagar is entirely omitted. Having regard to the eminence of Mánikka Váçagar as a saint, this would seem conclusive to show that he must have been subsequent to the time of the Devaram hymners, who lived no earlier than the beginning of the seventh century. Those, however, who insist on his priority would regard him as included in the postscript, "Others besides who attained saintship," appended to this document; but this view Mr. Tirumalai Kolundu Pillai seems rightly to hold cannot for a moment be entertained. He observes, also, that the omission cannot be owing to the remote antiquity of Mánikka Váçagar, since five saints who admittedly pre-

مكتبة قطر الوطنية
Qatar National Library

ceded Mánikka, two of whom are referred to in his own works, are included in the Catalogue.

Nor does he accept another reason that is assigned—namely, that Manikka's religious note was pitched too high for the purpose of Sundara and the other hymners, his ideal of God being too impersonal properly to impress the multitude. But he comes to the conclusion (p. 45) that Mánikka may be regarded as included in the clause of the document which runs "and poets of no untrue devotion," in which it was possibly intended to include, he thinks, all the poets of the Sangam Age, the enumeration of whom would have occupied too great a space in Sundara's work.

This, however, appears to me an inadmissible view. Would Sundara or any other writer have the presumption to lump up writers and thinkers and saints of the eminence of Mánikka, Kapilár, Kalládar and others in a mere appendix which relegated them to comparative insignificance?

Mr. Tirumalai Kolundu appears to be greatly influenced by the occurrence in Appár's writings of an allusion to the legend of the transformation of the jackals into horses, a legend specially connected, as is supposed, with the career of Mánikka Váçagar, though the passage does not expressly refer to him. If the passage be genuine, and Appár in his mention of this miracle performed by Siva showed that he intended to connect it with the history of Mánikka Váçagar, it would, of course, be conclusive in favour of the priority of Mánikka Váçagar to Appár. But this is not so, and the passage, even though it be allowed to be genuine, may simply point to the previous existence of a similar legend in some other connection, just as the legend of the Vanni tree may have existed prior to the time of Jnána Sambandhar;* and, looking to what has been said above, this circumstance can scarcely be said to have weight in favour of the priority of Mánikka Váçagar to Appár.

Mr. Tirumalai Kolundu Pillai also refers to the fact that Appár is found to use similar expressions to those employed

* Tirumalai Kolundu, p. 33.

BRITISH LIBRARY

by Mánikka Váçagar in some instances. But, apart from the fact that men of devotional minds are apt to hit upon a similar mode of expression, it is quite as probable that Mánikka Váçagar took his expressions from Appár, as that Appár took his from Mánikka Váçagar. The tradition also referred to that Appár was never without a copy of Mánikka Váçagar's hymns in his hands, and was always engaged in the study of them, has no historical basis. I come to the conclusion, therefore, that Mánikka Váçagar must stand at some date between 640 and 984 A.D., this latter date being the period of the compilation of the Saiva Bible, in which his works found a place.

It has never been suggested that he was a contemporary of Kumárila Bhatta (725 A.D.), or of Sankarácháriár, now considered to have been born about 788 A.D.,* or as having lived in the same century with them, nor is he mentioned or referred to by them. Now, Sankarácháriár was a native of Kérala (Malabár), and no doubt familiar with Tamil, of which Malayálam, his own vernacular, is an offshoot. If Mánikka had lived at or before Sankarácháriár's time, would not his doctrines and career have found a notice in the great reformer's works?

If, then, we accept the general opinion that Sankarácháriár's period is of the eighth century and part of the ninth, we may safely conclude that Mánikka Váçagar's period was not earlier than the middle of the ninth century —*i.e.*, 850 A.D. And as for the reasons above given he could not be later than 985, and from the place given him in the Saiva sacred books was prior to Gandaráditya, we may place his lifetime between 850 and 940 A.D.

The Sanscrit name "Arimardhana," that of the Pándyan King to whom he is said to have been Prime Minister, is not found, there being no lists of Pándyan Kings of that time forthcoming. The name, if from Arim and Mardhana, would mean "Pounder of his enemies," or, if from Arim and Ardhana, might mean "Tormentor of his enemies,"

* Some opinions place him as early as 590 A.D.

BRITISH LIBRARY

and it is very possible the name is, as Mr. Kolundu Pillai suggests, the Sanscrit equivalent of some other Tamil name actually borne by him. Perhaps it may hereafter be ascertained to be so, and it is worth while noticing that the name "Arimjaya," "Conqueror of his enemies," occurs at about this period in a list of Chóla Kings*—*i.e.*, between 900 and 950 A.D., showing that such an exclusively Sanscrit name was current at that period among the Chólas, and thus lending probability to the tradition that the Pándyan King may also have had such a Sanscrit name as *his* royal designation.

A serious objection to the great antiquity claimed for the writings of Mánikka, Tiruvalluvar, and other great Tamil writers is that referred to by M. Vinson in his letter to the editor of the Madras journal, *The Light of Truth*, of May 31, 1901, which appears at p. 30 of the June and July number of the journal for that year—viz., that writing was only introduced into South India towards the middle of the third century, A.D., and that there is no known inscription dating prior to the sixth century.

If we adopt the chronological order given below, which embodies the conclusions I have arrived at as set out in this paper, we shall find that all difficulties as to the silence of other writers in regard to Mánikka Váçagar and Tiruvalluvar disappear, which is a further confirmation of the accuracy of the position given to them. If, on the other hand, we adopt any other chronological order, such as that suggested by those who would antedate the third Sangam to the first or second century A.D., and the period of Mánikka Váçagar to a still earlier date, nothing but confusion arises and endless impossibilities of accounting for the silence of later writers as to persons and institutions supposed to have existed in these earlier times, which in the very nature of things they would have referred to had such persons and institutions actually occupied a place in that earlier period.

JAPANESE MONOGRAPHS.

By Charlotte M. Salwey, m.j.s.

IX.—CONCERNING MARRIAGE CUSTOMS.

In Japan a priestless ceremony, a ringless marriage, a wedding carried out devoid of almost any religious office, is as binding in its establishment (at least, on the part of the woman) as any marriage conducted under the most rigid rite and in conformity to ancient usage known throughout the civilized world.

Many manners and customs of the Japanese have struck us as being at least peculiar to the nation, full of interest and novelty in contrast with those of other countries. Those ceremonials which dispense entirely with every religious obligation strike us, perhaps, most of all, and excite a feeling of inquiry as to their ultimate successful fulfilment. Like everything else, Japanese customs vary in detail in the different provinces in which they exist. This is inevitable where dependence and custom are based on tradition.

The training of a young girl was severe and exclusive, particularly after the days of happy childhood were over, and the "festival dolls" had descended to a younger sister. There was no season in town, no début into circles where a likely partner might be found, no excitement of a first ball, or a dance with the most honoured guest to the envy of all present. The daughter's future was quietly arranged in the home between parents, guardians, and go-betweens of both families, after every item of suitability had been fully weighed, and found nearly equal. When all items were settled, presents were exchanged, and if the gifts were accepted by the parties and their relatives, there could be no withdrawal. The giving and receiving of presents corresponded to a formal betrothal, and the solemnity of the situation was thereby ratified. On rare occasions the couple were permitted to interview each other, generally in

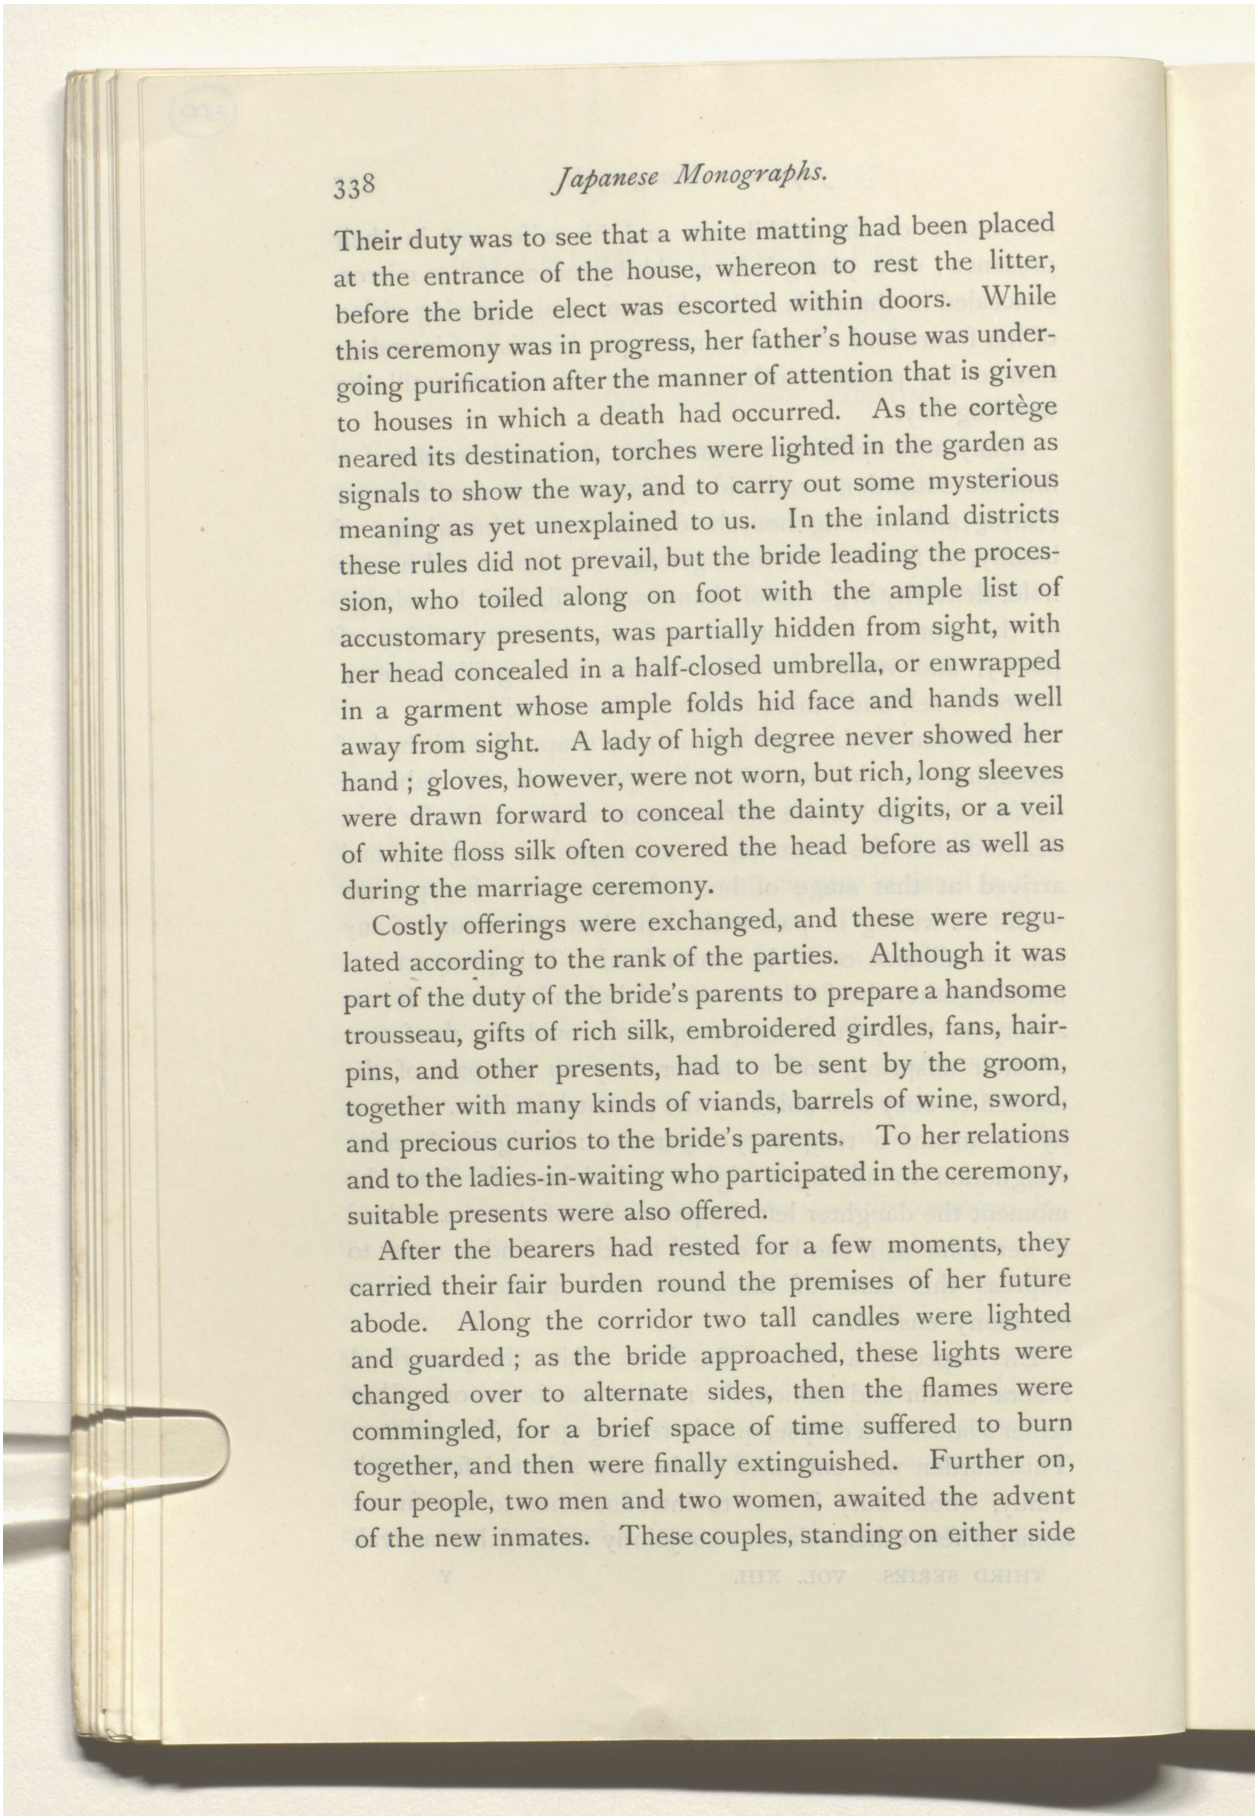
the house of the middleman and his wife, and in their presence; or a young lady would, by means of her mirror, concealed in the folds of her kimino, steal a passing vision of her future lord when he came to pay his visit of introduction to her parents; otherwise they did not meet till the wedding-day.

Many accomplishments came into the requirements of a finished education: embroidery, the arrangement of flowers, rearing and tending household pets, a good knowledge of botany, of fencing, the management of a house and household, dexterity in games of chance and skill, a fair knowledge of the works of celebrated authors, the composition of poetry, and numerous other means of beguiling weary hours for self and others within the home enclosure.



Alteration in dress, of colour and shape, the method of arranging the obé, or sash, and especially in the elaborate coiffure and the choice of ornaments displayed in the hair, denoted that the musumé, or marriageable daughter, had arrived at that stage of her existence when her parents would be willing to part with their dearest treasure, if any suitable alliance could be entertained. This prospect was not altogether the fulfilment of a delightful dream. It was a duty on the part of the parents to provide for the future of their offspring, and a sterner duty on the part of the maiden to obey and abide by the parents' decision. It was by no means a temporary separation: it signified entire resignation to all future rights and claims; for from the moment the daughter left the parental roof she was as dead to her home as if she had ceased to exist. And in order to impress this state of things on both parties a curious ceremony ensued.

Enveloped in a robe of the finest white, the prescribed funeral colour and fashion, the maiden was borne out of her father's house as a corpse, quietly resting upon a bier or litter. This burden was entrusted to bearers selected from each family, whose duty it was to introduce her to her future home, where other relations conjointly awaited her arrival.

Their duty was to see that a white matting had been placed at the entrance of the house, whereon to rest the litter, before the bride elect was escorted within doors. While this ceremony was in progress, her father's house was undergoing purification after the manner of attention that is given to houses in which a death had occurred. As the cortège neared its destination, torches were lighted in the garden as signals to show the way, and to carry out some mysterious meaning as yet unexplained to us. In the inland districts these rules did not prevail, but the bride leading the procession, who toiled along on foot with the ample list of accustomary presents, was partially hidden from sight, with her head concealed in a half-closed umbrella, or enwrapped in a garment whose ample folds hid face and hands well away from sight. A lady of high degree never showed her hand; gloves, however, were not worn, but rich, long sleeves were drawn forward to conceal the dainty digits, or a veil of white floss silk often covered the head before as well as during the marriage ceremony.

Costly offerings were exchanged, and these were regulated according to the rank of the parties. Although it was part of the duty of the bride's parents to prepare a handsome trousseau, gifts of rich silk, embroidered girdles, fans, hairpins, and other presents, had to be sent by the groom, together with many kinds of viands, barrels of wine, sword, and precious curios to the bride's parents. To her relations and to the ladies-in-waiting who participated in the ceremony, suitable presents were also offered.

After the bearers had rested for a few moments, they carried their fair burden round the premises of her future abode. Along the corridor two tall candles were lighted and guarded; as the bride approached, these lights were changed over to alternate sides, then the flames were commingled, for a brief space of time suffered to burn together, and then were finally extinguished. Further on, four people, two men and two women, awaited the advent of the new inmates. These couples, standing on either side

of the passage, were pounding up moche, or rice, in two separate mortars, and as soon as the litter passed, the contents of both mortars changed hands, and were finally incorporated into one inseparable whole mixture of the finest rice flour.*

Ladies-in-waiting repaired to the bridegroom's house the day before the wedding, and spent much time in preparing many comforts. The special robes for the forthcoming ceremony were hung over racks or screens, only used for this purpose; presents were made conspicuous, and the few articles that the bride was permitted to claim as her own from the home she was leaving for ever, were thoughtfully disposed of in a manner to give pleasure to the possessor, who had but little else to call her own.

In this strange marriage ceremony no vows were needed, no prayers or promises. No kiss of love sealed the compact, no gentle pressure of the hand reassured the trembling maiden of future and ever ready protection, no formal words were expected to be witnessed by the company present. It was a silent contract, as silent as the grave. Cups of wine, containing just one sip, were passed between the contracting parties—nine offered by the groom in triplets; nine in like manner returned by the bride, was the preliminary binding action. This wine had previously been mingled by the wine-bearers, from two separate bottles to which were attached models of male and female butterflies made in white paper. These were pressed together, or suffered to remain as emblems of immortal love in all its mystery. While the saké-drinking was proceeded with, delicacies were served—a pair of turtle-doves, fish, rice, cakes, dainty fruits, and other particular condiments.

Then the scene changed, and the second part of the ceremony was marked by the room being rearranged, while the

* It was not until we became acquainted with Japan that the custom of throwing rice over our brides was prevalent. Previously corn was used as a symbolic expression on the part of the wedding guests. The latest modern use of confetti is absurd, and of no symbolic value whatever.

company withdrew, and the robes of white were discarded for those of richer make. Costly and beautiful lacquer drinking vessels replaced those of porcelain. Upon these lacquer cups a representation of the double-headed pine-tree of Takasago was always found, and a model of the tree, with all its symbolic and traditional accessories, graced the room.

The marriage feast was considered incomplete without this significant representation; everyone present had learnt the beautiful traditional story of faithful wedded love and filial obedience, embodied in the graceful growth of this particular specimen of coniferæ—

> ". . . the emblem of unchangeableness;
> Exalted is their fame,
> As a symbol to the end of time—
> The fame of the fir-trees that have grown old together."

To the bottles from whence the mixed wine was poured out during the second ceremony, instead of white, gold and silver paper butterflies were attached, and in point of fact all the preparations were on a more luxurious scale. The ladies who presided as wine-servers dressed their hair after the manner adopted at Court—that is to say, the tresses were allowed to fall down the back between the shoulders, showing the entire length of the hair, and the ends were secured by butterfly bows. The wine was served out with spouted ladles having long handles. Saké was generally taken hot, or at least warm.

The tedium of the day did not end here; the bride had to be formally introduced to the mother- and father-in-law and near relations as the bride and newly-adopted daughter, each in turn drinking again tiny cups of wine, as she pledged her obedience to all in authority in her husband's household. Her position was fully realised by the time the ordeal was over. She became conscious she had parted with her last day of liberty, and that henceforth meek submission to her husband and his parents must ever mark her future actions.

If the bridegroom's parents were not living, the last duty that marked the day's events was a joint visit on the part of both young people to the family altar, in order to do obeisance before the *ihai*, or tablets, that recorded the names of the deceased relatives. For this purpose the *ihai* were placed on the *tokonoma*, with a portion of the wedding feast, as offerings to the ancestral spirit; a miniature feast, in fact, was spread, including even a pair of love-birds, never absent from the marriage menu. For this, the only religious sign of the event, the bride and groom were attired in robes of the richest brocaded silk, the groom with stiff wing-like ornamentation about the shoulders, to emphasize this part of the ceremonial. Then the last act and courtesy had to be carried through by the groom, whose duty it was to send to the bride's household an ample supply of rice, cakes, and other dainty food, carefully packed in rich lacquer boxes of special shape and make—no small item in the expenses of the day, but no doubt gratefully offered as the winding up of a rather lengthy festival.

One startling item in the ancient institution of marriage was personal disfigurement on the part of the bride. Before parents and guardians the honoured lady had to cover up the natural charms of a set of white teeth with a black dye. This custom was carried out by means of a severe prescription consisting of iron filings and gall-nuts stirred up with a red-hot iron bar, allowed to infuse for a certain number of days. But as even this formula did not appear impregnable, the process of blackening had to be constantly resorted to, lest a more unsightly disfigurement resulted, when the dye began to fade away. But the resignation of her personal charms did not end here. After marriage the wife had still to pursue the theory, and before she became a mother custom required her to part with her eyebrows by the process of shaving, to adopt henceforth a sombre shade of colour in her attire, to bind round her her sash in a less ornate fashion, to clip her sleeves of their graceful length, and to arrange her hair in a less attractive style; to enter-

tain towards her lord and master, as well as towards his parents, a submissive demeanour ; to suffer herself to take the second place in his household, as long as it pleased the mother-in-law to rule domestic affairs ; to walk behind her husband on occasions of ceremony ; not to speak to him unless first addressed ; and often, after handing round the first course at a feast, to retire and become a "corner lady," to be alone conversed with at the pleasure of those present.

So much for the ancient ceremony of alliance. From the man's point of view, he took the devotion of his wife as a matter of course. It has been stated that for seven slight disqualifications provisions were made for a divorce at the will of the husband. This has naturally called forth much comment. Noble families prided their honour too deeply to avail themselves of such a step, an inharmonious home being considered as much a disgrace as the alternative desire to dissolve it. But there existed customs to carry on the line of noble families. Should no heir be born, those who could afford it, by mutual consent, received a sho, or handmaiden, into their family to raise up an heir ; nevertheless, the first wife always ranked first as wife and even mother, and the child was given over to her care and tender keeping. This state of things was regarded as inevitable, and did not of necessity mar the peace of a faithful wife's devotion, so great was the desire to continue unbroken a long line of ancestry, based on the established belief in the unique and unbroken dynasty of Japan's Imperial rulers.

Marriages were legalised by registration in the office of the konchō, or registrar, at the Town Hall. The name of the bride was entered in the public records of the family into which she had been received. Notification was also sent to her own town or village that she had left her father's roof and had been adopted into her husband's family. This was necessary because a custom prevailed to speak of

the newly-married lady, not as Mrs. So-and-so, but as the wife of Mr. So-and-so.

It will be understood by this monograph that the marriage ceremony of Japan is simply a domestic and family agreement. No outward religious observance was required to complete the union. Priests were not summoned to bless the united pair, or to ask special advantages to crown their future. The ethics of ancestral worship alone influenced in a silent and unobtrusive manner the future lives of the wedded pair. It was the dead who were called to remembrance, whose spirits would watch over the living, who were believed to be ever present in the midst of the circle of the home-life, and on this auspicious occasion in particular. The ceremonial was full of symbolism. Each step in the proceedings, and every dish of food partaken of, set forth the lesson of indissoluble union. Surroundings silently supplied religious teaching: and the bride's white robe in time became her shroud.

But every custom has generally its bright side. There exist in Japan family ties deeper than those which influence as a rule the family affections of the West. This state of things has originated from the morals of Confucius and the ethics of Shintoism. There are many tenets which bind a home together and strengthen the harmony of life within its walls. These are not learnt through the public oratory in temples, but in the constitutional and religious government of the home-life of all classes. This training was undertaken first by the mother, later by the father, and by all in authority successively. Responsibilities weighed heavy on the heads of each household, and all points of importance relating to the career of each junior, received their most just and careful consideration, authority ranking thus: "Ancestors were the first ruling power, relations the second, society the third, and the law the fourth."

Hence, in order to carry out these responsibilities, the elder male member of a family inherited all real property.

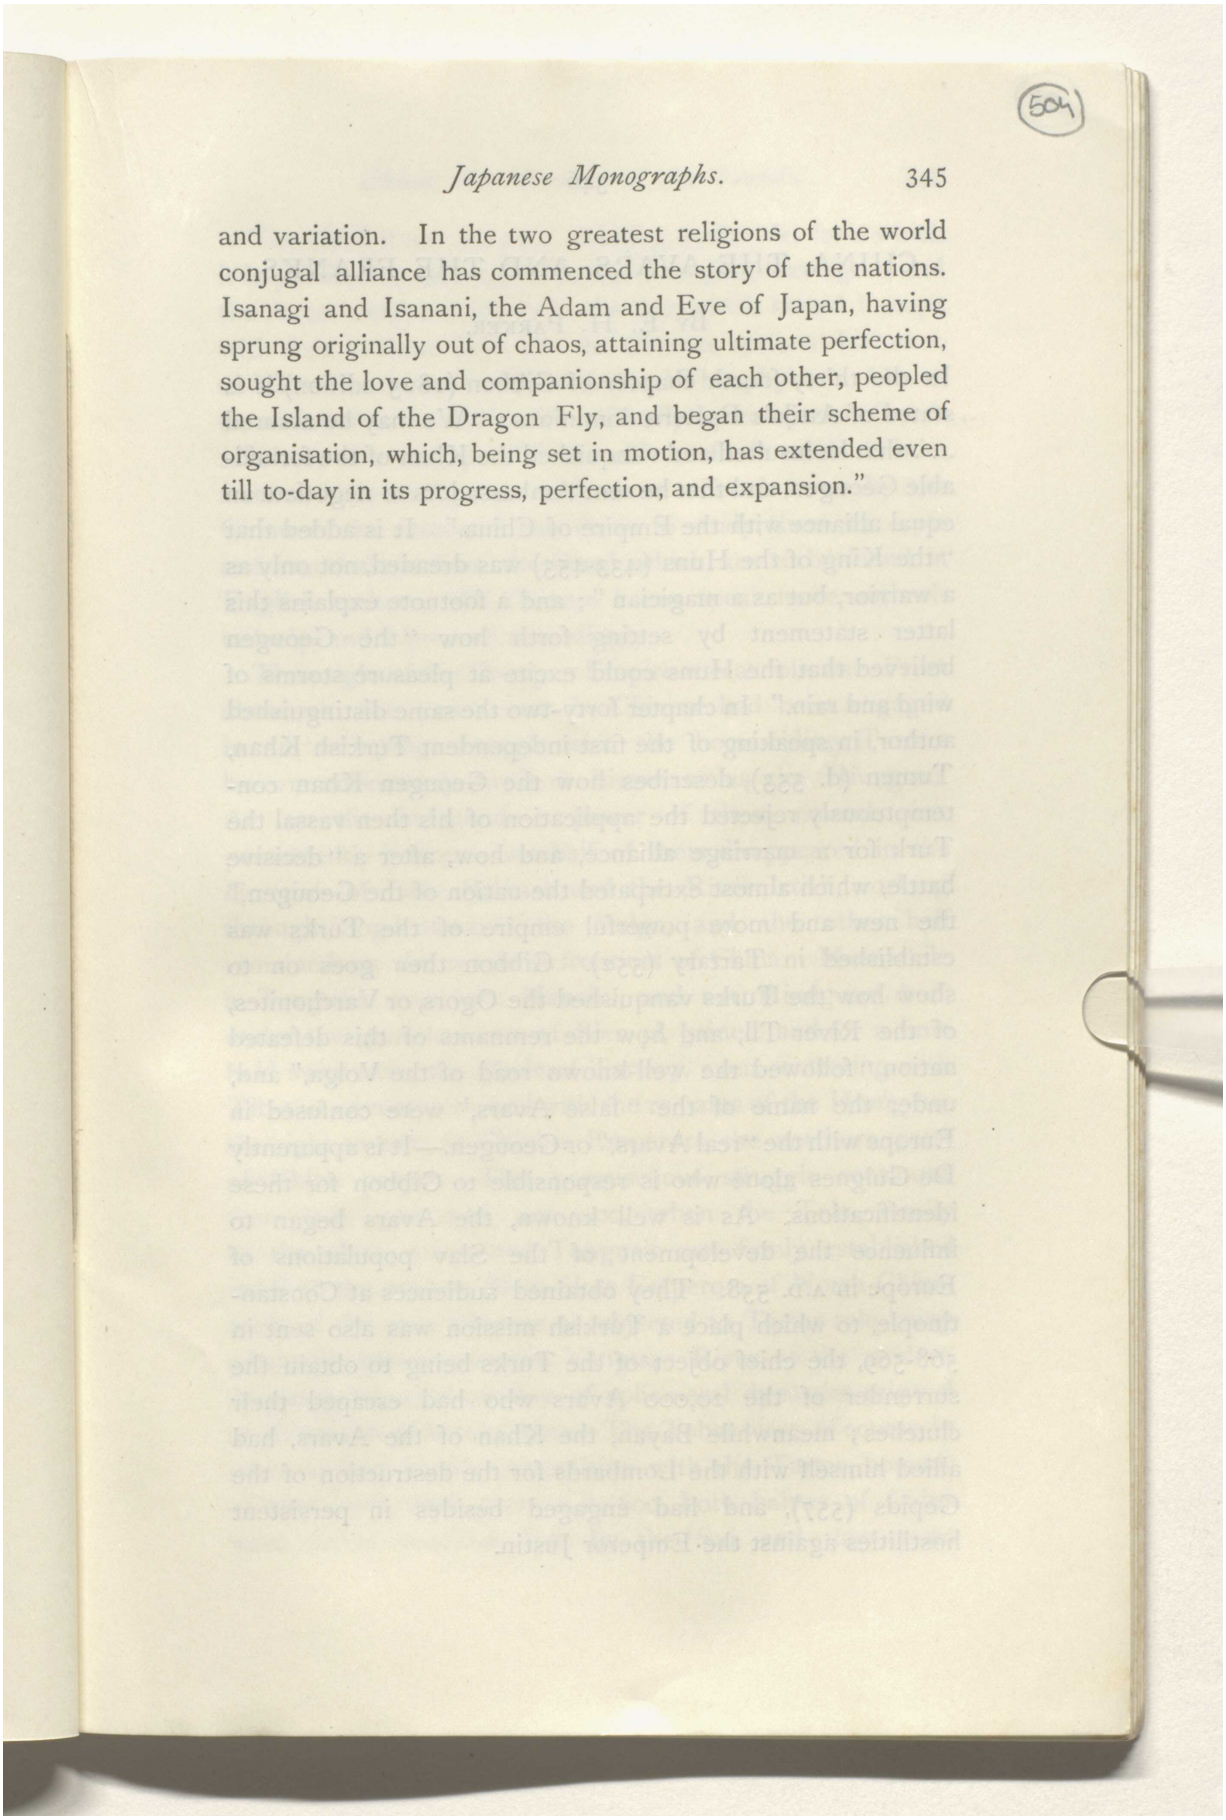
Money was not shared, and fortunes were seldom divided, except in the case of personal belongings. A dowry was not expected for the daughter on her marriage, except as was understood by the richness and amplitude of her trousseau. But the elder brother had to provide the necessary funds to start the younger in life, to pay for his education, and to look well after his mother during her widowhood. A curious custom existed in a home where no heir was born in respect to adoption. If only a daughter constituted the family, a second son from another family could be adopted, who would eventually become the husband of the daughter, but in this case his jurisdiction over his wife was not so great as in the case of ordinary marriage.

The religious system of Japan is sustained not so much by worship or attendance at the temples;* religion flourishes in the hearts and homes of the people. The family shrine is visited daily by all members; the altar receives the greatest care, also the cemeteries where rest the bodies of the departed. None who have lived together are ever forgotten; a *ihai*, or tablet, recording either the family name or the "going away" name, is conspicuous in every household. These are dusted and cared for, prayed before, and looked on tenderly as precious records of lives whose past beauty reflects honour and praise upon the living. Reverence is of more account than love or affection; obedience and submission the highest moral attainments. These characteristics have influenced the past history, and will still strengthen the future enterprises of the people of the Far East.



"Marriage," says Mr. Daigoro Goh, "is, in Dai Nippon as elsewhere, the greatest event in human life. It constitutes a life, a home, a family, a community, a nation; it is the continued union of two elements of the universe, without which the world could not continue in all its beauty and perpetual regeneration, its endless chain of youth

* It was not the custom for women to attend the temples much before the age of forty, or, in fact, any crowded place of entertainment.

and variation. In the two greatest religions of the world conjugal alliance has commenced the story of the nations. Isanagi and Isanani, the Adam and Eve of Japan, having sprung originally out of chaos, attaining ultimate perfection, sought the love and companionship of each other, peopled the Island of the Dragon Fly, and began their scheme of organisation, which, being set in motion, has extended even till to-day in its progress, perfection, and expansion."

CHINA, THE AVARS, AND THE FRANKS.

By E. H. Parker.

In the thirty-fourth chapter of Gibbon (1825 edition) it is stated of Attila's Eastern dominions: "We may be assured . . . that he insulted and vanquished the Khan of the formidable Geougen, and that he sent Ambassadors to negotiate an equal alliance with the Empire of China." It is added that "the King of the Huns (433-453) was dreaded, not only as a warrior, but as a magician"; and a footnote explains this latter statement by setting forth how "the Geougen believed that the Huns could excite at pleasure storms of wind and rain." In chapter forty-two the same distinguished author, in speaking of the first independent Turkish Khan, Tumen (d. 553), describes how the Geougen Khan contemptuously rejected the application of his then vassal the Turk for a marriage alliance, and how, after a "decisive battle, which almost extirpated the nation of the Geougen," the new and more powerful empire of the Turks was established in Tartary (552). Gibbon then goes on to show how the Turks vanquished the Ogors, or Varchonites, of the River Til, and how the remnants of this defeated nation "followed the well-known road of the Volga," and, under the name of the "false Avars," were confused in Europe with the "real Avars," or Geougen.—It is apparently De Guignes alone who is responsible to Gibbon for these identifications. As is well known, the Avars began to influence the development of the Slav populations of Europe in A.D. 558. They obtained audiences at Constantinople, to which place a Turkish mission was also sent in 568-569, the chief object of the Turks being to obtain the surrender of the 20,000 Avars who had escaped their clutches; meanwhile Bayan, the Khan of the Avars, had allied himself with the Lombards for the destruction of the Gepids (557), and had engaged besides in persistent hostilities against the Emperor Justin.

The chief, if not the only, existing authorities from which it is possible to ascertain who the Geougen, the Ogors, and the Avars were, and what was the link which bound Europe with Asia in those days, are the Chinese national histories, and Greek authors like Menander and Theophylact. I leave these latter to be dealt with critically by competent Greek scholars, who may possibly be able to fit in such definite facts as they can gather with those offered to us by the Chinese; the utmost I can do is to study those excerpts and translations from the Greek which are to be found in English authors. Of Chinese I can speak more authoritatively, and I proceed accordingly.

The origin of the Geougen Empire was as follows: From about B.C. 200 to A.D. 200 the Chinese had been engaged in an unceasing struggle with the horse-riding Tartars known collectively to their historians as the Hiung-nu. At last the independent power of these nomads was permanently broken; one half of them disappeared in the direction of Lake Balkash and the River Irtish, working through Sogd towards the Volga, and the other half remained on the northern frontiers of China. Meanwhile a Tungusic race (not Manchu, and not Hiung-nu) had, under the generic name of Sien-pi, gained, and for a time held sway over, the whole of Tartary, even contesting with Tibetan adventurers, and with the remains of the Hiung-nu, the right to rule, as Chinese Emperors, the northern parts of China proper. This promiscuous struggle continued from A.D. 300 until A.D. 400, when the Toba family of the above-mentioned Tungusic race firmly established itself in the modern Shan Si as Emperors of North China, such of the pure Chinese as objected to Tartar rule being gradually driven over the Yangtsze River to the modern Nanking, where a number of ephemeral dynasties reigned as Emperors of South China. The Tobas were, of course, in more or less hostile competition with the Tartar nomads of the north, until, about A.D. 600, both halves of China were firmly reunited, first by the Sui, and then more

BRITISH LIBRARY

completely by the great T'ang dynasty. It was between, and within about fifty years of these two dynastic periods, A.D. 200 and A.D. 600, that the power of the Geougen first grew and finally disappeared. It began in this way: About A.D. 275, when the Toba Tartars were just beginning to dream of empire, one of their captains in the course of desert fighting took a prisoner, of bald-headed appearance and unknown tribe, who was totally ignorant of his own name and origin. In a few years this captive's activity in the field as a trooper gained for him emancipation from slavery and promotion to sub-command; but, having failed on one occasion to be present with his "powers" at the appointed trysting-place, the ex-slave fled from punishment to a certain tribe of the Kao-ch'ê, or "High Cart" nation, which was the name then given to what became the Ouigour Turks of the Selinga region in the seventh century, also called in Turkish the Tölös tribes. Here the refugee gathered round him a band of desperadoes and adventurers. His son succeeded to the command, styling his band of ambitious marauders the "Jou-jan." What this Chinesified word may have originally meant it is impossible now to say. Not improbably it may be the old Turkish word *jïraja* of the inscriptions (recently discovered on the Orkhon), meaning "left-hand" or "northern"; but, however that may be, it is also met with in the Chinese forms *ju-ju* and *jwe-jwe*, and it is the word which the French Jesuits two centuries ago transliterated for us as "Geougen." The tribal succession passed from father to son during three or four more generations, when two royal brothers at last agreed to split up the rising nation into the east and west divisions. The end of the fourth century shows us this people constantly engaged in war with the Toba Tartars, who were now firmly established, with capital in the north of modern Shan Si, as Emperors of North China. The Geougen were next reunited under Shelun, a powerful descendant of the original "bald-head" family (who had finally adopted the word Bald as a clan name); and now,

BRITISH LIBRARY

apparently for the first time in Chinese history, occurs the word *Khaghan*, or "Emperor." The Khan of the Geougen Tartars, as we shall call him, usually held his Court in what is in our times called the Alashan region, somewhere about mediæval Etzina. He had conquered and annexed most of the High Carts, and also those remains of the earlier Hiung-nu called the Bayirku, lying further to his west. This last word again appears in Turkish on the Orkhon inscriptions of the seventh century, and some of their fighting with Shelun is plainly stated to have been on the Orkhon River. Owing to a misprint in some of the Chinese national histories, De Guignes, and after him Gibbon, erroneously gives this first Khan's name as Toulun, a mistake all the more important in that a century later the Geougen Khan really was named Toulun.

From first to last the Geougen never possessed anything in the shape of a town. They were what the Chinese call a "horse-back State," pure and simple; that is, they were nomads, moving about with their tents, and pitching for a few weeks or months in ever-changing valleys or oases, according to the needs of their flocks and herds, to the supplies of pasturage and water, and to the temperature of the seasons. Whilst we have tolerably full accounts of social usages amongst the ancient Hiung-nu, and their later descendants the Turks, we have very little to show us what were the particular points in Geougen character which differentiated the ruling caste among them from these two—that is, from their predecessors and successors in desert empire; but the bulk of them are clearly stated to have been Hiung-nu tribes too. The evidence of language is, of course, not to be despised. We are given the native trisyllable for "bald-head," and also the native words (as they sounded to Chinese ears) for all the Khans' descriptions or titles. Thus, beginning with Shelun the "Conqueror," we have, in succession, the "Extender," the "Fair," the "Victorious," the "Spiritual," the "Pensive," the "Good," the "Perpetual," the "Merry," the "Successor," the

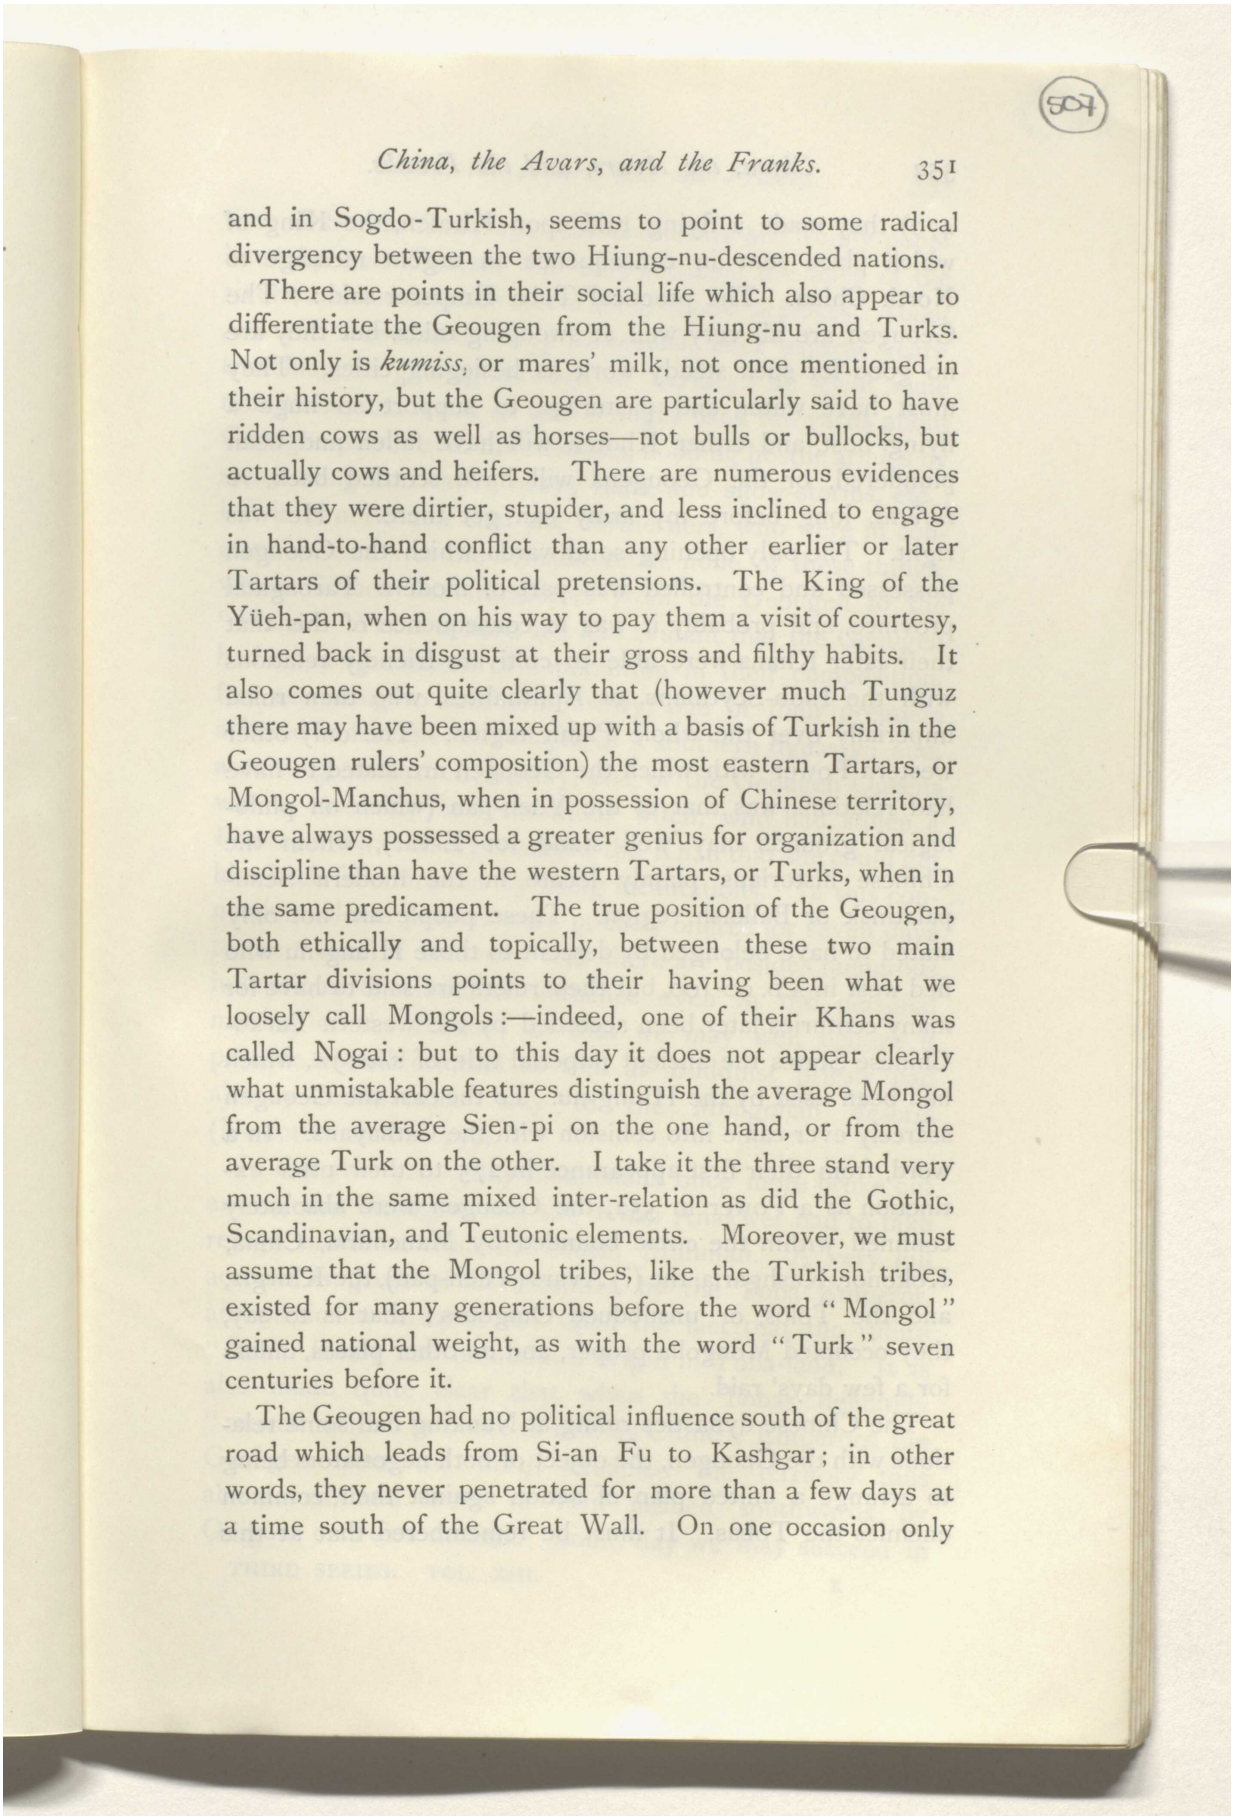
BRITISH LIBRARY



"Subduer," the "Peaceful," and the "Reuniting" Khaghans. All these words must have great potential value in the hands of competent Turkish, Mongol, or Manchu scholars, and such may always obtain the Chinese sounds from me for the asking.

The remarks of Cervantes, who lived long amongst the Turks of the Mediterranean, are here very much to the point: *Es costumbre entre los Turcos ponerse nombres de alguna virtud que en ellos haya.* This is almost word for word what the Chinese say of the Geougen: "The Khans and statesmen of the Geougen are designated according to their deeds and abilities, just as Chinese Emperors are so designated posthumously; but the Geougen appellations, on the contrary, were only used during life." The Prince's wife was called *Khaghatun*, which title, when in 550-552 the Turks overthrew the Geougen, was also applied to the Queen of the Turks, and is the more modern word *Khatun*. There are other evidences suggesting that the Geougen organization, such as it was, was bodily taken over, or at least partly imitated, by the Turks. For instance, the titles *Bagha*, *Teghin*, and *Tarkhan*, which frequently occur in the carved stone Turko-Chinese inscriptions in Sogdo-Aramæan writing discovered and deciphered within the past fifteen years, and which also occur as regularly in Chinese history, are found to have been used by the Geougen at least a century before the name "Turk" (taken from the appearance of the peak under whose shadow they dwelt) was applied to a petty Hiung-nu tribe. In the same way such Chinese imitation words as *tudun*, *bayen*, *djigin*, *djilifat*, and others not yet satisfactorily fitted with proved alphabetical Tartar originals, are proved to have been derived by the Turks from either the Geougen or from a common source; more especially the word *bayen* was used alike by the Geougen and Turks, by the European Avars, and by the Mongols. On the other hand, the entire absence from Geougen history of common Turkish words like *jabgu* and *chör*, found both in Chinese

and in Sogdo-Turkish, seems to point to some radical divergency between the two Hiung-nu-descended nations.

There are points in their social life which also appear to differentiate the Geougen from the Hiung-nu and Turks. Not only is *kumiss*, or mares' milk, not once mentioned in their history, but the Geougen are particularly said to have ridden cows as well as horses—not bulls or bullocks, but actually cows and heifers. There are numerous evidences that they were dirtier, stupider, and less inclined to engage in hand-to-hand conflict than any other earlier or later Tartars of their political pretensions. The King of the Yüeh-pan, when on his way to pay them a visit of courtesy, turned back in disgust at their gross and filthy habits. It also comes out quite clearly that (however much Tunguz there may have been mixed up with a basis of Turkish in the Geougen rulers' composition) the most eastern Tartars, or Mongol-Manchus, when in possession of Chinese territory, have always possessed a greater genius for organization and discipline than have the western Tartars, or Turks, when in the same predicament. The true position of the Geougen, both ethically and topically, between these two main Tartar divisions points to their having been what we loosely call Mongols:—indeed, one of their Khans was called Nogai: but to this day it does not appear clearly what unmistakable features distinguish the average Mongol from the average Sien-pi on the one hand, or from the average Turk on the other. I take it the three stand very much in the same mixed inter-relation as did the Gothic, Scandinavian, and Teutonic elements. Moreover, we must assume that the Mongol tribes, like the Turkish tribes, existed for many generations before the word "Mongol" gained national weight, as with the word "Turk" seven centuries before it.

The Geougen had no political influence south of the great road which leads from Si-an Fu to Kashgar; in other words, they never penetrated for more than a few days at a time south of the Great Wall. On one occasion only

470) they made a flying raid upon Khoten, the King of which place sent in consequence an urgent message to North China. The practical Toba Emperor said: "The Geougen are all very well at swooping raids, but they are no good for such steady work as besieging cities. They must have water and pasturage to support so huge a flying host, and either Khoten will have fallen and been plundered, or the Geougens will have scuttled back, *re infectâ*, long before my army can get there." He was right. The only opening southwards which the Geougen possessed and controlled was part of modern Tarbagatai province, and probably it was in consequence of this that their later Khans were able to cultivate friendly relations with the Indo-Scythians, or Ephthalites, who then ruled imperially over the whole Pamir region. The only other western Power with which the Geougen are stated to have had relations was that of the Yüeh-pan (which on philological grounds may well stand for E-var), whom the Chinese historians plainly locate in the modern Semipalatinsk or Balkash region. These people are not only stated to have belonged by descent to those Hiung-nu who fled west in A.D. 90-100, but their rulers are said to have for many centuries later been accorded by the western Turko-Chinese States the ancient imperial title of *shen-yü*, which had been used by the Hiung-nu. To the east the Geougen scarcely ever came into collision with the Cathayans. In a word, from their first appearance in 275 to their utter extinction as a Power in 552, the Geougen were absolutely confined within the circle bounded by Manchuria, China, Kokonor, Kashgaria, the (?) Avars (Yüeh-pan), the Khirgiz, and the Tölös, or unsubdued Ouigours; that is to say, they occupied Mongolia proper, and no other places, unless for a few days' raid.

The Chinese dynasties ruling at Nanking had some relations with the Geougen, the object of both negotiators being to arrange a united plan of action against their common enemies the Tobas. It must be remembered that at this

time all South China was semi-barbarous and thinly populated by true Chinese, who only occupied the lines of the rivers, and had colonies dotted about at central places. About A.D. 480 a southern envoy succeeded, after several years' travelling, in getting through to Tartary; he spent some time there, and it was he who brought back the yarns about Geougen power over the elements, flooding hostile armies by summoning hurricanes, heavy rains, and snow-storms, etc.; but it is noticeable that the northerners, who were in constant contact with the nomads, relate none of these things, which Gibbon has transferred from the Geougen to the "Huns." Yet it is none the less evident that the Geougen had a strong element of superstition in their composition, for, according to southern history, one of their premiers affected to foretell the collapse of a southern dynasty; and, according to northern history, one of the Geougen Queens was a successful and ambitious witch, who had stolen a Prince, and had then persuaded the Khan that she could get him back from heaven by using incantations. In this connection solemn prayers were publicly offered for seven days to the "God of Heaven," and there are besides numerous indications of Buddhist influence even in the personal naming of the Khans; so that we may well believe it possible that Nestorian as well as Buddhist priests had already found their way to the Mongolian deserts (Nestorius died in 439).

In the year 520 family dissensions once more broke out among the Geougen, and the Khan Anakwei had to take refuge in China from his cousin Brahman. A very full account is given of his reception by the Toba Emperor, and particular stress is laid upon the fact that the ruling "Bald" family had its obscure origin in Toba-land. It is also made quite clear that when the Tobas definitely "moved south" in order to rule as Chinese Emperors, the Geougen from the north occupied the territory thus abandoned, and were in turn pushed southwards by Ouigour or Tölös attacks. Some day we may succeed in

unravelling all this, but for the present it is enough to gain a few clear preliminary notions and leading principles. The dispute ended in China's conciliating the two claimants, and arranging to divide the Geougen Empire into the eastern and western divisions. Anakwei was given immense subsidies and settled in the modern Urga region. Brahman, on the other hand, ruled the country about medieval Etzina. Now it was that we first hear of Geougen-Ephthalite relations. Brahman's three wives were all Ephthalite women, and, being dissatisfied with the Chinese settlement, he seems to have sought to avail himself of existing alliances farther west; but he was pursued by Toba armies, captured, and ultimately imprisoned in China, where he died. Meanwhile Anakwei strengthened his position by concluding a marriage alliance with the Tobas.

Now, however, the powerful Toba dynasty began itself to fall into decay, and under the influence of two rival Generals was divided into the West Tobas of Si-an Fu and the East Tobas of modern Ho Nan. At last these Generals, or *maires-de-palais*, constituted for themselves and their sons a hereditary position, and, finally dethroning the *rois fainéants*, blossomed out into the rival empires of Chou and Ts'i. The Hiung-nu principalities dotted along the highroad to the West having during the fifth century been destroyed one after the other by the Tobas, it became possible for the Turks (who had for many generations been employed in the Alashan region as ironworkers by their masters the Geougen) to assert their independent rights. This is the earliest appearance in Chinese history of the word "Turk." Anakwei grew so presumptuous under the powerful Eastern Toba support which he enjoyed, that he offended, not only his patrons, but also his Turkish vassals, who consequently allied themselves with the Western Tobas. The important result of all this was that the first Turkish Khan Tumen almost annihilated the Geougen hosts in the year 552; Anakwei committed suicide, and family feuds about the succession further reduced the Geougens' failing strength.

In their despair the royal family, with about 1,000 other households, threw themselves upon the mercy of the Western Tobas at Si-an Fu. As the treacherous mayor of the palace was just contemplating an act of dethronement and the establishment of a dynasty of his own at that very moment, and was therefore most anxious to conciliate the rising Turks, he basely complied with the demand of the Turkish Ambassador, and surrendered to him all the fugitive Geougen in his hands, the Khan included. It is not very easy to find the exact date of this craven massacre, of which even the Chinese historians seem heartily ashamed, but either in 555 or 556 the Turks at the capital were allowed to butcher 3,000 able-bodied Geougen in cold blood, only reserving for slavery or worse ignominy the handsome and sturdy youths. From this moment the very word "Geougen" totally disappears from Chinese history—the Turks absorbed the whole of the Hiung-nu descended tribes; and, although the movements of the Western Turks of the Rivers Oxus and Jaxartes are closely followed by the historians, not a single word is said of any flying Geougen. It is therefore quite unreasonable to suppose that the miserable remains of a people, the whole ruling caste of which was confessedly annihilated in 556 at Si-an Fu, were, or could have been, the Avars who had in 558 already influenced the fortunes of the Slavs and appeared on the political horizon of the West. On the contrary, we are told that in 420-430 the Yüeh-pan were settled north-west of modern Tarbagatai and Ili, and that in 448 the Tobas accepted their offer to assist in attacking the Geougen. The word Yüeh-pan is never once again mentioned in any Chinese history, and both this fact and the evidence of their name point to their being the Avars of 558, who had thus a clear century for emigration movements towards the Danube.

The Western Wei (Tobas) annihilated the Eastern, and Chou was in turn displaced in 581 by a successful Chinese General belonging to the interest of the former family. This

General then founded the Sui dynasty, which in 589 also conquered the Southern or Nanking Empire. China was therefore now reunited; and the second Sui Emperor, a man of fitful and restless energy, carried his arms into Corea, "Turkey" (North Ordos), and Kokonor, personally visiting all those places himself, and sending Ambassadors even by sea to Loochoo and to what is now called Siam. He explicitly aimed at emulating the "First Emperor" (255 B.C.), who had revolutionized and recast the Empire 800 years before him. It is stated of this Sui Emperor that he "was often on the point of opening relations with Fuh-lin." In China it has always been the rule that each succeeding dynasty shall make up into historical form the annals of its predecessor, and under the head of "Persia" the Sui History says: "From Persia you go north-west 4,500 *li* (1,500 miles) to Fuh-lin." The extravagances of the above-mentioned ambitious monarch, which were all crowded into a period of twelve years, brought his dynasty to an ignominious end in 618, and nothing further whatever is said of Fuh-lin in the history of it, which was compiled and published a few years later by the succeeding T'ang dynasty. The above retrospective passage about opening relations occurs in the tenth-century history of the T'ang dynasty, which reigned at Si-an Fu from 618 to 904. This history, which of course simply transcribes the stored-up annals, then relates how Fuh-lin is the same country as the ancient Ta-ts'in, and how the "King," Po-to-lik (? Patriarch) of Fuh-lin had sent an overland mission to China in 643. The celebrated Nestorian stone of Si-an Fu is still plain evidence before our eyes; it explains how the Ta-ts'in monk Olopen came to China to preach the "Sublime" Faith. We possess, in a Chinese work published about 900, the original decree of the Chinese Emperor, dated in 638, authorizing the "Persian" priest Olopen to preach the "Orthodox" Faith, and establish a monastery at Si-an Fu. It has been proved to satiety how the Chinese of those times (and very naturally) often confused the Nes-

torian, Mazdean, Manichean, and possibly other forms of Western religion with "unorthodox" forms of Buddhism and how, in this as in other matters, Persia and Syria were but vaguely differentiated. The fact is, the Chinese themselves never once got beyond the continent of Asia into Europe, of which place they had only hearsay notions; or, if an occasional adventurer ever did so, he never succeeded in acquiring or recording in Chinese distinct conceptions of where the mysterious Ta-ts'in was. The boundaries of the Roman and Persian Empires had been, and were, perpetually shifting, and the eastern people of Ta-ts'in (or first the Roman and then the Eastern Roman Empire) would alone picture to the Chinese imagination the magnificence described to them by Persian and Turkish reports as existing farther west; and it must be remembered the Turks had actually been in Constantinople on a hunt for Avars the year after the Avars had taken prisoner the Frank King Sigibert in Bavaria, whence the Franks subsequently drove the Avars back into Pannonia. Clearly, at about the date A.D. 610, the Chinese must have obtained overland information concerning Fuh-lin, for, as we have seen, a ruler from some eastern part of that ill-defined State actually sent a mission in 643, and China's most adventurous Emperor had left it on record that one generation earlier he had wished to know more of the place.

I take it that Fuh-lin is simply the word Fer-reng, or some such form of the Arab word Afrangh, and I suggest that the first knowledge of the Europeans, subsequent to the vague first-century rumours about Ta-ts'in, was derived by the Chinese through the Avars and Turks. As the French historian Duruy remarks: "Les Francs avaient en effet apporté de la Germanie une idée qu'on ne connaissait plus dans l'Empire, celle de la souveraineté de la nation. . . . Dagobert (628-638) apparaît-il comme chef de tous les barbares établis dans les provinces de l'ancien empire d'Occident. Il était l'allié des Empereurs de Constantinople, et on le voit intervenir dans les affaires des

Wisigoths d'Espagne, auxquels il donna un Roi; dans celles des Lombards d'Italie, etc., etc. . . . Enfin ce fut sur la terre des Francs que les Bulgares fugitifs vinrent chercher un asile. . . . La *France romaine* fut vaincue par la *France teutonique*."

The only *national* designation to be then found in Europe, except that of "Roman," was thus "Frank.' The Emperors Maurice, Phocas, Constantine III., and Constans were all murdered, and Patriarchs for the Latin Church had only just been established in the Eastern Empire, which circumstance soon led to a schism. We have it on historical record that the Nestorian Olopen came from Ta-ts'in; that the same Olopen is confused with a Persian; that Ta-ts'in was the later Fuh-lin; and that a King (apparently "Patriarch") of Fuh-lin sent a mission a few years after Olopen came to China. We have Yüeh-pan totally disappearing from China; and Avars, a century later, suddenly appearing face to face with Franks in Europe. If this is not sound circumstantial evidence, what is?

I have endeavoured to obtain confirmatory evidence from Arabic scholars in England, but as these efforts have not been very successful, I have during the past two years caused careful inquiry to be made by a relative now resident in Egypt. At last a learned Syrian has been discovered by him at Assouan, and this Syrian gentleman, of whom I know no more than that his name is Shakoor Bey, has replied in writing, categorically, to a number of my questions placed before him, without in the least knowing for what purpose these questions were put, or who put them. This is the sum of his replies: "The Caliph Omar (632-644) in his conquests spoke of Europeans as 'Al Roum,' which term includes 'Afrangh.' In narrating his exploits the Arab writers style Europeans 'Afrangh.' The General Kotaiba, in his Turkestan conquests and fights with the Turks sixty years later, speaks of Europeans as 'Roum' or 'Afrangh'; of Turks as 'Tourk;' of Chinese as 'Sineeyien'; of Persians as 'Firs;' of Greeks as 'Roum.' In modern Egypt the vulgar

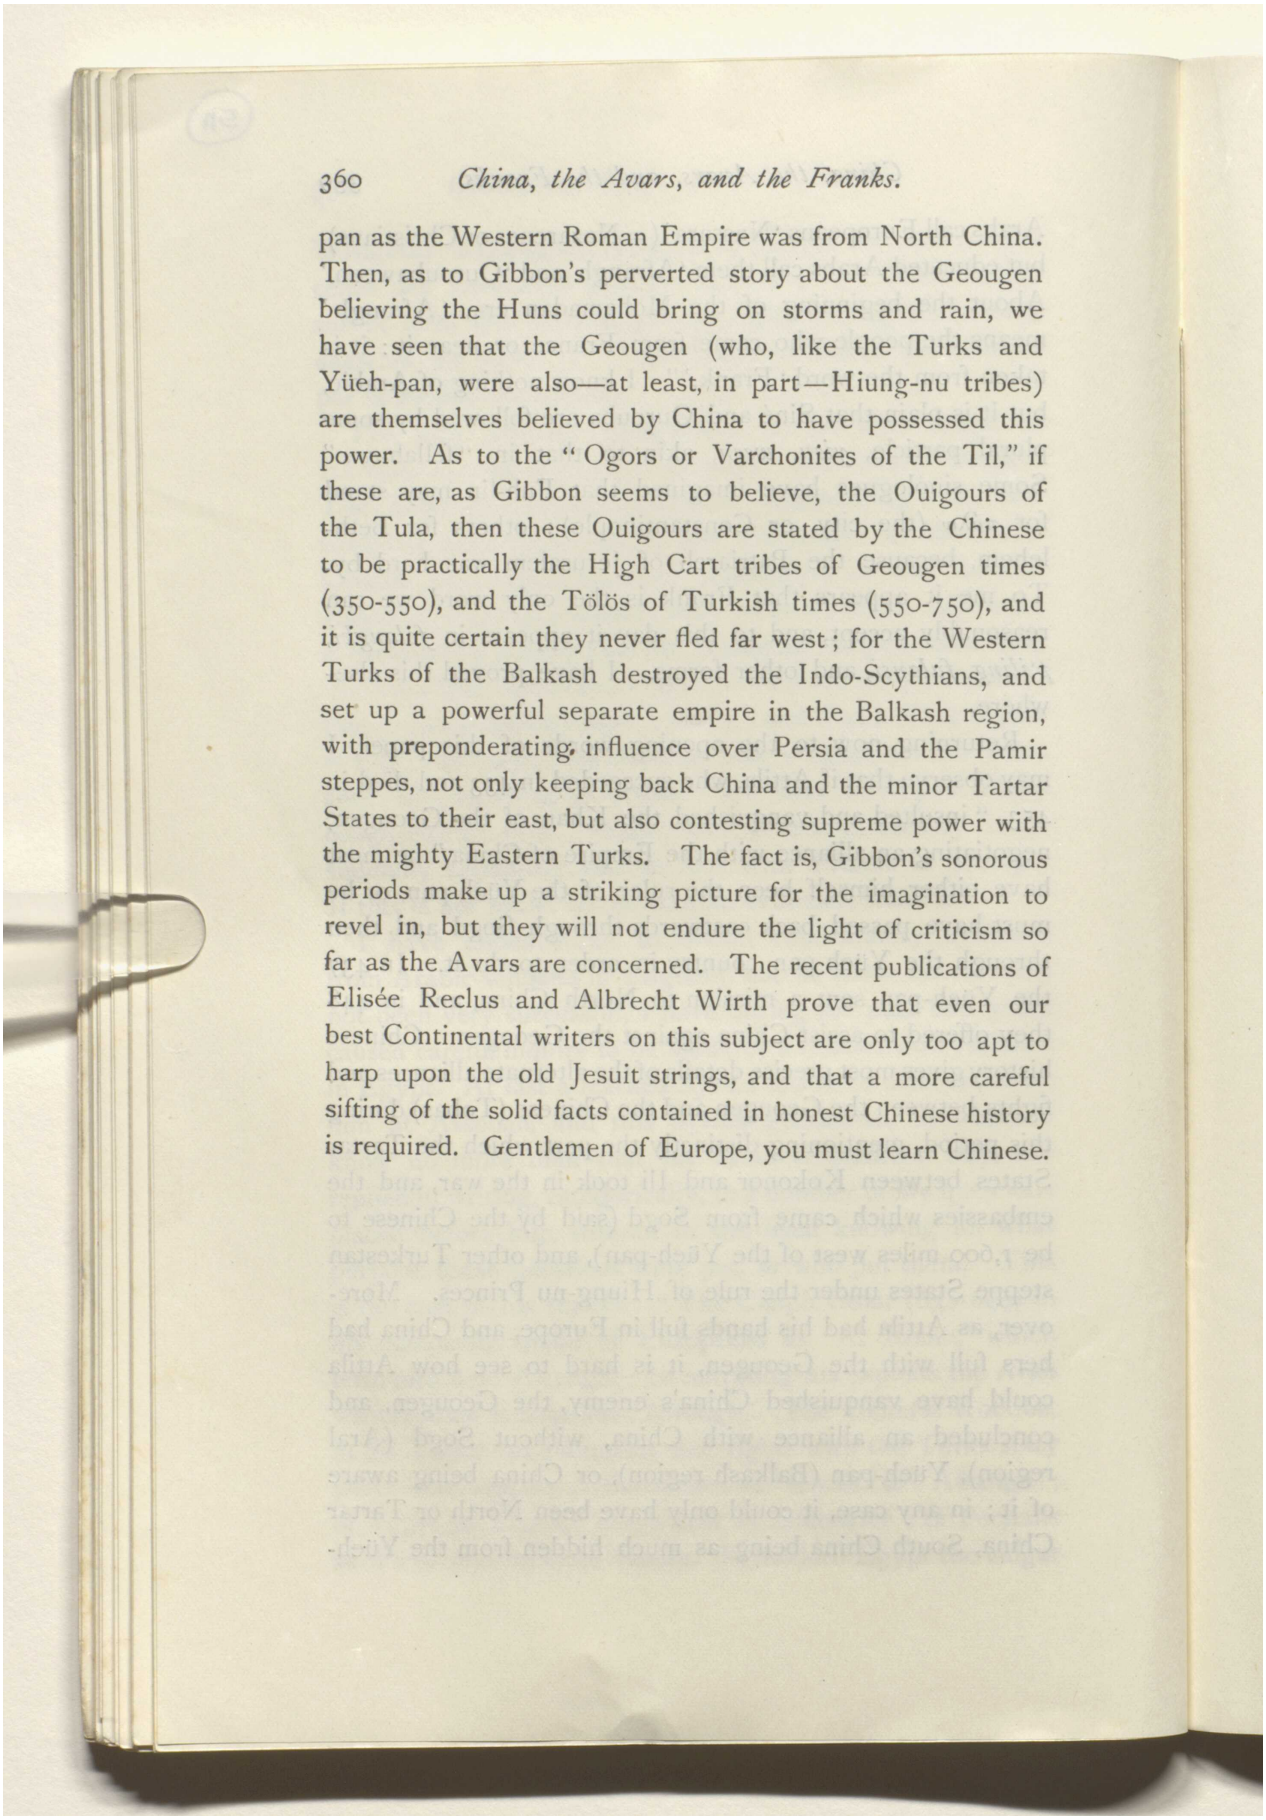
BRITISH LIBRARY



Arabs call Europeans 'Nassara' (= Nazarenes or Christians), but educated Arabs call them 'Afrangh' and 'Ouroubaween.' About the beginning of the Mohamadan era, 'Afrangh' means the people who came from France or near it: it is taken from the word 'Frank.'" I know nothing of Arabic, but it is plain that Siné and Ourouba are followed by some plural particle, *yien*, *ween*, akin to that in "fellah-*een*." Some sinologues have imagined that Fuh-lin may stand for πόλω (the city, or Constantinople); others for Bethlehem, because the Patriarch of Jerusalem was hard by. To me it appears that Frank is the only word we can reasonably accept, and to this day it appears in *folangki*, *p'iling*, *falansi*, and other forms. I have proved this elsewhere.

Returning now to the opening words of this paper, I may observe that if Attila, who succeeded in 433 and died in 453, "insulted and vanquished the Khan of the Geougen, negotiating an alliance with the Empire of China," he must have either himself been the ruler of the Yüeh-pan, or he must have passed back eastwards through Sogd and then through the Yüeh-pan country in order to do it. In 437 the Yüeh-pan sent a mission to North China, and in 448 they offered to assist China against the Geougen. Chinese history gives most precise details of the alternate alliances and fights between the Geougen and the Chinese (Tobas) during this period, mentioning distinctly the part which the Tartar States between Kokonor and Ili took in the war, and the embassies which came from Sogd (said by the Chinese to be 1,600 miles west of the Yüeh-pan), and other Turkestan steppe States under the rule of Hiung-nu Princes. Moreover, as Attila had his hands full in Europe, and China had hers full with the Geougen, it is hard to see how Attila could have vanquished China's enemy, the Geougen, and concluded an alliance with China, without Sogd (Aral region), Yüeh-pan (Balkash region), or China being aware of it; in any case, it could only have been North or Tartar China, South China being as much hidden from the Yüeh-

BRITISH LIBRARY

pan as the Western Roman Empire was from North China. Then, as to Gibbon's perverted story about the Geougen believing the Huns could bring on storms and rain, we have seen that the Geougen (who, like the Turks and Yüeh-pan, were also—at least, in part—Hiung-nu tribes) are themselves believed by China to have possessed this power. As to the "Ogors or Varchonites of the Til," if these are, as Gibbon seems to believe, the Ouigours of the Tula, then these Ouigours are stated by the Chinese to be practically the High Cart tribes of Geougen times (350-550), and the Tölös of Turkish times (550-750), and it is quite certain they never fled far west; for the Western Turks of the Balkash destroyed the Indo-Scythians, and set up a powerful separate empire in the Balkash region, with preponderating influence over Persia and the Pamir steppes, not only keeping back China and the minor Tartar States to their east, but also contesting supreme power with the mighty Eastern Turks. The fact is, Gibbon's sonorous periods make up a striking picture for the imagination to revel in, but they will not endure the light of criticism so far as the Avars are concerned. The recent publications of Elisée Reclus and Albrecht Wirth prove that even our best Continental writers on this subject are only too apt to harp upon the old Jesuit strings, and that a more careful sifting of the solid facts contained in honest Chinese history is required. Gentlemen of Europe, you must learn Chinese.

SIĀM'S INTERCOURSE WITH CHINA.*

(SEVENTH TO NINETEENTH CENTURIES.)

By Major G. E. Gerini, M.R.A.S

B.—REMARKS ON THE INTRODUCTION OF THE ART OF CROCKERY-MAKING AT SWANKHALÔK.

The crockery wares of Swankhalôk were made at the place now called *Tau Tulīeng*, *i.e.*, "*Tulīeng* Kilns," which lies about two or three miles up-stream from Old Swankhalôk, and on the same (right) bank of the river. I went carefully over the place a few years ago, when I found the remains of a large number of kilns. These apparently continued to work until stopped by the Burmese invasions of A.D. 1765-66. Since that date the manufacture of the Swankhalôk crockery has ceased. The honour of starting the industry is, by local tradition, ascribed to old Master *Tulīeng* (*Tu-liang*?),† said to be one of the Chinese artisans who came to Siam in King Rùang's train. Hence the site of the kilns was named after him. Heaps of débris of broken pottery are still to be seen about the kilns. The style of fabrication and of glazing is evidently Chinese, and the work was undoubtedly carried on by the descendants of the original Chinese starters of the industry, although Siāmese designs were introduced in the course of time. Most of the Swankhalôk wares belong to the *craquelé* type, which constitutes their main distinguishing feature. The crackle is generally wide apart, but on diminutive specimens it is close-set, and well produced, as in the Chinese cracklin wares of the so-called "fish-spawn" or *truité* pattern. The dominating colour is a creamy, and at times a fallow, white; although celadon—the beautiful sea-green tint so much appreciated in old Chinese porcelains—and deep rosedon also occur. Some specimens present a combination of several brilliant hues—for instance, the *pañca-rañga* vases (in Siāmese, *thô beñcharong*), so called from being adorned with representations of expanded lotus flowers exhibiting five different tints. These polychrome wares are, however, uncrackled, and undoubtedly belong to a later period. On the other hand, the white crackled musters and other monochrome specimens seem to have more than one point of analogy with the classical *Kwan-yao* and *Ko-yao* porcelains of the Sung

* For the previous portions of this paper, see our numbers for October, 1900, pp. 365-394; January, 1901, pp. 155-170; April, 1901, pp. 379-385; and January, 1902, 119-147.

† It is possible that some personal name, such as, for instance, *Tu-liang Tu-lien*, etc., is here implied, although the term seems to me to look more like atoponymic, introduced from, and adopted after, some place in China noted for either figuline clay or pottery works. There are, or were, places in China bearing the name of *Tu-liang*, but whether crockery was ever made there or not I am unable to say. On the other hand, the district of *Fu-liang*, very similarly named, has become well known from the fact of the famed King-tê-chên potteries being situated within its territory. Sinologists interested in the subject should be able to throw further light on the origin and purport of this curious term *Tulīang*, handed down to us in Siāmese oral tradition of ages long passed away.

BRITISH LIBRARY

dynasty, from which they were very likely imitated in the style of glazing, if not in the excellence of the workmanship. The paste is, in fact, comparatively coarse-grained, and the manufactured article thick and heavy, owing to the inferior quality of the prime material that was at hand; but the enamel is not, so far as I can judge, very considerably behind in excellence that of Chinese porcelains, and it is evident that the ingredients entering into its composition were imported from China. It is nevertheless pretty well certain that, but for the lack on the spot of a figuline clay as fine in quality as the famed *kao-lin* to be met with in the neighbourhood of the most renowned ceramic establishments in China, we would have had real porcelain produced at the Swankhalôk factories, just as good in quality as that turned out from the best Chinese pottery works, whereas the Swankhalôk wares, of which specimens remain, cannot be said to rank above the level of common crockery, although some of them may perhaps be classed in the category of soft porcelain, on account of the whitish paste of which they are composed, and the superior quality of the glaze. As regards the shape of the articles, it should be noted that not only bowls, cups, vases and spittoons were made, but also good-sized jars, terminals of pillars and lamp-posts, figures of animals such as *rājasīhas* (lions), etc., wherewith the Buddhist temples in and about Swankhalôk were adorned. Among the heaps of débris lying about the Tu-lïeng kilns I discovered a torso of *Garuḍa* overlaid with green enamel; several mutilated representations of the *hatthiliṅga* bird (a sort of fabulous vulture with a bill like an elephant's trunk) I picked up amongst the ruins of *Wat Khâu Rang-rëng* (the celebrated monastery of "Vulture-nest Hill"),* and many other interesting specimens of old Swankhalôk ceramic art I gathered amidst the remains of other Buddhist temples of the ancient city, all of which may now be seen in the Royal Museum at Bāngkōk. The chips of broken crockery to be met with about the Tu-lïeng kilns mostly belong to dishes and bowls of a somewhat rough design, glazed with a pale bluish-green crackled enamel recalling to a certain extent the delicate tint of the famed Lung-ch'üan celadons; but the coarseness of the material, as well as the inferiority of the workmanship, concur in indicating that these must be the productions of a later period, when the Swankhalôk factories were far down in the decline. Remains of other kilns are to be met with at other places to the north of the city, this being a proof that the ceramic industry was by no means localized to the Tu-lïeng kilns only. The latter formed, however, its most important centre, and the traditional name that remained to the bend in the river's bank close to the bottom of which the kilns are situated, viz., *Khụng Tap'hau* (*i.e.*, the "ship of junk's bend") well attests that river-craft used to moor and load the wares here, in the halcyon days

* This monastery was, according to the "Northern Chronicles," built by King Rùang himself, hence the *hatthilinga* figures probably belong to the period of that King's reign. It seems that it is this same hill which was reputed to have been at one time the resting-place of a gigantic trunk-billed vulture or *hatthilinga*. According to a legend related in the *Camadevī-vainsa*, a Pāli chronicle of Lamp'hūñ brought out to light by me (Section III.), the Risi Sajjanālaya residing at Swankhalôk made use of that monstrous creature in order to fetch from the ocean depths the huge chank-shell which served as a pattern for tracing the outline of the walls of the new Harïbhuñjaya city (Lamp'hūñ).

BRITISH LIBRARY

of crockery manufacture, when a populous Siāmo-Chinese village most undoubtedly thrived round about the famed kilns. Local tradition pretends that the craft which frequented this spot were sea-going junks, bringing up merchandise from abroad and taking away the prized products of the kilns to the neighbouring foreign nations, as the name *tap'hau*, usually designating a junk for sea-navigation, implies.* This tale, however, must be accepted with reserve, for although we have admitted and demonstrated that sea-going craft used in the old days to proceed up the river as far as Sukhôthai, and even, perhaps, Swankhalôk, it is scarcely credible that they could, even at high-water season, ascend the rapids existing abreast of the latter-named city. This feat is now performed only by river-boats of shallow draft, and has become easier of accomplishment during the last sixty years or so; before that the rapids appear to have been far more difficult to cross.† Nevertheless, it seems pretty well certain that a large proportion of the Swankhalôk wares were taken down-country in boats, and some of them exported thence to the southern coast of Indo-China, or carried overland across the watersheds.

The Martabani.

Here the much-debated question as to the original place of manufacture of the *Martabani* vases once more comes to the front, as brisk and intricate as ever it was. So much has been written about it, mostly by "arm-chair" Oriental scholars of our Western world, that we cannot afford to pass it unnoticed, as it directly bears upon the subject now under discussion. After due perusal of the principal arguments‡ brought forward by either of the parties engaged in the controversy as to the origin of the *Martabani* celadon dishes, tending on the one side to claim them as having been manufactured in China, and thence exported by the early traders to the Indian or Arabian countries, where they became so celebrated, and on the other to prove that they must been made at some place in Indo-China not far away from Martaban, whence they got their name. I am, on the whole, strongly inclined to side with Professor Karabacek, of Vienna, who has been the propounder and chief upholder of the latter view. The passage he quotes from the celebrated encyclopædist Haji Khalfa, who died in A.D. 1658, to the effect that "the precious, magnifi-

* *Tap'hau*, often spelled *Samp'hau*, seems to be a comparatively modern Siāmese term derived from the Chinese word (*po*, *p'o*, *boh*, etc.), denoting an ocean-going junk. *Ta* and *Sam* are prefixes, the latter standing very likely for (*ch'wan*, *sung*, *shon*, etc.), the Chinese generic name for a boat, ship, etc.

† Rafts of teak-timber do, of course, shoot the rapids during the high-water season, having to stop from about October to July each year, when the rapids become impassable. The rapids termed *Kĕng Lúang*, situated abreast of the old palace, are the most difficult to cross; a half-mile further below there are the rapids named *Kĕng Sāk*. The former are constituted by a quartz reef forming a barrier running across the river, and causing its waters to fall for about 9 feet.

‡ Chiefly as summed up in an able article on "Ancient Porcelain," published by Dr. Hirth in the *Journal, China Branch Royal Asiatic Society*, vol. xxii. (1887), p. 150 *et seq.*, on which my criticisms had to be based, not having access in this far-away land to the original publications of the parties concerned in the controversy.

cent celadon dishes and other vessels seen in his time were manufactured and exported at Martaban in Pegu," seems to me most decisive, although I believe that a mistake was made by its author in confounding Martaban, the port of shipment, with their place of origin. The latter, I am fain to think, was almost undoubtedly Swankhalôk, the only place I know of in Indo-China where glazed pottery closely approaching Chinese porcelain of the most classical pattern was ever manufactured. Truly, there appear to be two widely different kinds of wares to which the term *Martabani* was applied :* one, according to Jacquemart, presenting a thin, bright green glaze, overlaying a very white biscuit, which allows the light to appear through, and constituting, in the opinion of Professor Karabacek, the finest celadon porcelain to be met with throughout the Muslimic Orient ; the other typified especially, in the words of the same authority, by the "large, heavy, thick, green celadon dishes with the well-known ferruginous ring on the bottom, which have been found spread over all the countries of Arab civilization." Now, it is this latter kind which seems to possess the chief characteristics common to the Swankhalôk wares, and which very probably will some day, when an exhaustive examination and comparison has been instituted by experts, be identified with them. As to the superior class of the *Martabani* first described, they

* Even *three* kinds, if we include under this denomination the large-sized glazed jars, also called *Martabani*, but better known as "Pegu jars," which were famous all over the East for many centuries (see Yule-Burnell Glossary, p. 428). These were and are still chiefly made at Twanté and neighbouring places of the coast of Pegu, and although glazed they have nothing to do with Swankhalôk wares and the class of pottery (celadon dishes, etc.) forming the object of the present discussion ; hence I have refrained from dealing with them in the following pages. I cannot help, at the same time, calling attention here to the fact that this vague term *Martabani* has been made to cover, or designated at different periods, several quite distinct kinds of pottery, ranging from common glazed earthenware to the very finest porcelain ; thence, I think, a good deal of confusion has arisen as to the class of vessels that are more properly implied. On this subject authorities vary very considerably. Dulaurier, for instance, quotes from Father Azar, a Maronite, that *Martaban* means a casket or vase for keeping medicines and comfits, etc. But Colonel Yule observes ("Cathay," vol. ii., p. 476) the word is used for the great vessels of glazed pottery called *Pegu* or *Martaban jars* from the places where they were purchased, and which retained a wide renown up to the present [nineteenth] century. These are likewise the "great pottes of Martavan" mentioned by Linschoten (see Anderson's "English Intercourse with Siam," p. 33), in which palm-wine from the *Nipa*, or *attap*-palm, "was carried from Tenasserim to all places in India" ; and also the large *black-glazed* jars to which Barbosa devotes the passage rendered by Ramusio Navigationi, etc., vol. i., p. 317 a, of the 1563 edition), as follows : "Si lavorano in questo luogo di Martabane grandissimi vasi di porcellana bellissimi e invetriati di color negro, havuti i sommo pregio appresso li Mori : li quali gli levano di qui, come la maggior mercantia che possino havere." Now, these products of an undoubtedly local industry have nothing to do, it seems to me, with the "caskets or vases for keeping medicines," described by Father Azar, and less still with the celadon porcelain vessels known to the Muslimic Orient under the name of *Martabani*, which were certainly not manufactured at the same places where Pegu jars were turned out, and cannot in any way be classed with them. It is with this class of the superior—and perhaps older in date or style—*Martabani* that we propose to concern ourselves in the present discussion, and it will be now seen how necessary it was to draw a line of distinction between the so varied kinds of the wares so named, in order to avoid the confusion that has been made by many of the authorities who treated the subject.

may have been really manufactured in China, and it is possible that in the course of time—when coarse imitations were made of them in Siām and shipped to Muslimic countries by way of Martaban, becoming thus known by the name of *Martabani*—this same term was applied on account of many points of resemblance to the genuine old Chinese celadons, to the specimens of these articles that had long before that found their way from China to the Muslimic world. It may be also possible, on the other hand, that this superior class of porcelain was, in the early days of the initial establishment of the Chinese ceramic industry at Swankhalôk, manufactured at the latter place as well, its production being afterwards discontinued through decline of the art amongst the Sino-Siāmese descendants of the original starters of that industry. Hence the early thin and transparent *Martabani*, so appreciated for their excellence of material and workmanship, would be superseded by gradually coarser products, as the art went on declining in inexperienced hands, and the secret of the production of the original superior articles became perhaps lost for ever. This latter hypothesis cannot be maintained, however, until some specimen of ancient Swankhalôk wares is found, resembling to some extent in excellency the superior class of the *Martabani*. We accordingly adhere for the present to the view put forward at the outset, ascribing the paternity of the first-rate *Martabani* to China, and the merit of the creation of their inferior imitations to Siām, with Martaban as the port of shipment. This manner of viewing the question agrees, it will be seen, in a literal sense with the opinion expressed by the sinologist side, who claim the product as being of Chinese manufacture, but with the essential difference that, although turned out by Chinese artisans, it is believed by us to have been made in Siām, and not in the Flowery Land. At the same time it tends to strengthen the position taken by Professor Karabacek, who qualifies as a prejudice the idea that during the Middle Ages China was the only country where porcelain was manufactured. But where does Dr. A. B. Meyer, of the Dresden Ethnological Museum—the most *acharné* of Professor Karabacek's opponents—come in with his exclusive theory of the absolute origin on Chinese soil of indistinctly all the classes of *Martabani* vessels, based on the mere negative as well as startling premise that no evidence can be brought forward to show that real porcelain was made at Maulmein (Martaban), Rangoon, or Bangkok [!!]? He might have included Chölon (Saigon) as well in his indictment, thus completing the list of the places most noted to residents in Indo-China for the confection of bricks, and cooking-pots, and water-jars of red earthenware, where no one would certainly dream—in view of the low alluvial character of the soil—of looking for the production of articles in any respect approaching to porcelain. But the most curious of it all is that the worthy doctor—as a friend of mine afterwards informed me—being apprised of my discovery, in the course of my archæological explorations of the country in and about Swankhalôk, of a number of kilns whence glazed wares closely resembling, especially in the style of manufacture and enamelling, the old classical Chinese porcelains were turned out, still persisted in his opinion that positively nothing of the kind was ever produced in Indo-China. My object

in penning these lines is not to refute one-sided views of "arm-chair" professors who discourse on topics connected with Far Eastern countries, taking for their chief basis what is said—and too often left unsaid—in superficial and out-of-date books on these lands, to so large an extent still mysterious to us. My aim is, on the other hand, to simply call attention to the fact of the well-authenticated existence in Siām, despite all theoretical demonstrations to the contrary, of ceramic works where glazed wares were manufactured originally by Chinese artisans in imitation of the Chinese porcelains, which fact, so far almost unknown, and in any case as yet totally unproved before my investigations, may contribute to solve the as yet unsettled question as to the real origin of the mysterious *Martabani* vessels.

Two points still remain to be touched upon before dismissing the subject. The first regards the fluted pattern, so often met with in *Martabani* celadons, which Professor Karabacek regards as characteristic of Siāmese origin, and holds to be a specific ornament of Siāmese civilization. In this, I am sorry to say, he is completely mistaken; for not only does not the fluted or ***radialstreifen*** pattern, as he terms it, occur in Swankhalôk and other wares of local manufacture, but is not even, or hardly ever, met with in other works of Siāmese art except very modern ones where it was undoubtedly imitated from Chinese models. I am therefore disposed to regard it, with Dr. Hirth,* as peculiar to Chinese porcelains. What must have induced Professor Karabacek to err was having found it in modern so-called "Siāmese" crockery "made in China."

The next point concerns certain marks that Professor Karabacek has seen engraved on the bottom of some of the celadon dishes in dispute, and which he declared to be of Siāmese origin, while Dr. Meyer—backed in this by Dr. Hirth—attempts to explain them, not a little unsuccessfully, by means of Chinese hieroglyphs. Here are the three marks forming the subject of the debate: . "Of these," says Dr. Hirth,† "the first is admitted to strongly resemble the sign used in the Chinese running-hand style for *liu*, six. The third one has a decided similarity to Chinese, the running-hand sign for *wu*, five. The middle one is explained by Professor Karabacek as representing the letter L in the Peguan alphabet; however, this says not much, since the mark is especially described as *tief eingegraben*, *mit ausgezackten Rändern*, which seems to be a strong hint as to its having nothing to do with the manufacture of the dish, since an owner's mark drilled or chiselled into the hard paste after the completion of a vessel, may have been made at any time and in any country." This may be very well for sinologists, but for outsiders it does not require, I think, much reflection to see the puerility of the suggestion made as regards the identity of the first mark. The Chinese running-hand form of the number six is ⊥, and this scarcely bears comparison with the mark in question, which looks almost exactly like an inverted pall or Y, each of whose three branches is formed of four circlets or dots, making twelve

altogether. This system of representation by means of circlets is commonly employed in Siām and neighbouring countries to depict the stars occurring in the *nakṣatras* or lunar asterisms, according to local astrological ideas. Although none of the asterisms figured in native astrologic treatises exactly resembles mark No. 1, the nearest to it, if taken in an inverted form, being *Uttarāṣāḍhā*, represented as and assigned as a horoscopic constellation to Maulmein, it is quite plain that that mark is either a symbol or a diagram of some mystic meaning, mayhap even a trade-mark; but not certainly a letter, nor a numerical figure. The only Oriental letters resembling it closely are, perhaps, the , or *t*, of the Asóka pillar inscriptions (third century B.C.) and the or *g*, of the Northern Chēra character of the tenth century A.D.* As regards the third mark, its resemblance to the Chinese running-hand sign for five is more than problematic, since the latter is more generally represented in the form . It may be much more favourably compared to the modern Siāmese numeral six, written , whose ancient form was in both Siāmese and Lāu inscriptions; or else, if reversed, to the Mōñ , the sign for *four*. The second mark corresponds to the letter L not only in the Peguan (Mōñ) alphabet, as Professor Karabacek says, but also in several other Indo-Chinese alphabets, as well as in ancient Tamil writing (*circa* 1080 A.D.);† while, on the other hand, it very closely resembles the Lāu numeral *nine*, represented as . There is, therefore, not the slightest ground for assigning a Chinese origin to either of the three marks in question; on the contrary, the weight of evidence points towards their having been made in either Eastern Pegu or Northern Siām, the places whence the celadon dishes bearing them were exported, and where very probably also they were, at least in part, manufactured.

Anent the possibility of the Swankhalôk wares finding their way overland to the Gulf of Martaban, there cannot be the slightest doubt, in view of the very explicit statement made by William Methold to the effect that chinaware (which very likely included also the Siāmese products) was conveyed by this means to Tenasserim. Speaking of the trade of the seaport just named in A.D. 1619, Methold says, in fact, that the merchants of Golconda brought thither various products, "and landing them at Tenassery, carry them from thence to Siām, fourteen days' journey overland, from whence, by the like conveyance, they bring all sorts of China commodities, as porcelain, satins, damasks," etc.‡ It follows quite plainly from this passage, which appears to have escaped the attention of the parties engaged in the *Martabani* controversy, that the vessels or dishes so-named found their way to Tenasserim, and naturally also to Martaban, whether they had been made in China or Siām, along with many other kinds of porcelain and other products of Chinese manufacture, and were shipped thence together with Pegu jars and other glazed

earthenware of local make. This must be the reason, then, why under the term *Martabani* came to be included a motley variety of pottery, the grossest class of which only was produced locally, while the best kind was either of genuine Chinese make imported thither second-hand through Siām, or consisted of imperfect imitations of the latter, manufactured by Chinese or Chino-Siāmese artisans, in Siām itself. With these explanations, which it is hoped will in some measure contribute to the solution of the complex *Martabani* question, and lead in any case to the recognition of the share that Siām almost undoubtedly had in the manufacture of some of such vessels, I now return to the main subject of the present note.

(*To be continued.*)

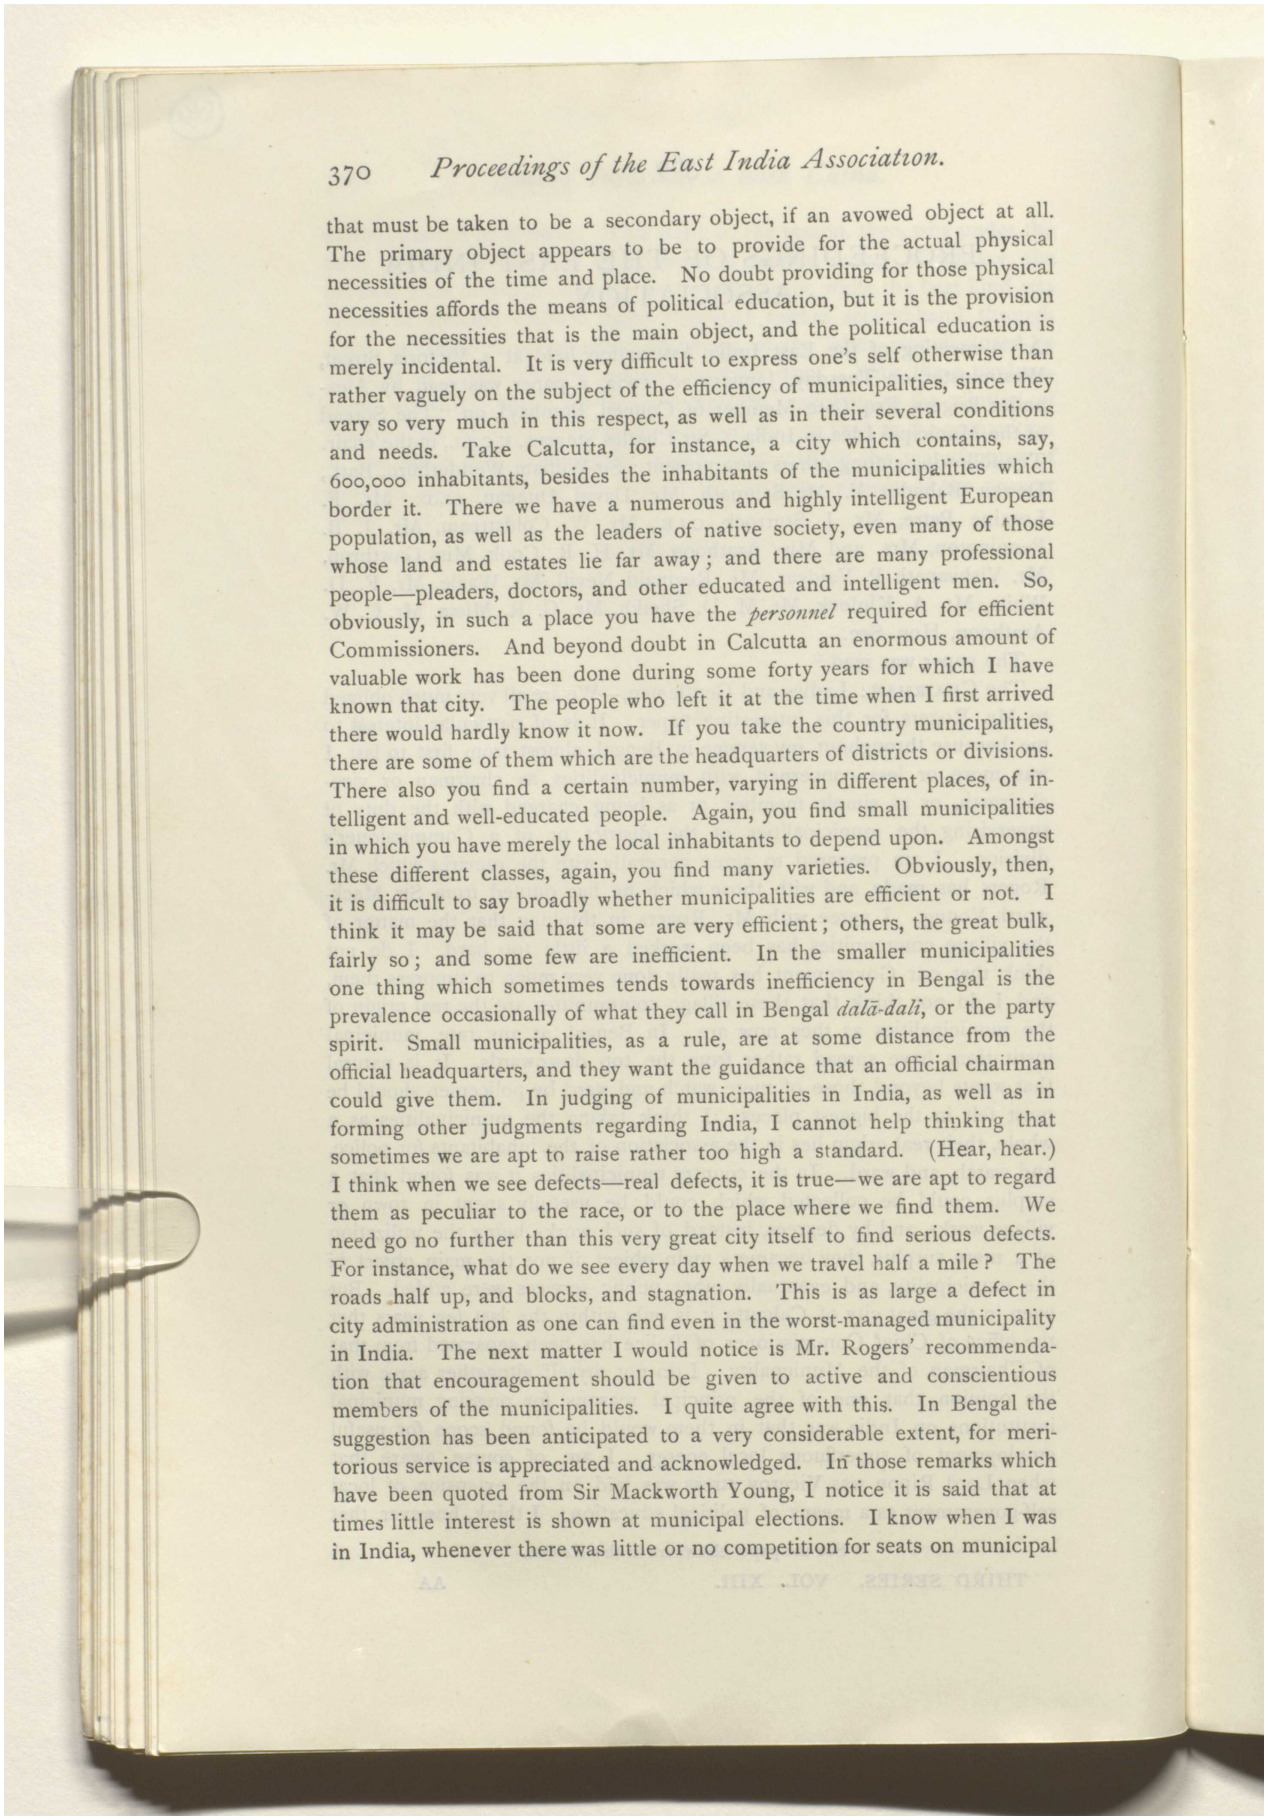
PROCEEDINGS OF THE EAST INDIA ASSOCIATION.

At a meeting of the East India Association held at 3, Victoria Street, Westminster, on Tuesday, January 28, 1902, a paper was read by Alexander Rogers, Esq. (late Member of Council, Bombay), on "The Spread of the Municipal Idea in India." Sir Charles Stevens, K.C.S.I., in the chair. The following among others were present: Sir William Wedderburn, Bart., Dewan Bahadur V. M. Samnath, Mr. David Duncan, LL.D., Mr. F. Loraine Petre, Mr. J. Sturrock, C.I.E., Mr. W. Coldstream, Mr. J. B. Pennington, Mrs. and Miss Arathoon, Mr. H. R. Cook, Miss Gawthrop, Mr. Vishvanath P. Vaidyar, Mr. Reginald Nevill, Mr. Wagle, Mr. F. D. White, Mr. A. Kinlock, Mr. M. D. Sheikh, Mr. G. R. Misra, Mr. C. W. Arathoon, Hon. Sec.

The paper was read.*



The Chairman: Ladies and Gentlemen,—We are all very much obliged to Mr. Rogers for this interesting paper. It is of particular interest to me because throughout my service in Bengal, almost from first to last, I was more or less concerned with municipalities as chairman or vice-chairman, or as simple member, or as being charged with the duty of supervising the municipalities of the district or of a Commissioner's division. I am prepared to agree generally with the remarks which Mr. Rogers has made, and with those which he has quoted from Sir Mackworth Young. I agree with Mr. Rogers in thinking that the matter of the village communities has been worked a little too hard. I do not think that our Government has really done very much to suppress them, and I do not think that these village communities are the real origin of the municipalities as they now are. In Bengal, at any rate, municipal institutions have spread rather from the top downwards. It is natural that wants beyond those of mere watch and ward by policemen should be most felt in the biggest places. I think, taking the municipalities as a whole, their real origin lies in the association of the inhabitants for police, and watch, and ward. In the country municipalities it was found that a surplus could be collected which could be usefully spent in town or village works, and by degrees, instead of such works being the utilization of a mere surplus, they became a main object, if not the main object of the municipality, and eventually other public services were added. But even in the great city of Calcutta it is only within the last few years that the office of Chief Commissioner of Police has been separated from that of Chairman of the Municpality. I do not myself altogether agree with the opinion that one of the principal reasons for pressing municipal institutions on India was that in them would be found scope for useful employment of superfluous local energy. I am, of course, aware that when Lord Ripon was Viceroy stress was laid on the extension of local self-government as a means of political education. I think, however, that

BRITISH LIBRARY

that must be taken to be a secondary object, if an avowed object at all. The primary object appears to be to provide for the actual physical necessities of the time and place. No doubt providing for those physical necessities affords the means of political education, but it is the provision for the necessities that is the main object, and the political education is merely incidental. It is very difficult to express one's self otherwise than rather vaguely on the subject of the efficiency of municipalities, since they vary so very much in this respect, as well as in their several conditions and needs. Take Calcutta, for instance, a city which contains, say, 600,000 inhabitants, besides the inhabitants of the municipalities which border it. There we have a numerous and highly intelligent European population, as well as the leaders of native society, even many of those whose land and estates lie far away; and there are many professional people—pleaders, doctors, and other educated and intelligent men. So, obviously, in such a place you have the *personnel* required for efficient Commissioners. And beyond doubt in Calcutta an enormous amount of valuable work has been done during some forty years for which I have known that city. The people who left it at the time when I first arrived there would hardly know it now. If you take the country municipalities, there are some of them which are the headquarters of districts or divisions. There also you find a certain number, varying in different places, of intelligent and well-educated people. Again, you find small municipalities in which you have merely the local inhabitants to depend upon. Amongst these different classes, again, you find many varieties. Obviously, then, it is difficult to say broadly whether municipalities are efficient or not. I think it may be said that some are very efficient; others, the great bulk, fairly so; and some few are inefficient. In the smaller municipalities one thing which sometimes tends towards inefficiency in Bengal is the prevalence occasionally of what they call in Bengal *dalā-dali*, or the party spirit. Small municipalities, as a rule, are at some distance from the official headquarters, and they want the guidance that an official chairman could give them. In judging of municipalities in India, as well as in forming other judgments regarding India, I cannot help thinking that sometimes we are apt to raise rather too high a standard. (Hear, hear.) I think when we see defects—real defects, it is true—we are apt to regard them as peculiar to the race, or to the place where we find them. We need go no further than this very great city itself to find serious defects. For instance, what do we see every day when we travel half a mile? The roads half up, and blocks, and stagnation. This is as large a defect in city administration as one can find even in the worst-managed municipality in India. The next matter I would notice is Mr. Rogers' recommendation that encouragement should be given to active and conscientious members of the municipalities. I quite agree with this. In Bengal the suggestion has been anticipated to a very considerable extent, for meritorious service is appreciated and acknowledged. In those remarks which have been quoted from Sir Mackworth Young, I notice it is said that at times little interest is shown at municipal elections. I know when I was in India, whenever there was little or no competition for seats on municipal

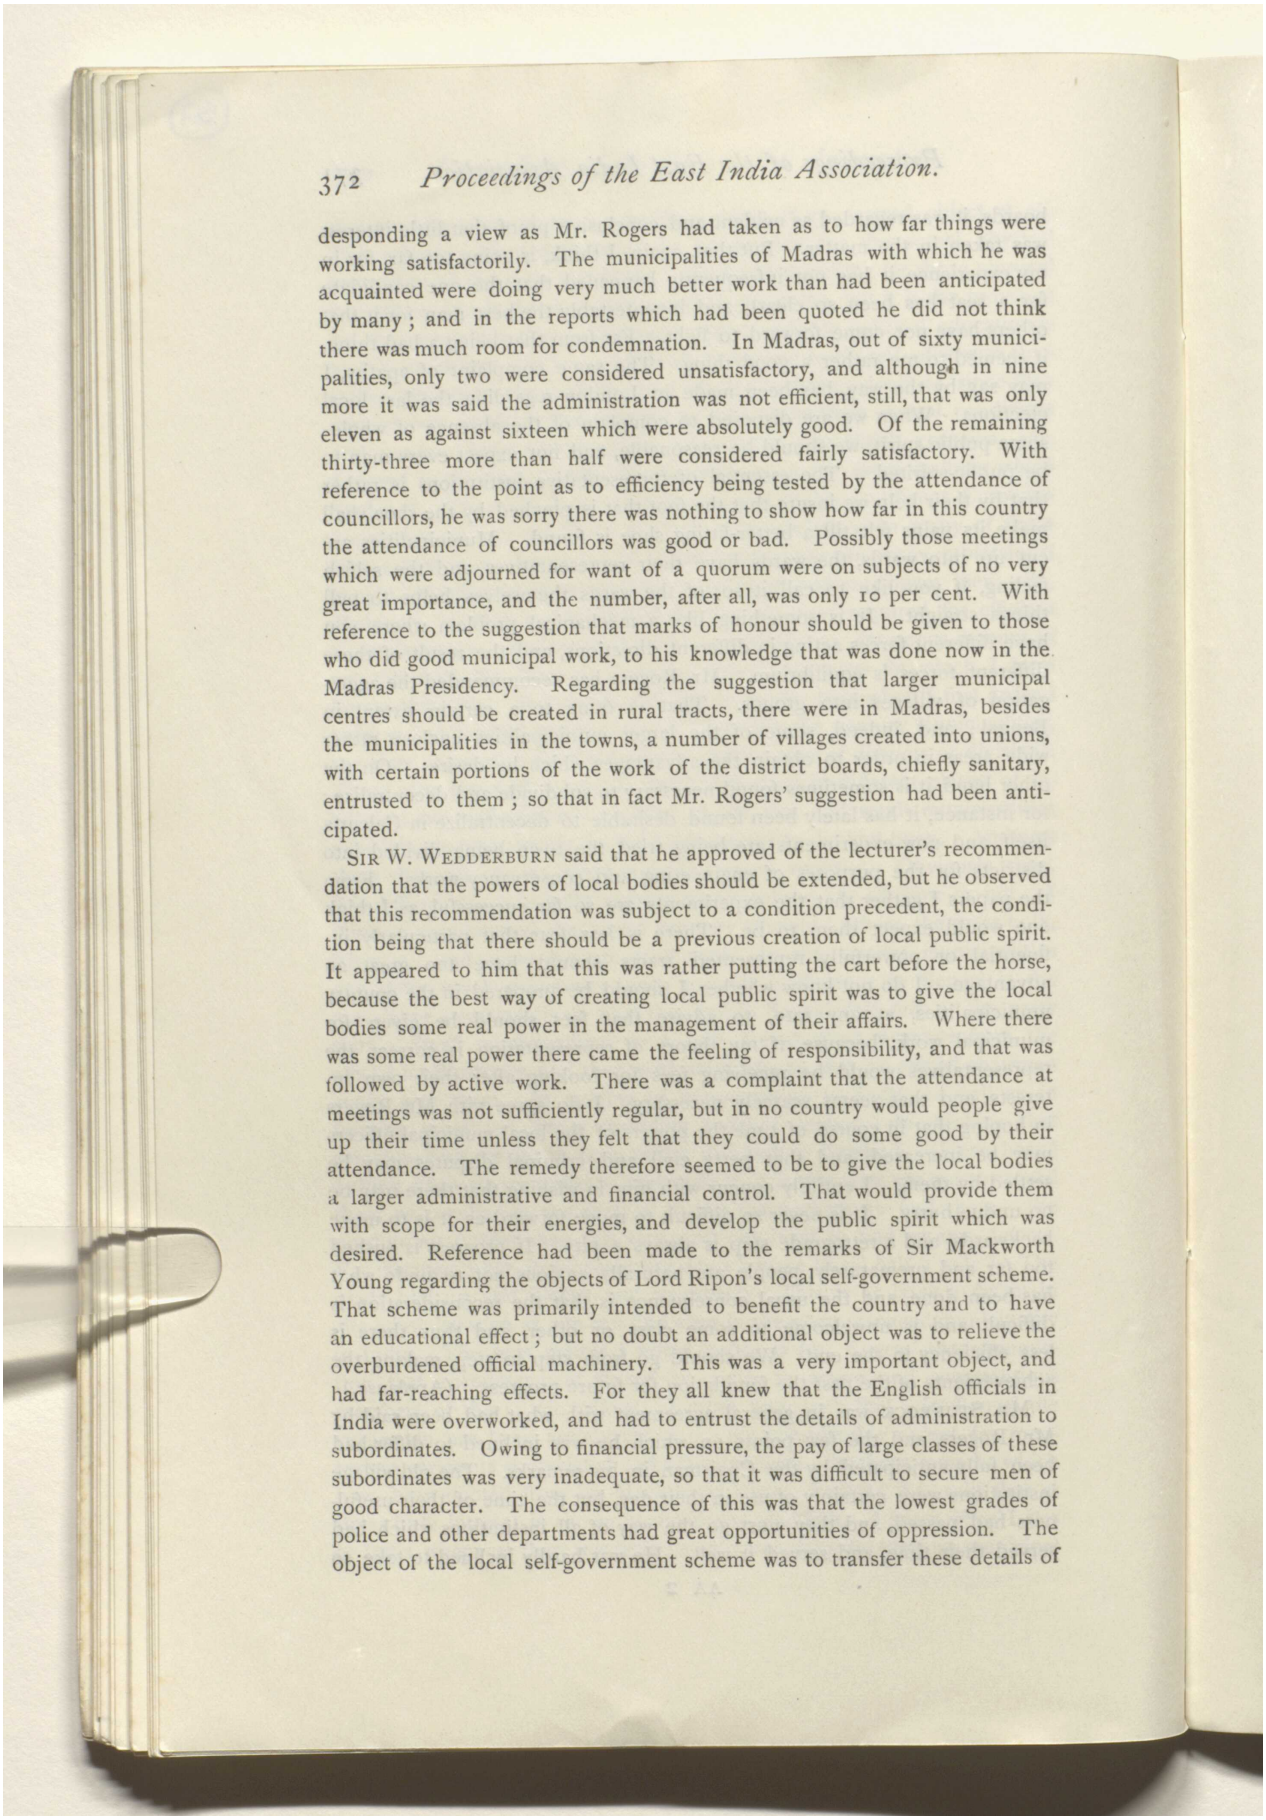
مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY



boards, it was regarded as evident and conclusive proof that little interest was taken in the matter. But that, again, I think, is going too far, for in my experience it has not infrequently happened that the one candidate for a seat has been so clearly and incontestably the best man for it that others have not come forward to fight. Far from that being a bad thing, it seemed to me rather a good thing. The same complaint of apathy, I may say by the way, has been made in London regarding the last local elections. When we are disposed to complain of the absence of wholesome public spirit, we should be reasonable, and not expect every man to be public-spirited. The essential of representative institutions is rather that by their help we insure that the foot that is pinched by the shoe shall make its pains felt till a better-fitting shoe is found. Municipalities are cut up into wards, the wards have their representatives, and the selfish feeling, if you like to call it so, of the wards themselves helps to pull things straight. It is something like a mechanical problem where you have different forces acting in different directions, and the result of these different forces is equilibrium. Mr. Rogers has recommended the aggregation of villages into groups. That is done to a certain extent in Bengal; and, indeed, some of the larger municipalities enclose rather wide areas in order to obtain the advantages which he desires. On the other hand, it is sometimes found necessary to subdivide and decentralize; for instance, it has lately been found desirable to decentralize in Calcutta itself, and now experiments are being tried, the town being divided into districts for the purposes of engineering and conservancy works. From the papers I gather that the experiments are so far successful, as I think one would expect them to be. There is less fear that particularly influential or powerfully represented tracts should have too great an advantage. I do not know whether I should be prepared in the country municipalities, at any rate, to advise that fees should be given for municipal work, because, if my theory of representation is correct, the representatives would be receiving fees for looking after their own interests, and that seems scarcely necessary. I do agree with Mr. Rogers in hoping that in course of time the powers of the local municipal officers may be increased, and that petty civil and criminal disputes may be settled by them. I entirely concur with him in wishing that there may be no undue hurry. It is never so difficult to move forward as it is to move backwards, and a retrograde step is always a pity. If progress is pushed too far and prematurely, people are naturally anxious not to undo what has been done, and the usual consequence is that the reconsideration is difficult and is unwelcome to some class or other, and thus there is less efficiency in the end. We should go from step to step, making the achievements of the past the foundation for future progress. (Applause.)

Mr. Sturrock was in general agreement with what had been said by Mr. Rogers, and the few points on which he was inclined to differ had been fully anticipated by the Chairman in his remarks. The old village institutions were certainly of use in their day, but the time of their usefulness had passed, and they must go the way of all institutions which had served their time, and served it well. He was hardly inclined to take so

BRITISH LIBRARY

desponding a view as Mr. Rogers had taken as to how far things were working satisfactorily. The municipalities of Madras with which he was acquainted were doing very much better work than had been anticipated by many; and in the reports which had been quoted he did not think there was much room for condemnation. In Madras, out of sixty municipalities, only two were considered unsatisfactory, and although in nine more it was said the administration was not efficient, still, that was only eleven as against sixteen which were absolutely good. Of the remaining thirty-three more than half were considered fairly satisfactory. With reference to the point as to efficiency being tested by the attendance of councillors, he was sorry there was nothing to show how far in this country the attendance of councillors was good or bad. Possibly those meetings which were adjourned for want of a quorum were on subjects of no very great importance, and the number, after all, was only 10 per cent. With reference to the suggestion that marks of honour should be given to those who did good municipal work, to his knowledge that was done now in the Madras Presidency. Regarding the suggestion that larger municipal centres should be created in rural tracts, there were in Madras, besides the municipalities in the towns, a number of villages created into unions, with certain portions of the work of the district boards, chiefly sanitary, entrusted to them; so that in fact Mr. Rogers' suggestion had been anticipated.

Sir W. Wedderburn said that he approved of the lecturer's recommendation that the powers of local bodies should be extended, but he observed that this recommendation was subject to a condition precedent, the condition being that there should be a previous creation of local public spirit. It appeared to him that this was rather putting the cart before the horse, because the best way of creating local public spirit was to give the local bodies some real power in the management of their affairs. Where there was some real power there came the feeling of responsibility, and that was followed by active work. There was a complaint that the attendance at meetings was not sufficiently regular, but in no country would people give up their time unless they felt that they could do some good by their attendance. The remedy therefore seemed to be to give the local bodies a larger administrative and financial control. That would provide them with scope for their energies, and develop the public spirit which was desired. Reference had been made to the remarks of Sir Mackworth Young regarding the objects of Lord Ripon's local self-government scheme. That scheme was primarily intended to benefit the country and to have an educational effect; but no doubt an additional object was to relieve the overburdened official machinery. This was a very important object, and had far-reaching effects. For they all knew that the English officials in India were overworked, and had to entrust the details of administration to subordinates. Owing to financial pressure, the pay of large classes of these subordinates was very inadequate, so that it was difficult to secure men of good character. The consequence of this was that the lowest grades of police and other departments had great opportunities of oppression. The object of the local self-government scheme was to transfer these details of

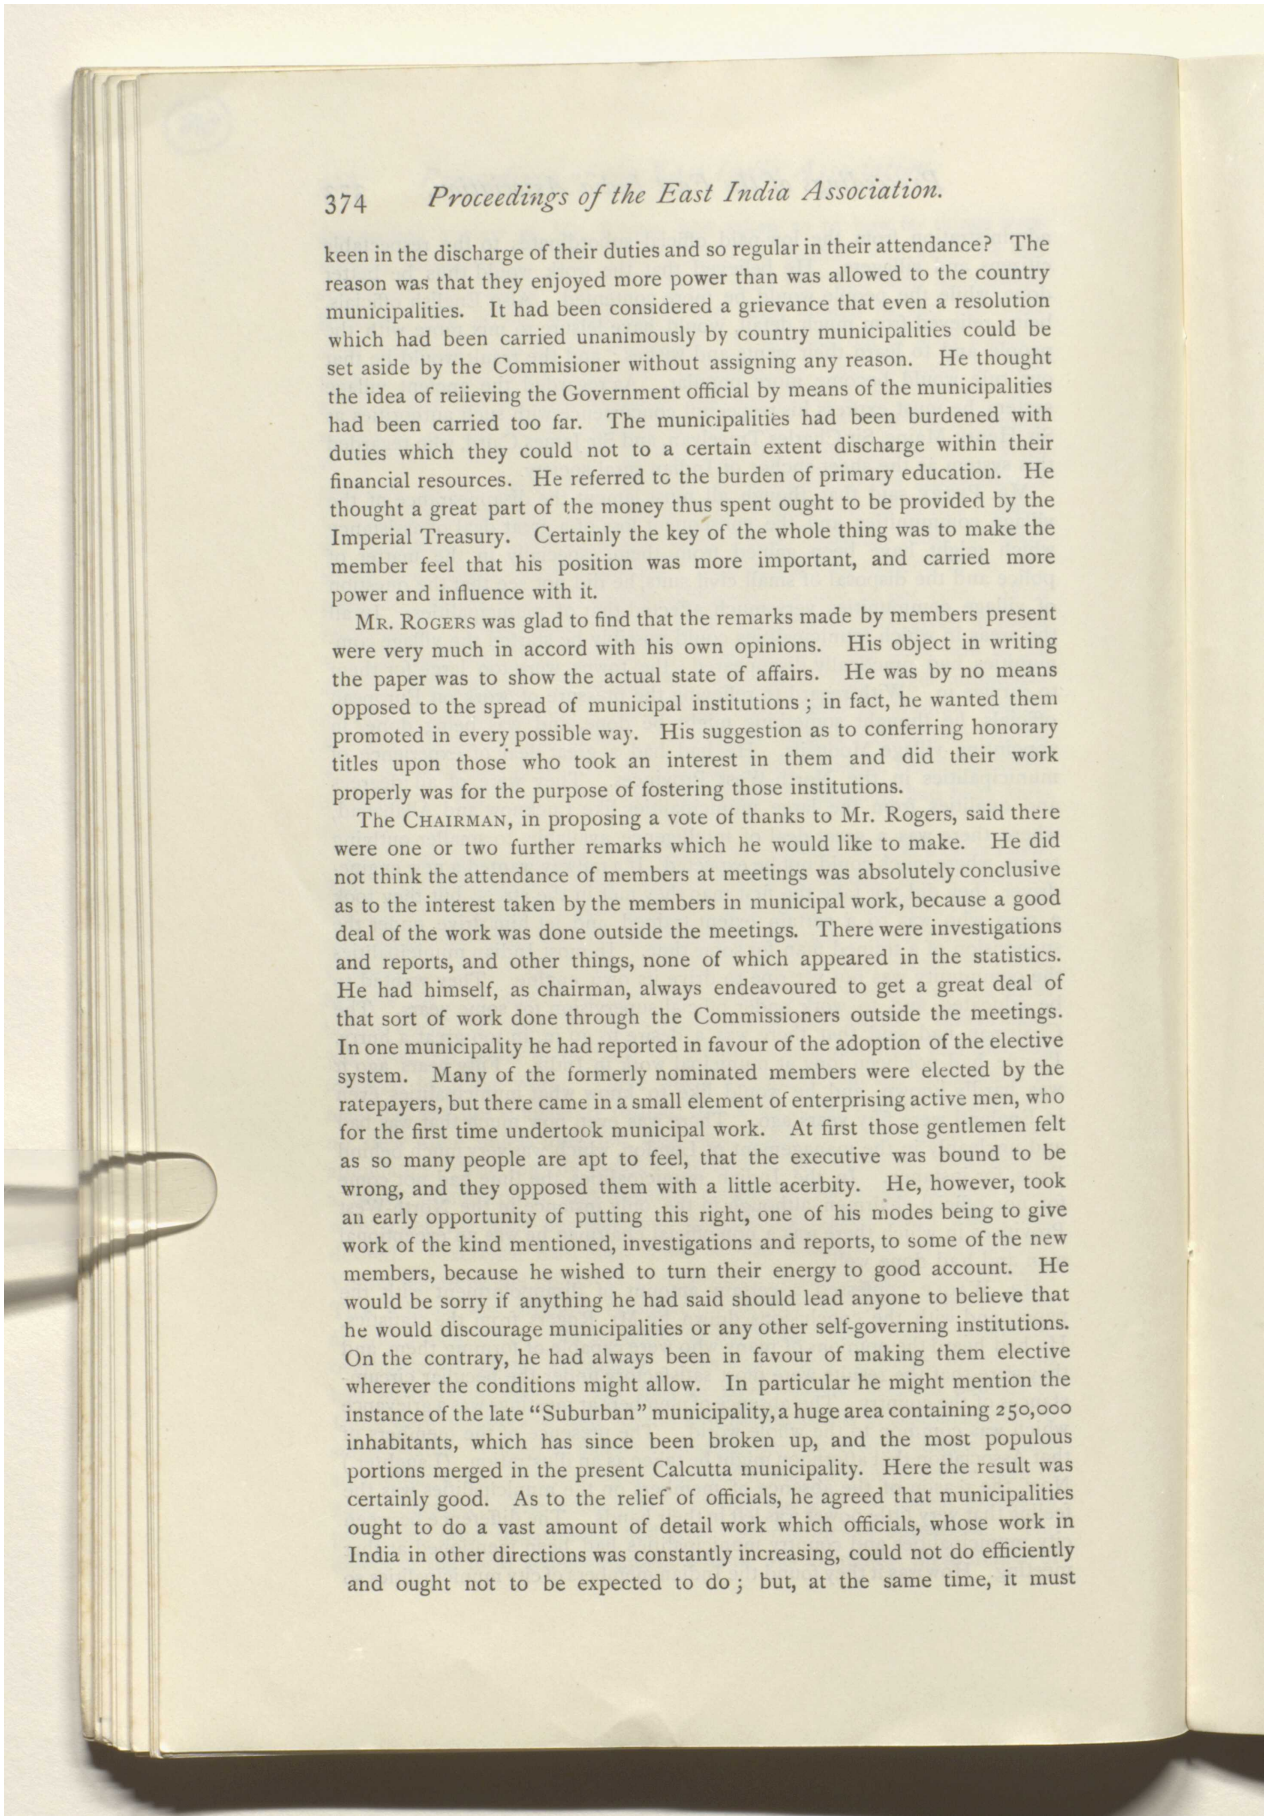
BRITISH LIBRARY

administration from the low-paid official subordinates to the respectable citizens and villagers. He believed that the work would thus be better done, while the people would be more contented. Also English officials, being relieved from much detail, would have leisure to mix more with the people and to learn their wants and wishes; and the result would be that our rule would become more popular. As regarded the ancient village system, he must express his respectful concurrence with such authorities as Sir Henry Maine, Sir Charles Trevelyan, and Sir James Caird, who regarded this system as the sheet-anchor of Indian rural society.



Mr. Petre said that, though all must lament the disappearance of the village communities, and the consequent loss of a great deal of assistance which might have been gained from them, especially in the matter of police and the disposal of small civil suits, he did not see that the question of village communities very much affected that of municipalities. In all the areas in which municipalities could possibly be started the village communities had practically disappeared; the towns were too large for them to survive in. With regard to relieving the pressure of work on European officials, he thought something might be done, and was being done, in appointing village Moonsifs. He had had a great deal of experience of municipalities in the North-West Provinces. They were of all degrees and qualities, from the large municipalities like Lucknow and Allahabad, where there was a great deal of intelligence available, to smaller outlying towns, where much could not be expected. If a railway wanted a new engine-driver, they did not take the first man they met in the street, but they took a man who was to a certain extent trained, and let him drive under the supervision of a trained man for some time. In most Indian municipalities the community was not yet ripe to drive its own engine. They wanted to be educated, and to work under official supervision for some years. The Chairman had said that there was a desire to go in, in too great a hurry. People had not been long at municipal work in India. Fifty years ago it was hardly known, and he would like to know what municipalities even in England were fifty years ago. There was even now much that was bad and uncleanly in the management of London, which was very much behind Paris, for instance. In the Indian municipalities the time had not come for non-official chairmen, although in the only instance in the North-West Provinces in which there was a non-official chairman he was an exceptional man and had done well.

Mr. Wagle confessed a certain amount of disappointment with the paper, and with the conclusions drawn by Mr. Rogers from the statistics. He had heard the opinions of many who were capable of forming them, and they were that the results were most satisfactory under the peculiar circumstances of the country. The absence of members at meetings was a grievance which was common to the whole world. The presence of the members of that Association that afternoon might be taken as an illustration. (Laughter.) Now, the reason of the absence of members on the municipalities was the feeling that very little power was left in their hands. The difference between city municipalities and country municipalities had been mentioned at that meeting. How was it they found the Indian members of city municipalities so

BRITISH LIBRARY

keen in the discharge of their duties and so regular in their attendance? The reason was that they enjoyed more power than was allowed to the country municipalities. It had been considered a grievance that even a resolution which had been carried unanimously by country municipalities could be set aside by the Commisioner without assigning any reason. He thought the idea of relieving the Government official by means of the municipalities had been carried too far. The municipalities had been burdened with duties which they could not to a certain extent discharge within their financial resources. He referred to the burden of primary education. He thought a great part of the money thus spent ought to be provided by the Imperial Treasury. Certainly the key of the whole thing was to make the member feel that his position was more important, and carried more power and influence with it.

Mr. Rogers was glad to find that the remarks made by members present were very much in accord with his own opinions. His object in writing the paper was to show the actual state of affairs. He was by no means opposed to the spread of municipal institutions; in fact, he wanted them promoted in every possible way. His suggestion as to conferring honorary titles upon those who took an interest in them and did their work properly was for the purpose of fostering those institutions.

The Chairman, in proposing a vote of thanks to Mr. Rogers, said there were one or two further remarks which he would like to make. He did not think the attendance of members at meetings was absolutely conclusive as to the interest taken by the members in municipal work, because a good deal of the work was done outside the meetings. There were investigations and reports, and other things, none of which appeared in the statistics. He had himself, as chairman, always endeavoured to get a great deal of that sort of work done through the Commissioners outside the meetings. In one municipality he had reported in favour of the adoption of the elective system. Many of the formerly nominated members were elected by the ratepayers, but there came in a small element of enterprising active men, who for the first time undertook municipal work. At first those gentlemen felt as so many people are apt to feel, that the executive was bound to be wrong, and they opposed them with a little acerbity. He, however, took an early opportunity of putting this right, one of his modes being to give work of the kind mentioned, investigations and reports, to some of the new members, because he wished to turn their energy to good account. He would be sorry if anything he had said should lead anyone to believe that he would discourage municipalities or any other self-governing institutions. On the contrary, he had always been in favour of making them elective wherever the conditions might allow. In particular he might mention the instance of the late "Suburban" municipality, a huge area containing 250,000 inhabitants, which has since been broken up, and the most populous portions merged in the present Calcutta municipality. Here the result was certainly good. As to the relief of officials, he agreed that municipalities ought to do a vast amount of detail work which officials, whose work in India in other directions was constantly increasing, could not do efficiently and ought not to be expected to do; but, at the same time, it must

BRITISH LIBRARY

be remembered that even the municipalities themselves sometimes give the officials a great deal of work. Where things are not going smoothly, and charges and countercharges are freely bought by excited partisans, the official is expected to go down and do justice between the parties. It is very much less troublesome for an official chairman by a phrase or two to stop a dispute orally than to inquire into and adjudicate on it when it has occurred. This is certainly a case in which it is easier to prevent than to cure. Under any circumstances, a considerable load of responsibility and labour rests on those who have to watch, and sometimes to control, municipalities.

The vote of thanks to Mr. Rogers was then put to the meeting, and carried by acclamation.

A vote of thanks to the Chairman for presiding was put by Mr. Pennington, and carried, and the proceedings then terminated.

At another meeting held at Westminster Palace Hotel, on Monday, February 10, 1902, a paper was read by J. B. Pennington, Esq., B.L. (Madras Civil Service, retired), on "The Indian Civil Service, and the Further Admission of Natives of India," the Hon. Percy Wyndham in the chair. The following, among others, were present: Sir William Wedderburn, Bart., Sir Lepel Griffin, K.C.S.I., the Hon. Mrs. Mure, Mr. J. D. Rees, C.I.E., Mr. J. Sturrock, C.I.E., Mr. F. Loraine Petre, Colonel Hutchins, Mr. A. K. Connell, M.A., Mr. W. Coldstream, Surgeon Lieut.-Colonel Ince, M.D., Mr. J. F. and Mrs. Pennington, Mrs. Arathoon, Mr. Nilkant B. Wagle, Mr. Drury Pennington, Mr. V. M. Samarth, Mr. H. R. Cook, Mr. Allbless, Mr. and Mrs. J. A. R. Clark, Mr. Nanabhai D. Daru, Mr. E. le B. Martin, Mr. R. D. Perestman, Mr. J. O. Millar, Mr. P. C. Lobo, Mr. J. F. Brown, Mr. J. E. Champney, Mr. Jayer Rao, Mr. W. Martin Wood, and Mr. C. W. Arathoon, Hon. Sec.

The CHAIRMAN having briefly introduced Mr. Pennington, the paper was read.*

SIR LEPEL GRIFFIN, after the paper was read, said it seemed to him less alarming than he had imagined it might be, and he did not find very much to which he could take objection. It seemed to resolve itself into a mere question of political economy, of expediency, and the question of fact—namely, what is the number of English Civil Servants necessary to rightly and securely carry on the Administration of India? He had lately read several books which endeavoured to make out that British government was a failure, that India was being exploited for the sole benefit of England, and that their whole administration was a calamitous mistake. Any Indian gentleman would know that those books were founded on exaggeration—grotesque exaggeration; and he thought that everyone who had lived in India must admit that the intentions of the Government towards our Indian fellow-subjects were both liberal and beneficent. (Hear, hear.) He did not disagree with Mr. Pennington when he said that they should open in every legitimate way the doors of the Services to all their deserving fellow-subjects in India. He himself desired that, as heartily as any Indian

BRITISH LIBRARY

gentleman in the room could do. The question of competency for executive, far more than for judicial appointments, must be determined by the Government of India itself, and by the heads of local governments. They could not force upon Governors and Lieutenant-Governors feeble, incompetent men for the executive charge of districts, whose conduct on the Punjab frontier or elsewhere, would be open to a description such as that given by Mr. Rudyard Kipling in one of his famous stories. The local governments must decide this question of competency, but subject to that, he thought every civilian present would most heartily welcome the generous sentiments of the lecturer, and would desire that, so far as was consistent with safety, all appointments should be open to Indian gentlemen.

Sir William Wedderburn said that doubtless a certain amount of European civil agency in India was necessary, in order to preserve the British connection. But some good system of recruitment and distribution should be adopted, so that the agency should be of the best quality, that there should not be more of it than absolutely necessary, and that the Government of India should be able to employ it in those provinces and departments where it would be most useful. Also it was desirable to prevent the unseemly struggle, which so often took place, when a vacancy occurred for which both Europeans and Indians were candidates. He thought that the scheme sketched out in the Minority Report of the Royal Commission on Indian Expenditure would have this effect. The proposed method was suggested by the existing arrangement for the Royal Engineers, when serving in the Public Works Department in India. A young man obtaining his commission in the Royal Engineers occupied a position in a close seniority service. If he went out to India as a Lieutenant or a Captain, and was appointed an Executive Engineer, he drew the pay of his rank, as a personal allowance, plus the pay of an Executive Engineer. An outsider appointed to a similar post drew only the pay of the appointment and no personal allowance. Similarly the prize in the open competition for the Covenanted Civil Service should be simply entry into a close seniority service, enjoying personal pay according to the number of years of service. This would represent compensation for exile, and the retaining fee which bound him to be at the orders of the Government. When he was appointed to any post he would draw the pay of that post plus the pay of his rank. The result of this arrangement would be that the pay of all appointments in India could be reduced to the ordinary market value, and all civil appointments would be held by Indians except those held by the limited number of Covenanted European civilians who came out every year. It would be the duty of the Government each year carefully to consider the smallest number for their requirements, so that no more of this expensive agency should be recruited than was absolutely necessary. Then as regards distribution, the lecturer had pointed out that in the quieter districts the highest judicial and educational appointments might be held by Indians, while Sir Lepel Griffin had urged that in turbulent frontier districts Europeans were necessary for executive posts. This could be met by having a maximum budget allotment for European officers, who might be employed in the provinces and departments as seemed best for

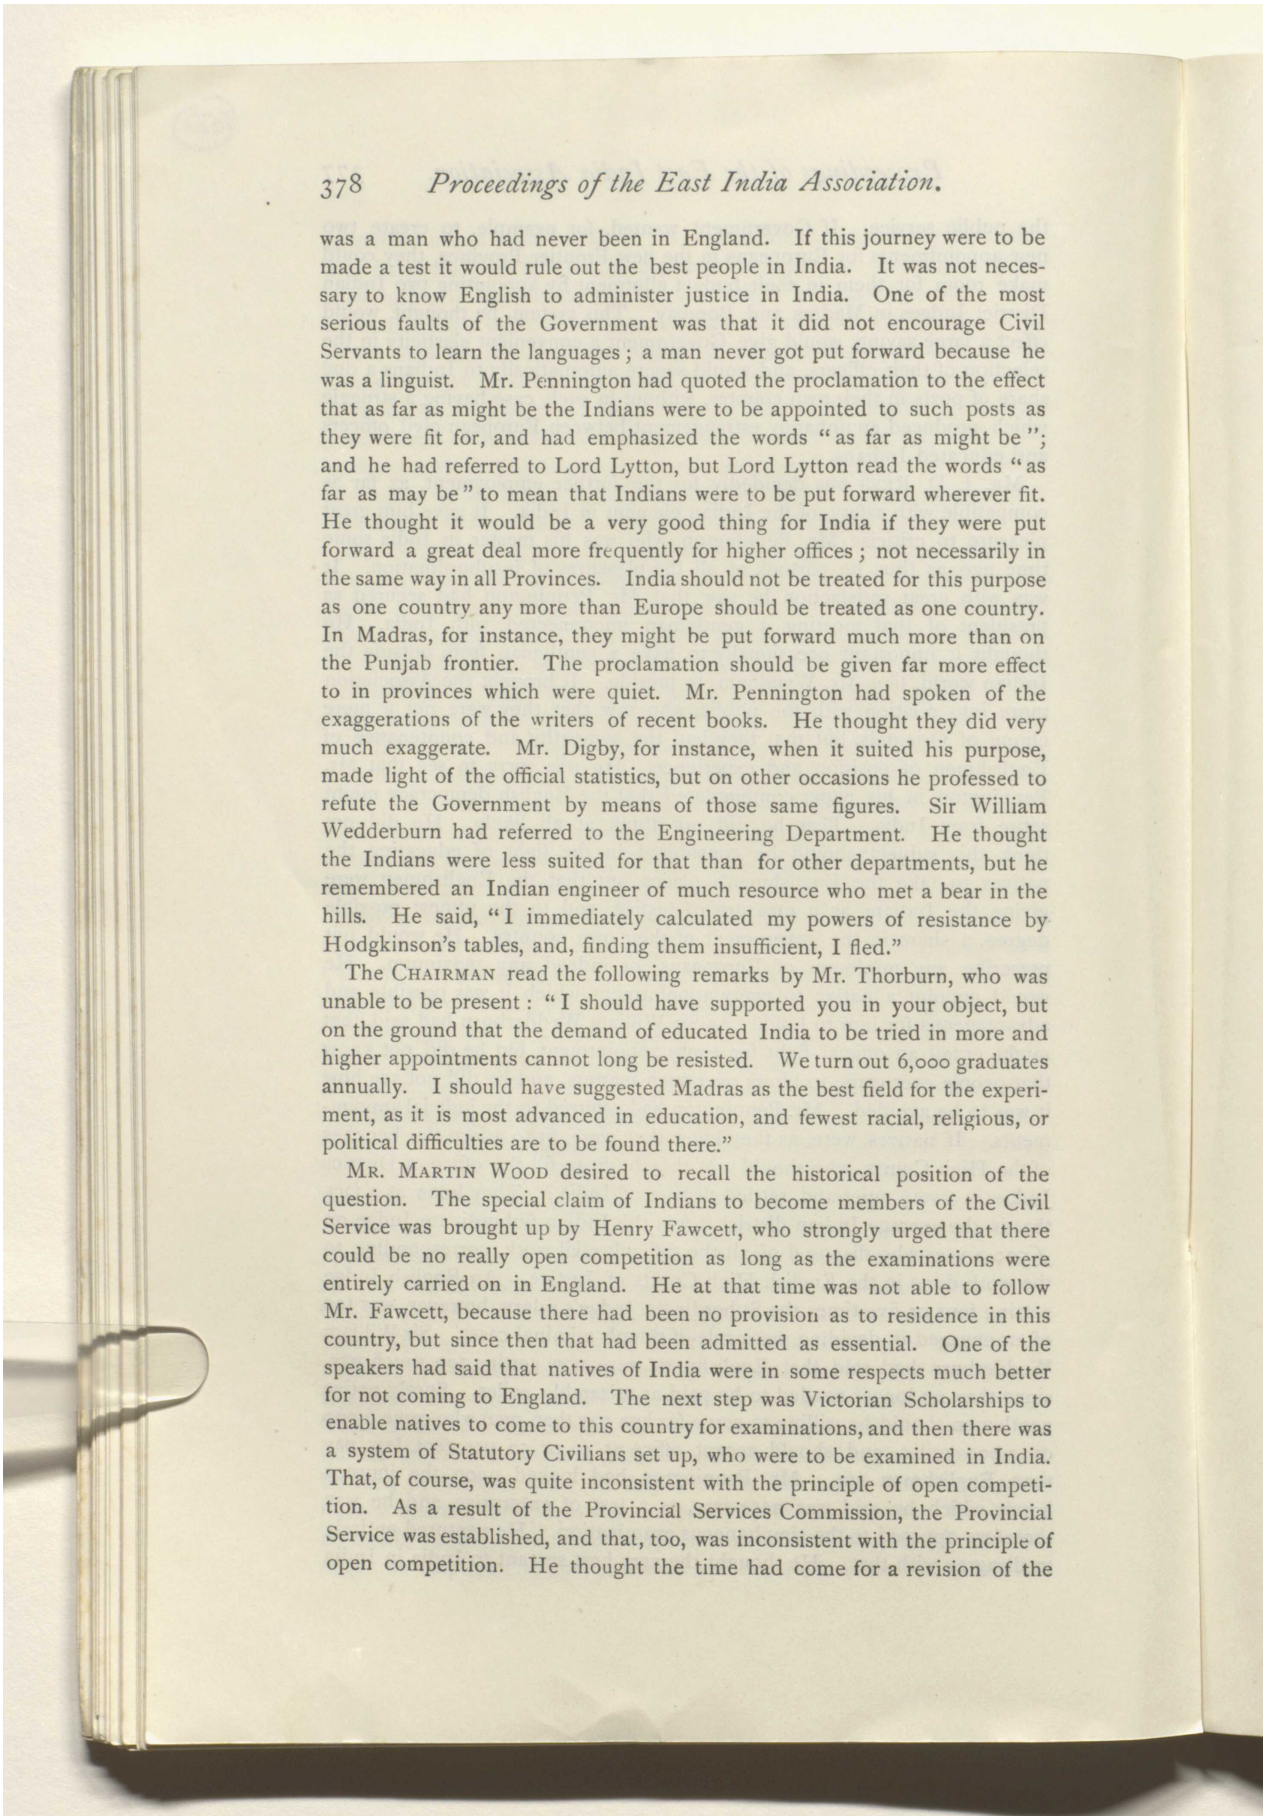
BRITISH LIBRARY



the public service. If Government wanted, for example, to create two new appointments for Europeans in the new Frontier Province, they could make room for them in their budget allotment by appointing two Indian District Judges in Madras and Bombay. This system, he thought, would effect a large saving, would give Government a convenient elasticity in the selection of their officers, and would secure automatically to Indians a due share of posts in their own country, without in each case having a struggle which produced an unhappy estrangement between European civil officers and educated Indians.

Mr. J. D. Rees was decidedly for the further employment, as far as compatible with safety, of the Indian element in India. It gave him great pleasure to criticise Mr. Pennington, who was his master in India some time ago, as thus he partook of all the pleasures of insubordination. It was with great satisfaction he saw that Mr. Pennington had secured as president of that meeting a gentleman unconnected with India. He thought it important occasionally to have a gentleman from outside the Indian world, like Mr. Wyndham, to preside. It brought the Association more into relation with the public, who saw that they were not a mere clique of Orientals, but that they had the sympathy and countenance of Englishmen of position and experience. He was sorry to see that Mr. Pennington in his paper contemplated that the English democracy might retire from India. That he did not think at all likely. He did not think this subject should be considered in the light of educating the natives to take the Englishmen's places, but that the Englishmen were giving the Indians as a measure of justice, and to the utmost possible degree, a share in the government of their own country. He would not prescribe any minimum of Europeans, or indeed any maximum. He would appoint a native to every appointment which it was possible and advantageous for him to hold. As Sir William Wedderburn had said, that might entail an official fight for every appointment, but he did not know that people ever came to blows over such matters, and he did not see how it was to be avoided. Mr. Pennington had referred to the judicial appointments. If natives were, as they knew they were, fit to adorn the benches of the High Courts, why should not they be fit to fill the office of District Judge in every quiet and settled district of India? They knew as a fact that in the average Indian district it was the Indian Subordinate Judge on £500 a year who disposed of all the difficult civil work, corresponding to the work done in the English High Courts of Justice. An English Judge getting four or five times the Subordinate Judge's salary, however, was too often engaged in deciding mere rule-of-thumb criminal cases. Sir William Wedderburn had said that Englishmen were now getting too much pay, since they no longer needed to be paid as miserable exiles. Surely native gentlemen should be willing to serve for less pay than men who came 6,000 or 7,000 miles, and should accept office at 40 or 50 per cent. less pay than Englishmen got. Mr. Pennington had looked upon the journey home, which he said was necessary, as a test of enterprise, and he was therefore opposed to the simultaneous examination. He ventured entirely to disagree with that. He thought the very best servant to India in India

BRITISH LIBRARY

was a man who had never been in England. If this journey were to be made a test it would rule out the best people in India. It was not necessary to know English to administer justice in India. One of the most serious faults of the Government was that it did not encourage Civil Servants to learn the languages; a man never got put forward because he was a linguist. Mr. Pennington had quoted the proclamation to the effect that as far as might be the Indians were to be appointed to such posts as they were fit for, and had emphasized the words "as far as might be"; and he had referred to Lord Lytton, but Lord Lytton read the words "as far as may be" to mean that Indians were to be put forward wherever fit. He thought it would be a very good thing for India if they were put forward a great deal more frequently for higher offices; not necessarily in the same way in all Provinces. India should not be treated for this purpose as one country any more than Europe should be treated as one country. In Madras, for instance, they might be put forward much more than on the Punjab frontier. The proclamation should be given far more effect to in provinces which were quiet. Mr. Pennington had spoken of the exaggerations of the writers of recent books. He thought they did very much exaggerate. Mr. Digby, for instance, when it suited his purpose, made light of the official statistics, but on other occasions he professed to refute the Government by means of those same figures. Sir William Wedderburn had referred to the Engineering Department. He thought the Indians were less suited for that than for other departments, but he remembered an Indian engineer of much resource who met a bear in the hills. He said, "I immediately calculated my powers of resistance by Hodgkinson's tables, and, finding them insufficient, I fled."

The CHAIRMAN read the following remarks by Mr. Thorburn, who was unable to be present: "I should have supported you in your object, but on the ground that the demand of educated India to be tried in more and higher appointments cannot long be resisted. We turn out 6,000 graduates annually. I should have suggested Madras as the best field for the experiment, as it is most advanced in education, and fewest racial, religious, or political difficulties are to be found there."

MR. MARTIN WOOD desired to recall the historical position of the question. The special claim of Indians to become members of the Civil Service was brought up by Henry Fawcett, who strongly urged that there could be no really open competition as long as the examinations were entirely carried on in England. He at that time was not able to follow Mr. Fawcett, because there had been no provision as to residence in this country, but since then that had been admitted as essential. One of the speakers had said that natives of India were in some respects much better for not coming to England. The next step was Victorian Scholarships to enable natives to come to this country for examinations, and then there was a system of Statutory Civilians set up, who were to be examined in India. That, of course, was quite inconsistent with the principle of open competition. As a result of the Provincial Services Commission, the Provincial Service was established, and that, too, was inconsistent with the principle of open competition. He thought the time had come for a revision of the

BRITISH LIBRARY

question. Much had been done to define the matter in point of principle. He had heard much with regard to the proportion of Europeans and natives of India, but he distrusted all prescribed proportional arrangements of that kind. There were, of course, different methods of proving fitness for important posts. Mr. Rees had said he would sweep away all distinctions, and that any Indian in the Service should be open to be appointed to the very highest post, but he did not think there was much danger of that being adopted. A most unwarrantable use had been made of the phrase "as far as may be" in the Proclamation.

Mr. Petre thought too little mention had been made of the Provincial Services, which were practically entirely officered by natives of India. Speaking, at any rate, for the North-West Provinces, he thought the number of high appointments at present reserved for Indians in the Executive was as high as it could with safety be. With regard to the judicial line, he thought the number of posts open to natives might perhaps be increased. It was sometimes forgotten how invidious often was the position of a native in charge of a large district in the Upper Provinces. He assumed that every native in the Civil Service, or in the Provincial Service, was either a Hindu or a Mohammedan. There were Parsees, but in his view a Parsee was nearly as much an alien to the native of India as the European. (Hear, hear, and No, no.) He instanced the case of a Hindu Collector under him, one of whose Mohammedan subordinates insulted the priests of a Hindu Temple by shooting a monkey, and when they complained, beat one of them with a shoe. The end of it was that upon the man's conviction the Collector merely fined him a month's pay. On appeal to him, Mr. Petre, as Commissioner, set the matter right by dismissing the delinquent. The Collector, of whom Mr. Petre held the highest opinion, was led into error by a desire to avoid any appearance of prejudice in favour of his own co-religionist. In one of the more turbulent districts such an occurrence would have raised a blaze of fanaticism which would have made a Hindu or a Mohammedan Collector's position intolerable. Most natives of India would be only too glad to avoid a position of that sort. On the question of economy, the European, he took it, was paid for living the better half of his life in a foreign country and an uncongenial climate. The native who had passed by open competition was paid at precisely the same rate, and was thereby compensated for his voyage to Europe. It was different in the Provincial Service, where the native in charge of a district, having the same authority and the same position as his confrère in the Covenanted Service, received only two-thirds of the pay. If there were to be any such system as that suggested, of the Government bearing the expense of candidates selected to compete for the Civil Service, the corollary would be to differentiate between the pay of such candidates and the pay of the European officers, as was done in the Provincial Services.

Mr. Connell said Mr. Pennington had alluded to a paper which he had the honour to read before the Association thirteen or fourteen years ago. He then had the benefit of a discussion which had been going on for some years in the Indian press on the subject, and of having before him a large amount of the evidence which had been taken in India by the Commission

BRITISH LIBRARY

on the Employment of Natives in the Civil Service. It was, he thought, most important to know the results of the labours of that Commission. At that time, roughly speaking, the Civil Service of India was divided into five branches: First, the Covenanted Service, with about 900 members, nearly all Europeans, holding the highest posts; then there came the military officers in civil employ, amounting to about 1,600; then the small and recently established Statutory Service of the natives of India, in which there were only 30; then came the great army of uncovenanted civilians, with salaries of £100 a year and upwards, holding the lower judicial and administrative offices, amounting to 14,500, about half being natives of India. Below them came an army of clerks, village officials, police, and so on. He had made some suggestions that the Indian Civil Service should be divided into the upper, or Imperial Service, chiefly European; the Provincial Service, almost entirely confined to natives; and below that, the great army of Civil Servants, doing a variety of humble work. He believed the Commission reported on somewhat similar lines. He did not know whether Mr. Pennington could tell them the result of the changes which had been since made. The age had been raised for the open competition in England, and he believed with very good results. He understood that a better and maturer class of men had gone out from England to India. As to the effect on the number of Indian candidates, he supposed the result was much as before. He did not think any alteration ought to be made as regards the Indian Imperial Service, except in one respect. He thought it should still be open to competition in England. The coming of the candidate from India to England was in itself a very good test of enterprise and energy. No doubt it limited the competition to men fairly well to do, but this was an advantage, as it probably produced men with larger views of life. One change might be made, that it should as much as possible limit the Imperial Service, which had still to be recruited by open competition, and gradually from the Provincial Service introduce men of proved ability. He agreed with Sir Lepel Griffin that the local governments in India must be responsible for securing adequate tests of competency and executive capacity of men promoted from the provincial administration. Although the competitive test worked fairly well in England under certain conditions, he did not think it would be a good test to apply for the purpose of securing the best administrative ability in India. Therefore, he said that if they wanted to recruit the highest administrative posts and the highest executive posts with Indian gentlemen it must be, not by competitive examination, whether in England or in India, but from men tried in administrative posts under the eye and supervision of British officers. It was that which had been the basis of success in Egypt.

Mr. Allbless thought the tone of Mr. Pennington so reasonable, and his suggestions so sensible, that very few speakers could take any exception to them. He wished to say a few words on the subject of simultaneous examination. As a Parsee he had received the highest possible education at the University of Bombay. He found that that education was not sufficient; it was solid and sound, but not broad enough, and it was only

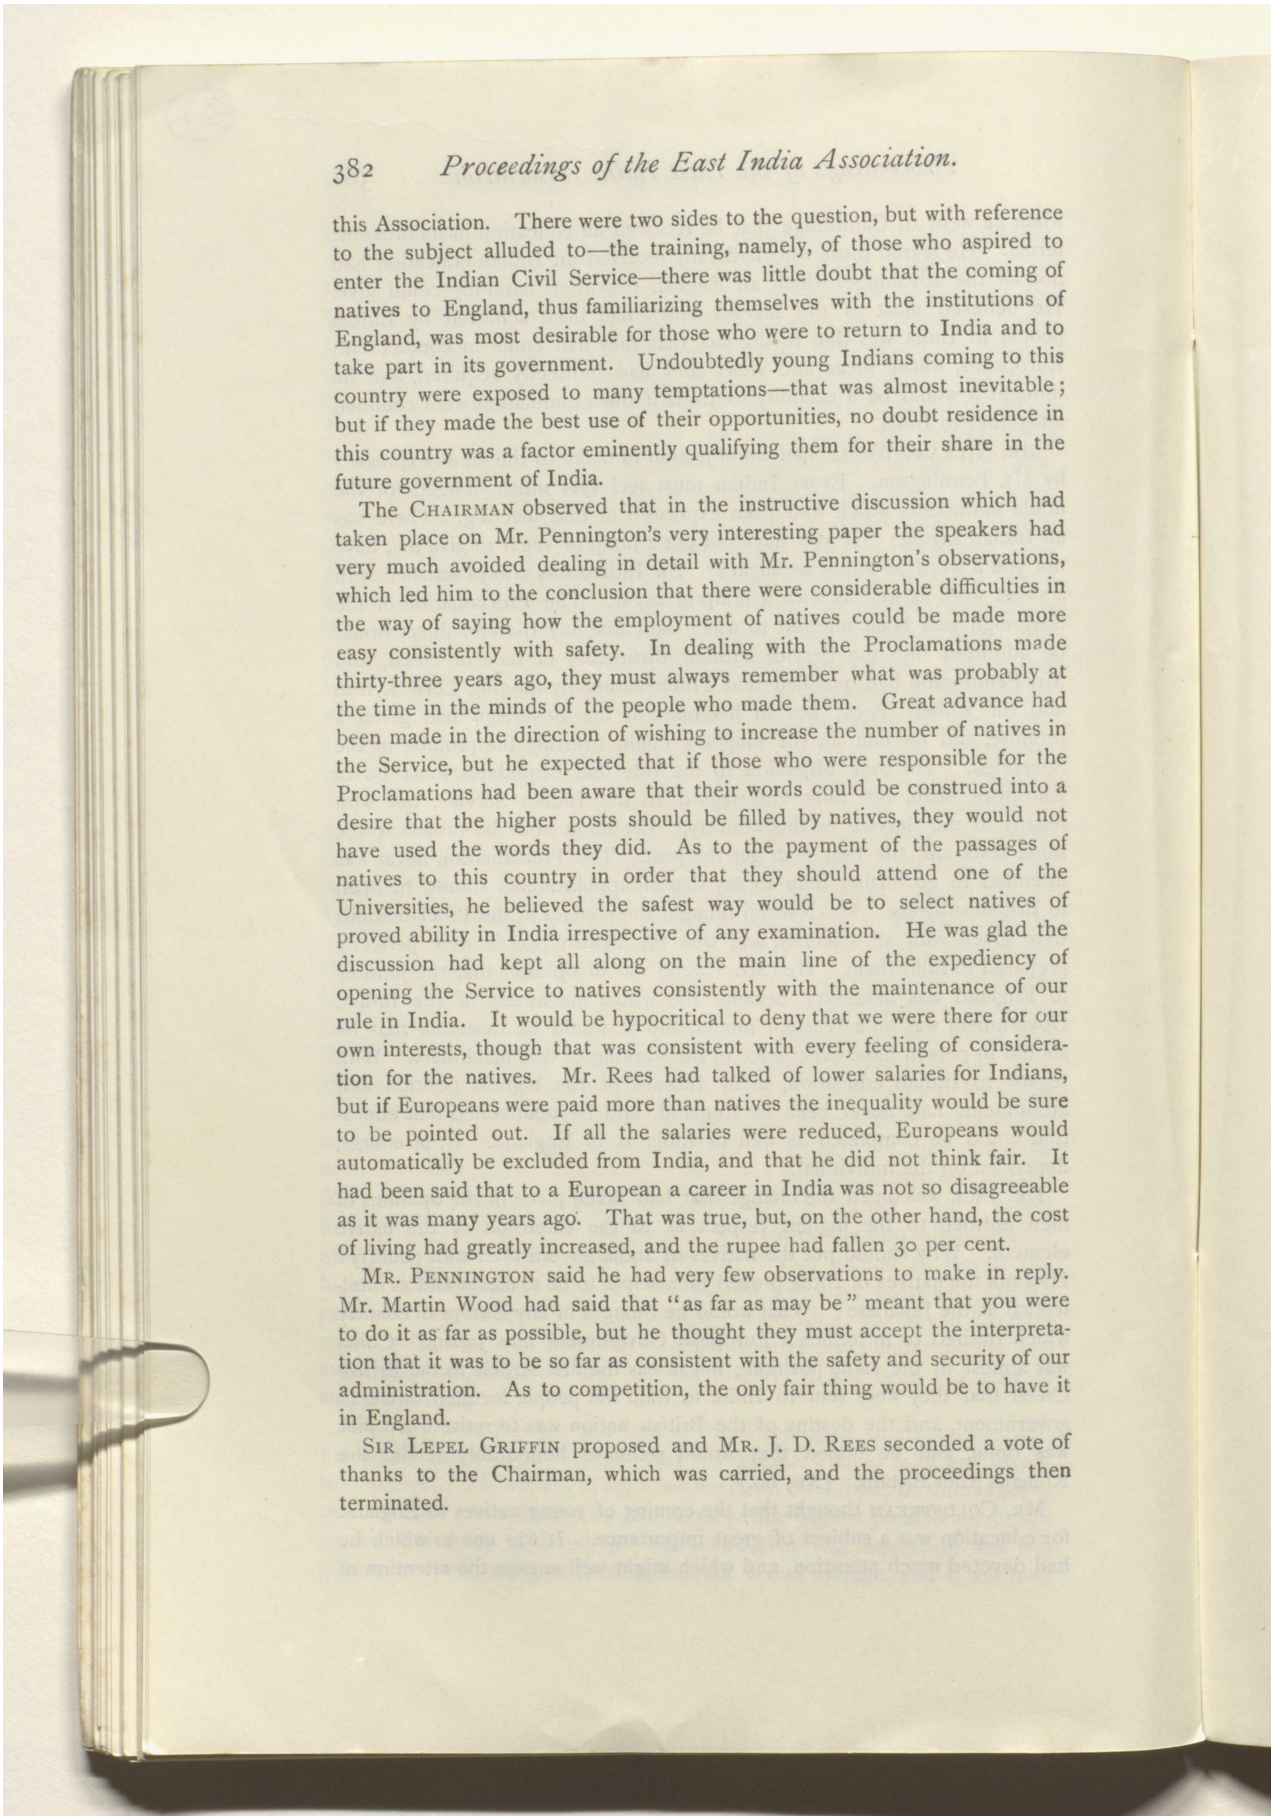
BRITISH LIBRARY

when he went to Cambridge that he received an education in its broadest terms. He feared those who had only received an Indian education had not all the advantages which an English education naturally could give. He believed most of the success which had been achieved by Indian people in India was due to the fact that they had come in contact with Europeans, whose ideas and views they had indirectly acquired, and he thought it would be a calamity to India if the examination were confined altogether to India.

Mr. Nilkant Wagle had no objection to make to the views expressed by Mr. Pennington. Every Indian must feel very much obliged for the noble sentiments which had been expressed at that meeting. There was an Indian saying: "If you have not got a lump of sugar to give me, have not you a word as sweet as sugar?" An Indian was always satisfied with a sweet word as well as with a lump of sugar. The Proclamation of the Sovereign had been referred to which said that any Indian subject would be admitted into the Service without distinction of race or creed, and Mr. Pennington had qualified that Proclamation by quoting Lord Lytton and Sir Robert Peel; but in his opinion the Sovereign had given a promise, and no man in the kingdom could overrule the promise of the Sovereign. He took objection to the rule that candidates must be of European birth, not only with regard to the Indian Service, but with regard to the Service in this country. Let them both be subject to the same tests and the best man get the post. The Proclamation never was intended to go further than to say that all appointments should be open to British subjects. Mr. Naoroji thought the pledges in the Proclamations were given with all sincerity, and that the British people were perfectly prepared to fulfil them. He (Mr. Wagle) was of opinion that the journey to England was necessary, because the whole machinery of the Indian Government was on a Western model, and it would be desirable that he should in person have experience of the working of that machinery. With regard to Indian education, many Indians of the highest position and attainments had never been to England, and he maintained that education could be completed as well in India as in England. It, of course, depended on the individual.



Dr. Ince welcomed the change that had taken place in the opinions of men entitled to the highest respect as to the extension of the native element. Why should not the natives of India govern their own country? Had not the natives of India proved themselves to be as clever and as intellectual as the Japanese? What would be thought of any European country which desired to introduce a European Government into Japan? China was almost in the same position; but it was the first Article in the British Creed that they were sent to India to train the people for their own self-government, and the destiny of the British nation was to retire when that was done, and he hoped they would retire as honourably as did the Romans from Britain. (No, no.)

Mr. Coldstream thought that the coming of young natives to England for education was a subject of great importance. It was one to which he had devoted much attention, and which might well engage the attention of

BRITISH LIBRARY

this Association. There were two sides to the question, but with reference to the subject alluded to—the training, namely, of those who aspired to enter the Indian Civil Service—there was little doubt that the coming of natives to England, thus familiarizing themselves with the institutions of England, was most desirable for those who were to return to India and to take part in its government. Undoubtedly young Indians coming to this country were exposed to many temptations—that was almost inevitable; but if they made the best use of their opportunities, no doubt residence in this country was a factor eminently qualifying them for their share in the future government of India.

The CHAIRMAN observed that in the instructive discussion which had taken place on Mr. Pennington's very interesting paper the speakers had very much avoided dealing in detail with Mr. Pennington's observations, which led him to the conclusion that there were considerable difficulties in the way of saying how the employment of natives could be made more easy consistently with safety. In dealing with the Proclamations made thirty-three years ago, they must always remember what was probably at the time in the minds of the people who made them. Great advance had been made in the direction of wishing to increase the number of natives in the Service, but he expected that if those who were responsible for the Proclamations had been aware that their words could be construed into a desire that the higher posts should be filled by natives, they would not have used the words they did. As to the payment of the passages of natives to this country in order that they should attend one of the Universities, he believed the safest way would be to select natives of proved ability in India irrespective of any examination. He was glad the discussion had kept all along on the main line of the expediency of opening the Service to natives consistently with the maintenance of our rule in India. It would be hypocritical to deny that we were there for our own interests, though that was consistent with every feeling of consideration for the natives. Mr. Rees had talked of lower salaries for Indians, but if Europeans were paid more than natives the inequality would be sure to be pointed out. If all the salaries were reduced, Europeans would automatically be excluded from India, and that he did not think fair. It had been said that to a European a career in India was not so disagreeable as it was many years ago. That was true, but, on the other hand, the cost of living had greatly increased, and the rupee had fallen 30 per cent.

MR. PENNINGTON said he had very few observations to make in reply. Mr. Martin Wood had said that "as far as may be" meant that you were to do it as far as possible, but he thought they must accept the interpretation that it was to be so far as consistent with the safety and security of our administration. As to competition, the only fair thing would be to have it in England.

SIR LEPEL GRIFFIN proposed and MR. J. D. REES seconded a vote of thanks to the Chairman, which was carried, and the proceedings then terminated.

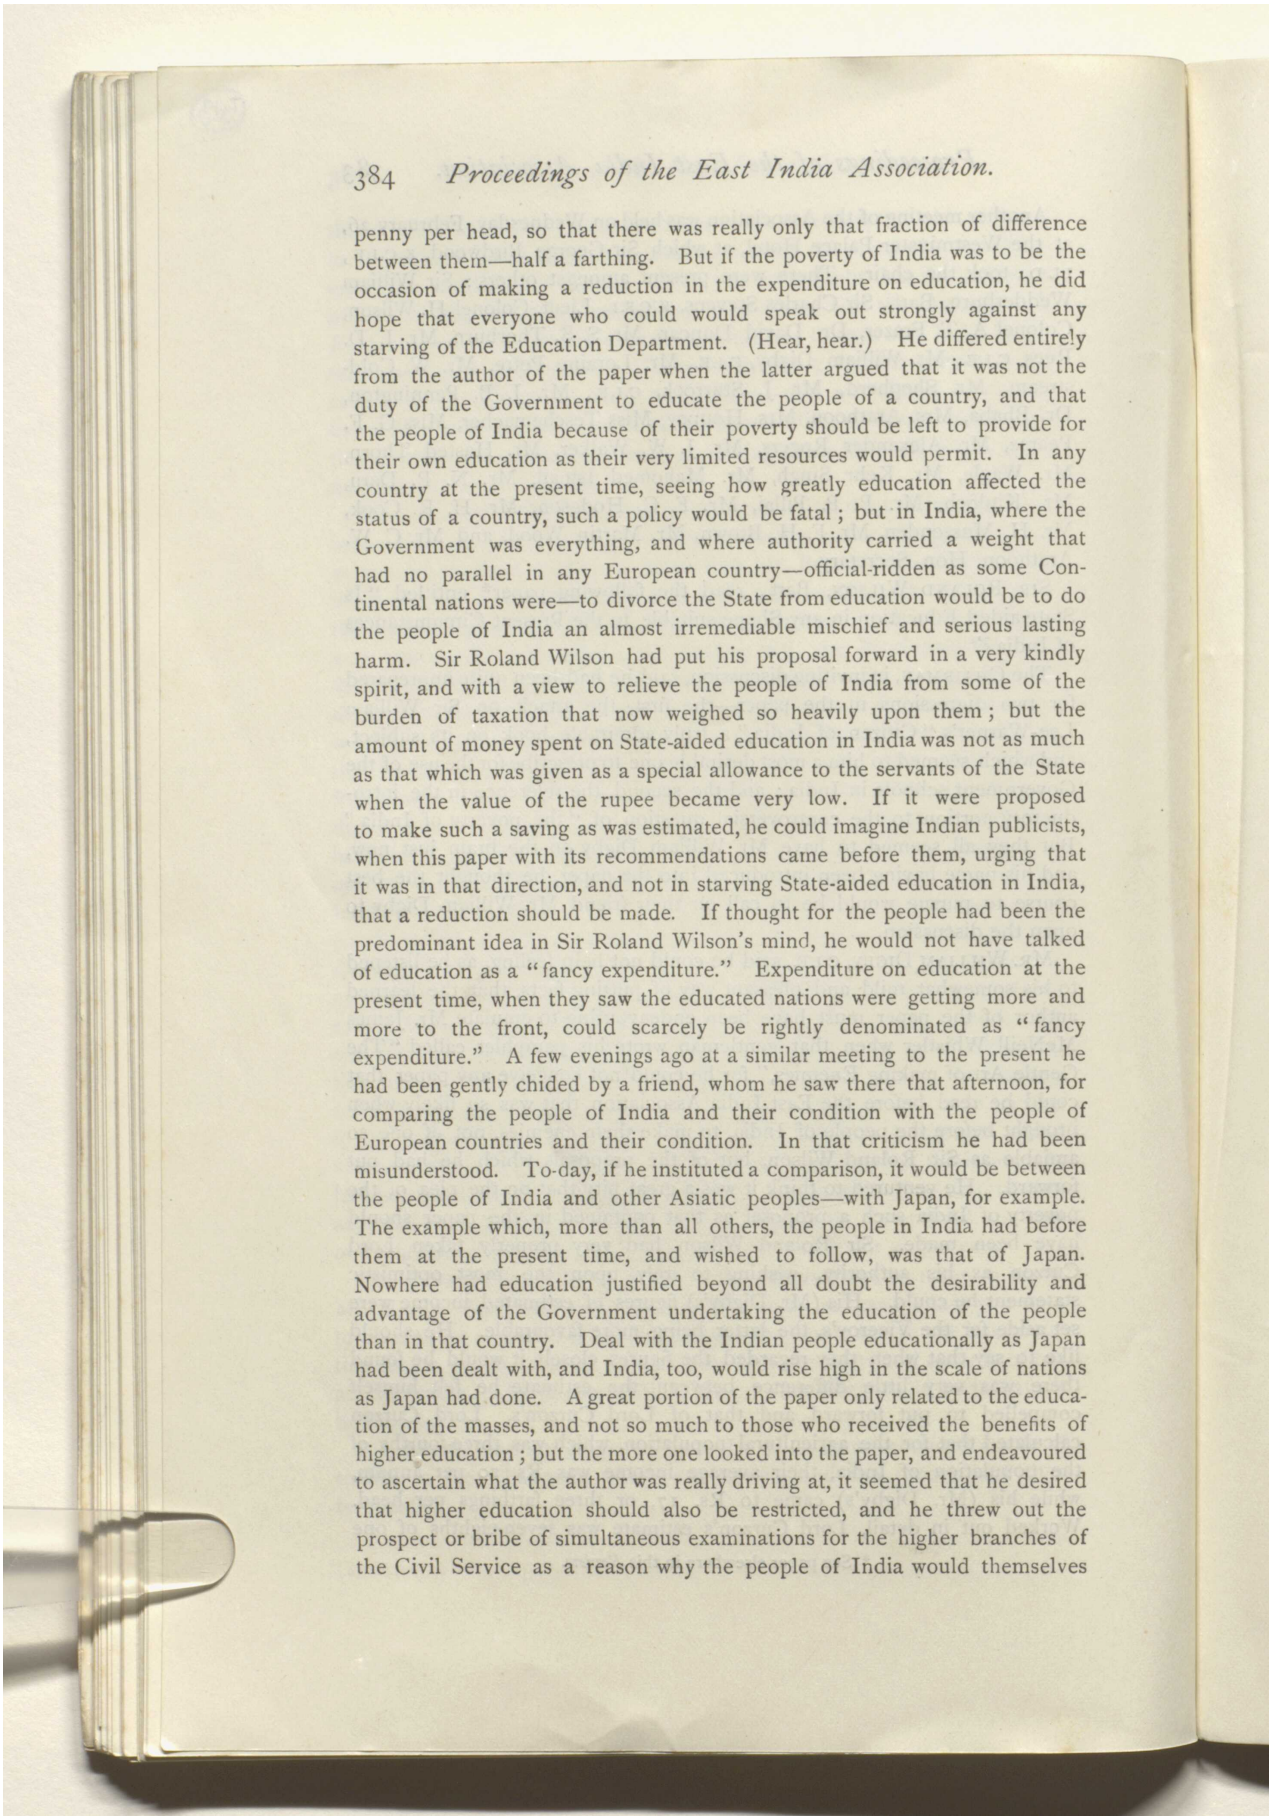
Another meeting of the Association was held on Wednesday, February 26, at the Westminster Palace Hotel, at which Sir George Birdwood, K.C.I.E., LL.D., took the chair. There were present amongst others: Sir William Wedderburn, Bart., Sir Charles Stevens, K.C.S.I., Lieut.-Colonel H. Wilson, Colonel A. T. Frazer, Dr. David Duncan, Mr. S. S. Thorburn, Mr. J. D. Rees, C.I.E., Mr. William Digby, C.I.E., Mr. Loraine Petre, Mr. W. Coldstream, Mr. Shepherd, Mr. J. Sturrock, C.I.E., Mr. J. B. Pennington, Dr. Bhaba, Mrs. Arathoon, Mrs. Hoppey, Miss Teschemacher, Miss G. F. Pearse, Mr. Alexander Rogers, Mr. J. W. Walker, Mr. Hasted Thorn, Mr. Wagle, Mr. Kehr Singh, Mr. Mahomed Ismail, Mr. N. P. Daru, Mr. Kinloch, Mr. P. P. Pillai, Mr. F. C. Hodgson, Mr. H. R. Cook, Mr. H. Mussenden, Mr. F. H. Brown, Mr. Martin Wood, and Mr. C. W. Arathoon, Hon. Secretary.

Sir Roland Wilson, Bart., read the following paper* entitled "Is State-aided Education in any Shape suitable to the Present Circumstances of India?"

The Chairman, in inviting discussion, said he had been quite unprepared for two digressions in the paper—the first, the attack on Sir William Lee-Warner's "Citizen of India," a truly admirable book on its subject, and which seemed to him a most desirable one to prescribe for the use of the Government schools in India; and the second, the reference in the introductory portion to the controversial question of "the poverty of India." But they all seemed to have Mr. William Digby on the brain just now, and his name having been introduced into the paper, he thought the best course to pursue would be to call on their friend Mr. William Digby to open the discussion.



Mr. William Digby, C.I.E., said he could not help feeling, as he listened to his somewhat mild and pleasant way of putting facts, that the learned author of the paper must have been endeavouring to emulate Mr. James McNeill Whistler when that gentleman wrote his pamphlet called "The Gentle Art of making Enemies," for he could not conceive any paper that could be read before the East India Association that was so likely when brought before the people of India, to make them enemies, not of one so amiable as Sir Roland Wilson, but of the proposals which he had put forward. He ventured to think it was a great pity that on the plea of the poverty of India such a proposal as that contained in the paper should have been made. Sir Roland Wilson had very properly taken Lord Curzon as his authority, wishing to rely upon the most optimistic statement he could. His (Mr. Digby's) figures of estimated income were set aside for the Viceroy's, the latter being more favourable. He should like to say that when they regarded the figures closely it would be found there was very little difference between the estimate he felt himself compelled to put forward and that of Lord Curzon's. Lord Curzon calculated that for the agricultural population, which was three-fourths of the population of India, their average income was Rs. 20 per annum, while his (Mr. Digby's) came to Rs. 17, or three farthings per head. Worked out in detail, Lord Curzon's estimate was seven-eighths of one

penny per head, so that there was really only that fraction of difference between them—half a farthing. But if the poverty of India was to be the occasion of making a reduction in the expenditure on education, he did hope that everyone who could would speak out strongly against any starving of the Education Department. (Hear, hear.) He differed entirely from the author of the paper when the latter argued that it was not the duty of the Government to educate the people of a country, and that the people of India because of their poverty should be left to provide for their own education as their very limited resources would permit. In any country at the present time, seeing how greatly education affected the status of a country, such a policy would be fatal; but in India, where the Government was everything, and where authority carried a weight that had no parallel in any European country—official-ridden as some Continental nations were—to divorce the State from education would be to do the people of India an almost irremediable mischief and serious lasting harm. Sir Roland Wilson had put his proposal forward in a very kindly spirit, and with a view to relieve the people of India from some of the burden of taxation that now weighed so heavily upon them; but the amount of money spent on State-aided education in India was not as much as that which was given as a special allowance to the servants of the State when the value of the rupee became very low. If it were proposed to make such a saving as was estimated, he could imagine Indian publicists, when this paper with its recommendations came before them, urging that it was in that direction, and not in starving State-aided education in India, that a reduction should be made. If thought for the people had been the predominant idea in Sir Roland Wilson's mind, he would not have talked of education as a "fancy expenditure." Expenditure on education at the present time, when they saw the educated nations were getting more and more to the front, could scarcely be rightly denominated as "fancy expenditure." A few evenings ago at a similar meeting to the present he had been gently chided by a friend, whom he saw there that afternoon, for comparing the people of India and their condition with the people of European countries and their condition. In that criticism he had been misunderstood. To-day, if he instituted a comparison, it would be between the people of India and other Asiatic peoples—with Japan, for example. The example which, more than all others, the people in India had before them at the present time, and wished to follow, was that of Japan. Nowhere had education justified beyond all doubt the desirability and advantage of the Government undertaking the education of the people than in that country. Deal with the Indian people educationally as Japan had been dealt with, and India, too, would rise high in the scale of nations as Japan had done. A great portion of the paper only related to the education of the masses, and not so much to those who received the benefits of higher education; but the more one looked into the paper, and endeavoured to ascertain what the author was really driving at, it seemed that he desired that higher education should also be restricted, and he threw out the prospect or bribe of simultaneous examinations for the higher branches of the Civil Service as a reason why the people of India would themselves

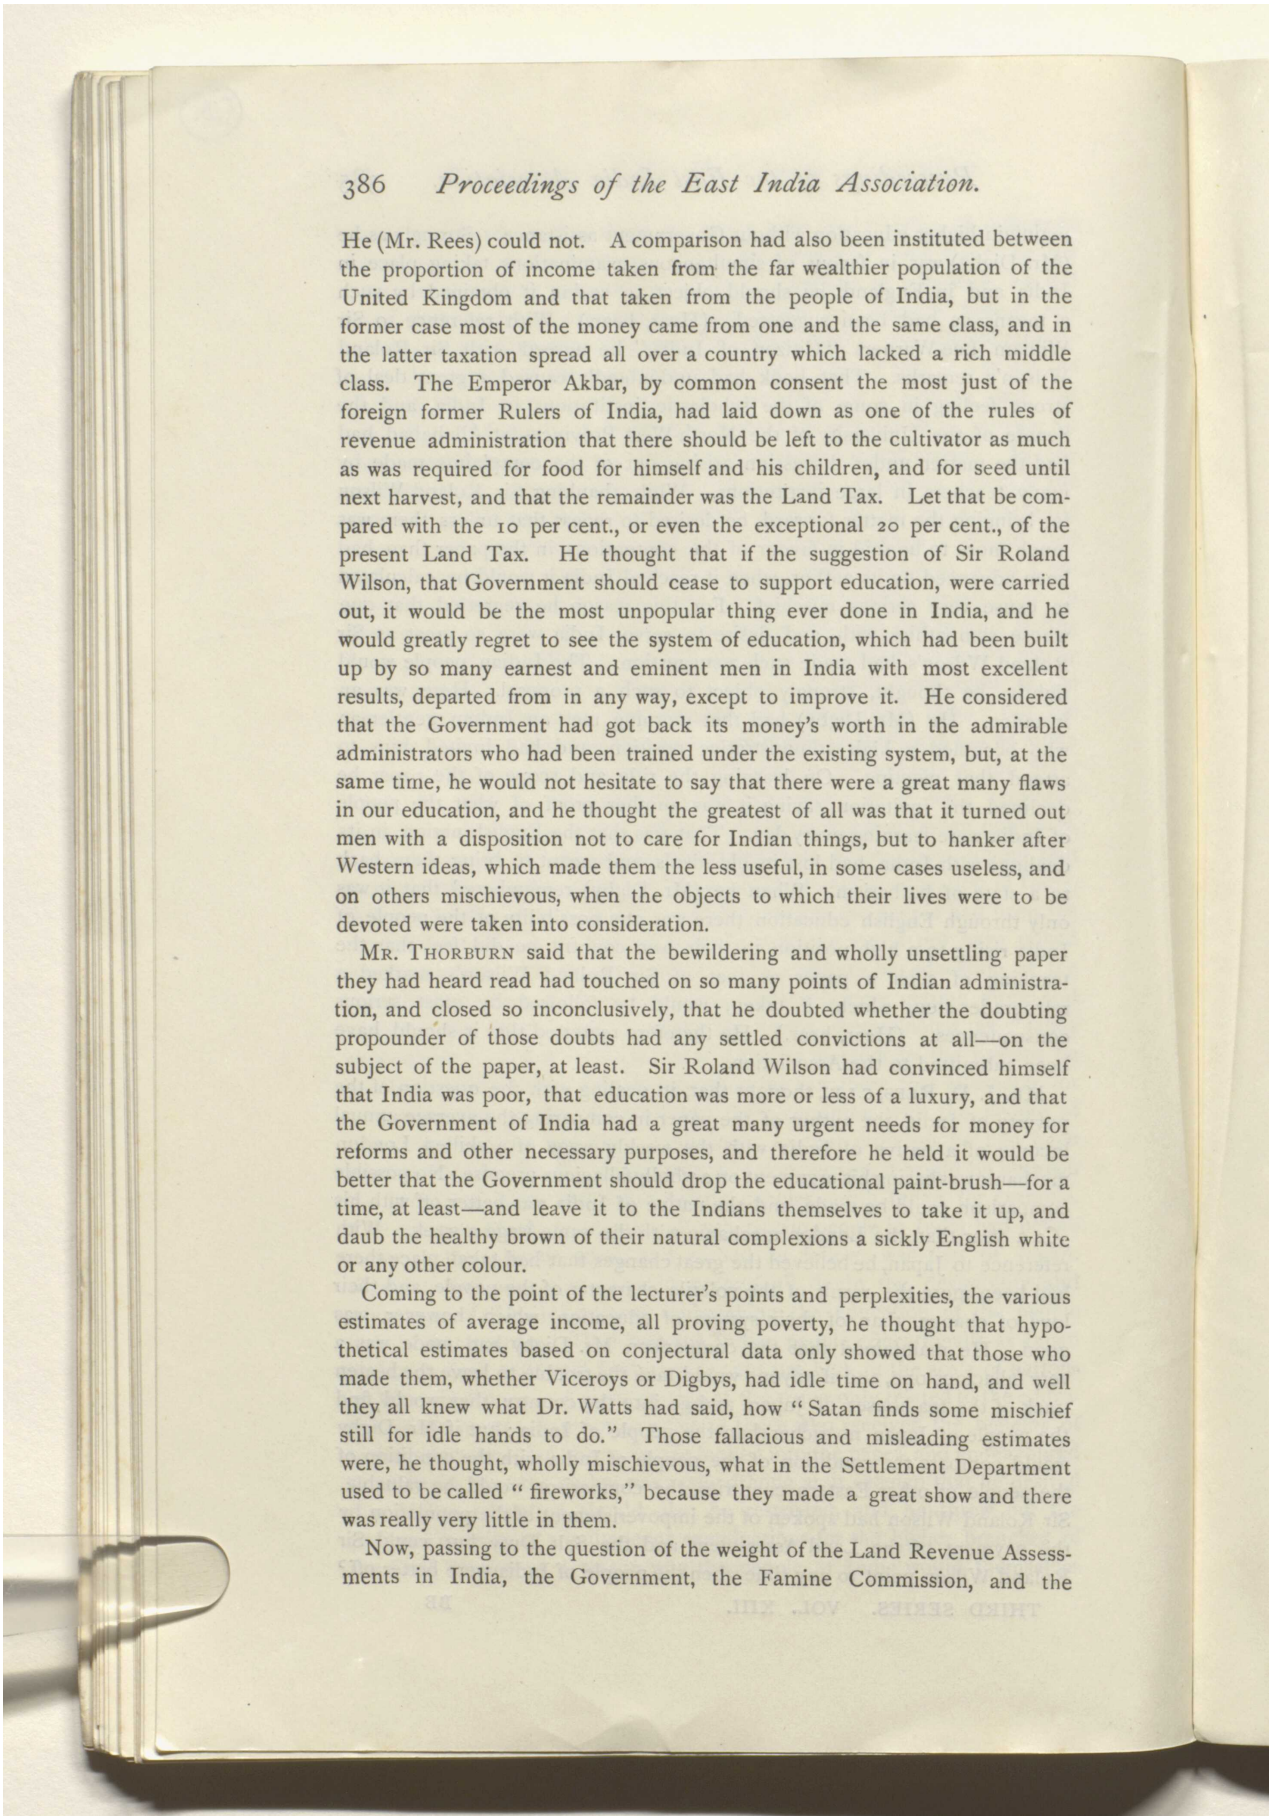
BRITISH LIBRARY



maintain higher education without Government assistance. Strongly as he (Mr. Digby) was in favour of simultaneous examinations taking place in India and in England, he should object to seeing it obtained by such a means as had been suggested. (Hear, hear.) With reference to Sir William Lee-Warners "Citizen of India," he agreed with Sir Roland Wilson's remarks. That book had undoubtedly caused a great deal of strong feeling in some of the scholastic institutions in India, and the Senate of the University of the North-West Provinces at Allahabad had had the matter under discussion arising out of the complaints made by many teachers in large institutions. While thanking Sir Roland Wilson for bringing the matter forward, he desired to repeat that unless there was much more to be said in favour of the contentions in the paper than had been advanced by its author, when it reached India it would be calculated to cause very serious mischief. For this reason he regretted that one whose sympathies with, and desire to serve, India were so great as Sir Roland Wilson's had made such a suggestion. The Indian people would rightly, he thought, strongly object to such a proposal. Here was an instance. He (Mr. Digby) had that morning met an Indian gentleman who occupied a high administrative position, and had invited him to attend that meeting. On learning the title and scope of the paper he declined the invitation, saying it was another proof of what the people of India were learning every day. That was that the English nation, in its dealings with India, had lost its old ideals, and meant to bring them back to a state of barbarism. When he (Mr. Digby) remembered that it was only through English education there was any possibility of the people of India rising to a high position in their own country, he did feel that the teaching of such a paper as that of Sir Roland Wilson's marked a retrograde step, which, if taken, would be followed by most serious consequences. (Hear, hear.) He therefore regretted that it should have been submitted to the Association.

Mr. J. D. Rees, C.I.E., thought that, in dealing with the question of the poverty of India, the author of the paper in comparing the average annual income of a native of India with the weekly wage of a skilled London mechanic was basing his argument on a wholly fallacious premise. No possible comparison could be made, and the native of India was better off with his £2 a year than the London mechanic with the same wage a week. With reference to Japan, he believed the great changes that had taken place there had been more the result of the volatile character of the people, and their love of change, than of their system of education, which, however, was good. He maintained that the comparison Mr. Digby had made was a very fallacious one, and if anyone would take the trouble to leave the beaten track of the tea-houses of Japan, and go into the country, they would find the people of Japan no richer than the people of India; but if Mr. Digby would compare the condition of the people of India with the condition of the people of other Eastern countries, the comparison would be valuable. Sir Roland Wilson had spoken of the impoverishment of the population by the payment of the Land Assessment and the Salt Duty, but would Sir Roland Wilson point to any time when the people of India were better off?

BRITISH LIBRARY

He (Mr. Rees) could not. A comparison had also been instituted between the proportion of income taken from the far wealthier population of the United Kingdom and that taken from the people of India, but in the former case most of the money came from one and the same class, and in the latter taxation spread all over a country which lacked a rich middle class. The Emperor Akbar, by common consent the most just of the foreign former Rulers of India, had laid down as one of the rules of revenue administration that there should be left to the cultivator as much as was required for food for himself and his children, and for seed until next harvest, and that the remainder was the Land Tax. Let that be compared with the 10 per cent., or even the exceptional 20 per cent., of the present Land Tax. He thought that if the suggestion of Sir Roland Wilson, that Government should cease to support education, were carried out, it would be the most unpopular thing ever done in India, and he would greatly regret to see the system of education, which had been built up by so many earnest and eminent men in India with most excellent results, departed from in any way, except to improve it. He considered that the Government had got back its money's worth in the admirable administrators who had been trained under the existing system, but, at the same time, he would not hesitate to say that there were a great many flaws in our education, and he thought the greatest of all was that it turned out men with a disposition not to care for Indian things, but to hanker after Western ideas, which made them the less useful, in some cases useless, and on others mischievous, when the objects to which their lives were to be devoted were taken into consideration.

Mr. Thorburn said that the bewildering and wholly unsettling paper they had heard read had touched on so many points of Indian administration, and closed so inconclusively, that he doubted whether the doubting propounder of those doubts had any settled convictions at all—on the subject of the paper, at least. Sir Roland Wilson had convinced himself that India was poor, that education was more or less of a luxury, and that the Government of India had a great many urgent needs for money for reforms and other necessary purposes, and therefore he held it would be better that the Government should drop the educational paint-brush—for a time, at least—and leave it to the Indians themselves to take it up, and daub the healthy brown of their natural complexions a sickly English white or any other colour.

Coming to the point of the lecturer's points and perplexities, the various estimates of average income, all proving poverty, he thought that hypothetical estimates based on conjectural data only showed that those who made them, whether Viceroys or Digbys, had idle time on hand, and well they all knew what Dr. Watts had said, how "Satan finds some mischief still for idle hands to do." Those fallacious and misleading estimates were, he thought, wholly mischievous, what in the Settlement Department used to be called "fireworks," because they made a great show and there was really very little in them.

Now, passing to the question of the weight of the Land Revenue Assessments in India, the Government, the Famine Commission, and the

BRITISH LIBRARY

Secretary of State all said that the assessments were very low, and quoted figures. The trilogy, Messrs. Digby, Dadabhai Naoroji, and Dutt, all said the assessments were high. They also quoted figures, and maintained that the height of those assessments were one of the causes of the poverty of Indian agriculturists. His own view was this: that the Government of India was the Overlord of India, and the Land Revenue Assessment were State rent. Indigenous Governments used to take elastically about two rupees to one that our Government took, but the difference was that we took it rigidly, crop or no crop, whereas our predecessors took the lion's share of a crop when there was one only. As a result, our light rigidity was harder on the people than our predecessors' heavy elasticity. (Hear, hear.)

With reference to the remarks made about "The Citizen of India," he had never seen the book, but, according the description given by Sir Roland Wilson, that it dragged in dogmatically a number of points which were really controversial, and that its aim and object was to glorify the British Government—why should it not? As a matter of course, every civilized Government in the world had to introduce text-books into its schools, and among those text-books there must be works on history, political economy, and on the constitution of the State. Would not the Government of India be very foolish if it did not do its best to impress on the young idea that its own way of treating the subject was the best possible? (Hear, hear.) Take the text-books used in French, German, and Russian schools. They were misleading from an English point of view, but from the point of view of the Governments concerned they were what it was necessary to teach.

Now, coming on to what the lecturer had called "the religious difficulty," it had twice recently been discussed before this Association, and he had hoped it was dead and buried, but here it was coming to the fore for the third time. With reference to Dr. Duncan's statement, that in 85 per cent. of the schools of India the religious teachers had a free hand, he (Mr. Thorburn) thought that the great bulk of that large percentage was made up of merely infant rote-schools, attended by babes from two years of age to seven, who were taught like parrots in some classical language which they did not understand.

Coming to the question raised as to the utility of primary education, he was really distressed to hear Sir Roland Wilson remark that there was a great deal of unreality in the argument that, except by teaching the masses of the agriculturists the three R's, these masses would be unable to cope with the wily usurer. His own conviction was that in the extension of primary education among the masses lay the chief hope of raising them from a position resembling that of bovine bipeds with the intelligences of quadrupeds to that of human beings able to take care of themselves through life. (Hear, hear.) As to what the educational system in India might be, and what it should be, he held that it was the absolute duty of the Indian Government to continue and extend a system of State-aided education for the benefit of the agriculturists, who, it must be remembered, contributed nine-tenths of the taxation of India. (Hear, hear.) Further, every rupee taken from them and applied to education ought to be spent on those tax-payers who found the money. With reference to higher education, he was

BRITISH LIBRARY

not sure that Sir Roland Wilson's opinion was not right, that that might now be left to the people of India themselves. Throughout India the commercial and professional classes were numerous and comparatively well off, and in every province there were two or three rupee-millionaires. If the Government would distinguish with titles and in other ways persons who gave large educational benefactions, he was certain that in a short time they would have in every province not one, but half a dozen Carnegies! (Hear, hear.)

Sir Charles Stevens said he agreed with Mr. Rees as to the impossibility of applying an English standard to the condition of the natives of India. The first thing that struck him in Sir Roland Wilson's paper was the absence of detail as to facts, and an absence of discrimination between different classes of education and of schools. No distinction was drawn between educational establishments which were directly managed as Government schools, and those which were technically spoken of as grant-in-aid institutions. It is conceivable that it might be perfectly right for the Government to maintain, for instance, agricultural or technical schools, or to take up schools in particular localities for particular classes of people, and still not advisable for them to manage, or even aid, schools in other localities or among other classes of people; it did not at all follow that an argument applicable to one class of schools was equally applicable to all. Sir Roland Wilson had quoted descriptions by Mr. Carstairs of the system of school inspection with which he (Sir Charles Stevens) could not agree. It certainly did not represent his own experience of the state of affairs in Bengal. The lowest class of inspecting officers (the sub-inspectors) inspected the lower schools. The deputy-inspectors supervised the sub-inspectors and inspected some of the lower schools, while they themselves also inspected higher schools. They in turn were supervised by the inspectors, who had large tracts of country under them, and who inspected some of all sorts of schools except (he believed) the collegiate schools. He was altogether opposed to the withdrawal of State aid from education in India, and he thought Sir Roland Wilson had for the moment forgotten how the educational system did not stand apart, but was bound up in the whole administration of the country. It was admitted that the preservation of order was the first consideration. How was the Government to insist on the provision of efficient magistrates, police officers, civil judges? Doctors, lawyers, engineers, and other professional men, must be educated, if only to carry on the administration; the Government has, therefore, a direct interest in the matter, and, in the speaker's opinion, mere commercial competition could not be depended upon to give the necessary men. With reference to primary schools, he strongly approved of the work that had been begun in Bengal by Sir George Campbell, of bringing the old indigenous schools into touch with the Education Department and improving the teachers. He illustrated the danger and difficulty arising from the want of instruction of this sort by referring to the taking of the census in 1881 among the Sonthals of the Birbhum District, and to the discontent which he had personally traced to the bad treatment of the Sonthals by some enterprising Bengalis, who had taken advantage of their ignorance

BRITISH LIBRARY

and rented lands to them on perfectly outrageous conditions, such as no one capable of reading and understanding the terms would have accepted. In reporting to Government, he particularly advised the establishment of some primary schools, so that this evil should not be perpetuated. He did not, of course, deny that there is still room for improvement in the educational system of Bengal; and he would particularly like to see it less completely dominated than it is at present by the University. (Hear, hear.)

MR. N. D. DARU objected to the description in the paper of the Government as an alien Government. The proper persons to say that were the natives of the country, and not the Government itself. The Government should try and put itself on a level with the natives of the country, and remove from their minds any idea at all that it was an alien Government. Then, with reference to education, he would put it to the meeting whether primary education, as given in the vernacular schools of India, was in any real sense education at all, and if that was the sort of education the Government were to spend their money on—whether it was a proper return for the money. The retiring of the Government from higher education, or their charging high fees for higher education, would simply mean that poor people would never get it. If the Government did not have institutions of its own, private institutions would spring up on a business basis, and poor people would be shut out. With reference to the introduction of text-books, like Sir William Lee-Warner's book, into schools, although he was not sure he ought properly to say anything, yet he would suggest that it was necessary to exercise great care, as was illustrated by what happened when Butler's Sermons were prescribed for an examination in the Bombay University, and the students, having read the book, invented some plausible arguments against the statements contained in it, and considered they were justified in not believing in the existence of God.

The CHAIRMAN, in moving a vote of thanks to Sir Roland Wilson, said that on some points the paper had been entirely misrepresented, and in others misunderstood. Mr. Thorburn had called it "a most bewildering and wholly unsettling paper." But what valid objection could there be to it on these grounds? The paper was an academical one, and intended to provoke discussion. It was not like a proposal brought forward in Parliament or before an Indian Legislative Council. It was a paper submitted to a debating society, and certainly it had provoked one of the very best discussions he had listened to in that room. Then again, Sir Roland Wilson did not object to higher education; he simply suggested that the cost of it should not be entirely borne by the State. For his own part, he was an out-and-out supporter of primary education, and secondary education, and higher education. It was useless to talk about promoting primary and secondary education and industrial education unless you insisted on higher education being simultaneously promoted to the utmost extent possible. They all hung together, and it would be soon found that primary and industrial education would be of very little benefit to a country if it neglected higher education. The remarkable development of the dyers'

BRITISH LIBRARY

trade in England during the past thirty years, and in all the artistic denominations of textile manufacture, and in furniture and house decoration, was attributable ultimately to the writings of Ruskin and William Morris, and the paintings of Rossetti, Millais, and others. While in India he was an enthusiastic promoter of higher education; but what was wanted in India was that the higher education should not be developed after an exclusively English type. One of the greatest of crimes against a people, and the meanest wrong that could be perpetrated on them, was to dislocate the continuity of their national culture and to destroy their historical and literary personality. Therefore, wherever the people of India had, as in the Madras Presidency and in the Mahratta country, developed a great literature of their own, the most scrupulous and strenuous care should be taken that their higher education should be directed to its ever-increasing cultivation. With reference to the administration of education in India, he had always thought that it should be left more and more in the hands of the people of India themselves. As for the Government expenditure on education in India, he thought a million and a quarter a mere flea-bite. But it was time to remember that there was an enormous reserve for educational purposes—industrial, scientific, and literary—in the temple funds of India. No Government could raise that question; but gradually as the modern educated classes of Hindus became more and more influential, they would bring their influence to bear on the present trustees of the temples, and thus secure certain obvious and spontaneous reforms in the administration of their vast funds, whereby they would be increasingly applied to the relief of poverty and distress, and the promotion of education. The schools would thus everywhere spring up within the sacred precincts of the tutelary village temples, and there would be no more talk then of people being driven by Joseph Butler's "Analogy of Revealed Religion," into atheism. Before moving the formal vote of thanks to Sir Roland Wilson, he must renew his protest against the repeated attacks on Sir William Lee-Warner's book. He only wished it was available for use in the schools in England. He did not know any other book from which students in any country could so comprehensively and thoroughly learn their duties as citizens, and if they were to have State-aided education in India, the Government of the country were bound to instruct the people in their duties to the State, and not only that, but in the duties of the State to the people; and the latter was particularly necessary in a country where the acts of the Government were constantly misrepresented, and that not so much through misunderstandings arising on the spot, as under deliberate instructions circulated by political partisans in this country, the active crater of whose agitation lay within the precinct of Westminster Abbey. In conclusion the Chairman moved: "That the most cordial thanks of the meeting be given to Sir Roland Wilson for his valuable and most interesting paper."

The resolution was carried by acclamation.

Sir Roland Wilson thanked the Chairman for the way in which he had proposed the vote of thanks, and the meeting for the manner in which it had been received. There were only two points he would notice in his present reply. The first was that he should not like to go out to

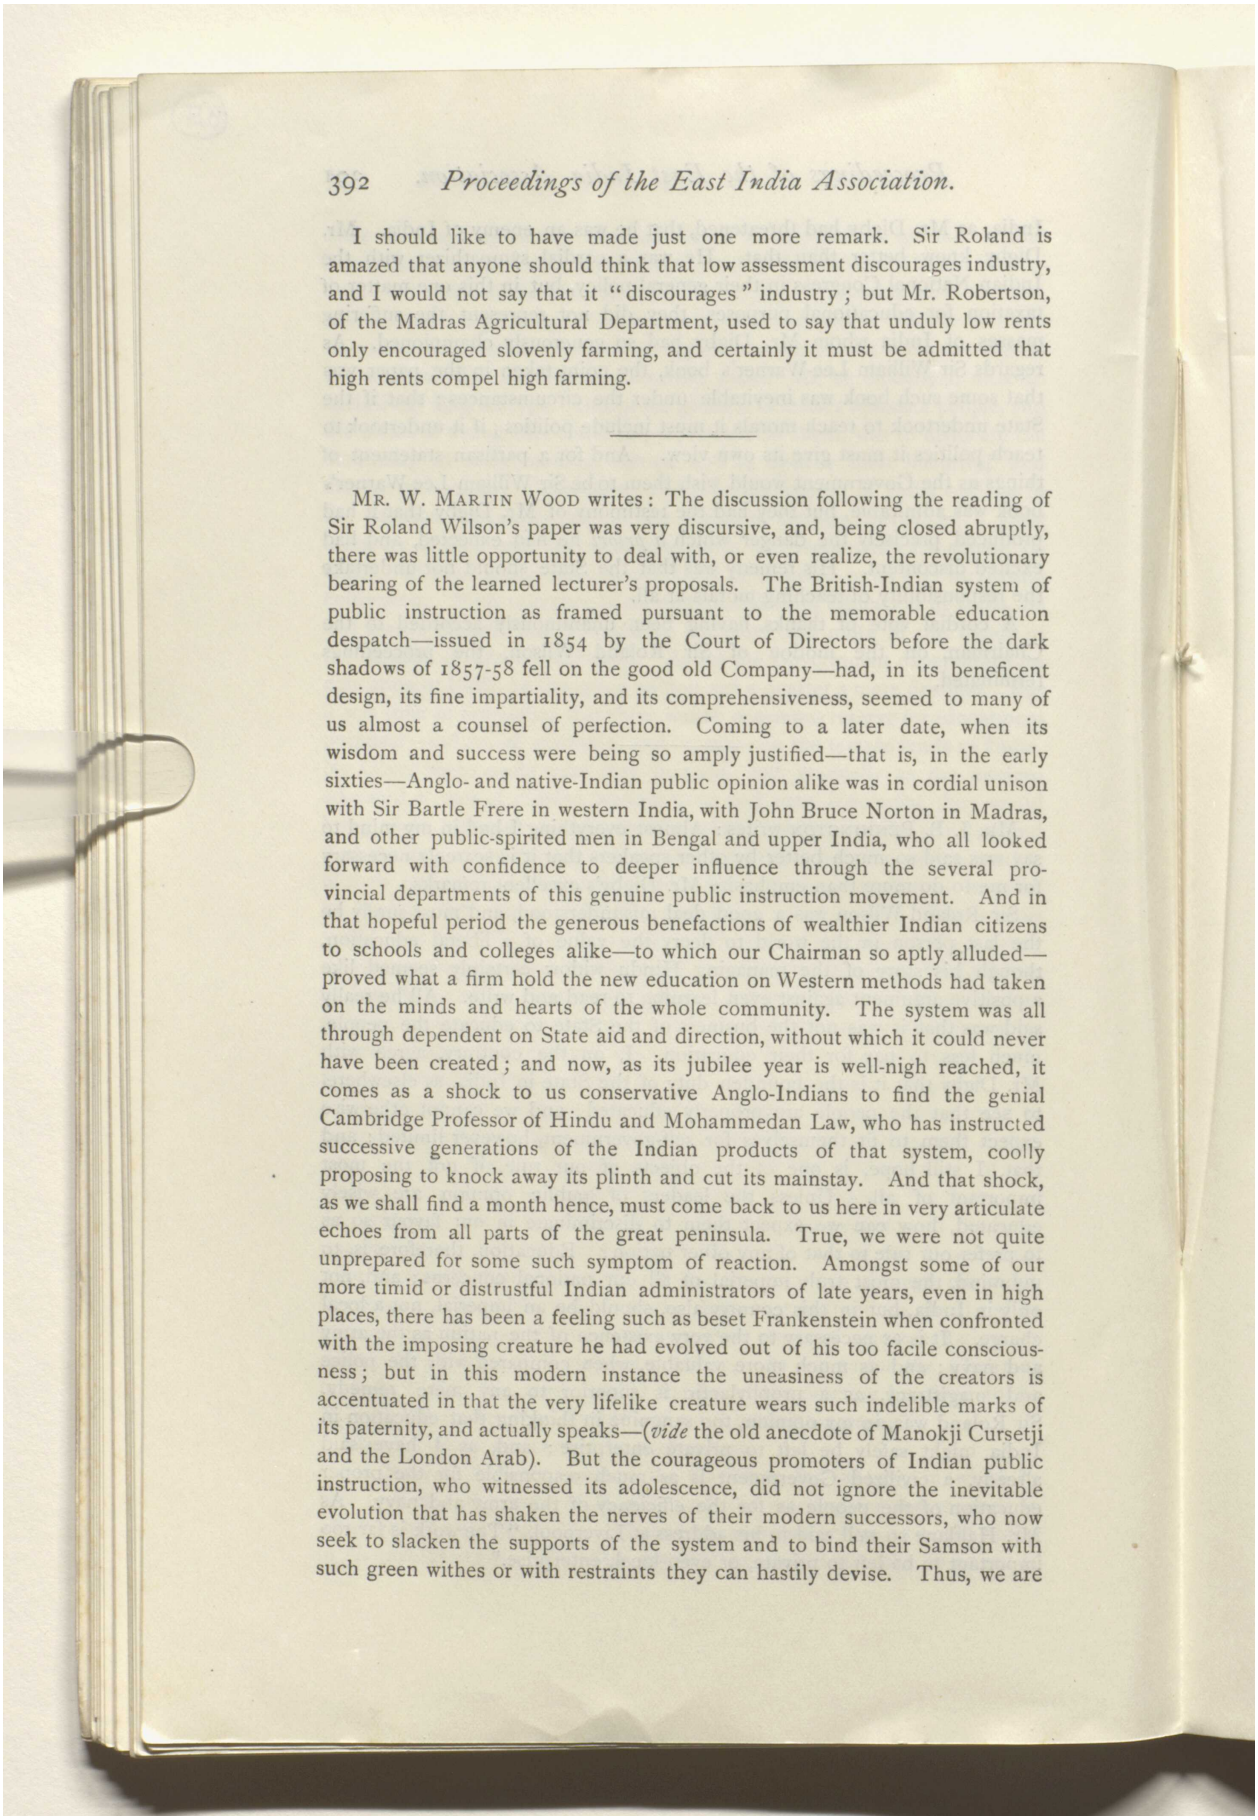
BRITISH LIBRARY

India, as Mr. Digby had threatened, that he was an enemy of India. Mr. Digby knew better than that. He was a cordial sympathizer with the Indian National Congress in their general policy, but in this one matter of taxation for educational purposes they did not represent the suffering masses of India whom Mr. Digby had so generously championed. As regards Sir William Lee-Warner's book, the point taken in the paper was that some such book was inevitable under the circumstances; that if the State undertook to teach morals it must include politics; if it undertook to teach politics it must give its own view. And for a partisan statement of things as the Government would wish them to be Sir William Lee-Warner's book was admirable, but they had the testimony of Mr. Digby that it had produced precisely the danger which *a priori* he had expected, and had excited discontent. His remedy was that the State should not undertake the responsibility of teaching morals at all.

A cordial vote of thanks having been unanimously accorded to the Chairman, on the motion of Sir Roland Wilson, the proceedings terminated.



Mr. J. B. Pennington writes: Almost everything I had in my mind to say was said so much better by other speakers that it is scarcely necessary for me to do more than emphasize Mr. Digby's excellent remarks.

Sir Roland Wilson was a good deal misunderstood, and must surely be the last person in the world to decry the value of a liberal education, though his story of the managing Hindu widow certainly seemed like a positive argument against even learning to read and write. All he really said was that it was not the business of the State to educate the people, much less to pay for their education. I, on the contrary, agree with Mr. Digby that it is the bounden duty of the State in India, as elsewhere, to see that the people are properly educated; and we cannot otherwise expect them to fit themselves for self-government, however limited; and that, I still hope, is one of the objects of our rule, if not the most important of all. Unless the leaders of public opinion are wisely educated, how can we expect them to discriminate in our favour so as to prefer our rule to that of any other nation? Education, therefore, is, to my mind, the most truly imperial of all our national concerns; and, not only in India, but in this country also, should be an imperial, not a local charge. It is as necessary to the very existence of the nation as the army and navy; and as much more valuable, when compared with the police and magistracy, as a prophylactic is superior to any mere remedy. Sir Roland was, in my opinion, too sanguine in thinking that education in India might safely be left to private enterprise; and, as I have said already, a civilized Government is as much responsible for the proper education of the people as for the efficiency of the army and navy. As Mr. Haldane so well said in his address at Liverpool, "The work is far too important to be left to private, or even local, enterprise."

BRITISH LIBRARY

I should like to have made just one more remark. Sir Roland is amazed that anyone should think that low assessment discourages industry, and I would not say that it "discourages" industry; but Mr. Robertson, of the Madras Agricultural Department, used to say that unduly low rents only encouraged slovenly farming, and certainly it must be admitted that high rents compel high farming.

Mr. W. Martin Wood writes: The discussion following the reading of Sir Roland Wilson's paper was very discursive, and, being closed abruptly, there was little opportunity to deal with, or even realize, the revolutionary bearing of the learned lecturer's proposals. The British-Indian system of public instruction as framed pursuant to the memorable education despatch—issued in 1854 by the Court of Directors before the dark shadows of 1857-58 fell on the good old Company—had, in its beneficent design, its fine impartiality, and its comprehensiveness, seemed to many of us almost a counsel of perfection. Coming to a later date, when its wisdom and success were being so amply justified—that is, in the early sixties—Anglo- and native-Indian public opinion alike was in cordial unison with Sir Bartle Frere in western India, with John Bruce Norton in Madras, and other public-spirited men in Bengal and upper India, who all looked forward with confidence to deeper influence through the several provincial departments of this genuine public instruction movement. And in that hopeful period the generous benefactions of wealthier Indian citizens to schools and colleges alike—to which our Chairman so aptly alluded—proved what a firm hold the new education on Western methods had taken on the minds and hearts of the whole community. The system was all through dependent on State aid and direction, without which it could never have been created; and now, as its jubilee year is well-nigh reached, it comes as a shock to us conservative Anglo-Indians to find the genial Cambridge Professor of Hindu and Mohammedan Law, who has instructed successive generations of the Indian products of that system, coolly proposing to knock away its plinth and cut its mainstay. And that shock, as we shall find a month hence, must come back to us here in very articulate echoes from all parts of the great peninsula. True, we were not quite unprepared for some such symptom of reaction. Amongst some of our more timid or distrustful Indian administrators of late years, even in high places, there has been a feeling such as beset Frankenstein when confronted with the imposing creature he had evolved out of his too facile consciousness; but in this modern instance the uneasiness of the creators is accentuated in that the very lifelike creature wears such indelible marks of its paternity, and actually speaks—(*vide* the old anecdote of Manokji Cursetji and the London Arab). But the courageous promoters of Indian public instruction, who witnessed its adolescence, did not ignore the inevitable evolution that has shaken the nerves of their modern successors, who now seek to slacken the supports of the system and to bind their Samson with such green withes or with restraints they can hastily devise. Thus, we are

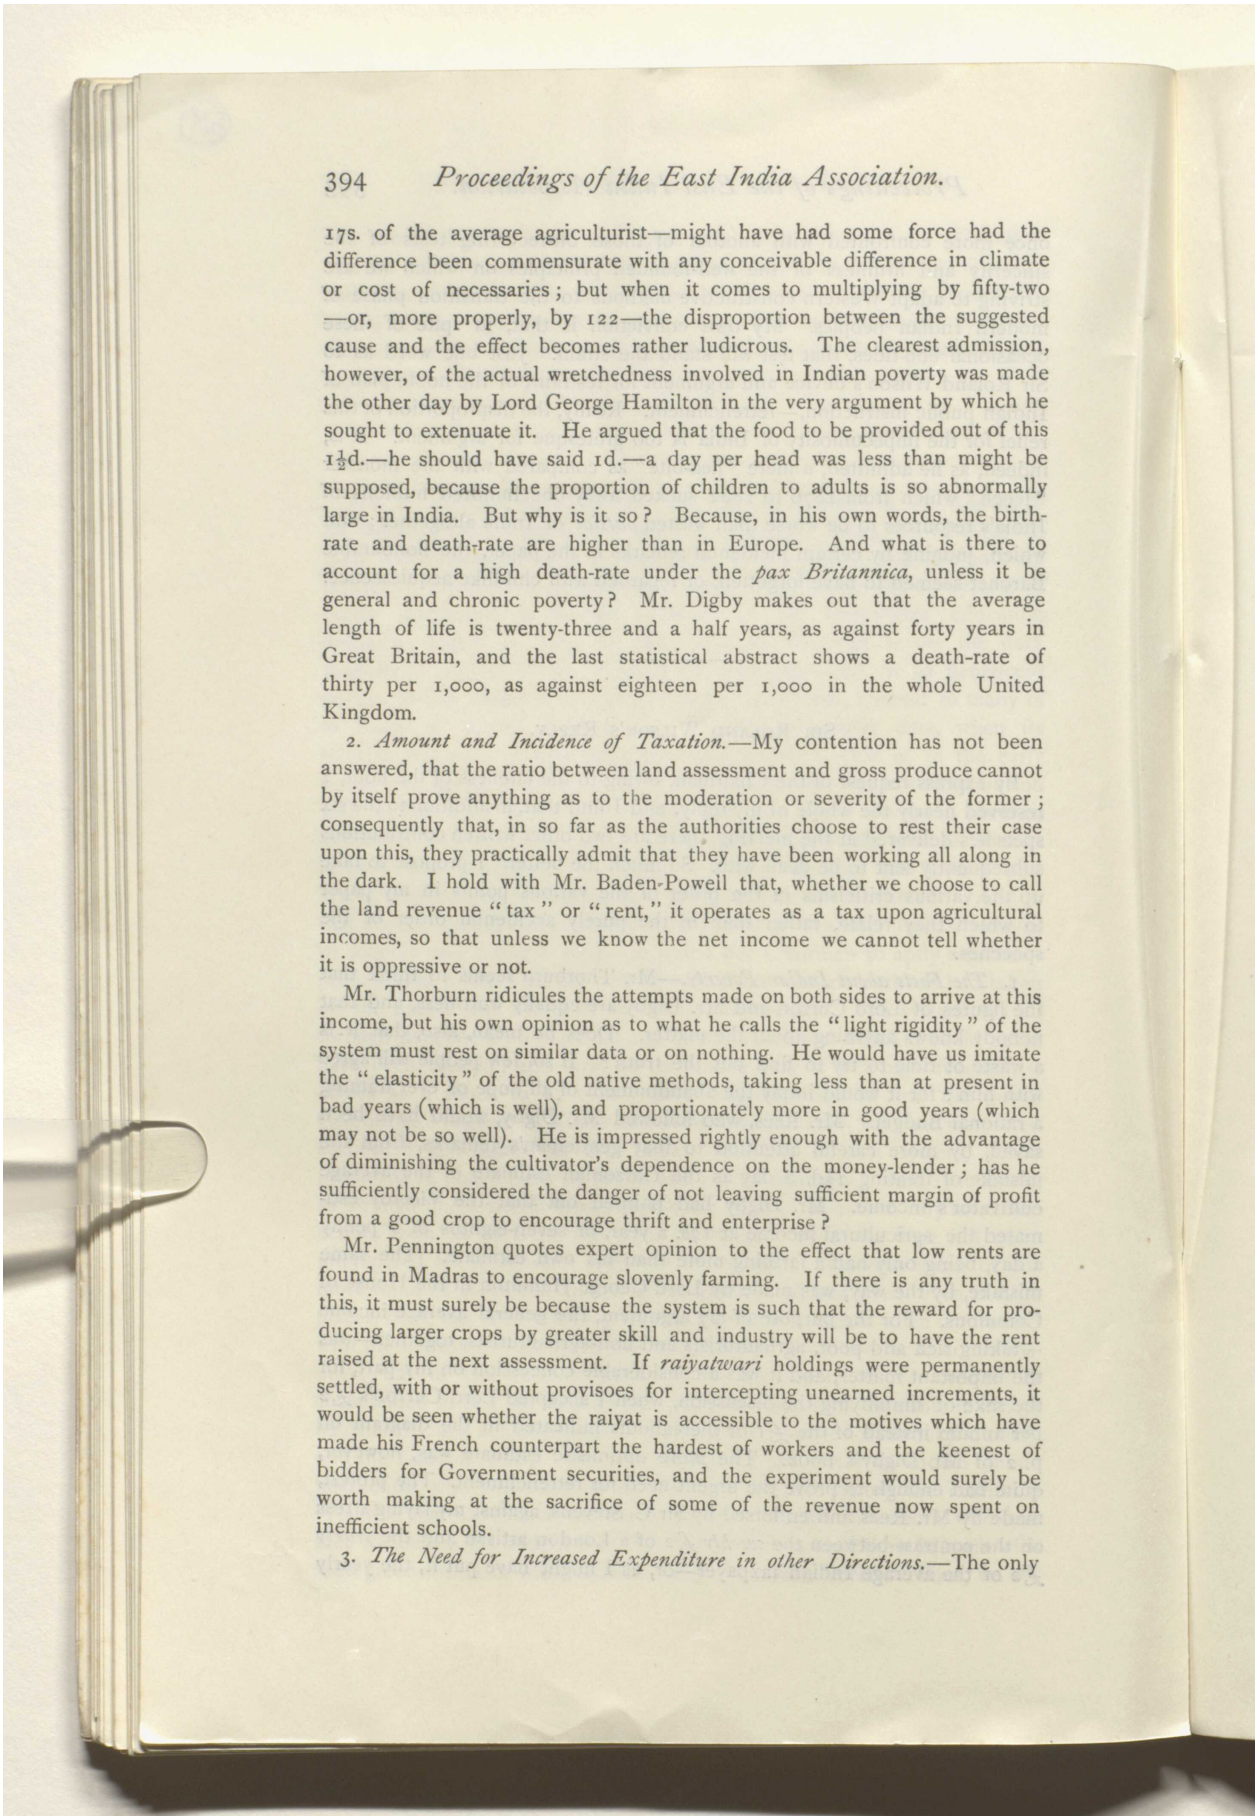
BRITISH LIBRARY

once more confronted with another of those oft-recurring tests of the sincerity and firmness of the well-founded principles on which we are striving to adapt Western constructive methods to the transition phase of modern Indian peoples. My own conviction is that, in spite of these occasional ebb-tides, that test will stand the strain. Just one word as to Sir Roland Wilson's device and argument for restraint of the noble plan of Indian public instruction,—retrenchment. Really, the disproportion of this relief for the impecuniosity of India is too grotesque for argument. It is, indeed, as he admitted, a mere "flea-bite" as compared with the monster "leech" which from 1876 to 1882 sucked away one hundred millions of India's resources to be worse than wasted *outside* of India altogether; and which, judging by certain incidental remarks in the paper, the honourable Baronet seemed to have forgotten, or regarded with childlike acquiescence.

Sir Roland Wilson's Reply.



By express request of the Chairman, owing to the lateness of the hour, I reserved nearly the whole of my reply, and I find that, in addition to the six speeches delivered at the meeting, there are two other written contributions subsequently sent to be dealt with. So much the better. I propose to take up the various criticisms in the order of the various points in my paper to which they relate, rather than in the purely accidental order of the speeches.

1. *The Facts about Indian Poverty.*—Mr. Thorburn seems to think that the figures of Lord Curzon and Mr. Digby are equally worthless, and that nobody knows anything about the matter. Does he mean, also, that it is a waste of time to try to find out the truth? If so, few people will agree with him; for it would imply the abandonment of all hope of ever framing a rational Budget. Mr. Rees, who followed Mr. Digby, would have been saved, by more careful attention to that gentleman's remarks, from the mistake of treating 1½d. a day as the Curzonian estimate of the average cultivator's income. Mr. Digby had pointed out that the Viceroy estimated the agricultural income at 17s. a year, or seven-eighths of a penny a day, being only half a farthing more than his own estimate. The same mistake, by the way, was made by Lord George Hamilton in the House of Commons. For the purpose of my argument, the general average income —taking rich and poor, agriculturists and non-agriculturists, together—was the important matter, and it was a considerable concession on my part, for the sake of simplifying the discussion, when I accepted Lord Curzon's £2 per annum instead of the £1 or thereabouts indicated in the diagram on p. 2 of Mr. Digby's book. The more optimistic estimate was, however, quite bad enough to prove the urgent need for retrenchment. The protest, made by Mr. Rees and endorsed by Sir C. Stevens, against my laying stress on the contrast between the *weekly* £2 of a London artisan and the *yearly* £2 of the average Indian taxpayer—or, as I might have put it, the yearly

17s. of the average agriculturist—might have had some force had the difference been commensurate with any conceivable difference in climate or cost of necessaries; but when it comes to multiplying by fifty-two —or, more properly, by 122—the disproportion between the suggested cause and the effect becomes rather ludicrous. The clearest admission, however, of the actual wretchedness involved in Indian poverty was made the other day by Lord George Hamilton in the very argument by which he sought to extenuate it. He argued that the food to be provided out of this 1½d.—he should have said 1d.—a day per head was less than might be supposed, because the proportion of children to adults is so abnormally large in India. But why is it so? Because, in his own words, the birth-rate and death-rate are higher than in Europe. And what is there to account for a high death-rate under the *pax Britannica*, unless it be general and chronic poverty? Mr. Digby makes out that the average length of life is twenty-three and a half years, as against forty years in Great Britain, and the last statistical abstract shows a death-rate of thirty per 1,000, as against eighteen per 1,000 in the whole United Kingdom.

2. *Amount and Incidence of Taxation.*—My contention has not been answered, that the ratio between land assessment and gross produce cannot by itself prove anything as to the moderation or severity of the former; consequently that, in so far as the authorities choose to rest their case upon this, they practically admit that they have been working all along in the dark. I hold with Mr. Baden-Powell that, whether we choose to call the land revenue "tax" or "rent," it operates as a tax upon agricultural incomes, so that unless we know the net income we cannot tell whether it is oppressive or not.

Mr. Thorburn ridicules the attempts made on both sides to arrive at this income, but his own opinion as to what he calls the "light rigidity" of the system must rest on similar data or on nothing. He would have us imitate the "elasticity" of the old native methods, taking less than at present in bad years (which is well), and proportionately more in good years (which may not be so well). He is impressed rightly enough with the advantage of diminishing the cultivator's dependence on the money-lender; has he sufficiently considered the danger of not leaving sufficient margin of profit from a good crop to encourage thrift and enterprise?

Mr. Pennington quotes expert opinion to the effect that low rents are found in Madras to encourage slovenly farming. If there is any truth in this, it must surely be because the system is such that the reward for producing larger crops by greater skill and industry will be to have the rent raised at the next assessment. If *raiyatwari* holdings were permanently settled, with or without provisoes for intercepting unearned increments, it would be seen whether the raiyat is accessible to the motives which have made his French counterpart the hardest of workers and the keenest of bidders for Government securities, and the experiment would surely be worth making at the sacrifice of some of the revenue now spent on inefficient schools.

3. *The Need for Increased Expenditure in other Directions.*—The only

BRITISH LIBRARY

remark elicited by this portion of my paper was a reference in Mr. Martin Wood's written notes to the waste of Indian resources in wars beyond the frontier. Here I am with him generally as to the past, and as anxious as he can be that our "forward" policy should be carefully watched and checked in the future. I strongly suspect that, if only the will were present, a way might be found of placing our relations with both Russia and Afghanistan on such a footing that we might save the Afghan subsidy and reduce the numerical strength of our army. But, on the other hand, the cost per man will have to be increased if in the present state of the labour market we are to secure the kind of recruit who will not disgrace the British name by vice and violence. Lumping together the military and civil branches of the absolutely indispensable work of Government, and assuming (contrary to present probability) that all the economies which ought to be effected will be effected, I much doubt the possibility of reducing the total without sacrificing some of the security that the subject has a right to expect.

4. *The Pleas for State Aid to Primary Education.*—Mr. Pennington puts concisely the now dominant view when he writes that "a prophylactic is superior to any mere remedy." I hold with Sir George Cornewall Lewis that in legislation the proverb ought to be reversed, and that more often than not cure is better than prevention. The reason is that the only curative or preventive methods at the disposal of governments are acts so intrinsically mischievous that they rank as crimes when done without special justification. Taxation is *prima-facie* robbery, as arrest is *prima facie* an assault. As a wise Government does not arrest people without strong suspicion of actual or imminent criminality, so neither should it rob them of their money without some more urgent and obvious necessity than a vague idea that the State knows better how it should be spent than the proprietor.

Sir C. Stevens, Mr. Thorburn, and Mr. Pennington all lay stress on the importance of teaching the *raiyat* to read and cipher in order that he may protect himself against being cheated. I will ask them to reckon up on the one hand the cost of providing efficient elementary instruction to any given number of Santal, Punjabi, or Tamil children, and on the other hand the cost of providing efficient petty tribunals in the same localities, numerous enough to be accessible to everyone without the loss of a day's work, to listen patiently to every story, to clear up honest misunderstandings, and to detect and punish wilful impositions, and all this without court fees or other expense to the parties. I am much mistaken if they do not find the latter plan (which we may call the mere remedy, or the more direct prophylactic) both cheaper and more certainly efficacious for its immediate purpose; and I am not at all sure that it would not also be more educative. The right end at which to begin is to teach people in a practical way what fair dealing is, and how it can be enforced; the less important lessons that occupy the attention of school inspectors will follow in due time. In dealing with the prophylactic view of State education, this matter of relative cost is fundamental. In spite of my preliminary *caveat*, several speakers, including the Chairman dwelt on the smallness of

BRITISH LIBRARY

the present educational budget as a reason why the saving to be effected by its abolition was not worth a thought. No one attempted to grapple with my argument, that the choice really lies between abolition and an enormous increase, the present expenditure being altogether insufficient to do any real good. Sir C. Stevens naturally said all he could for the system in the development of which he had taken so active a part; but all the impartial testimony that I have been able to collect tends to confirm the doubt expressed by another speaker (Mr. Daru), "whether primary education, as given in the vernacular schools in India, is in any real sense education at all"; and I repeat that, if not, the money spent on it has not merely been wasted, but has done positive mischief.

5. *The Higher Education.*—I am glad to find myself, on one point at least, in agreement with Mr. Thorburn, who thinks that the commercial and professional classes might now pay for their own higher education, with some help from here and there an Indian Carnegie, instead of charging it on the taxes, nine-tenths of which, he says, are paid by the agriculturists. At the same time, I admit, so far as the principle is concerned, the soundness of Sir C. Stevens' plea that the Government must train its own servants to suit its own requirements, and that it may not be always possible to make candidates for Government employment pay the whole cost of qualifying themselves for the posts that they desire to fill. For instance, I find that, in the period covered by the last Quinquennial Review, the Medical Colleges were a source of considerable expense, while the Law Colleges were practically self-supporting. I am willing to rank public expenditure, for the purpose of securing a sufficient supply of competent army surgeons, sanitary inspectors, and so forth, on the same level of necessity with the actual pay of soldiers and policemen; but I do not admit any similar obligation on the State to provide medical aid for persons not in its service, or medical training preparatory to private practice. It is a question to be settled by experiment in each branch of the public service how far commercial competition can be relied on to produce fit candidates; but much will, of course, depend on the degree of public confidence that the fittest will really be selected and promoted, and, in particular, that Europeans will not be promoted over the heads of equally competent Indians.

With this exception, I should like to see the Government withdraw, not only from financial, but from every sort of responsibility for the higher education, and this for the very reason that leads Mr. Pennington to desire its continuance—namely, because, like him, I want to hasten the day when the people of India will be able to take charge of their own affairs. I agree with him as to the end, but differ as to the means. I believe that at the stage now reached the best preparation for self-government is self-education, using the former term in its conventional sense to denote co-operative and indigenous, as opposed to despotic and foreign, government, and meaning by the latter voluntary, as opposed to compulsory, co-operation for educational purposes, which, of course, implies popular and diversified, as opposed to official and uniform, choice of subjects and methods.

Mr. Daru seemed to think it rather unbecoming in me as an Englishman to keep harping on the fact of ours being an alien Government. I did so purposely, because it is a fact which can neither be altered nor explained away, and which ought to inspire constant caution on our part. It is not so much a matter of race and creed as of distance and domicile. Of our countrymen who represent us in India, few were born, much fewer educated there; not more than half have wife or child with them at any given moment, and practically none wish to die there. Where their treasures are, there must their hearts be also. The more clearly we recognise these limiting conditions and the distinctness of British and Indian interests, the more careful shall we be, if we are faithful to our trust, not to compromise the independent future of our ward by any greater interference with his concerns than the business in hand absolutely requires. Present circumstances undoubtedly require that we should act as parish constable—to borrow Cromwell's description of himself when forced to act without a Parliament. They do not require that we should make them pay for being taught how wise and good we are. Yet this is what they do in Germany and France, says Mr. Thorburn. Precisely so, and the political condition of both countries supplies a strong reason for not imitating them. It is often said, and was said by Mr. Digby at this meeting, that in India the Government is everything, more so than in the most official-ridden nations of Europe. Considering (to put it mildly) his imperfect confidence in the wisdom of the present rulers of India, I should have expected him to be among the first to urge restriction rather than enlargement of their sphere of activity, and I can only regret that he does not see the matter in that light.

And now a word or two, in conclusion, as to my own attitude on the question. That Mr. Thorburn should find the paper bewildering and unsettling is in no way surprising. Such is very commonly the first effect of presenting a familiar subject in a new light. But I must have expressed myself very badly to give him the impression of a "doubter doubting his own doubts," when I was trying to give expression to one of my deepest and most settled convictions. Nor can I altogether accept the Chairman's description of the paper as one submitted to a debating society, which sounds hardly respectful to an Association composed largely—perhaps I might say predominantly—of veteran administrators, though it is quite true that it was, and was intended to be, too academical to be submitted to a working legislative body. I believe firmly, and did my little best to convince the influential persons whom I was addressing, that India would be better off now—economically, politically, and even educationally—if the despatch of 1854 had been pigeon-holed and ignored, and that it would be the beginning of a better time if it were possible now to reverse that policy. But I am no less clearly of opinion that, even if I had been so fortunate as to convince them all, and the Secretary of State and Viceroy into the bargain, they would have been powerless to bring about any such reversal without first effecting a radical change in the current conceptions of State functions, of which I see no immediate likelihood, either in this country or among educated Indians. The practical aim, therefore, of my

diagnosis was to put some, if only a few, open-minded individuals on the alert to apply such palliatives as may suggest themselves for the evils inseparable from the present policy.

I think I may fairly claim that, though no speaker supported my conclusion, support was forthcoming from some quarter or other for each one of the several premises on which that conclusion was based.

CORRESPONDENCE, NOTES, AND NEWS.

FAMINE IN INDIA: ITS CAUSES AND EFFECTS.

SIR,

In Mr. Hare's pamphlet on "Famine in India: its Causes and Effects," published by Messrs. P. S. King and Son, Westminster, I had hoped to find something more practical in the way of remedy than we have hitherto seen. If we could be clear as to the causes of famine, we should, perhaps, be led to the proper remedy.

What, then, does Mr. Hare's indictment amount to? Simply, I think, that labour is always and everywhere deprived of its fair share of the produce of labour; and that, I think, is true not only in India, but in England also, and still more conspicuously so in Italy and Russia, and most other countries, except, perhaps, America. What is the whole secret of American prosperity? High wages and (comparative) temperance, or "thrift" amongst the labouring classes, says Mr. Schwab. In England, on the other hand, it is an elaborate and enormously expensive poor law, which spends (or wastes) £6,000,000 *every* year in the "famine relief" of 40,000,000 of people, as compared with about the same amount, too frequently, indeed, but *not* yet *every* year, on 220,000,000 of people in India. Has it every occurred to our critics that the proportion of people who in ordinary years never have enough to eat is practically the same in India as in England—viz., about 30 per cent.? I see Mr. Hare has evidently not quite overlooked this significant fact (p. 20).

It seems to me, however, that there is some confusion in his interesting and instructive essay. It apparently proceeds upon the assumption that in India only the labouring classes (coolies) suffer from famine; but it is very largely the petty land-holders (ryots) themselves who are affected. Then, the suggested remedy—the storage of grain—applies only to land-holders, and was surely never a practice of the unskilled labouring classes proper. They scarcely ever save anywhere. Moreover, if the British Government is to bear the blame for the disastrous results of modern civilization in the rest of India, it must be allowed some credit for the fact that since 1770 there has been no famine to speak of in Bengal proper. Mr. Hare's crosses against Bengal in 1865, 1885, 1891, and 1897, must be the result of some slip, and everyone knows that the so-called Bengal famine in 1873 was nothing of the kind. And yet practically the same system of administration prevails in Bengal, so far as the actual cultivator or labourer is concerned, the only difference being that the Government has made over about £5,000,000 a year of its legitimate revenue to a set of middlemen, who have become the wealthy zemindars so well known all over the world, whilst the rights of the actual cultivating ryot have been, until quite lately, entirely overlooked, and even now he is nothing but a tenant with certain rights more or less secured by law. How does Mr. Hare account for the comparative prosperity of the Bengali

BRITISH LIBRARY

cultivator? He does not seem to admit that climatic considerations are responsible at all. Trade is just as brisk in the Ganges Valley as elsewhere, and I have no doubt the ryots rejoice in the steady demand for their crops, which enables them to realize their value promptly. Being prosperous themselves, they perhaps treat their labourers liberally, and perhaps pay them in grain, as they did in Tanjore when I was there, in which case the rise or fall of prices affects them not at all.

I am not personally acquainted with Lower Bengal, but I feel sure the ryots there no longer follow the antiquated practice of storing grain as a safeguard against famine. Nature is bountiful, and no doubt the careful and more intelligent ryot there has learnt that it is better and easier to store his crop in the form of rupees. Mr. Hare's whole book is an attack on trade, and what he calls "the curse of modern civilization." Evidently he would agree with Horace where he says (with some reason, no doubt):

"Beatus ille, qui procul negotiis,
Ut prisca gens mortalium,
Paterna rura bobus exercet suis,
Solutus omni fœnore;"

but is it likely he can so put back the clock, or "Juggernaut car of Western progress," as Mr. Thorburn calls it? The survival of the fittest seems to be one of Nature's apparently cruel laws, and just now it is the agricultural labouring classes everywhere—not in India alone—who are suffering from it. As far as I can see, Mr. Hare has no practical remedy to suggest, and Mr. Digby now despairs of any. But surely the case is not quite hopeless even yet. Land nationalizers insist that if land is made freely accessible to labour all will be well; and, certainly, when every labouring man has the option of taking land for himself, instead of working for someone else, he will have been truly emancipated for the first time in the history of England. But that his right to get land will not save him from famine is, in India at any rate, a matter of sad experience; for, whatever defects it may have, the Madras ryotwari system of land-holding is, in fact, land nationalization, and everyone in Madras can almost always get land direct from the Government if he really wants it, or can do well by emigrating, and can also have land in his village *free of charge* on which to build his humble home.

It is useless to complain of evils unless one is prepared to at least suggest a remedy, and I, unfortunately, have no panacea to offer; but I do think that we should do all in our power to educate the natives to manage their own affairs, and reduce the number of Europeans employed, as far as may be compatible with safety. In other words, I would endeavour to make our rule more "enlightened" and less "selfish" every year, and I am inclined to agree with Mr. Thorburn that the tendency is in that direction, though progress is desperately slow. As I have said elsewhere, Mr. Hyndman's idea that we should extend the Mysore system, with its native administration "under light English guidance," seems the most practicable solution of our troubles that I have yet met with.

It is not likely that an intelligent ryot could be persuaded to sell his

BRITISH LIBRARY

reserves unless he has first fallen into the power of the money-lender; and certainly something might be done by well-to-do friends of India in the way of setting up agricultural banks; but they must be started by natives of the country, as Mr. Nicholson has pointed out in his invaluable report, and will be warmly welcomed by our present enlightened Government. After all, when a man sells his produce, he has (or ought to have) the value of it in cash, and would have it always but for want of "thrift"; the thrifty ones manage to keep it, and do not suffer. Moreover, it is probably true that but for the railways, which it is the fashion with our critics to decry, much of the grain that is exported would never have been grown at all, or would even have rotted on the ground, as it often used to do in inaccessible regions. Mr. Hare's discovery that districts mostly affected by famine are those through which the railways run—as if the railways had caused the famines—reminds me of the pious monk's comment on the goodness of Providence in causing all the great rivers to flow past the great towns. The railways were largely laid out through famine tracts, because they were so liable to famine.

Chapter ii., p. 9.—The most easily accessible stock is *money*—not grain, which is liable to all kinds of damage. It is not quite true that "the controllers of land and capital *always* pursue the working classes to their doom" (p. 11). On the contrary, the more intelligent and thrifty of the working classes frequently displace the others. I should say history familiarizes us with some famines in the old times which were even more terrible than any we have now, and when nothing was done to alleviate them. It is *not true* that "man" in those days "grappled with Nature, and was able to avert by common-sense the inevitable starvation." On the contrary, in those famines cannibalism was not uncommon, and even Brahmins were often reduced to eating dogs. "Common-sense," or, in other words, "thrift," would often avert starvation even now. Mr. Hare seems to recommend a return to the system of collecting the revenue in kind—the worst system ever known, as he will see by reading a report of the Hon. A. Seshiah Shastri on the State of Puducottah in 1881. I have had some experience of that system myself in Puducottah, and I know that Seshiah is entirely right. Under the old communal system no progress was possible, but that may be Mr. Hare's reason for approving of it.

The argument that because under British rule land has become more valuable (or, rather, individual rights to land have been largely developed), *therefore* the owners are worse off than before, because they are tempted to mortgage their land, and so get into debt, seems somewhat paradoxical to the ordinary mind, but is supported by Mr. Thorburn, and has been accepted as a basis of legislation in the Punjab. I cannot believe that any such legislation would be endured in Madras, where private property in land has existed for at least a century.

Some of Mr. Hare's statements are open to question. For instance, he says "Lord Curzon *will not* devote himself to the causes of famine or its prevention." But how can he possibly have any information on that subject? Lord Curzon may decline to speak because he has not satisfied himself as to the real causes of famine, or how it is to be prevented; but,

BRITISH LIBRARY

as a matter of fact, we know from a recent resolution that he has been devoting a good deal of thought to the question, and has practically accepted some of the suggestions recently made for mitigating the rigour of collection. In a note on p. 18 it is stated that "between one and two million die of insufficient food in every year of so-called plenty." I doubt if there is any good authority for such a statement. A great many—perhaps rather a larger proportion than in England—always suffer from "insufficient food," and some, no doubt, die of starvation and misery every year in both countries, but hardly, I think, a million. I am not aware if there are any trustworthy statistics as to the comparative prevalence of suicide in India and Europe, but I should be surprised if suicide from want and misery was not more common in Europe, (except, of course, amongst widows,) than in India. The digest of Lord Curzon's speech on pp. 18, 19, and the statement that all the officials in India and a great many others have conspired to say what they know to be untrue, is not very intelligible to me, but is certainly very libellous and offensive. It is strange that so many writers seem to think officials have neither the feelings nor the rights of ordinary people, and may be grossly insulted without the smallest hesitation. Speaking as an official myself, I have no doubt they are generally quite as conscientious as their critics.

The real question is, Why the ryots, when they have sold their produce, have no money in their pockets to buy food. That the unskilled labouring classes have none is not unusual or surprising, and the only remedy for them against starvation is to receive their wages in grain or emigrate, as many of them do in the South of India. Emigration is their great weapon when their employers are unjust, and many are the devices resorted to by the large farmer to keep his serfs at home one of the commonest being to keep a loan running against them, and a udgment of the court held over them *in terrorem*—not for actual use, except in case of attempted flight.

As to the interesting table on p. 25, it must be remembered that it was not till the Orissa famine of 1865 that we as a nation became fully alive to our responsibilities in this matter. The really terrible loss of life on that occasion aroused such indignation that for some time there was certainly a tendency to find famines where none existed—as, for instance, in Bengal in 1873—and scarcity was sometimes exaggerated into famine by district officers afraid of being charged with losing a single life contrary to the stringent orders then in force. It was partly in consequence of this feeling that the number of famines largely increased since 1865, so that we have nine famines in the thirty-five years from 1866 to 1900, and, unfortunately a greater number of provinces were affected in the two last than in any previous years. Then it will be observed that Madras seems to have suffered more constantly than any other province, with eleven famines in 119 years—from 1781 to 1900; but it must be remembered that Madras extends from Ganjam to Tinnevelly, 950 miles, with a breadth of 450, and an area of more than 138,000 square miles, with a great variety of climates, so that there will often be famine in one part of it while there are copious harvests in another; and the great famine of 1877 was the only one that

BRITISH LIBRARY

was at all general. It need hardly be added that none of them affected the river-irrigated districts.

Mr. Hare's final recommendation is that "the affairs of India must be administered in the interest of her people, and not in the interest of the people who receive their annual tribute of £30,000,000." That either means that all the Europeans are to leave the country or that they are to give their services gratuitously. Does Mr. Hare seriously contemplate either alternative as an immediate remedy?

J. B. PENNINGTON.

March, 1902.

AN IMPENDING FAMINE IN INDIA—A FORECAST.

(FROM OUR INDIAN CORRESPONDENT.)

It is generally acknowledged by Indian authorities that failure of monsoon and famine are convertible terms.

Lord Curzon most emphatically declared in a recent Government resolution that the relation, as of cause and effect, between a good rainfall, abundant crops, and agricultural prosperity on the one hand, is not more obvious than that between a bad monsoon, failure of crops, and a starving population on the other.

Such being the case, I venture to predict that the year 1902 will be memorable in Indian history chiefly for a famine of unprecedented severity, affecting large tracts of country, and causing untold misery to the people and loss of revenue to the Government.

I base my prediction upon a general experience of the Indian climate for several decades past, and also upon the fact that this year the cold weather temperature—*i.e.*, since the commencement of January—has been on an average about twelve degrees higher over the greater portion of the Indian peninsula than it should be, as compared to previous years. I may note here what has doubtless been observed by others, that the mango-trees have commenced to blossom about six months before their time—at least, in this part of India, the N.W. Provinces—which is a very bad sign.

An abnormally high temperature in the winter months means an early hot weather of exceptional severity. It also means a prolonged hot weather and delay in the advent of the periodical S.W. monsoon.

The result of these conditions will be that the soil will get thoroughly baked and hard as iron between now (February 7) and, say, June 15 next, rendering all agricultural operations difficult and unsatisfactory, and cattle will suffer terribly from want of grass. I have lived many years in India, and am not exaggerating when I tell you that already (February) there is great scarcity of grass in this the most fertile part of India, viz., the Gangetic valley. What it will be like in June I am afraid to think.

I have said above that the soil will get thoroughly baked and hard, and I may add that this condition will be greatly aggravated by the want of trees, which is a very noticeable feature in the plains of India—at least, in the Panjab and the N.W. Provinces of India. The protection which the shade of trees gives to excessive evaporation of moisture and drying of soil is wanting to a lamentable extent, and, whatever the causes, India

Qatar National Library

BRITISH LIBRARY

is fast becoming a vast, arid waste—so far, at least, as these provinces are concerned.

One thing leads to another, and the result of this excessive baking and drying of soil for some six months before the advent of the S.W. monsoon will be that the whole volume of atmosphere over the Indian peninsula from north to south, and from east to west, will be abnormally heated up and deficient in humidity, which is a necessary factor in the production of rain-bearing clouds, and this defective production of rain-bearing clouds must, in its turn, lead to the general failure of the S.W. monsoon for 1902.

It is this abnormal local condition of an enormous volume of dry and heated atmosphere all over India, antecedent to the advent of the S.W. monsoon, which, I think, largely determined the total quantity of rain which that monsoon would give. Why is it that Siam, Burma, Assam, Manipur, Chin-Lushai, and Bengal proper seldom or never suffer from a total failure of rains? It is because these countries are well wooded and their climate more or less moist all the year round. The Meteorological Department in India, and the Indian public generally, ignore, I think, the local condition above described, and believe that the causes of a good or bad monsoon are entirely outside India, in the Indian Ocean and the countries to the S.W. of that ocean. This, I think, is a mistake. It is reasonable to suppose that the total production of rain-bearing clouds in the Indian Ocean, and the strength of the S.W. wind that brings these clouds from the ocean to India, are important factors in the quality of the monsoon; but what I believe is that, no matter how favourable to a good monsoon these factors may be, their favourable influence is rendered negative by an unfavourable "local condition" obtaining in India prior to the advent of the monsoon. If it takes two to make a quarrel, it also takes two to produce a good monsoon in India. Both external and internal causes must be taken into consideration. This year the heat promises to be phenomenal and the humidity very small, so, if my theory be correct, the S.W. monsoon will be poor and a famine may safely be predicted, while the fact that the spring crops in the Panjab dependent upon winter rains have almost entirely failed already will not tend to improve the situation.

Unfortunately, this "local condition" of excessive heat and dryness of atmosphere threatens to recur every year and thus become permanent, as India is now greatly denuded of trees and the absence of protection of shade in controlling excessive heat and dryness has likewise become permanent. One might be led to think from this that the gradual reafforestation of India (how nice it sounds!) is the one thing needful for India; in fact, this suggestion has been publicly made, and it is to show that it is economically unsound that I refer to it here. However fascinating the idea may be to convert India into a primeval forest once again, a little consideration will show that it will not be expedient to carry out the idea. India is essentially an agricultural country—it never will be anything more in spite of all fine talk about high education and technical industry—and for agriculture you want open fields and not forests. It is certain that you

BRITISH LIBRARY

cannot have fields and forests growing upon the same spot any more than two lines can occupy the same space, and anything like a general reafforestation of India is therefore out of the question. It may be laid down as an axiom that as populations increase forests must decrease, and the population of India now stands somewhere near three hundred millions. By all means plant your trees where there may be waste and fallow lands, but I doubt if their total effect upon the rains will be anything appreciable.

The moral of it all is that the Government of India will do well to take time by the forelock and to undertake extensive irrigation works over the length and breadth of the country before it becomes another Sahara Desert by the end of, say, the year 2400—*i.e.*, in another 500 years—though this, I think, is a very liberal calculation.

Much time has been lost by Indian economists, but it is never too late to begin. India is fortunate in having in Lord Curzon an energetic Viceroy and a far-seeing statesman, and it is a happy augury of the times that he has appointed an Irrigation Commission with a very able officer as its president, whose deliberations soon ought to be in print. I only hope this Commission will recommend no cheese-paring policy, as half-measures are always unsatisfactory.

Nature has provided India with many mighty rivers, the waters of which, alas! find their way to the ocean year in, year out. If only a quarter of the water that is thus wasted were turned to account, what a different story it would be! India would doubtless be a rich and prosperous country beyond the wildest dreams of avarice, and the gaunt spectre of famine laid low for ever.

It is true we have some irrigation works in India, but, unfortunately, it is also true that the amount of land for which irrigation is available is as yet a mere fraction of the land totally dependent upon rainfall for cultivation; and if, as recently stated somewhere, irrigation pays 6 per cent. upon the outlay, it is past all understanding why the Indian Government do not boldly go forward and devise means for irrigating the whole country without further heckling. What the Nile is to the Egyptians the Ganges, the Brahmaputra, and a hundred other mighty rivers in India should be to the Indians.

In America President Roosevelt lately declared that in the western countries of the States, irrigation should be extensively adopted, as those countries can feed untold millions of people if so irrigated, and, depend upon it, Roosevelt will do what he will say, no matter what it may cost. It is necessary for India, I think, to follow the good example of Egypt and America in this respect, or permanent bankruptcy and ruin must result in the long-run.

It has been calculated that the Government of India have spent a hundred millions sterling upon railways within the last twenty years, while they have spent only twelve millions sterling upon irrigation works within the same period. Whatever be the reasons for this rush of railways in the past, it is certain that in the future policy of the Government of India irrigation must take precedence of railways, or an economic crisis will

inevitably result in the near future, presuming that bad monsoons will be the rule and good ones the exception in future years.

One word more and I have done. We have a Meteorological Department in India whose business it is to collect and publish information on different points connected with the monsoon, and to issue forecasts. The information they give is generally worded in such vague and mystical language that few can understand it or draw any conclusions from it. Instead of an endless repetition of such expressions as "centre of depression," "mean temperature," "cyclonic area," and other choice expressions which are crammed down the throats of the public with painful monotony, if they will condense their reports and issue a forecast fortnightly or monthly, and merely say that the monsoon will be strong or weak for such and such a part of India and for such and such a period, the Department might be able to justify its existence.

It is to be hoped that they will issue their first forecast soon, and that it will be a little more cheerful than mine.

INDIA, *February* 7, 1902.

AGREEMENT BETWEEN GREAT BRITAIN AND JAPAN.

The Marquis of Lansdowne, in forwarding the recent Treaty to His Majesty's Minister at Tôkio, Sir C. MacDonald, explains that this agreement may be regarded as the outcome of the events which have taken place during the last two years in the Far East, and of the part taken by Great Britain and Japan in dealing with them.

"Throughout the troubles and complications which arose in China consequent upon the Boxer outbreak and the attack upon the Peking Legations, the two Powers have been in close and uninterrupted communication, and have been actuated by similar views.

"We have each of us desired that the integrity and independence of the Chinese Empire should be preserved; that there should be no disturbance of the territorial *status quo* either in China or in the adjoining regions; that all nations should, within those regions, as well as within the limits of the Chinese Empire, be afforded equal opportunities for the development of their commerce and industry; and that peace should not only be restored, but should, for the future, be maintained.

"From the frequent exchanges of views which have taken place between the two Governments, and from the discovery that their Far Eastern policy was identical, it has resulted that each side has expressed the desire that their common policy should find expression in an international contract of binding validity.

"We have thought it desirable to record in the preamble of that instrument the main objects of our common policy in the Far East to which I have already referred, and in the first article we join in entirely disclaiming any aggressive tendencies either in China or Corea. We have, however, thought it necessary also to place on record the view entertained by both the High Contracting Parties, that should their interests as above described be endangered, it will be admissible for either of them to take such

BRITISH LIBRARY

measures as may be indispensable in order to safeguard those interests, and words have been added which will render it clear that such precautionary measures might become necessary and might be legitimately taken, not only in the case of aggressive action or of an actual attack by some other Power, but in the event of disturbances arising of a character to necessitate the intervention of either of the High Contracting Parties for the protection of the lives and property of its subjects.

"The principal obligations undertaken mutually by the High Contracting Parties are those of maintaining a strict neutrality in the event of either of them becoming involved in war, and of coming to one another's assistance in the event of either of them being confronted by the opposition of more than one hostile Power. Under the remaining provisions of the Agreement the High Contracting Parties undertake that neither of them will, without consultation with the other, enter into separate arrangements with another Power to the prejudice of the interests described in the Agreement, and that whenever those interests are in jeopardy they will communicate with one another fully and frankly.

"The concluding article has reference to the duration of the Agreement, which, after five years, is terminable by either of the High Contracting Parties at one year's notice.

"His Majesty's Government have been largely influenced in their decision to enter into this important contract by the conviction that it contains no provisions which can be regarded as an indication of aggressive or self-seeking tendencies in the regions to which it applies. It has been concluded purely as a measure of precaution, to be invoked, should occasion arise, in the defence of important British interests. It in no way threatens the present position or the legitimate interests of other Powers. On the contrary, that part of it which renders either of the High Contracting Parties liable to be called upon by the other for assistance can operate only when one of the allies has found himself obliged to go to war in defence of interests which are common to both, when the circumstances in which he has taken this step are such as to establish that the quarrel has not been of his own seeking, and when, being engaged in his own defence, he finds himself threatened, not by a single Power, but by a hostile coalition.

"His Majesty's Government trust that the Agreement may be found of mutual advantage to the two countries, that it will make for the preservation of peace, and that, should peace unfortunately be broken, it will have the effect of restricting the area of hostilities.

"THE EXACT TEXT OF THE AGREEMENT.

"The Governments of Great Britain and Japan, actuated solely by a desire to maintain the *status quo* and general peace in the extreme East, being moreover specially interested in maintaining the independence and territorial integrity of the Empire of China and the Empire of Corea, and in securing equal opportunities in those countries for the commerce and industry of all nations, hereby agree as follows :

BRITISH LIBRARY

"ARTICLE I.

"The High Contracting Parties having mutually recognised the independence of China and of Corea, declare themselves to be entirely uninfluenced by any aggressive tendencies in either country. Having in view, however, their special interests, of which those of Great Britain relate principally to China, while Japan, in addition to the interests which she possesses in China, is interested in a peculiar degree politically, as well as commercially and industrially, in Corea, the High Contracting Parties recognise that it will be admissible for either of them to take such measures as may be indispensable in order to safeguard those interests if threatened either by the aggressive action of any other Power, or by disturbances arising in China or Corea, and necessitating the intervention of either of the High Contracting Parties for the protection of the lives and property of its subjects.

"ARTICLE II.

"If either Great Britain or Japan, in the defence of their respective interests as above described, should become involved in war with another Power, the other High Contracting Party will maintain a strict neutrality, and use its efforts to prevent other Powers from joining in hostilities against its ally.

"ARTICLE III.

"If in the above event any other Power or Powers should join in hostilities against that ally, the other High Contracting Party will come to its assistance and will conduct the war in common, and make peace in mutual agreement with it.

"ARTICLE IV.

"The High Contracting Parties agree that neither of them will, without consulting the other, enter into separate arrangements with another Power to the prejudice of the interests above described.

"ARTICLE V.

"Whenever, in the opinion of either Great Britain or Japan, the above-mentioned interests are in jeopardy, the two Governments will communicate with one another fully and frankly.

"ARTICLE VI.

"The present Agreement shall come into effect immediately after the date of its signature, and remain in force for five years from that date.

"In case neither of the High Contracting Parties should have notified twelve months before the expiration of the said five years the intention of terminating it, it shall remain binding until the expiration of one year from the day on which either of the High Contracting Parties shall have denounced it. But if, when the date fixed for its expiration arrives, either ally is actually engaged in war, the alliance shall, *ipso facto*, continue until peace is concluded.

"In faith whereof the Undersigned, duly authorized by their respective

Governments, have signed this Agreement, and have affixed thereto their seals.

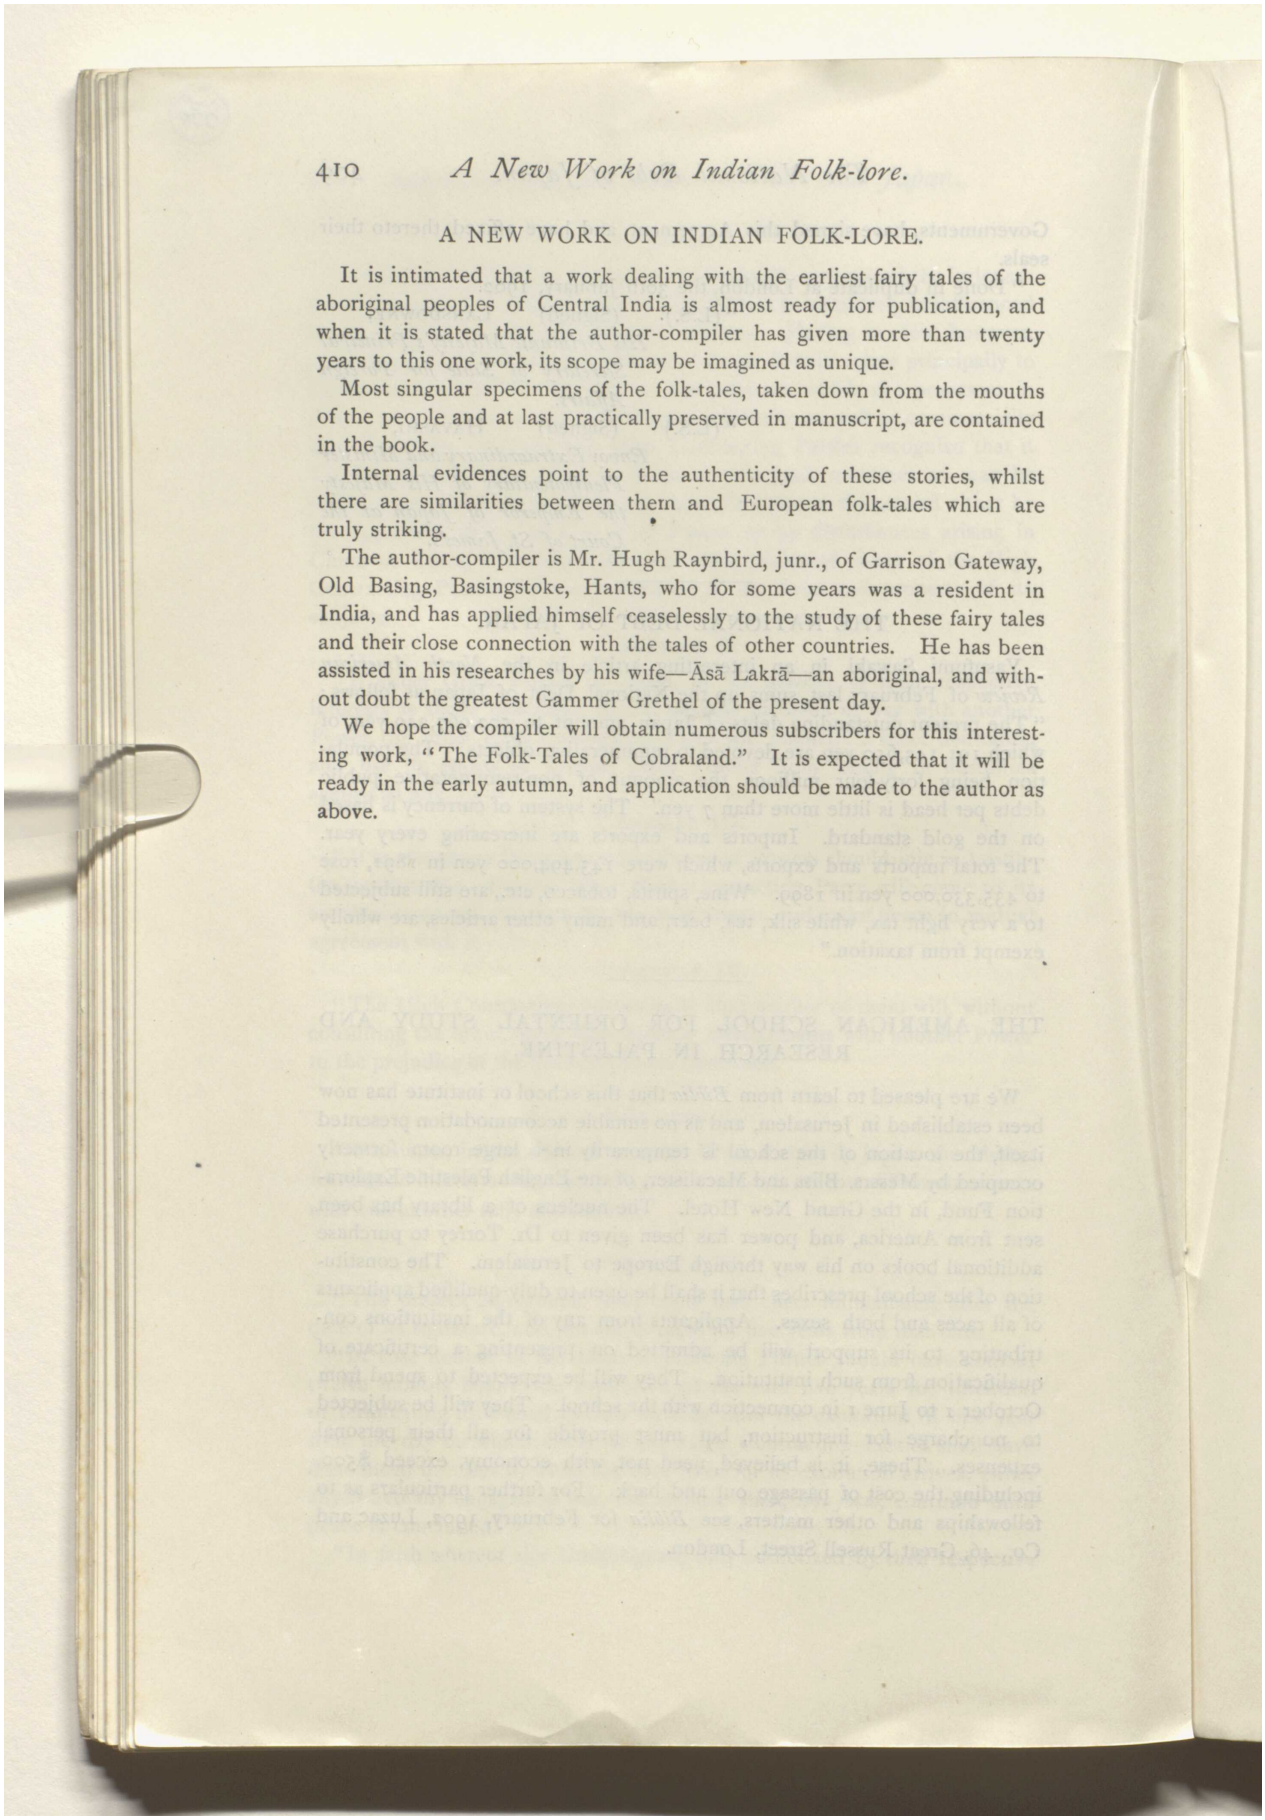
"Done in duplicate at London, the 30th January, 1902.

"(L.S.) (Signed) LANSDOWNE,
His Britannic Majesty's Principal Secretary of State for Foreign Affairs.

"(L.S.) (Signed) HAYASHI,
Envoy Extraordinary and Minister Plenipotentiary of His Majesty the Emperor of Japan at the Court of St. James's."

THE NATIONAL DEBT OF JAPAN.

Yasufumi Sawaki, in an interesting article in the *North American Review* of February last, sums up the National Debt of Japan as follows: "The present outstanding debts of Japan amount to 502,967,249 yen, of which 191,143,650 yen are devoted to remunerative objects. The population being forty-four millions, the amount of non-remunerative public debts per head is little more than 7 yen. The system of currency is based on the gold standard. Imports and exports are increasing every year. The total imports and exports, which were 143,494,000 yen in 1891, rose to 435,330,000 yen in 1899. Wine, spirits, tobacco, etc., are still subjected to a very light tax, while silk, tea, beer, and many other articles, are wholly exempt from taxation."



THE AMERICAN SCHOOL FOR ORIENTAL STUDY AND RESEARCH IN PALESTINE.

We are pleased to learn from *Biblia* that this school or institute has now been established in Jerusalem, and as no suitable accommodation presented itself, the location of the school is temporarily in a large room formerly occupied by Messrs. Bliss and Macalister, of the English Palestine Exploration Fund, in the Grand New Hotel. The nucleus of a library has been sent from America, and power has been given to Dr. Torrey to purchase additional books on his way through Europe to Jerusalem. The constitution of the school prescribes that it shall be open to duly-qualified applicants of all races and both sexes. Applicants from any of the institutions contributing to its support will be admitted on presenting a certificate of qualification from such institution. They will be expected to spend from October 1 to June 1 in connection with the school. They will be subjected to no charge for instruction, but must provide for all their personal expenses. These, it is believed, need not, with economy, exceed $500, including the cost of passage out and back. For further particulars as to fellowships and other matters, see *Biblia* for February, 1902, Luzac and Co., 46, Great Russell Street, London.

A NEW WORK ON INDIAN FOLK-LORE.

It is intimated that a work dealing with the earliest fairy tales of the aboriginal peoples of Central India is almost ready for publication, and when it is stated that the author-compiler has given more than twenty years to this one work, its scope may be imagined as unique.

Most singular specimens of the folk-tales, taken down from the mouths of the people and at last practically preserved in manuscript, are contained in the book.

Internal evidences point to the authenticity of these stories, whilst there are similarities between them and European folk-tales which are truly striking.

The author-compiler is Mr. Hugh Raynbird, junr., of Garrison Gateway, Old Basing, Basingstoke, Hants, who for some years was a resident in India, and has applied himself ceaselessly to the study of these fairy tales and their close connection with the tales of other countries. He has been assisted in his researches by his wife—Āsā Lakrā—an aboriginal, and without doubt the greatest Gammer Grethel of the present day.

We hope the compiler will obtain numerous subscribers for this interesting work, "The Folk-Tales of Cobraland." It is expected that it will be ready in the early autumn, and application should be made to the author as above.

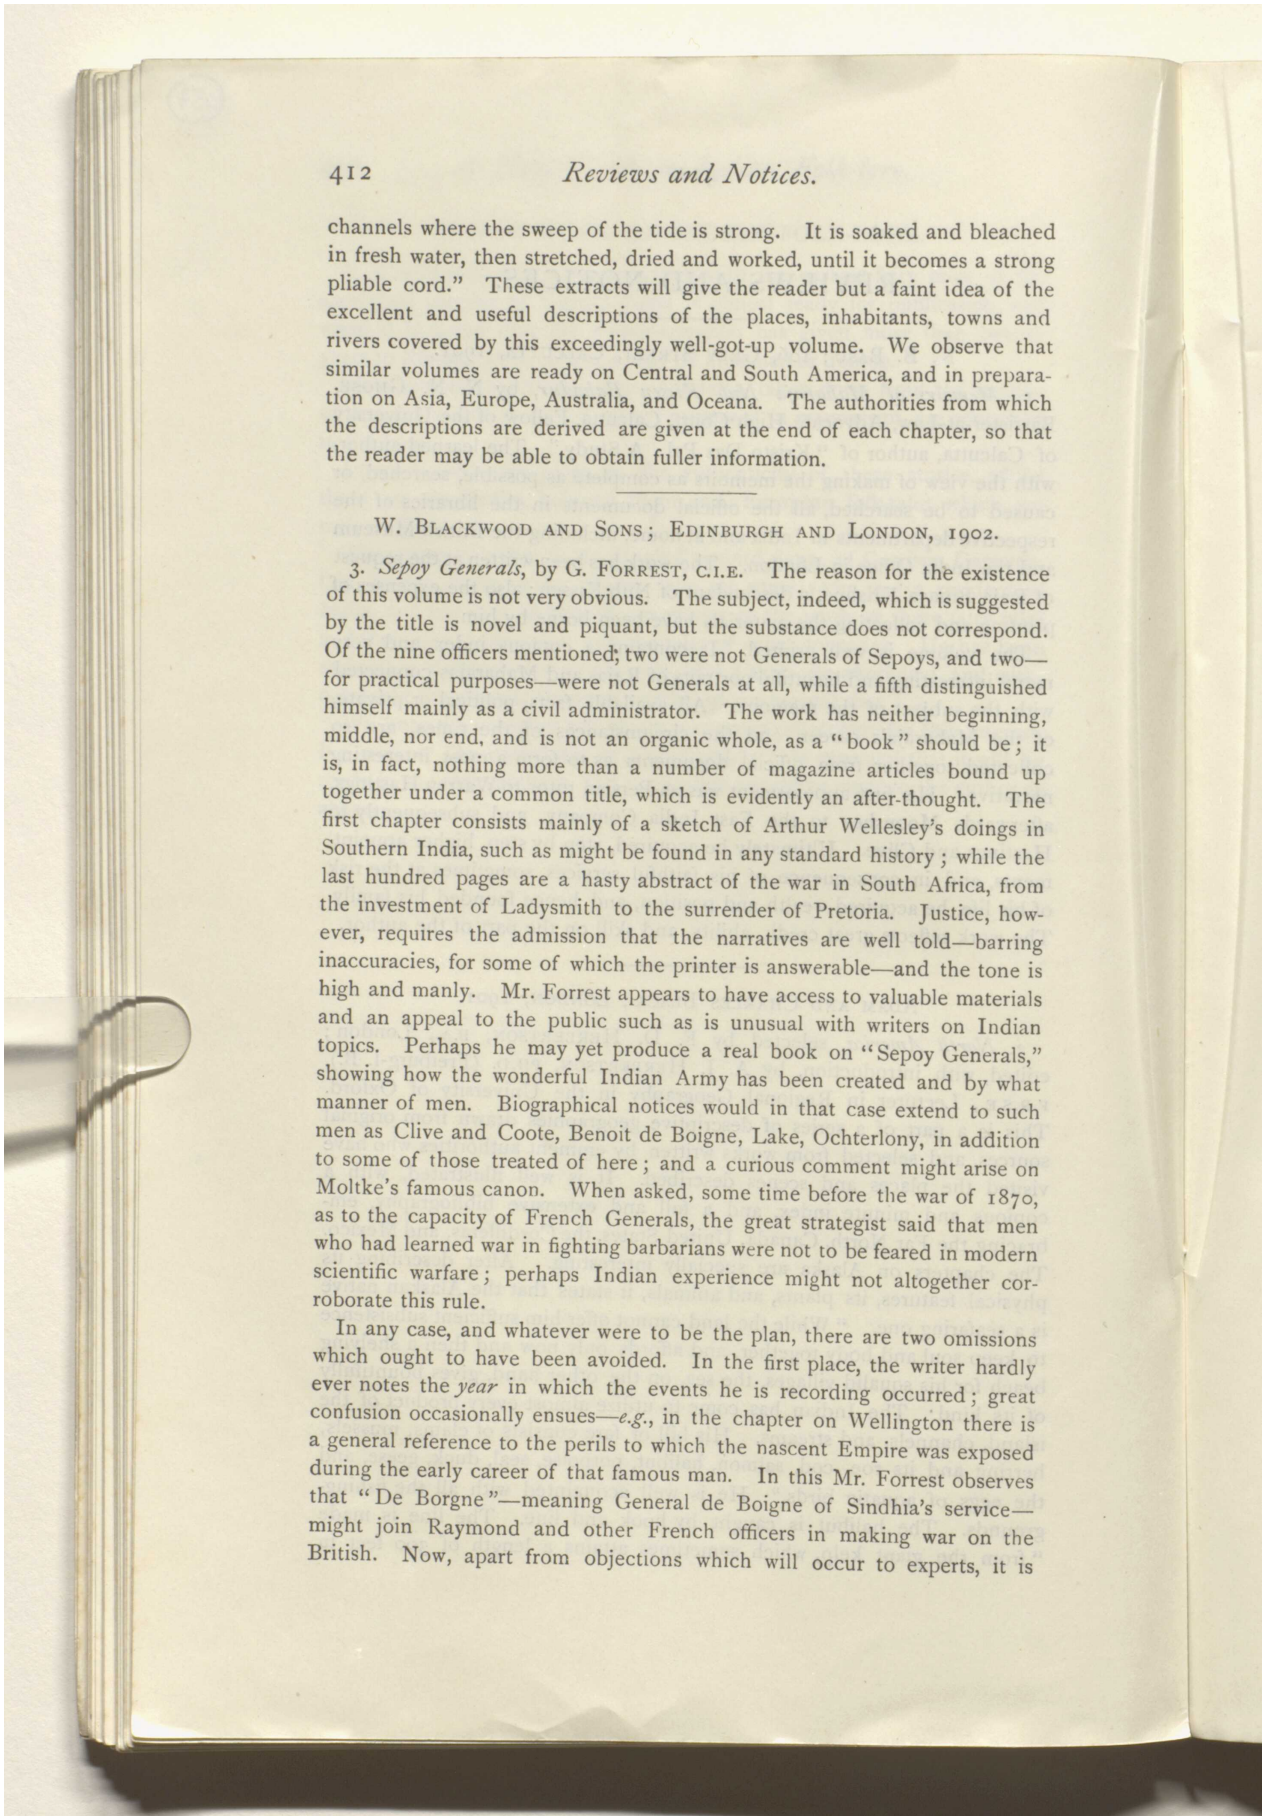
REVIEWS AND NOTICES.

K. B. Basu; 106, Grey Street, Calcutta, 1901.

1. *Memoirs of Maharaja Nub Kissen Bahadur*, by N. N. Ghose, Barrister-at-Law, Advocate High Court, Calcutta, Fellow of the University of Calcutta, author of "Kristo Das Pal: A Study." The learned author, with the view of making the memoirs as complete as possible, searched, or caused to be searched, all the official documents in the libraries of the respective departments in India and at home, including the British Museum and the India Office in London. The work has been written at the request of Raja Binaya Krishna, a descendant of Nub Kissen; also the expenses of printing and collecting the materials have been borne by him.

The volume is well printed. It contains a copious index, and very many interesting and beautiful portraits of Rajas and Maharajas connected with the subject of the memoirs. All available facts, political or private, of the Maharaja's career, and the circumstances of the times, are so collected together from official documents as to form a most interesting narrative. His first appointment was as Persian tutor to Warren Hastings, afterwards Moonshee to the East India Company, and subsequently to Hastings and Clive. Ultimately he acquired, step by step, higher appointments, and in consequence of his faithful services, sometimes at the risk of his life, he acquired wealth and position, and hence founded his family. The work reflects great credit, ability, and skill on the part of the author.



Adam and Charles Black; London, 1901.

2. *North America*, selected by F. D. Herbertson, B.A., London; edited, with introduction, by A. J. Herbertson, Ph.D. (Freiburg-i. B.), F.R.S.E., Lecturer in Regional Geography in the University of Oxford. This is a part of a series of descriptive geographies drawn from original sources, and selected from works written by eminent authorities who have visited the places and scenes described. It is well illustrated, with a copious and minute index, and a full and extensive bibliography, embracing the Far North, Canada, United States, the Cordilleras, and Mexico. The chapters on Alaska are specially interesting. After describing its physical features, its plants, and animals, it states that the Alaskan native is a seafaring one. "While the land cannot offer him sufficient subsistence to keep soul and body together, and affords only now and then a shelving beach for his squalid villages, the sea, on the other hand, gives bountifully of its kind. The Indian has come to utilize almost every product of the island, channels, and streams. His bill of fare consists of clams, mussels, herring and its roe, cod, salmon, halibut, porpoise, seal, duck, geese, and the eggs of aquatic birds." He is well acquainted with all the fishing-grounds. The halibut is caught by hook and line. The line is made "from the giant kelp, which sometimes attains a length of 300 feet in

BRITISH LIBRARY

channels where the sweep of the tide is strong. It is soaked and bleached in fresh water, then stretched, dried and worked, until it becomes a strong pliable cord." These extracts will give the reader but a faint idea of the excellent and useful descriptions of the places, inhabitants, towns and rivers covered by this exceedingly well-got-up volume. We observe that similar volumes are ready on Central and South America, and in preparation on Asia, Europe, Australia, and Oceana. The authorities from which the descriptions are derived are given at the end of each chapter, so that the reader may be able to obtain fuller information.

W. Blackwood and Sons; Edinburgh and London, 1902.

3. *Sepoy Generals*, by G. Forrest, C.I.E. The reason for the existence of this volume is not very obvious. The subject, indeed, which is suggested by the title is novel and piquant, but the substance does not correspond. Of the nine officers mentioned, two were not Generals of Sepoys, and two—for practical purposes—were not Generals at all, while a fifth distinguished himself mainly as a civil administrator. The work has neither beginning, middle, nor end, and is not an organic whole, as a "book" should be; it is, in fact, nothing more than a number of magazine articles bound up together under a common title, which is evidently an after-thought. The first chapter consists mainly of a sketch of Arthur Wellesley's doings in Southern India, such as might be found in any standard history; while the last hundred pages are a hasty abstract of the war in South Africa, from the investment of Ladysmith to the surrender of Pretoria. Justice, however, requires the admission that the narratives are well told—barring inaccuracies, for some of which the printer is answerable—and the tone is high and manly. Mr. Forrest appears to have access to valuable materials and an appeal to the public such as is unusual with writers on Indian topics. Perhaps he may yet produce a real book on "Sepoy Generals," showing how the wonderful Indian Army has been created and by what manner of men. Biographical notices would in that case extend to such men as Clive and Coote, Benoit de Boigne, Lake, Ochterlony, in addition to some of those treated of here; and a curious comment might arise on Moltke's famous canon. When asked, some time before the war of 1870, as to the capacity of French Generals, the great strategist said that men who had learned war in fighting barbarians were not to be feared in modern scientific warfare; perhaps Indian experience might not altogether corroborate this rule.

In any case, and whatever were to be the plan, there are two omissions which ought to have been avoided. In the first place, the writer hardly ever notes the *year* in which the events he is recording occurred; great confusion occasionally ensues—*e.g.*, in the chapter on Wellington there is a general reference to the perils to which the nascent Empire was exposed during the early career of that famous man. In this Mr. Forrest observes that "De Borgne"—meaning General de Boigne of Sindhia's service—might join Raymond and other French officers in making war on the British. Now, apart from objections which will occur to experts, it is

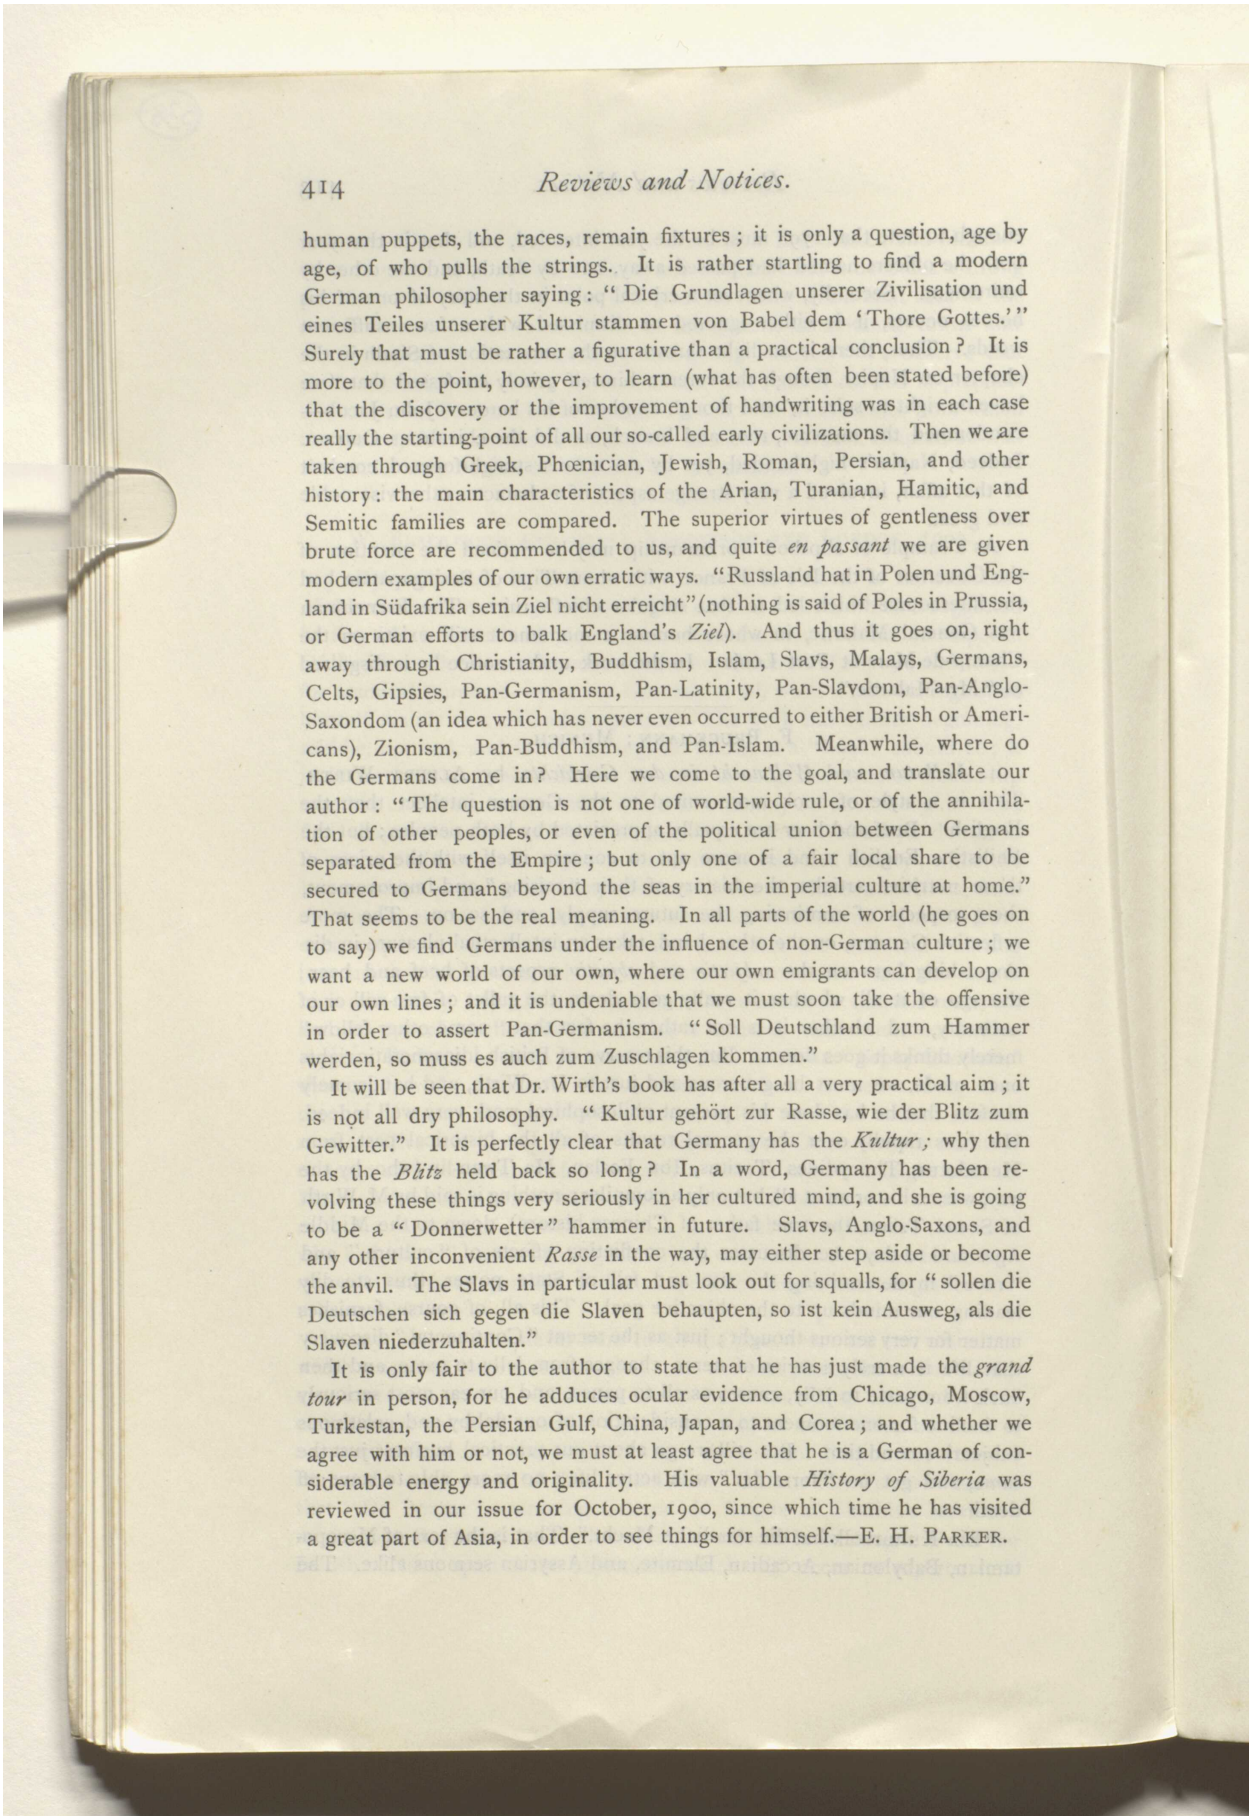
مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

enough to note that 1798 must be the year intended, and that in that year both the officers named had passed away, one by death, and the other by retirement. Secondly, whenever a critical point in the story of one of his heroes occurs, it is either ignored or dismissed with a few insufficient words. Thus, there is no light thrown on the annexation of Sindh in the chapter on Napier, though the veteran himself grimly confessed that "we have no right to seize it," and though another of his heroes—John Jacob—condemned the measure, root and branch, as did the chivalrous Outram. Indeed, Napier's high-handed, yet by no means straightforward conduct of that affair, involved a very strange aspect of a character otherwise noble and great.

As a sample of slipshod workmanship may be noticed the mention of the Governor of the Isle of France, with whom Tipu of Seringapatam had the intercourse which led to that singular chief's ruin. The Frenchman was General Malartic, in whose honour a monument still exists on the Champ-de-Mars at Port Louis. In the work under notice he is disguised as "Mr. Malartie."

F. Bruckmann; Munich.



4. *Volkstum und Weltmacht in der Geschichte*, by Albert Wirth. This is a style of book more suited to the German intellect than the English. Beef and beer are equally appreciated by both peoples; but the Philistine English mind is more apt to concern itself with the prices of those nutritive articles, the history of their "raising" and improvement, the prospects of continuing the future supply, and so on. The more reflective German, on the other hand, takes an intellectual pleasure in distinguishing between the *subjectiv* and *objectiv* aspects of beef and beer; the *ego* of it all, whether it really goes down the gullet of free-will or of necessity, and whether it is not rather the fact that "some other fellow" merely thinks it goes down. But, this reserve of British idiosyncratic rights once made, we must be generous and just to Dr. Wirth, and handsomely confess that he has done his present philosophical work very well indeed. He runs rapidly over the general results of all the historical past, from Herodotus, Thucydides, Tacitus, Ibn Fozlan, Ma Twan-lin (who, by the way, was no historian at all, but only a compiler; nothing is said by M. Wirth of Sz-ma Ts'ien, the true father of Chinese history), down to the Middle Ages and to-day: he discusses the conflicting effects of "culture" and "race" in determining the rise and fall of State power, thus steadily leading our minds up to the objective goal. This all, of course, furnishes matter for very serious thought; just as the recent "Continental" discovery that life is merely a series of nerve changes from jelly to paste, and then back from paste to jelly, causes us all to pause, and our ear most seriously to incline for one moment to a consideration of our flabby and gelatinous subjective condition. But still we go about our practical business just the same, and get no "forrarder" with active life; no more able to stave off death.

"Ein Kulturvolk hat die staatliche Macht." That is the text of Mesopotamian, Babylonian, Accadian, Elamite, and Assyrian sermons alike. The

BRITISH LIBRARY

human puppets, the races, remain fixtures; it is only a question, age by age, of who pulls the strings. It is rather startling to find a modern German philosopher saying: "Die Grundlagen unserer Zivilisation und eines Teiles unserer Kultur stammen von Babel dem 'Thore Gottes.'" Surely that must be rather a figurative than a practical conclusion? It is more to the point, however, to learn (what has often been stated before) that the discovery or the improvement of handwriting was in each case really the starting-point of all our so-called early civilizations. Then we are taken through Greek, Phœnician, Jewish, Roman, Persian, and other history: the main characteristics of the Arian, Turanian, Hamitic, and Semitic families are compared. The superior virtues of gentleness over brute force are recommended to us, and quite *en passant* we are given modern examples of our own erratic ways. "Russland hat in Polen und England in Südafrika sein Ziel nicht erreicht" (nothing is said of Poles in Prussia, or German efforts to balk England's *Ziel*). And thus it goes on, right away through Christianity, Buddhism, Islam, Slavs, Malays, Germans, Celts, Gipsies, Pan-Germanism, Pan-Latinity, Pan-Slavdom, Pan-Anglo-Saxondom (an idea which has never even occurred to either British or Americans), Zionism, Pan-Buddhism, and Pan-Islam. Meanwhile, where do the Germans come in? Here we come to the goal, and translate our author: "The question is not one of world-wide rule, or of the annihilation of other peoples, or even of the political union between Germans separated from the Empire; but only one of a fair local share to be secured to Germans beyond the seas in the imperial culture at home." That seems to be the real meaning. In all parts of the world (he goes on to say) we find Germans under the influence of non-German culture; we want a new world of our own, where our own emigrants can develop on our own lines; and it is undeniable that we must soon take the offensive in order to assert Pan-Germanism. "Soll Deutschland zum Hammer werden, so muss es auch zum Zuschlagen kommen."

It will be seen that Dr. Wirth's book has after all a very practical aim; it is not all dry philosophy. "Kultur gehört zur Rasse, wie der Blitz zum Gewitter." It is perfectly clear that Germany has the *Kultur*; why then has the *Blitz* held back so long? In a word, Germany has been revolving these things very seriously in her cultured mind, and she is going to be a "Donnerwetter" hammer in future. Slavs, Anglo-Saxons, and any other inconvenient *Rasse* in the way, may either step aside or become the anvil. The Slavs in particular must look out for squalls, for "sollen die Deutschen sich gegen die Slaven behaupten, so ist kein Ausweg, als die Slaven niederzuhalten."

It is only fair to the author to state that he has just made the *grand tour* in person, for he adduces ocular evidence from Chicago, Moscow, Turkestan, the Persian Gulf, China, Japan, and Corea; and whether we agree with him or not, we must at least agree that he is a German of considerable energy and originality. His valuable *History of Siberia* was reviewed in our issue for October, 1900, since which time he has visited a great part of Asia, in order to see things for himself.—E. H. Parker.

DEAN AND SON, LTD.; 160A, FLEET STREET, LONDON, 1901.

5. *My Fourth Tour in Western Australia*, by ALBERT F. CALVERT, F.R.G.S., author of "The Discovery of Australia," "The Exploration of Australia," "The Aborigines of Western Australia," etc. Second edition. A handsome quarto volume of 360 pages, profusely illustrating various places and incidents which came under the author's own personal purview. He has set down, as he himself says, "only such things as I saw and heard during my visit, and in so doing I have, to a large extent, sacrificed my opportunities of unfailing information in order to confine myself to a narrative of personal experiences. In previous books my object has been to advance the interests of the colony, and draw attention to her wonderful, but little-known, resources. But the object of the present volume is to interest and amuse." Apart from the ordinary statistical hand-books, there is no other work yet produced which affords so much accurate information and which creates so much interest. There are beautiful maps, also very numerous sketches of persons, places and incidents. Among the places visited are Albany, Perth, the Goldfields of Coolgardie, Geraldton, Cue, the Murchison, Roebourne, the Coast, Tambourah Creek, Nullagine, Talga-Talga and other places. The work is magnificent, and for the purpose intended it cannot be excelled.

WILLIAM HEINEMANN; LONDON, 1902.

6. *The Garden of Káma, and other Love Lyrics from India*, arranged in verse by LAURENCE HOPE. To give an idea of the merits of this work, it will, perhaps, be fairest to notice, in the first instance, the composition at p. 133, viz., "The Garden of Káma, the Indian Eros," from which its title is derived, and from which we quote as follows:

Verse 1. "The daylight is dying,
The flying fox flying,
Amber and amethyst burn in the sky.
See, the sun throws a late,
Lingering roseate
Kiss to the landscape to bid it good-bye.

Verse 3. "We know not Life's reason,
The length of its season,
Know not if they know, the great Ones above.
We none of us sought it,
And few could support it,
Were it not gilt with the glamour of love."

The story of Lilavanti (p. 73), which is, of course, meant to be intensely pathetic, contains the following description of a drowned "unfortunate":

"By women here, who knew her life,
A leper husband, I am told,
Took all this loveliness to wife
When it was barely ten years old.
And when the child in shock'd dismay
Fled from the hated husband's care,
He caught and tied her, so they say,
Down to his bedside by her hair."

It is really difficult to know where to begin the criticism of such effusions as these, of which the book contains 172, almost equally vapid, full of tawdry sentiment, imperfect metre, and occasional bad grammar. Some of the incidents related appear to describe personal adventures in varied regions of the East, ranging from Burma to Cashmere, and would be worthy of treatment by an abler Muse; while others, such as that of "His Rubies, told by Valgovind," and the story of "Udaipore, told by Lalla-ji, the Priest," are so *outré* as to be unworthy of publication.

A. R.

CHARLES H. KELLY; 2, CASTLE STREET, CITY ROAD, AND 26, PATERNOSTER ROW, LONDON, E.C.

7. *Scenes and Studies in the Ministry of our Lord, with Thoughts on Preaching*, by the REV. JAMES H. RIGG, D.D., Principal of Westminster Training College, twice President of the Wesleyan Conference. This admirable and useful volume, by a veteran educationist and preacher in connection with the Wesleyan denomination, will be read with much interest and no little profit. The "Scenes and Studies" are not sermons, but relate to passages of Scripture of special interest and importance in the history of Christ, such as His Baptism, His First Disciples, the Woman of Samaria at Jacob's Well, the Calling of the Apostles, the Sisters of Bethany, and many other incidents in the history of Christ, which have been favourite subjects of study during Dr. Rigg's long ministry and educational work as the head of the eminent training college in Westminster. Perhaps his History of Preaching in the Christian Church, Ancient and Modern, and his Thoughts on Extemporaneous Preaching, will be perused with special interest and usefulness by the sincere and faithful preachers of the Gospel of all Christian denominations. There is in the Appendix an interesting note on the eloquence and power of Dr. Newton's preaching. He was "charming as a half-colloquial orator; he was pathetic in his strokes of tenderness and pictures of distress; he was thrilling and powerful in his appeals; but he also deserves a reputation which has not always been accorded to him—that of a clear, able, consecutive expositor of Scripture, both textual and doctrinal."

LONGMANS, GREEN AND CO.; LONDON, NEW YORK, AND BOMBAY, 1901.

8. *The Oriental Club and Hanover Square*, by A. F. BAILLIE, F.R.G.S. The sumptuous volume before us is worthy of the spacious and eminently select club which occupies one corner of Hanover Square. The Oriental is an elderly, but not an ancient club; it dates from 1824, and was formed by a distinguished society of Oriental officers, chiefly Anglo-Indians, with the Duke of Wellington for President and Sir John Malcolm for its first chairman. The clubs of the eighteenth century were either dining societies or were devoted to play or politics. They were succeeded by various clubs of the modern fashion when George IV. was King; and among these the Oriental was one of the earliest. The age of the Nabobs had passed; men no longer amassed colossal fortunes, or combined the functions of soldier,

civilian, diplomatist, and merchant all in one; and the age of officials had come in. This new race of Anglo-Indians had spent the better part of their lives in the East; they were out of touch with English politics; their old acquaintances were scattered, their relatives lukewarm, and their interests were mainly centred in each other. And so they founded the Royal Asiatic Society, and out of the Asiatic Society, where men met to read the papers and discuss things new as well as old, the Oriental took shape. The Asiatic has since then given birth to various learned associations, and its social gatherings are still as much appreciated as its lectures, but we do not think it has given rise to another club. Of course, the Oriental did not profess to be merely a sodality of good fellows, meeting because they loved to meet and enjoy their leisure after their own fashion. It took itself quite seriously like many other clubs; it was to instruct the world on the condition of the East. And, as in the case of most other clubs, this part of its programme has fallen into the background; like the Sultan's programmes, it is an excellent make-belief, and a man may enjoy as sound a siesta in its unfrequented library on a warm summer afternoon as in most other club libraries, or even in the British Museum Reading Room. The Oriental started with a very catholic constitution; it admitted all who could show any connection with the East, although they had never been there. This led in 1847 to the creation of a second club for officials only—the East India United Service Club, in St. James's Square. This secession was also, perhaps, partly due to the situation of the Oriental, far away from ordinary "Clubland" in Hanover Square. Our author explains that in the early days of Queen Victoria Anglo-Indian magnates chiefly affected the large and solemn houses in Harley Street and Wimpole Street. The loss of a considerable part (but by no means the whole) of the official element was compensated by amalgamation with the Albert, a club with a literary reputation which had numbered Lord Byron among its members, and so many Bishops that a witty Lord remarked he could not enter the place without being reminded of his Catechism. Since the amalgamation with the Albert, there has been no further change in the constitution of the club, although, like all Anglo-Indian haunts, it has lost something of its distinctive character. Our author gives us some lively glimpses of the generation which frequented the club in the forties and early fifties: the ancient warriors with jingling spurs whose horses were led up and down before the hall door; the sallow-faced, irascible gentlemen who lived on hot curries and tugged at their mustachios; the member who would dine on many courses at 11 p.m.; and the members whose hair-dye stained the club brushes. Among these striking figures of the past the author recognises General Charles Carmichael as a prototype of Colonel Newcome. The General was a man of action. One day when the club committee happened to be sitting, a chop was served not to the General's liking, and the General promptly ordered it to be laid with his compliments, before the committee. The newspaper wits occasionally made fun of these ancient warriors after the not over-refined fashion of the day, and the youthful students of the Royal Academy of Music used to treat them to a fanfaronade of all the wind instruments

from the windows opposite. Since 1860 the club has pursued the even tenor of its prosperous way, disturbed only by those questions which are a standing difficulty with every club committee—the admission of strangers, the rules as to smoking, and the coffee-room expenditure. The Oriental Club evidently regarded the last with a tender eye, for when their *chef* was imprisoned for stealing the club property, the committee pensioned his wife and family. There are many excellent stories scattered through these pages, and the author has made a readable work from unpromising material, but there is one defect: the references to India are very few, but they are generally wrong.

K.

LUZAC AND CO.; 46, GREAT RUSSELL STREET, LONDON, 1901.

9. *Arabic Manual.* A Colloquial Handbook in the Syrian Dialect, for the Use of Visitors to Syria and Palestine, containing a Simplified Grammar, a Comprehensive English and Arabic Vocabulary and Dialogues. The whole in English characters, carefully transliterated, the pronunciation being fully indicated, by F. E. CROW, late H.B.M. Vice-Consul at Beirut. This is No. IV. of Luzac's "Oriental Grammar Series," the other three being "Manual of Hebrew Syntax," "Manual of Hebrew Grammar," and "A Modern Persian Colloquial Grammar." The title fully explains the contents of this handy volume of 333 pages, which is a practical guide to the spoken languages of Syria and Palestine. It will be found most useful by both visitors to the East and students. We can fully recommend it.

MACMILLAN AND CO., LTD.; LONDON, 1901.

10. *The Brahmo Samaj and Arya Samaj in their Bearing upon Christianity:—a Study in Indian Theism*, by FRANK LILLINGSTON, M.A. This little book is the work of a cultured and sympathetic mind, a study from the Christian standpoint of the best-known theistic schools of modern India. The author apparently addresses himself primarily to European readers, although not without a hope that his work may catch the eye of native students also; but in this, as in some other matters, he is occasionally too busy with his own intentions and ideas to explain himself clearly to his audience. The introduction deals with the past history of monotheism in India, but this is much the poorest part of the book. The writer is at his best in dealing with the Brahmo Samaj, where the influence of Western thought, becoming very visible, enables him to get into contact with the Eastern mind. He has sketched fully and clearly the difference between the easy eclecticism of the earlier Samaj, founded by Ram Mohan Rai, and the more ardent and enthusiastic school of Keshab Chander Sen. Ram Mohan Rai, the founder of the original Samaj, who made a fortune as head-clerk in a Government office, and always displayed a lively sense of the good things of this life, was hardly the man to count the world well lost for the love of God. Endowed with a lively intellect, an open mind, and a true admiration for virtue, he was able to found a philosophic school which imparted a certain elevation of character to its disciples,

BRITISH LIBRARY

and incited them to combat some of the grossest abuses of idolatry, but which could not be a seminary of enthusiam or create any radical reform. A further step was necessary, and it was taken by Keshab Chander Sen, a man unlike his predecessor in everything except his openness to impressions from outside the circle of his ancestral creed. Keshab Chander Sen was a born enthusiast, not always consistent, it is true, but always eloquent, ardent, devoted, and emotional, and able to inspire the society which he founded with like feelings to himself. No wonder that he has prospered where the other failed. Mr. Lillingston's criticism of this new creed is just. He points out its subjective character, he says with truth that it sets up individual feeling and intuition as the sole test of objective truth, and he dwells on its want of a historical basis. All this is true and excellently put. Unfortunately, the very points he selects for condemnation are the points which commend it to the Hindoo mind. The dreamy character of Hindoo speculation is always subjective, and the Hindoo mind has rarely, if ever, felt the need of historical truth. Moreover, although Hindoo speculation has always been receptive of external influences, it never abandons its fundamental tenets; it adopts, it syncretises, it assimilates, but it does not radically change. And, above all, a faith which hopes to make converts must flatter the national vanity, it must assume a national basis, and it must exalt the Indian sages, with their aureole of traditional wisdom, to a level with any that the West can boast, if not to a pinnacle above them. This feeling, inherent in every religious movement of the Hindoo mind, is most apparent in Dayanandan Sarasvate's Arya Samaj, whose monotheism is tempered with pronounced hostility to Christianity. At the bottom of the feeling there is a germ of good which must be carefully preserved, if the Hindoo mind is to retain its self-respect; but politics have been the bane of religion in the East, not only of the pagan faiths, but of Muhammadanism and of Christianity itself. How to preserve the good and eradicate the evil is the problem which faces administrator and missionary alike. And for the solution of the problem the first and truest key is sympathy, and of that sympathy this little work shows a generous and abundant proof. K.

11. *Kim*, by RUDYARD KIPLING. A remarkably interesting and instructive story of a certain phase of Indian life, its habits and peculiarities. It is interspersed with graphic descriptions of Indian towns and modes of travelling. It is beautifully illustrated. The author, from his intimate knowledge of Indian ways, has elucidated with accuracy the peculiar trait of Oriental thought and action. Kim is introduced as "white—a poor white of the very poorest." The half-caste woman who looked after him (she smoked opium, and pretended to keep a second-hand furniture shop by the square where the cheap cabs wait) told the missionaries that she was Kim's mother's sister; but his mother had been nursemaid in a Colonel's family and had married Kimball O'Hara, a young colour-sergeant of the Manericks, an Irish regiment. He afterwards took a post on the Sind, Punjab, and Delhi Railway. Kim's mother died, and the father took to drink and loafed about the line with the keen-eyed three-year-old baby. The child became the object of solicitude on the part of societies and

BRITISH LIBRARY

chaplains, as well as the Colonel (as the father said) "of one of the finest regiments of the world." Kim was left an orphan, but became adept as a message-boy, and carried messages of intrigue, during the night, from "sleek and shiny young men of fashion," who usually crowded the house-tops. In his peregrinations he came in contact with the faquirs, who frequent the shrines of Lahore, and from his alacrity and courtesy he was nicknamed "The Little Friend of All the World." He came in contact with a stranger, the like of whom he never saw before. He was old, nearly six feet high, and wore a peculiar garb. He had come from the hills and snow, "where the air and water are fresh and cool"—Bhotiyal (Tibet). He was a lama, on a pilgrimage to see "the Four Holy Places before I die." Kim became his companion and attendant on his pilgrimage to the holy places of Benares. The story details the various incidents during this pilgrimage, and the various grades of characters whom they met, and also an accurate description of the scenes and places on their way, all indicating the life and characteristics and mode of thought of the masses of the people. For a time Kim became separated from the lama, having been induced to enter a school (St. Xavier's), but he did not like the atmosphere and discipline of the school, and, taking advantage of a holiday, contrived to meet the lama, who received him again with fond affection. Having determined to return home from the object of his research, Kim accompanied him to the "mountains and the snow," and remained with him till his death.

METHUEN AND CO.; 36, ESSEX STREET, LONDON, W.C., 1902.

12. *A Short History of the British in India*, by ARTHUR D. INNES, sometime scholar of Oriel College, Oxford. With eight maps. The object of this concise work is to set out clearly and in an attractive form the history of the various steps by which British supremacy was obtained in India. Such a volume forms an excellent basis for a more minute study of larger works. The analytical contents and the chronological summary of the leading events, under classified heads, from 664 to the transfer, in 1858, of the Government of India to the Crown, is extremely useful. There is also a copious index.

JOHN MURRAY; ALBEMARLE STREET, LONDON, 1901.

13. *The Great Persian War and its Preliminaries: a Study of the Evidence, Literary and Topographical*, by G. B. GRUNDY, M.A., Lecturer at Brasenose College and University Lecturer in Classical Geography, Oxford. With illustrations. This volume deals exclusively with the Græco-Persian wars up to the end of 479 B.C. The author gives us fresh evidence as to the old history of these wars, and is of opinion that the treatment of pre-existing evidence is not satisfactory from a historical point of view. "Herodotus' evidence as an historian," he says, "differs greatly in value, according as he is relating facts or seeking to give the motives or causes lying behind them." The book consists of 579 pages, divided into fourteen chapters, under the following headings: Greek and Persian — Persian

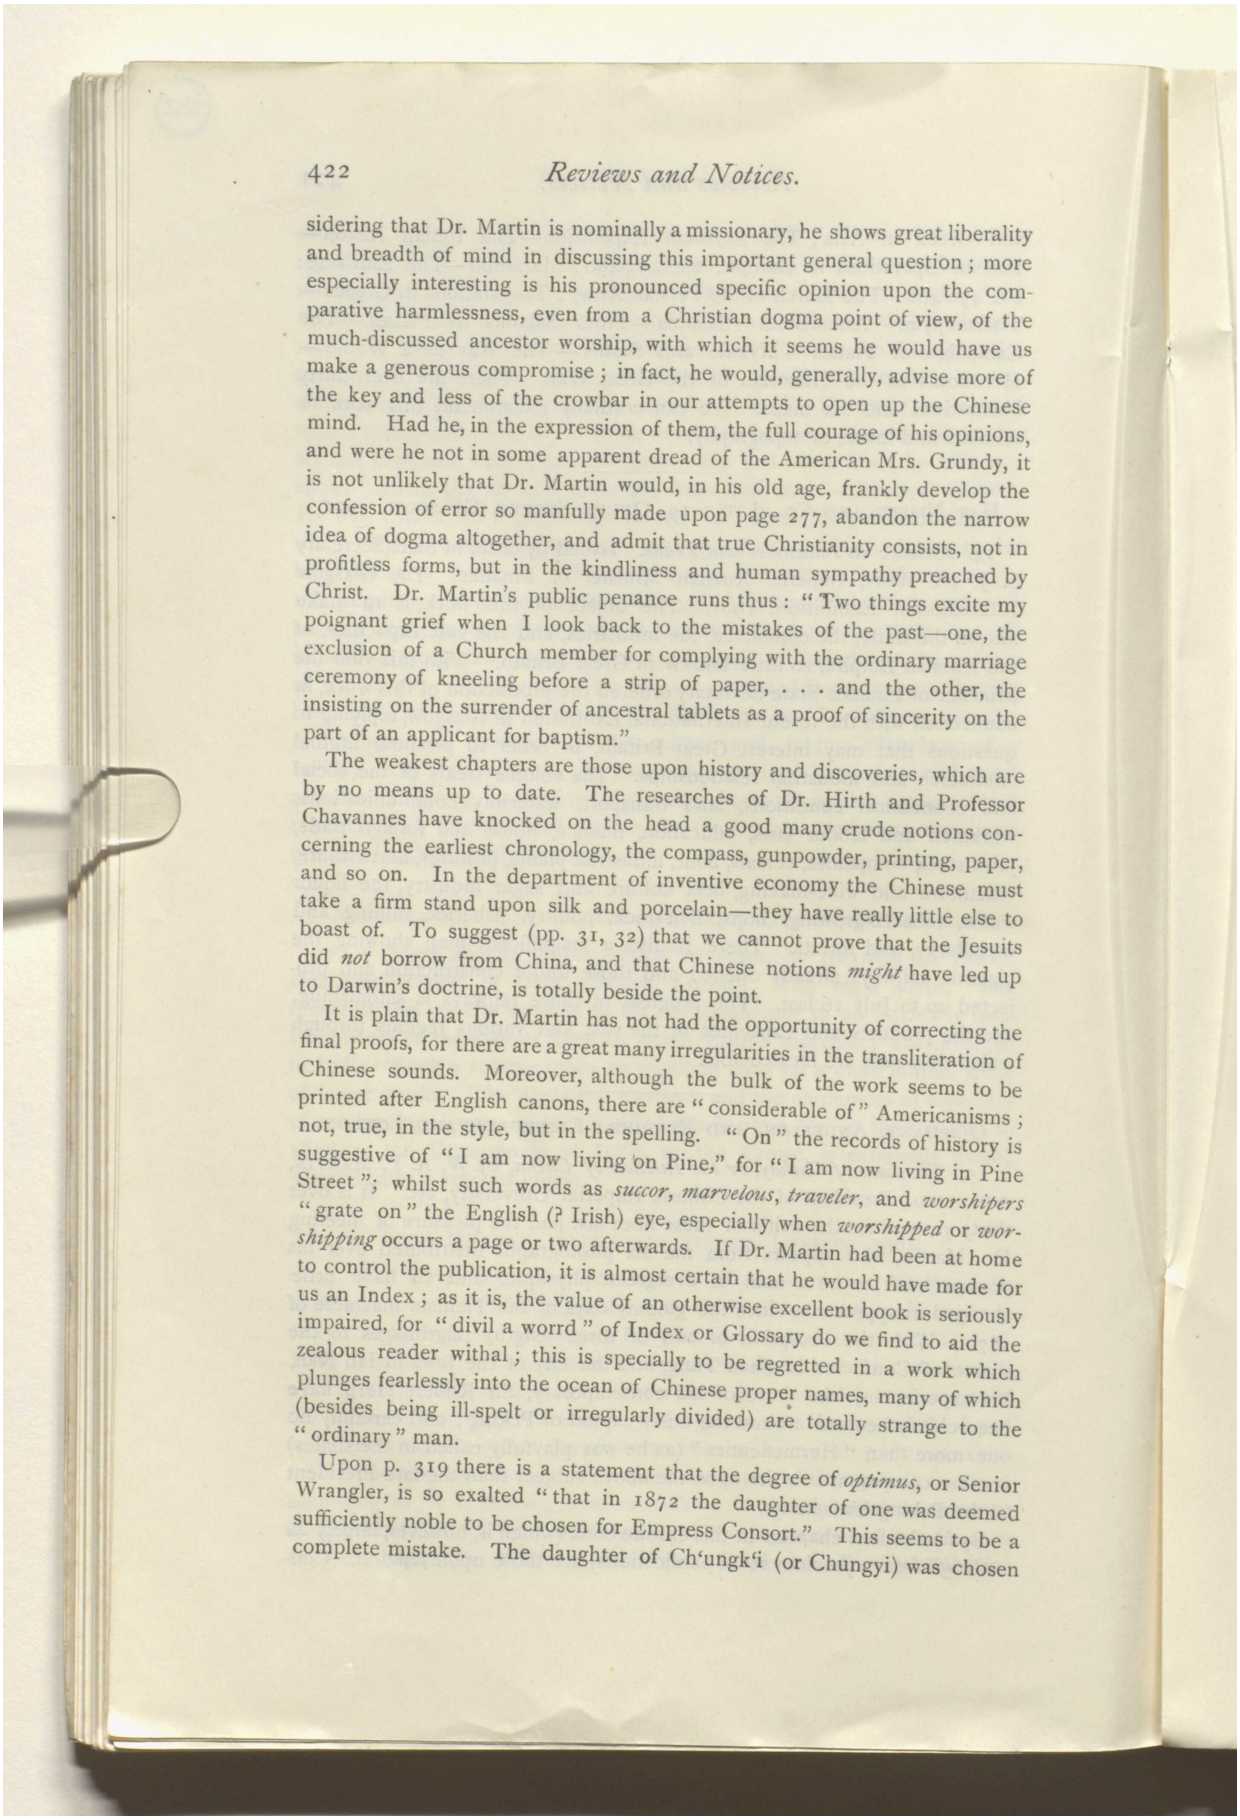
and Greek in Asia; The Scythian Expedition—The Ionian Revolt—Persian Operations in Europe: B.C. 493-490; Marathon—The Entr'acte: B.C. 490-480—The March of the Persian Army: Preparations in Greece—Thermopylæ—Artemisium—Salamis—From Salamis to Platæa—The Campaign of Platæa—Mykale and Sestos—The War as a Whole—Herodotus as the Historian of the Great War. There are over thirty illustrations and six maps. We can cordially recommend this work to scholars and lovers of topography.

HAY NISBET AND CO., LTD.; 19, QUEEN STREET, GLASGOW, 1901.

14. *Russia: its Industries and Trade.* Issued by order of State Secretary S. J. De Witte, Imperial Russian Minister of Finance. The Glasgow International Exhibition, 1901. The object of this work is to make known the trade, the commerce, the industries, and the vast capacities, of the Russian Empire, so little known in Great Britain. With this view the Minister of Finance State Secretary ordered the production of this work, in connection with the recent International Exhibition in Glasgow, replying to questions that may interest Great Britain, in order to promote mutual commerce and industrial relationships. The volume treats of the social and economical conditions, land transport, waterway communications, workmen and labour laws, education, finance, home and foreign trade, joint stock companies, cereals, flour, industrial plants, pastures, horticulture, viticulture and wine-making, beet culture and sugar industry, the liquor traffic, tobacco-growing, hops, live-stock, poultry, fisheries, mining and metallurgy, and forests. There is also a magnificent map showing the gigantic railways already opened and those under construction and projected up to July 16 last. The progress of those railways is astonishing, and the products and capacities of the vast and various regions through which they pass are incalculable.

OLIPHANT, ANDERSON, AND FERRIER; EDINBURGH AND LONDON.



15. *The Lore of Cathay, or the Intellect of China*, by W. A. P. MARTIN, D.D., LL.D., President of the Chinese Imperial University, etc. It is over thirty years since the writer of these lines last had the pleasure of meeting Dr. Martin, who appears from the six photographs distributed over his present book to be a man of evergreen physique, and to have little changed in appearance since the gloomy days of the Tientsin massacre of 1870. With the exception of two or three lengthy pilgrimages to the shrine of Confucius in Shan Tung, and the city of the Jews in Ho Nan, his experiences, like those of his contemporary, Sir Robert Hart, have been chiefly centred around the dusty capital of Peking; and certainly no one more than "Hermeneutics" (as he was playfully called in the sixties) is more competent to write upon the above subject than the late President of the Peking University.

By far the best chapters in this erudite book (which is, however, largely *du rechauffé* from a previous set of publications) are those upon religion. Con-

BRITISH LIBRARY

sidering that Dr. Martin is nominally a missionary, he shows great liberality and breadth of mind in discussing this important general question; more especially interesting is his pronounced specific opinion upon the comparative harmlessness, even from a Christian dogma point of view, of the much-discussed ancestor worship, with which it seems he would have us make a generous compromise; in fact, he would, generally, advise more of the key and less of the crowbar in our attempts to open up the Chinese mind. Had he, in the expression of them, the full courage of his opinions, and were he not in some apparent dread of the American Mrs. Grundy, it is not unlikely that Dr. Martin would, in his old age, frankly develop the confession of error so manfully made upon page 277, abandon the narrow idea of dogma altogether, and admit that true Christianity consists, not in profitless forms, but in the kindliness and human sympathy preached by Christ. Dr. Martin's public penance runs thus: "Two things excite my poignant grief when I look back to the mistakes of the past—one, the exclusion of a Church member for complying with the ordinary marriage ceremony of kneeling before a strip of paper, . . . and the other, the insisting on the surrender of ancestral tablets as a proof of sincerity on the part of an applicant for baptism."

The weakest chapters are those upon history and discoveries, which are by no means up to date. The researches of Dr. Hirth and Professor Chavannes have knocked on the head a good many crude notions concerning the earliest chronology, the compass, gunpowder, printing, paper, and so on. In the department of inventive economy the Chinese must take a firm stand upon silk and porcelain—they have really little else to boast of. To suggest (pp. 31, 32) that we cannot prove that the Jesuits did *not* borrow from China, and that Chinese notions *might* have led up to Darwin's doctrine, is totally beside the point.

It is plain that Dr. Martin has not had the opportunity of correcting the final proofs, for there are a great many irregularities in the transliteration of Chinese sounds. Moreover, although the bulk of the work seems to be printed after English canons, there are "considerable of" Americanisms; not, true, in the style, but in the spelling. "On" the records of history is suggestive of "I am now living on Pine," for "I am now living in Pine Street"; whilst such words as *succor*, *marvelous*, *traveler*, and *worshipers* "grate on" the English (? Irish) eye, especially when *worshipped* or *worshipping* occurs a page or two afterwards. If Dr. Martin had been at home to control the publication, it is almost certain that he would have made for us an Index; as it is, the value of an otherwise excellent book is seriously impaired, for "divil a worrd" of Index or Glossary do we find to aid the zealous reader withal; this is specially to be regretted in a work which plunges fearlessly into the ocean of Chinese proper names, many of which (besides being ill-spelt or irregularly divided) are totally strange to the "ordinary" man.

Upon p. 319 there is a statement that the degree of *optimus*, or Senior Wrangler, is so exalted "that in 1872 the daughter of one was deemed sufficiently noble to be chosen for Empress Consort." This seems to be a complete mistake. The daughter of Ch'ungk'i (or Chungyi) was chosen

BRITISH LIBRARY

because he was a high-born Manchu, and no Manchu can (by rule) be a Senior Wrangler; his was, however, a notorious exception.

On the whole, it is possible to speak very highly of Dr. Martin's book, and he may be congratulated upon having refrained from denouncing British and French barbarity—and that but lightly—more than twice; it is not noticeable that he anywhere adversely criticises American policy; for instance, their Exclusion Bills, their violent attacks upon Chinese in the Far West, their rather ungenerous restrictions inManila, etc. The gifted author himself was, a year ago, taken to task by the Shanghai press for his unmeasured *delenda est Cambalu* opinions which followed immediately upon his escape from the "Boxer" attacks at Peking. Probably it is partly on this account that the new University is now being organized under other presidency; not that the Chinese are petty or unforgiving in such matters, but because they may well be excused for taking the opportunity thus offered to separate on friendly terms from an old servant whose years may well excuse a little petulance. Either he or the old Dowager (who, it is believed, once nominated him for the Inspector-Generalship of Customs) may say to the other:

> "How sharper than a serpent's tooth it is
> To have a thankless child."

It will be for the advantage of us all if Dr. Martin will settle down to polish up and reconstruct his stores of knowledge in better digested and sweeter form. In North China, or at least in Peking, the name of Ting Wei-liang (=William [Mar]tin) will for many years be a household word.—E. H. Parker.

The Religious Tract Society; 56, Paternoster Row, London, E.C., 1901.

16. *The Ainu and their Folklore*, by the Rev. John Batchelor, F.R.G.S. (C.M.S. Missionary to the Ainu). Illustrated. Mr. Batchelor's book on "The Ainu and their Folklore" differs from most works of missionaries who have visited obscure regions of the earth for the purposes of evangelization. He has not entered upon statistics of the number of souls he believes he has influenced, but he gives us a somewhat closer acquaintance of this individual, curious and ancient tribe, whose peculiarities form a most interesting study. His work claims the attention of the historian, traveller, ethnologist, and missionary. All he has related aids us to a better understanding of the aborigines of Japan, who have been driven so far northward that their days seem numbered and their dynasty about to fail. The folklore stories may appear on a level of merit, but they faithfully delineate the minds of this child-like race, whose nature seldom rises to the fever-heat of passion or to the storms of sensational venture. Yet these legends have a charm which cannot be overlooked, inasmuch as they touch upon and interpret, here and there, the verbal histories of other lands, with remarkable parallels, that set us wondering through what agency the gossamer web of thought has found a foothold in regions so far remote.

Mr. Batchelor may be considered the pioneer of Jezo, and those who follow in his footsteps will find the land well surveyed; they should make no mistakes when approaching these people, or in the manner in which to proclaim "the glad tidings" of a higher, nobler life, a great hereafter, of an example to follow, of a life worth living. Yet the Ainu is not without his good qualities. Prehistoric barbarism has been supplanted by gentler characteristics; there is but little cruelty left in their nature. Animal creation is cared for—nay, even worshipped. Flowers and trees, reptiles, and other living things which surround them, play important parts of a strange faith that has satisfied dead generations. A religious system still exists of a belief in things present, established by virtue of ancestral convictions—accepted, but not proved. Weighed down by superstition, trammelled by customs, the Ainus, grand of physique though childlike in disposition, must not be forgotten or overlooked. The passive nature needs arousing, for, save for such able men as Mr. Batchelor, they would be more than content to remain as they are, or lag behind in this momentous era of the world's history, utterly ignoring the civilizing influence now penetrating to the farthest stretch of Eastern territory.—S.

SMITH, ELDER AND CO.; 15, WATERLOO PLACE, LONDON, 1901.

17. *The Tale of the Great Mutiny*, by W. H. FITCHETT, B.A., LL.D., author of "Deeds that won the Empire," "Fights for the Flag," "How England saved Europe," "Wellington's Men," etc., with portraits and maps. This is a very concise and well-written tale of the great Mutiny in India. It ought to be perused and studied as a serious and an instructive lesson by the present generation, in whose keeping the just administration of Indian affairs rests. The work contains excellent portraits of Lord Roberts, Lieutenant George Willoughby of the Bengal Artillery, Sir Henry Lawrence, Sir Henry Havelock, Lord Lawrence, Sir Herbert Edwardes, John Nicholson, and Sir James Outram, all illustrious in their respective spheres of heroic action, in defence of the British position in India, and which has resulted in inestimable blessings to the rulers and natives of the country. There are also maps, illustrating the military operations at Cawnpore, Lucknow, and Delhi, and the distribution of our troops on May 1, 1857, with a minute and carefully prepared index. The work is an admirable résumé of a most critical period of British history in India.

SMITHSONIAN INSTITUTION, GOVERNMENT PRINTING OFFICES; WASHINGTON, 1901.

18. *Annual Report of the Board of Regents of the Smithsonian Institution, showing the Operations, Expenditures, and Condition of the Institution for the Year ending June* 30, 1897. This Annual Report, ending June 30, 1897, contains Part II. of the U.S. National Museum. It opens with an admirable memorial of George Brown Goode, together with a selection of his papers on "Museums" and on the "History of Science in America." There are no fewer than 109 well-executed portraits of men of science and

BRITISH LIBRARY

literature, and concise memoirs, occupying more than 500 pages. There is also a very valuable index of men and subjects referred to in the volume.

The Annual Report for the year ending June 30, 1899, and a report of the U.S. National Museum, contain valuable and most interesting papers on anthropology, biology, geology, and other subjects of discovery and research; also papers describing and illustrating the collections in the Museum. The plates of the various objects are exceedingly well executed. The volume of nearly 600 pages closes with a minute index.

THEOSOPHICAL PUBLISHING SOCIETY; LONDON AND BENARES, 1901.

19. *Apollonius of Tyana, the Philosopher-Reformer of the First Century A.D.*, by G. R. S. MEAD, B.A., M.R.A.S. This well-written volume affords a critical study of the only existing record of the life of Apollonius of Tyana. It also contains an account of the war of opinion concerning him, and a valuable introduction with respect to the religious associations and brotherhoods of the time, and an examination as to the possible influence of Indian thought on Greece. His principles, his mode of teaching, his travels in the East and in the South and West, his mode of life, his sayings, sermons, letters, and writings, and bibliographical notes, are all set forth in a clear and interesting style.

T. FISHER UNWIN; LONDON.

20. *Prosperous British India: a Revelation*, by W. DIGBY, C.I.E. This book is full of very painful reading to anyone who is interested in the future of India, but it is difficult to criticise it within reasonable limits. Personally I am quite satisfied that Mr. Digby greatly underestimates the produce of the country in an ordinary year, and what might have been an admirable book of reference is, to my mind, sadly marred in parts by a sensational and sarcastic style ill-suited to the tragic character of the subject.

Some of the conclusions seem to me to be contradictory, and he proves too much when he says that the country only provides 3s. 4d. a head for each of its inhabitants, and yet exports large quantities of food grain. If there is no food in the country, how do the money-lenders support so many millions for several months every year?

It is too long since I left India for me to depend on my own knowledge of the condition of the people as I used to do, and it may have deteriorated in fifteen years, as he says it has; but the figures on which he bases his conclusions are quite hypothetical, and, in my opinion, untrustworthy. All these calculations as to the gross produce depend on an assumed ratio between it and the Government assessment, as to which ratio none of us agree. Mr. Digby quite arbitrarily takes it at 10 per cent., Mr. Naoroji used to make it 12½, but the Government of India say it is from 5 to 8, and I am inclined to think it must be even less than 5 per cent. in Bengal. Obviously there is room for great errors in such calculations.

Unfortunately, however, many of them are based on figures furnished by the Government itself, and on statements of officials still in the service of the Government. But mistakes are not uncommon even in Government

statistics, as, for instance, on p. 559, where the half of R6.13.3, being (apparently) given as R5.8.7, instead of R3.6.7, has led Mr. Digby, and perhaps Mr. Dutt, to believe that it is quite usual in Madras to take 31 per cent. of the gross by way of assessment. We all know that such cases are quite exceptional, though I am aware that there is land assessed as low as four annas an acre, which never could show any "net" produce at all if the cultivation expenses are calculated on the principles of the Settlement Department. Such land is held on puttah for other reasons altogether, sometimes simply to prevent a stranger from taking it up.

On the whole, however, Mr. Digby seems to me to have made out a case from the mouth of the Indian Government itself which loudly calls for some such minute inquiry as has been suggested (apparently in vain) by the Famine Union.—J. P.

OUR LIBRARY TABLE.

Picturesque New South Wales: a Guide for Settler and Tourist, prefaced under the direction of T. A. COGHLAN. (Sydney: William Applegate Gullick, Government printer. Agent-General's Office, 9, Victoria Street, Westminster, S.W.) This well-known author has condensed his vast knowledge of New South Wales in a short but picturesque volume for the guidance of settlers and tourists. It contains a historical sketch, the geography and climate of the colony, its fauna and flora, its government and social and commercial conditions up-to-date, its industries, Sydney and its surroundings, and the Western, Northern, and Southern districts. The illustrations of scenery, places of industry, and other objects of interest are beautifully executed, and the statistics and other information drawn from official records are concise and accurate.

A Sketch of the Vedânta Philosophy, to which is prefixed that of the Life of Sujna Gokulaji Zâlâ, a Typical Vedântin, by MANASSUKHARÂMA SÛRYARÂMA TRIPÂTHI. Second edition. (Bombay: N.M.T. and Company, Kâlikâdevi Road, 1901.) A well-written and interesting biography of one who, by his zeal, perseverance, honesty, and religious principles, rose from the ranks to be the trusted and high official of the Junagâdh States. The biography is accompanied with a concise outline of the Vedânta philosophy derived from various sources. There are also an excellent photogravure of Zâlâ and a minute index.

Hindustanī Self-Taught, with English Phonetic Pronunciation, containing Vocabularies, Idiomatic Phrases and Dialogues, Travel Talk, Military, Legal, Religious, Commercial, Shooting, Fishing terms, Money, Weights, Measures, Indian Titles, Castes, Festivals, by C. A. THIMM, F.R.G.S. (London: E. Marlborough and Co., 51, Old Bailey, E.C., 1902.) The title explains the object of this handy work, and will be of practical service to travellers, traders, missionaries, and soldiers, as well as students, who find themselves among those of whose language they are totally ignorant. The second part, the "Grammar Self-Taught," is in course of preparation. In the first column the English word is given, in the second the Hindustani words are given in Roman characters, and the pronunciation phonetically in the same characters in the third column.

The Rise of British West Africa, comprising the Early History of the Colony of Sierra Leone, the Gambia, Lagos, Gold Coast, etc., by CLAUDE GEORGE, of the Colonial Secretary's Office, Sierra Leone. Part I., complete in five parts. (London: Houlston and Sons, 7, Paternoster Buildings, E.C. Plymouth: William Brendon and Son, 1902.) This work promises to be interesting and valuable. It is to be completed in five parts. The present part is well printed, commencing with the statement of Herodotus as to the voyage and exploration of Africa by Pharaoh Necho, King of Egypt (B.C. 600). When the whole work is completed there will, no doubt, be the usual title-page, contents, and index. The information contained in the present part is derived from interesting letters, and other official documents.

Travel in the First Century after Christ, with Special Reference to Asia Minor, by CAROLINE A. J. SKEEL, former Student of Girton College, Cambridge; Lecturer in History, Westfield College, Hampstead. (Cambridge: University Press, 1901.) A well-written and interesting history of the mode and roads of travelling by all classes, from the prince to the peasant, from the merchant to the travelling beggar, in the first century of the Christian era, throughout the Roman Empire in the West and Asia Minor in the East. The work is accompanied with good maps and a minute index. The information of the author has been derived from ancient classical authors as well as from modern writers, and she has executed her task with accuracy and skill.

Famine in India: Its Causes and Effects, by WILLIAM L. HARE, Editor of the *Candlestick*, with a foreword by WILLIAM DIGBY, C.I.E. (London: P. S. King and Son, Orchard House, Westminster.) See Mr. Pennington's letter elsewhere in this *Review*.

The Chronology of Ancient India, by VELANDAI GOPALA AIYER, B.A., Pleader, Chittoor. (Madras: G. A. Natesan and Co., Esplanade, 1901.) This is a short and valuable treatise, the first of a series. It contains researches, beginning with the Kali Yuga, next the date of the Mahabharata War, closing with the Four Yugas. The second volume is expected to be ready this year, containing an inquiry as to the Kaliyuga, which the learned author maintains began in 1177 B.C. instead of 3102 B.C., and as to the dates of Vishnu Purana, the Rigveda, the Aryan immigration, and other interesting subjects relating to Indian Chronology.

The Gold Coast Guide, by the REV. J. B. ANAMAN, F.R.G.S., F.R.M.S., author of the "Fanti Spelling Book," assistant author of the "Fanti-English Dictionary," etc. (*Christian Herald* Office, 6, Tudor Street, London, E.C., 1902.) An exceedingly well-got-up guide of the Gold Coast. The first edition was published at Cape Coast in 1894, and the present edition was published in London, greatly improved, at the end of last year. It contains, under specific heads, every possible information on geography, history, education, agriculture, commerce, population, hints on outfit, the preservation of health, missionaries, and various other particulars interesting and useful to European inhabitants and intending emigrants.

On Traces of an Indefinite Article in Assyrian, by R. CAMPBELL THOMPSON, M.A., Assistant in the Department of Egyptian and Assyrian Antiquities, British Museum. (London: David Nutt, 57, Long Acre, 1902.) Mr. Thompson in his reading and copying certain Babylonian and Assyrian cuneiform texts preserved in the Museum, has noted from time to time a considerable number of passages in which the case-endings of the noun have been dropped, notwithstanding the fact that the noun is obviously not in the construct state. Other Assyrian scholars have noticed the same thing. Mr. Thompson in his short treatise discusses the whole matter, and gives beautifully executed representations of inscriptions, illustrating his conclusions. The treatise will prove interesting to all Assyrian scholars.

Presidential Address of the Seventeenth Indian National Congress, Calcutta, December 26 to 30, 1901. The President, MR. D. E. WACHA. This important address deals with a variety of subjects, such as famine, in its various aspects, State and private relief, the policy of administration, agrarian legislation, irrigation *versus* railways, agricultural banks, grain storage, the condition of the masses, the economic evils of absenteeism, Indian finance, taxation and currency, military and other public expenditure, industrial development, and other public questions, all of which deserve the close and sincere attention of the Government, and the statesmen who control Indian affairs both at home and in India.

The Briton's First Duty: the Case for Conscription. Cheap edition. Revised throughout. By GEORGE F. SHEE, M.A. (with an introduction by COLONEL LONSDALE HALE). With diagrams. (London: The Army League and Imperial Defence Association, 8, King Street, Cheapside, E.C., 1901.) A well-written patriotic production, showing the necessity for more vigorous action towards home defence as the heart and keynote of the defence of the whole Empire. The diagrams are very instructive, interesting and important, and ought to be carefully studied by every citizen who loves his country and homestead.

The Things Above: Helps Heavenward (second series), by GEORGE G. FINDLAY, B.A., D.D. (London: Charles H. Kelly, 2, Castle Street, City Road, E.C., and 26, Paternoster Row, E.C., 1901.) This volume forms part of the second series entitled "Helps Heavenward." It embraces, among other subjects, "Coming to Mount Zion," "Serving and Waiting," "Maran Atha," the "Ascension," and "Resurrection." The author's style is clear and laconic, as will be seen from the following quotation: "Without the sun in heaven there is neither day nor life; and without God and the immortal future there is neither man nor duty, neither safe guidance nor a worthy end for our present faith." The perusal of the work will be highly profitable and refreshing to the Christian.

Books for Bible Students, edited by the Rev. ARTHUR E. GREGORY, D.D., Principal of the Children's Home. *The Epistles of Paul the Apostle to Timothy and Titus*, by R. MARTIN POPE, M.A. (London: Charles H. Kelly, 2, Castle Street, City Road, and 26, Paternoster Row, E.C., 1901.) A very useful and valuable work, not only to students of the Greek text, but also to lay preachers and Christian workers.

The Great Symbols, by W. J. TOWNSEND, D.D. (London: Charles H. Kelly, 2, Castle Street, City Road, and 26, Paternoster Row, E.C., 1901.) This volume contains a valuable introduction on the meaning of the scriptural and ecclesiastical term "Symbol," and on the "Sanctuary," "the Ark of God," "the Cherubim," the "Sacrifice for Sin," "the High Priest and his Vestments," "the Seven-branched Lamp Stand," "the Altar of Incense," "the Table of Shewbread," "the Laver," "the Abolition of Symbolism," "the Veil before the Holiest." All these served their purpose, but all passed away by the death and resurrection of Christ.

We beg to acknowledge the receipt of the following publications of George Newnes, Ltd.: *The Captain*, January, February, March;—*The Sunday Strand*, January, February, and March;—*The Strand Magazine*, January, February, and March;—*The Citizen's Atlas*, parts 8-12;—*The Wide World Magazine*, January, February, and March;—*From Cradle to Crown: King Edward VII.*, part 1, to be completed in twenty parts;—also *Archæological Survey of India*, a Report on a Tour of Exploration of the Antiquities in the Tarai, Nepal, the region of Kapilavastu, during February and March, 1899; illustrated by 32 plates by Babu Purna Chandra Mukherji, with a prefatory note by Mr. Vincent A. SUMMARY OF EVENTS.

INDIA: GENERAL.—On February 14 Lord Curzon issued a proclamation formally announcing that the Coronation festivities in connection with the accession of the King will take place in January, 1903, at a special Darbar to be held at Delhi. Governors, Lieutenant-Governors, heads of administrations, princes, chiefs, nobles, and representatives of the people, will be invited, and orders in the Viceroy's Council will be issued forthwith for appropriate public ceremonies and rejoicings.

A Government resolution announces that an annual provision of one lac of rupees will be made for the preservation of ancient monuments, and urges that the provinces should also fix annual payments for this purpose.

The Budget estimates for 1902-3 show a surplus of £838,000, with closing balances on March, 1903, of £10,832,000 in India, and £4,851,000 in England.

The Government has issued a resolution dealing with recent attacks on the land revenue system. It explains the principles of the system, replies to the criticisms urged against it, and maintains that the system is well suited to the present conditions of the country, and compatible with its future development; and that the revenue which it provides, and which is more lenient in its incidence than at any previous stage of Indian history, is capable of being levied from the people with surprisingly little hardship and without discontent.

In the middle of March the number of persons in receipt of famine relief was 380,000. There was still no sign of rain.

The seventeenth Indian National Congress was opened in Calcutta at the end of last December. Mr. D. E. Wacha presided, and over 5,000 persons were present. Resolutions were passed on the questions of famine, the separation of judicial and executive functions, the strengthening of the Privy Council by the appointment of Indian lawyers, police reforms, and other subjects.

The Indian Social Conference was also held at the same time, under the presidency of Raja Benoy Krishna Deb Bahadur, the leader of the Calcutta Orthodox Hindu community. The conference emphasized the necessity of widespread female education at home and in public institutions. Other resolutions referred to the sea-voyage movement, the admission into Hindu society after a sea-voyage, the fusion of the subcastes, the curtailment of marriage expenses, the raising of the marriageable age, the relaxation of the rules regarding intermarriages, child-widow marriages, the admission of converts to Hindu society, the establishment of orphanages, and the spread of temperance and purity. With the exception of the widow remarriage and subcaste fusion questions, all the other resolutions were unanimously carried.

The conferences on Rajkumar Colleges, over which His Excellency the Viceroy presided daily, ended on January 30. All the main questions were fully thrashed out, and a select committee, consisting mainly of heads

BRITISH LIBRARY

of colleges, continued to sit and submit proposals regarding the best curriculum to be adopted in future.

The Sind Muhammadan Educational Conference met at Haidarabad on January 4 and 5. A number of resolutions were passed, amongst which were those relating to the organization of committees, the opening of rural schools with religious instruction, the teaching of subjects of practical utility, the provision of boarding-houses for the sons of Zemindars at ten of the principal centres, also dealing with the education of those boys desirous of entering Government service, and for the acquisition of suitable text-books for the moral and religious instruction of Muhammadans, etc., etc.

The Lieutenant-Governor of the Panjab on New Year's Day unveiled a statue of the late Queen-Empress which has been erected in Lahore as a memorial of the Diamond Jubilee.

Colonel Sir T. J. Gallwey has been appointed principal medical officer in India.

Professor J. H. Marshall, late of King's College, Cambridge, has been appointed to the newly-created post of Director-General of the Archæological Survey of India.

Mr. H. A. Kirk, Director of Traffic of the Indian Traffic Department, has taken up his new appointment of Director-in-Chief of the Indo-European line (Karachi-Teheran section).

The tariff between Great Britain and India and Burma has been reduced from 4s. and 4s. 2d. per word respectively to 2s. 6d. from last month.

The final revised census returns show that the population of India is 294,266,701.

The out-turn of the tea crop for the year 1901 was 165,263,453 pounds, as against 177,677,257 in 1900.

Indian Railway earnings in the nine months ending December 31 last were no less than one and three-quarter crores above the earnings in the corresponding months of 1900.

The Victoria Memorial Fund now amounts to nearly 39 lacs.

Dr. Sven Hedin, the famous explorer, paid a visit last January to India, at the Viceroy's invitation. He came from Ladakh, and returned to Sweden by Ladakh, Kashgar, and Russia.

His Highness the Maharaja of Darbhanga and Rai Bahadur Bipen Krishna Bose have been appointed additional members of the Viceroy's Legislative Council.

Sir Harman Singh has given Rs. 50,000, to be managed by a committee, for scholars and for poor Indian Christian students in the Panjab.

Passengers proceeding to Australia from India are required by the Australian Government to be certified as British subjects before being allowed to land. Applications for certificates of identity should be addressed to the local Governments of the Provinces to which intending passengers belong, and not to the Government of India.

INDIA : FRONTIER.—Punitive columns left Jandola, Jam Khel and Datta

BRITISH LIBRARY

Khel on January 1, under the command of General Dening, Colonel Macrae, and Colonel Tonnochy respectively, for further operations against the Mahsud Waziris. The columns destroyed many of their strongholds and villages before they gave in. They have now paid the fine imposed (Rs. 20,000) in full, and delivered up the rifles demanded. The blockade has now been withdrawn, the Mahsuds having given security for replacing looted cattle, and for the expulsion of certain outlaws from their country. The Reserve Brigade has already moved back.

On February 9 between 200 and 300 Afridis raided a village ten miles from Jamrud, carrying off some cattle. They were, however, overtaken by a company of Khaibar Rifles, who recovered the cattle and took eleven Afridis prisoners.

CEYLON.—General satisfaction prevails amongst all classes at the extension of Sir J. West Ridgeway's term of office as Governor till October, 1903. His Excellency will visit England to represent the Eastern Colonies at the Coronation ceremonies.

The Bishop of Colombo has been appointed to succeed Dr. Welldon as Bishop of Calcutta and Metropolitan of India.

The population of the colony has increased in the thirty years 1871-1900 from 2,417,000 to 3,530,000 in round numbers. About half this was due to immigration.

BURMA.—In January last the Lieutenant-Governor opened the Mandalay Canal at the Sedaw head works, which will irrigate an area of 89,000 acres, and yield, it is calculated, a revenue of 337,555 rupees, the net return on expenditure being estimated at 7·55 per cent. The canal is from 30 to 35 feet deep, and the average width about 57 feet.

PERSIAN GULF.—All is quiet at Koweyt. The Sheikh Mubārak's capital is in a state of defence.

The Resident at Bushire, Colonel Kemball, made his annual tour round the Gulf in January; he visited Lingah, Bandar Abbas, the Arabian Coast, and the Shatt-ul-Arab.

Lieutenant-Colonel John Meade, C.I.E., has been appointed Consul-General for the Provinces of Fars, Khuzistan and Laristan, and the district of Lingah, and for the coasts and islands of the Persian Gulf being within the dominion of Persia, to reside at Bushire.

AFGHANISTAN.—As the Amir was anxious that the refugees who had left the country in recent years should return to their former homes, a large party of them have taken advantage of the Amir's offer. Amongst others were Mir Khāja Jān Sāhibzādah and Mir Abdur Rasul Sāhibzādah of Kūhistan, with their families. General Mir Atta Khan, formerly Commander-in-Chief, who was imprisoned a year ago by the late Amir, has been released and reappointed to his former post.

There appears to be a feeling of unrest due to the predominance of the fanatical element, fomented by the Hadda Mulla, who is said to have the Amir completely under his influence.

The season has been abnormally dry, and apprehensions of impending severity are beginning to be felt. The Amir, as a precautionary measure, has stopped all export of grain from the country.

BALUCHISTAN AND MEKRAN.—A gang of raiders from Persia, under the leadership of Muhammad Ali, had last year successfully raided Kantdar, in Mekran, and had seized the fort of Nodiz, belonging to Muhammad Omar. Here they were blockaded by the Nazim of Mekran with 985 men, who besieged the fort for fifty-three days, but, having no artillery, failed to capture it. Later a force under Major Showers arrived and took the place by assault. Muhammad Ali was killed and the band broken up.

The Government of India has sanctioned a grant of $3\frac{1}{2}$ lacs of rupees for increasing and improving the water-supply of Quetta.

The Amir of Bukhara has lately paid a visit to St. Petersburg.

TURKEY IN ASIA.—The line of the Damascus-Mecca Railway has been completed from El Mezarib (63 miles south of Damascus) for another 25 miles southwards, and the earthworks for a distance of another 40 miles. The total amount subscribed towards the cost of the undertaking up to the present is over £400,000.

Abdul Aziz bin Feysul, a descendant of the old Wahabi Amirs, with an army of 2,000 men, has captured the city of El Riad in Central Arabia. It is believed that the Wahabi dynasty is endeavouring to regain the supremacy, to overthrow Ibn Rashid, and to conquer Nejd. Many tribes are flocking to the Wahabi banner.

Many cases of cholera have been reported at Medina, and some at Mecca. Quarantine has been imposed by Turkey on arrivals from the Hejaz coast between Yambo and Mamūrat-el-Hamidiyyeh.

RUSSIA IN ASIA.—An earthquake occurred in the Shemakha district of Transcaucasia on February 13 last, which was attended by very great loss of life. The town of Shemakha, inhabited mainly by Muhammadans, was almost completely destroyed. Over 2,000 persons were killed, 4,500 houses were destroyed, and 25,000 inhabitants rendered homeless and foodless; 126 villages were affected by the disturbance and numbers of cattle perished. Near the village of Marasa, east of Shemakha, a volcano is in active eruption.

CHINA.—The Chinese Court returned to Peking on January 7, the Imperial *cortège* passing between a double line of soldiers, all kneeling, who lined the route for a distance of four miles. The Emperor and Empress-Dowager were attended by 1,000 Chinese noblemen.

The total claims filed against China amount to 461,000,000 taels, while the amount of the indemnity for which China has given a general bond is 450,000,000 taels. Negotiations are proceeding for the subtraction of 11,000,000 taels from the claims, but no agreement has been reached. The proposal for a *pro rata* reduction is entirely unjust. The British claim is considerably less than the actual military expenses and the losses of British subjects, and Sir E. Satow has refused to accept any reduction in view of the exorbitant claims of several secondary Powers, which enormously exceed their expenditures and losses.

The Government is paying the indemnity to the Powers in monthly instalments, in accordance with a protocol.

On February 3 an agreement was signed between Mr. Detring, representing the Inspector-General of Customs, and the Provisional Government

Qatar National Library

of Tien-tsin, regarding the collection of the *likin* dues at present collected by the Provisional Government. The latter agrees to pay the foreign Customs 700,000 taels per annum in twelve monthly instalments, commencing on March 1 last, during the continuance of the Provisional Government, and on its cessation the whole revenue derived from the dues, the staff, the books and offices, etc., shall revert to the foreign Customs, the collection of the Tien-tsin *likin* being thus brought under the foreign Customs control.

Russia has informed the Chinese plenipotentiaries that she refuses to amend the Manchurian treaty.

The condition of the interior of Manchuria is said to be unsatisfactory and the animosity to Russia is increasing. The Russian troops in the province number about 63,000 men.

A rebellion which broke out in the Nan-ning district threatened to become grave, many soldiers having joined the ranks of the insurgents. Marshal Su has arrived at the scene of rebellion from Hu-pei, and has defeated the rebels at Lang-chau.

Cheng Te-yi has been appointed Chinese Minister to Great Britain in the place of Sir Chihchen Lofêngluh.

KOREA.—The Government has officially notified to the French Minister that it considers the loan contract of last April void and ended through lapse of time, and the absence in the contract of power to transfer loan rights to another syndicate or any third party.

JAPAN.—The foreign trade of the country for 1901 shows 251,750,000 yen of exports, and 255,500,000 yen of imports, against 198,750,000 yen and 282,500,000 yen respectively for the preceding year. The outflow of gold was 800,000 yen.

The question of the purchase of railways by the State is now being revived, and it is understood that the Premier is in favour of this step on strategical grounds.

The Budget shows ordinary revenue amounting to 225,000,000 yen, and ordinary expenditure to 177,500,000 yen. The surplus, together with 38,000,000 yen obtained by selling the Chinese new indemnity bonds, and 15,500,000 yen taken from the Chinese old indemnity and miscellaneous sources, is proposed to be devoted to redeeming the national debt, building railways and telegraphs, and restoring the naval maintenance fund.

The capital of the newly-established Crédit Mobilier (10,000,000 yen) was subscribed three times over.

An important agreement has been concluded between Great Britain and Japan, the text of which will be found amongst our "Notes." The Emperor, in connection with the conclusion of the agreement, has conferred titles on several of the Ministers, and has made Baron Hayashi, Minister to Great Britain, a Viscount.

The issue of Exchequer Bills to the amount of 10,000,000 yen has been highly successful. The application reached a total of 15,500,000 yen.

PHILIPPINES.—The situation in the islands appears to be slowly improving, but some time must elapse before the number of American troops can be materially lessened.

EGYPT.—It has been proposed to create a commercial port at Port Said and connect it with the Egyptian railway system. It is understood that an agreement has been arrived at between the Government and the Suez Canal Company on this subject. This scheme would greatly tend to promote the development of Egyptian commerce.

The Caisse of the Public Debt has agreed to grant to the Government the extra expenditure incurred in the Assuan and Assiut reservoirs out of the Reserve Fund. The original estimate amounted to £2,000,000 sterling, provision for which was made by the Government at the time. The extra cost, now given by the Caisse, amounts to £1,500,000 sterling.

The accounts for 1901 show that the revenue amounted to £E12,160,000, as against £E11,663,000 during 1900, an increase of nearly £E500,000. The actual expenses incurred during 1901 amounted to £E9,924,000, being an increase of £E24,000 as compared with 1900. The balance of £E2,236,000 has been employed as follows: £E64,000 has been paid into the Sinking Fund, £E265,000 to the Economies Fund, and £E1,143,000 to the General Reserve Fund, which is controlled by the Caisse of the Public Debt. The remainder, £E764,000, represents the surplus at the disposal of the Government. The balances of the various reserve funds at the end of 1901 were as follows: Economies, £E4,491,000; General Reserve, £E3,795,000; Special Reserve, £E1,287,000; total £E9,573,000.

A camel caravan proceeding to Kumbek, some 210 miles north-west of Lado, was attacked by Dinkas, and during the fighting which ensued the officer in command, Lieutenant Scott-Barbour, of the Highland Light Infantry, was killed. A small detachment of Sudanese troops was immediately despatched to Kumbek from Gaba Shambeh, the nearest point on the Nile.

ABYSSINIA.—The two hundred and first kilometre of the Jibuti and Harar Railway has been opened. The Negus was present, and expressed his satisfaction at the progress of the line.

EAST AFRICA AND UGANDA.—The laying of the rails of the Mombasa-Uganda Railway has been completed, the railhead having reached the shore of Lake Victoria Nyanza. The first locomotive arrived at Port Florence on December 20 last. The railway is 572 miles in length. The expenditure incurred up to the end of the last financial year amounted to £4,115,002, or, including the estimates for the current year, to £4,815,602. The population of the district traversed amounts to nearly 4,000,000.

Colonel Hayes Sadler has been appointed Commissioner for the Uganda Protectorate.

DELAGOA BAY.—An agreement has been come to between Great Britain and Portugal for the opening of the Delagoa Bay railway line for the transit of civil merchandise. It establishes through traffic rates on the old classification, and provides that no exceptions shall be made either as regards individuals or nationality in the forwarding of goods.

NATAL.—The imports for the year 1901 amounted to £9,789,104, against £6,075,227 in 1900. The exports were £4,792,097, against £1,135,322 during the previous year.

The estimates for the current financial year amount to £5,471,000 as compared with £4,674,967 last year. The loan expenditure shows an increase of £500,000, chiefly for the Cape-Natal Railway.

ORANGE RIVER COLONY.—The net revenue for the six months ended December 31 last amounts to £32,000, notwithstanding that nothing has yet been received on account of railway profits, which in normal times varied from £400,000 to £500,000 a year. The total receipts for the period named were £131,000, while the expenditure amounted to £99,000.

A sum of £400,000 has been spent on the refugee camps, including £30,000 for the native camps. The whole of this expenditure has been recovered from Army funds.

CAPE COLONY.—The imports for the year ended December 31 last amounted to £23,990,543, against £19,678,336 in 1900. This total includes specie £2,575,871, against £2,516,525 in 1900. The exports amounted to £10,873,273, against £8,147,670 in the previous year. The main items are colonial products, £4,017,158; diamonds, £4,930,104; and gold, £1,225,899.

The net earnings of the Cape Government Railways during 1901 were equal to a dividend of £4 8s. 4d. per cent.

SOUTH AFRICA: THE SEAT OF WAR.—In January continuous rains everywhere interrupted operations in the Transvaal. Lord Methuen's column overtook a Boer commando near Boschport, and captured the whole laager. Kekewich surprised Klassen's laager at Paardeberg, taking prisoners. The Boers in the Eastern Transvaal have become demoralized on account of numerous captures made there by us. Commandant Hans Botha, General Ben Viljoen, and General Erasmus, and many other Boer officers, have been captured, and General J. D. Opperman killed. The blockhouse line has been several times rushed by the enemy by means of immense droves of cattle, and many of the enemy have crossed. Colonel Firman's camp at Tweefontein was successfully rushed by a large force of 1,200 under De Wet, when 6 officers, including Major Williams, and 50 men were killed, and 8 officers wounded. Lord Kitchener has given permission to the Boer General Vilonel to raise a new burgher corps of 1,500 men, and the General has written to ex-President Steyn telling him that the formation of the corps is the outcome of his obstinacy. The activity of some of the Boer leaders, notably De Wet and Delarey, is shown by a grave reverse which has lately befallen Lord Methuen's column, in the Western Transvaal. Nine hundred mounted troops, under Major Paris, with 300 infantry, 4 guns, and a pom-pom, were moving from Vryburg to Lichtenburg early on March 7, when they were attacked by Delarey's force. The column was thrown into confusion, mules stampeded, and a part of the mounted troops became panic-stricken. Five hundred troops escaped to Kraaipan. Major Paris, after a gallant defence, surrendered, together with Lord Methuen, who was dangerously wounded.

WEST AFRICA: THE EXPEDITION AGAINST THE AROS.—Colonel Festing's column, after a vigorous pursuit, defeated the enemy and demolished the "Long Juju," and captured Loko on January 2. Columns 1, 2, and 4, under Major Aplin, Colonel Festing, and Colonel Heneker,

BRITISH LIBRARY

concentrated at Akwete on February 1. Opposition has been constantly encountered, but the results obtained were satisfactory, several important towns having submitted. The above columns moved on March 1 northwards from Olele, Asa, and Obegu respectively.

NORTHERN NIGERIA.—A force under Colonel Morland, the commandant, left for Lake Chad at the end of January, viâ Bauchi. Owing to the great distances to be traversed, some time must elapse before any detailed account of the expedition can be received. There is reason to believe that this expedition will mark the commencement of a permanent occupation of this remote portion of the British sphere, and that a garrison under white officers will be established at some point on the shores of the lake.

A British Resident has been established at Zaria, an important Hausa town belonging to the Amir of Sokoto. A new and important garrison has been established at Ilorin.

CANADA.—The total population of the Dominion at the end of 1901 was 5,369,666.

In Rossland and the boundary districts of British Columbia the gold and copper ore output for last year amounted in aggregate to 660,000 tons.

A bulletin issued by the Minister of Mines estimates the value of the mineral production of British Columbia in 1901 at $20,713,501, being an increase of 25 per cent. over the previous year. The lode mines show an increase over 1900 of 57 per cent.

The treatment of lead ore by the Canadian Pacific Company's smelter, the reduced freight, and the Dominion bonus, will greatly stimulate the silver industry.

The aggregate foreign trade for the six months ended December 31 last showed an advance of $13,605,066 over the same period in 1900. The imports increased by $8,076,537, and the exports by $5,528,529. The additional exports include nearly $2,000,000 in fisheries, over $4,000,000 in agriculture, and $750,000 in manufactures.

Since the beginning of the Boer War, the Dominion has sent food and forage to the value of $7,000,000 to South Africa on behalf of the War Office.

Sir Oliver Mowat, the Lieutenant-Governor of Ontario, opened the Legislative Council on January 8.

The Dominion Parliament was opened by Lord Minto, the Governor-General, on February 13.

Senator Templeman, of British Columbia, has entered the Cabinet as Minister without portfolio.

Mr. David Mills, K.C., Minister of Justice in the Dominion Cabinet, has resigned his portfolio, and accepted a Judgeship of the Supreme Court of Canada. He is succeeded by Mr. C. Fitzpatrick, K.C., the Solicitor-General.

Mr. Gordon Hunter, K.C., has been appointed Chief Justice of British Columbia.

The Royal Commission on the subject of Chinese immigration, after a thorough investigation, recommends that the further immigration of

مكتبة قطر الوطنية
Qatar National Library

Chinese labourers into the Dominion be prohibited, and suggests a treaty to accomplish this end. In the meantime it is proposed that the capitation tax be increased to $500.

NEWFOUNDLAND.—The Revenue for the last quarter of 1901 was $526,000, against $504,000 for the same period of 1900. This is the largest total in the history of the colony.

The Government has renewed the *modus vivendi* with reference to the French shore for another year.

The winter herring fishery on the southern and western coast was one of the best on record. American fishermen have paid the coast folk $220,000 for herring.

The census of 1901 shows that the population of the colony and Labrador numbers 220,249, against 202,040 in 1891.

AUSTRALASIA: NEW SOUTH WALES.—The revenue for the half year ended December 31 last amounted to £5,102,893, being a decrease of only £2,033, notwithstanding the large deduction for the transferred services. For the eight months ended February 28 it was £7,085,903, an increase of £120,876 as compared with the corresponding period of the previous year.

During the last ten years the tonnage of ships arriving in the ports of the colony have increased from 5,700,000 to 8,000,000, and during the last three years the exports have increased in value from £22,000,000 to upwards of £28,000,000, and the imports from £16,000,000 to £27,500,000 in value.

Vice-Admiral Sir Harry H. Rawson, K.C.B., has been appointed Governor.

VICTORIA.—The revenue for the last six months of 1901 amounted to £3,943,076, an increase of £213,971.

Mr. Barton, the Federal Premier, has said that Australia must take a share in all matters affecting the integrity of the Empire, sending men and ships abroad, if necessary, to help in its wars.

The Bengal Chamber of Commerce has made remonstrance against the Australian Bill stipulating that no postal contract shall be given unless white labour only is employed on the mail steamers.

WESTERN AUSTRALIA.—On the resignation in December last of Mr. Morgan's Ministry, Mr. Leake was summoned to form a new one, which is now composed as follows: Mr. G. Leake, Premier and Attorney-General; Mr. Kingsmill, Commissioner of Railways; Mr. Illingworth, Treasurer and Colonial Secretary; Mr. Gregory, Minister of Mines; Mr. Rason, Director of Public Works; Dr. Jameson, Commissioner of Crown Lands; Mr. Holmes, Honorary Minister in Council. Mr. Leake and Mr. Cornthwaite Rason have been re-elected in their constituencies by heavy majorities on assuming office.

SOUTH AUSTRALIA.—The revenue for the last six months of 1901 was £1,085,752, a decrease of £224,193.

TASMANIA.—The revenue returns for 1901 are about £100,000 less than in 1900, the chief shortage being in Customs, which, owing to the Commonwealth tariff, yielded £72,000 less than in the previous year.

PRICE ONE SHILLING.

LONDON: J. E. HAWKINS, 36, BAKER STREET, W., AND 15, PATERNOSTER ROW, E.C.; AND THE PUBLISHING DEPARTMENT OF THE ORIENTAL INSTITUTE, WOKING, SURREY.

BACK NUMBERS, AND A VERY FEW COMPLETE SETS OF

The Asiatic Quarterly Review

since its foundation in 1886, are still available at the ordinary rate of 5s. per number of 240 or more pages each. As a considerable proportion of the articles contained in them are contributions from specialists, statesmen, and other leading men, which have not appeared in any other form, they constitute a Thesaurus of invaluable information on subjects connected with Oriental Politics, Learning, Travels, etc., which are unobtainable elsewhere, and which throw light on many obscure questions now coming to the front. A list of the contents of the back numbers of the *Asiatic Quarterly Review* will be supplied on application to Manager, *Asiatic Quarterly Review*, Woking.

TO ANNUAL SUBSCRIBERS OF, AND REGULAR ADVERTISERS IN, "THE ASIATIC QUARTERLY REVIEW."

Annual subscribers on the list of ***The Asiatic Quarterly Review***, and regular advertisers in the same, are entitled to obtain the publications of the Oriental University Institute, a list of which will be found, as an inset, among the advertisements, at a reduction of 33 per cent. from the published price, as also to a discount of 25 per cent. on all books and printing work ordered through the undersigned. Literary and scientific advertisements of special interest to Orientalists and to residents in Eastern countries, that appear in this Review, will also be reprinted, if there be room, in ***The Journal of the East India Association***, or will be inserted as insets, in such publications of the Oriental University Institute, in which their appearance may be considered to be appropriate.

THE MANAGER OF THE
Publishing Department of the Oriental Institute,
WOKING.

SOCIETY FOR RELIEF OF PERSECUTED JEWS

(SYRIAN COLONIZATION FUND).

President:—LORD AMHERST OF HACKNEY.

TORTURE and MASSACRE of JEWS has continued this year, and there have been many bad outbreaks. Jews, therefore, leave Russia, where there is no safety for their wives or children. Very few can be received here. **THIS SOCIETY ENDEAVOURS TO RELIEVE,** by food and work, the misery of some of the thousands who have found refuge at Jerusalem. Owing to the long and serious illness of the Secretary, the work at Abraham's Vineyard (where **70** Jews have been employed) was for a time suspended. **1,500 Families** of aged, sick, and blind are on our registry for relief.

WE ASK FOR FUNDS, as the winter has added to the chronic distress of these poor in their miserable homes. **WORK, FOOD,** and **FUEL** are **URGENTLY NEEDED.** There is much illness, Scarlet Fever, Measles, &c., among them.

DONATIONS THANKFULLY RECEIVED by :—

F. A. BEVAN, Esq., *Hon. Treasurer*, 54 Lombard Street, E.C., and by
E. A. FINN, *Secretary*, 41 Parliament Street, S.W.

BRITISH LIBRARY

KEGAN PAUL, TRENCH, TRÜBNER & CO., LTD.

SOME DISTINGUISHED VICTIMS OF THE SCAFFOLD.
By HORACE BLEACKLEY, M.A. Oxon. With Twenty-one Illustrations in Collotype from Old Prints. Royal 8vo, cloth gilt, 10*s.* 6*d.* net.

"Throughout the work the style is vigorous and picturesque, and the author knows the period well, and every picture, terrible, pathetic, or fascinating, has its adequate setting. Moreover, the value of the book is enhanced by a series of rare illustrations admirably reproduced, and by notes on each case, which are both concise and historically valuable."—*Manchester Courier.*

THE QUEEN'S SHILLING. A Soldier's Story. By Major ARTHUR GRIFFITHS. Crown 8vo, 3*s.* 6*d.*

THE LIFE STORY OF CHARLOTTE DE LA TRÉMOILLE, COUNTESS OF DERBY. By MARY C. ROWSELL. Demy 8vo, with Frontispiece, 6*s.* net.

"The book is well worth reading, Miss Rowsell having both knowledge and literary ability. We approve of her lengthy account of the siege of Lathom House, during which the Countess, in the absence of her husband, kept at bay the Parliamentary forces. The book is eminently readable, and contains an excellent reproduced portrait of the brave and heroic Countess."
—*Publishers' Circular.*

THE ORIGIN OF THOUGHT AND SPEECH. By M. MONCALM. Translated from the French by G. A. WHITMARSH. Demy 8vo, 9*s.*

"M. Moncalm has studied his perplexing and mystifying subjects so profoundly that his book deserves the most respectful treatment."—*Westminster Gazette.*

SPECIES AND VARIETIES: their Origin by Mutation.
Lectures delivered at the University of California. By HUGO DE VRIES. Price 21*s.* net.

"The book is certainly a credit to author, editor, and publishers, being clearly and well printed, and it will especially appeal to the general reader owing to the simple and, as far as possible, untechnical language used throughout. The work is likely to prove a text-book for some time to come."—*Field.*

AMBIDEXTERITY; or, Two-handedness and Two-brained-ness; being an Argument for Rational Education. By JOHN JACKSON, F.E.I.S., Founder and Hon. Sec. of the Ambidextral Culture Society; Founder of the System of Upright Penmanship; Author of "The Theory and Practice of Handwriting," &c. With an Introduction by Major-General R. S. S. BADEN-POWELL, C.B. With Illustrations. Demy 8vo, 6*s.* net.

"The book, in a word, is a thorough and instructive treatise on its subject, indispensable to everyone who takes an active interest in promulgating the important educational idea which it subserves."—*Scotsman.*

THE DRYDEN LIBRARY.

Each volume 6 in. by 3¾ in. 1*s.* 6*d.* net in cloth, 2*s.* net in leather.

AUSTIN DOBSON. Selected Poems. With Frontispiece by GEORGE H. BOUGHTON, R.A.

THE BOOK OF PSALMS. Translated by Canon T. K. CHEYNE, D.D.

SHAKSPERE'S SONNETS. Edited by Prof. EDWARD DOWDEN. With Frontispiece.

CHAUCER'S CANTERBURY TALES. 2 vols. Edited by A. W. POLLARD.

BURNS' POEMS. Selected and Edited by ANDREW LANG.

A New Work by JAMES A. B. SCHERER, Ph.D., LL.D.

YOUNG JAPAN. The Story of the Japanese People, and especially of their Educational Development. Crown 8vo, price 6*s.* net.

KEGAN PAUL, TRENCH, TRÜBNER & CO., LIMITED,
DRYDEN HOUSE, 43 GERRARD STREET, LONDON, W.

GEORGE NEWNES, LIMITED.

LATER PEEPS AT PARLIAMENT. By H. W. LUCY

("Toby, M.P.," of *Punch*), with over 300 illustrations by "F.C.G." (F. Carruthers Gould). Demy 8vo, **7s. 6d.** net.

Athenæum.—"We welcome Mr. Lucy's most entertaining volume, which also yields some of the most admirable of the caricatures of 'F. C. G.'"

Daily Chronicle.—"He (Mr. Lucy) has become a depository of Parliamentary stories gathered from men on all sides of the House, and he tells them in a manner which furnishes us with very pleasant reading."

NEWNES' ART LIBRARY.

Each volume contains about sixty-four full pages in monochrome and a Frontispiece in photogravure. These are in many cases made from works which have not previously been reproduced. Each Volume also contains a list of the principal works of the Artist. **3s. 6d.** net.

BOTTICELLI. By Richard Davey.
SIR JOSHUA REYNOLDS. By A. L. Baldry.
CONSTABLE'S SKETCHES. By Sir James D. Linton, R.I.
VELASQUEZ. By A. L. Baldry.
GOZZOLI. By Hugh Stokes.
RAPHAEL. By Edgcumbe Staley.
VAN DYCK. By Hugh Stokes.
G. F. WATTS. By Dr. R. Pantini.
TINTORETTO. By Mrs. Arthur Bell.
PAOLO VERONESE. By Mrs. Arthur Bell.
BURNE-JONES. By Malcolm Bell.
Early Works of TITIAN. By Malcolm Bell.
FILIPPINO LIPPI. By P. J. Konody.

Studio.—"Messrs. Newnes' now celebrated series devoted to the Great Masters . . . excellently reproduced, and apparently considerable trouble has been taken to secure reproductions of some of the less known and least accessible of the painters' chief works."

*** *Other Volumes in preparation.*

NEWNES' LIBRARY OF THE APPLIED ARTS.

A series of Volumes for those interested in the Applied Arts of the past, providing information of really practical value to collectors and students. Particular attention has been paid to the Illustrations, which are both numerous and of the highest quality, and include both Monochromes and Subjects in Colour. Crown 8vo, cloth, gilt top, **7s. 6d.** net.

DUTCH POTTERY AND PORCELAIN. By W. Pitcairn Knowles.
OLD ENGLISH FURNITURE. By Frederick Fenn.
ENGLISH EMBROIDERY. By A. F. Kendrick.
ENGLISH TABLE GLASS. By Percy Bate.

LIBER STUDIORUM OF J. M. W. TURNER.

With Introduction by C. F. Bell. *10s. 6d.* net. Contains reproductions of the entire series of seventy-one plates, each on a page measuring 11¾ in. by 8¾ in. Full justice has been done to the original plates in the method of reproduction, the tints being accurately copied, and every detail brought out in the clearest manner.

St. James's Gazette.—"Another excellent piece of work in the matter of reproduction . . . An entirely fascinating collection of plates."

IMPERIAL JAPAN: the Country and its People. By George William Knox.

With 22 full-page Illustrations. Large Crown 8vo, gilt top, **7s. 6d.** net.

Manchester Guardian.—"Deserves attention as a well-informed and serious essay. . . . A sane and balanced estimate enlivened by agreeable reminiscences."

Athenæum.—"A more critically honest and informed delineation of that most interesting folk has not come under our notice."

China Telegraph.—"Alike correct and sensible."

DRAWINGS BY GREAT MASTERS.

The Drawings in this new series are reproduced on a large scale on a page 11¾ in. by 8¾ in. The volumes each contain 48 reproductions, many of them printed in tints, and of these four or five are mounted on a coloured paper in harmony with the tint in which the illustration is printed. The volumes are bound in delicately tinted paper boards with vellum backs, with a beautiful design printed in three colours. 4to, **7s. 6d.** net each.

HOLBEIN. By A. Lys Baldry.
ALBRECHT DÜRER. By Dr Hans Singer.

Manchester Guardian.—"Is sure of a welcome. The reproductions are printed with unusual care."

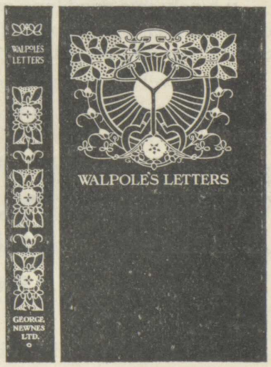
MODERN MASTER DRAUGHTSMEN.

Uniform with "Drawings by Great Masters." **7s. 6d.** net each.

DRAWINGS OF BURNE-JONES. By T. Martin Wood.
DRAWINGS OF J. M. SWAN, R.A. By A. Lys Baldry.
DRAWINGS OF SIR E. J. POYNTER, P.R.A. By Malcolm Bell.

SHORTLY.

DRAWINGS OF DAVID COX. By A. J. Finberg.
DRAWINGS OF ROSSETTI. By T. Martin Wood.



Daily Telegraph.—"The books are not too thick or heavy, but just large enough to give an appropriate rendering of detail and a fair reproduction to large compositions, and the plain grey bindings are excellently designed . . . the reproductions of these, some of them tinted, are especially fine."

NEWNES' THIN PAPER CLASSICS.

These charming and portable volumes are small enough for the pocket (6¾ in. by 4 in. and ¾ in. thick), yet large enough for the bookshelf. Printed in large type on thin but thoroughly opaque paper, with Photogravure Frontispiece and Title-page to each Volume printed on Japanese vellum, and in a dainty binding, they make an ideal present.

Cloth, **3s.**; limp lambskin, **3s. 6d.** net per volume.

Pepys' Diary.
Keats' Poems.
Poe's Tales.
Captain Cook's Voyages.
Marco Polo's Travels.
Rossetti's Early Italian Poets.
Autobiography of Benvenuto Cellini.
The Poems of Samuel Taylor Coleridge.
Homer's Iliads. Translated by George Chapman.
Homer's Odysseys and Shorter Poems. Translated by George Chapman.
Swift's Journal to Stella.
Ben Jonson's Plays and Poems.
Herrick's Poems.
Evelyn's Diary.
Lamb's Works.
The Vision of Dante.
Peacock's Novels.
Boswell's Life of Dr. Johnson. 2 vols.
Hawthorne's New England Romances.
Tennyson's Poems.
Poems of Wordsworth.
The Shorter Works of Walter Savage Landor.
Letters of Horace Walpole.
The Ingoldsby Legends.
Mrs. Browning's Poems. 2 vols.
Shakespeare. 3 vols.
Milton's Poems.
Burns' Poems.
Don Quixote.
Bacon's Works.
Shelley's Poems.

Pall Mall Gazette.—"The 'Thin Paper Classics' is keeping well ahead of everything else we know of in its own particular line. The selection of works for it has never yet descended in standard from the highest; and yet it is as various and comprehensive as any reasonable mind could wish."

GEORGE NEWNES, Limited, 3 to 12, Southampton Street, Strand, London, W.C.

BRITISH LIBRARY

A MOST REMARKABLE ENTHUSIASM

Has greeted the Publication of

Mr. H. G. WELLS'S

Imaginative and Picturesque Sociological Study,

A MODERN UTOPIA

and the critics are unanimous in considering it
. his FINEST and MOST POPULAR WORK .

READ THEIR OPINIONS.

THE ATHENÆUM says:

"THERE HAS BEEN NO WORK OF THIS IMPORTANCE PUBLISHED FOR THE LAST THIRTY YEARS.

"IT IS AN AMAZINGLY ABLE CONSTITUTION, AND ONE WONDERS THAT IT SHOULD BE THE OUTCOME OF A SINGLE MIND.

"THIS ASTONISHING BOOK IS A PIECE OF WORK WHICH EMBODIES IMAGINATIVE SCIENCE AT ITS HIGHEST."

"'A Modern Utopia' ought to set people talking and discussing. Mr. Wells's ideas are always stimulating and crisply expressed. Domestic politics would become interesting again if Mr. Wells could convert a few statesmen to his way of thinking."—*Daily Telegraph.*

"The book has high value, and a significance that should not be overlooked, for it indicates both clearly and with some gaiety the course which civic and spiritual endeavours should follow if the world is not to revert to the type established in the Middle Ages."—*Morning Post.*

"Mr. Wells's book is interesting precisely because it challenges criticism and opposition. It is a book of great originality, the result of real thinking—a criticism of life by an acute and reflective observer who throws his work into a most attractive form."—*Westminster Gazette.*

"Broadly conceived and brilliantly written. . . . Full of profound thought, of brilliant imaginative effort, with a background of sociological and economical possibilities which will stimulate interest in many world-problems of to-day."—*Daily Chronicle.*

"The work is crowded with thought and suggestion, with all those characteristics of candour and sincerity which have made Mr. Wells the author perhaps best worth reading of modern English writers engaged in the function of prophecy."—Mr. C. F. G. MASTERMAN in the *Daily News.*

"Mr. Wells's is much the most scientific and sensible construction of a Future based on the Present that I have ever read."—Mr. H. HAMILTON FYFE in *Evening News.*

Mr. H. G. WELLS'S Finest Work:

A MODERN UTOPIA

Illustrated by EDMUND J. SULLIVAN.

"One of the most powerful and cogent indictments of the whole Russian System which has yet been published in English."
—THE WORLD.

RUSSIA IN REVOLUTION

By G. H. PERRIS,

Author of "Leo Tolstoy, the Grand Mujik," "The Further Memoirs of Marie Bashkirtseff," "The Eastern Crisis and British Policy," &c.

With Portraits and Illustrations. Demy 8vo, 10s. 6d. net.

"What is passing at present is not a simple riot, but a revolution."—Prince TROUBETSKOY, President of the Moscow Zemstvo, to Prince SVIATOPOLK-MIRSKY, December, 1904.

CONTENTS:

PART I.—A BLACK HERITAGE.

Mise-en-scène—The Oligarchy—The Land without Law—The Underworld: Mendel Rosenbaum's Story—The Old Bastille—Annals of Schlusselburg—Siberian Exile as it is—Russia's "Ile du Diable"—The Budget—Debt and Drink—The Tariff—A Sick Society—The Final Crime.

PART II.—PIONEERS OF REVOLUTION.

The Propagandists, 1870–74: Nicholas Tchaykovsky's Narrative—The Tsar's Vengeance: Madame Kovalsky's Narrative—Felix Volkhovsky—Sergius Stepniak and Terrorism—The New Generation: Dr. Soskice; Mark Broido—The Rise of the Labour Movement: Father Gapon.

PART III.—THE AWAKENING.

The End of Plehve—"Bloody Sunday" and after—Terrorists and Reformers—The Prospects of the Revolution.

FROM THE FIRST REVIEWS.

"One thinks of Ibsen's remark to a Russian exile, as one reads over Mr. Perris's new book—'What a splendid tyranny you have to fight against!' For the story of the revolution in Russia, if it is a chronicle of cruelty, stupidity, and unimagined misery, is also the splendid record of a heroism and a daring which one could parallel in no other country of modern Europe. Mr. Perris has seen much more than the pathos of his story, and he has seen it from the standpoint which the martyrs themselves would have chosen. Suffering on such a scale, wilfully courted, and gallantly endured, becomes something almost glorious and beautiful. . . . The best part of his book consists in the full and vivid sketches which he supplies, often in their own words, of the careers of the leaders of the revolution. It is a vivid and accurate piece of work, commendably free from exaggeration, and yet inspired by enthusiasm. It is much of it a first-hand narrative, and where it is based on documents these are invariably authoritative. The chapters on the Russian Government, on the lawlessness of the administration, on finance, and on the tariff are careful, reliable, and clear. Mr. Perris's aim was to explain the revolutionary movement to English readers, and this he has done with an admirable fulness and a wise sympathy. His book is at once a valuable political essay and an intensely moving human document."—H. N. BRAILSFORD in *The Morning Leader*.

"A book of blood and tears. The story begins at the beginning. The author shows how a despotic Government based originally on the need for self-defence has become an engine of exploitation and conquest, with which the newer economic forces are inevitably in direct conflict. The result has been the destruction of any true Government or Law. In industrial matters, the author brings the same indictment of arbitrary, and, in fact, stupid mismanagement against the Government. It is, in fact, their stupidity rather than their tyranny that he most strongly urges against them all through. Of the devoted groups of educated men and women who have organised the movements for the attainment of a measure of freedom and for the education of the masses to that end, Mr. Perris tells us much that is new and interesting. His acquaintance with many of these leaders of opinion has enabled him to give us a series of romantic yet terrible life-histories. The fortresses of Schlusselburg and St. Peter and Paul, with their soul-and-body desolating *régime*, the cruelties of Siberia, were known by bitter experience to all these men and women. One must read, in order to form any conception of them, the persecutions to which these people have been subjected. The author, it is clear enough between the lines, has but little hope of a peaceful solution. By blood and tears the tale has been told to its present chapter, and not without more blood and tears will the closing page be reached."
—*Evening Standard and St. James's Gazette.*

"Mr. Perris's vivid, well-ordered, and altogether fascinating book is a review of the past thirty-five years of Russian public life. It takes us back, that is to say, to the kindling days of the early seventies, the seed-time of the harvest of wrath. . . . The revolution is now once again in progress throughout the empire, in which, though laws be many, there is no law. . . . What in the end are the prospects of 'Russia in Revolution'? Mr. Perris, whose incisive style goes with a very temperate manner, is properly sanguine on this point."—*Daily Chronicle.*

"A very timely and informing book. It is very ably written, and constitutes one of the most powerful and cogent indictments of the whole Russian system which has yet been published in English. Mr. Perris writes coolly enough, on the whole, to make his arguments all the more acceptable. The savage measures of repression, of which he gives a blood-curdling account from the unimpassioned narratives of many who went through them, have had much the same effect as screwing down the safety-valve of a boiler. . . . Those who like to watch history in the making will do well to study Mr. Perris's able work."
—W. E. GARRETT FISHER in *The World.*

BRITISH LIBRARY

The Book of the Summer Season.

LOVE IN JUNE.

A PASTORAL COMEDY.

By KEBLE HOWARD,

Author of "The God in the Garden," "Love and a Cottage," &c., &c.

With Illustrations by FRANK REYNOLDS, R.I.

Price 6/-

THE MORNING LEADER says: "It would be a great benefit to the human race at large if Mr. Keble Howard would write one novel a week, instead of one a year. He has the lightest touch in the world, the happiest wit, the most kindly humour."

THE DAILY MAIL says: "Full of sweetness and kindliness and human feeling. . . . We doubt whether even George Eliot wrote a more tenderly eloquent passage. . . . Altogether a delightful book for these summer days."

THE DAILY NEWS says: "There is humour in it and pathos, the humour and pathos of simple life as it carries on its quiet courses towards the end. It is essentially a holiday book for the summer, and as such deserves hearty commendation. So long as Mr. Keble Howard can write with such freshness of the fresh air and sunshine and open fields, he will never lack a multitude of readers."

THE EVENING STANDARD says: "It seems to have become Mr. Keble Howard's mission in life to provide books for summer reading. He has given us 'Love and a Cottage' and 'The God in the Garden' in past years, and now comes 'Love in June,' with the same little impish Cupid on the cover, the same freshness and sweetness inside. They are the sort of stories one can smile, perhaps now and then drop a sentimental tear, over, when the grass is green and the sun high in the heavens, when labour is folly and idling the only wisdom."

THE MANCHESTER COURIER says: "Mr. Keble Howard chooses his point of view and selects his material, both for his portraits and his landscapes, with all the daintiness of an artist in paint as well as in words, with the result that one lingers over his work in sweet content. . . . Altogether, this is *one of the most delicate and most beautiful pieces of fiction written for many a day.*"

Mr. HAMILTON FYFE in *THE EVENING NEWS* says: "It smells of summer flowers. It will make you laugh a little, and I think the old lady's death will make you cry. It made me. It is told with a really beautiful simplicity. It reveals the meaning and the power of a quiet faith in God, better than all the sermons Dr. Boanerges Torrey ever has preached, or ever will preach."

THE BIRMINGHAM POST says: "As a writer of charming love stories Mr. Howard has few equals, and in his latest idyll he has excelled all his previous efforts."

THE GLASGOW HERALD says: "We lay this novel down with the impulse to mount our bicycle and make straight for the English Midlands in search of such another village as Mr. Howard so exquisitely describes, redolent of roses, mignonette, and hay, and with a fine old inn, a charmingly sentimental host and hostess, and a Hebe not averse to flirtations in the moonlight."

BRITISH LIBRARY

LAST MONTH'S FORTNIGHTLY REVIEW.

CONTENTS OF THE JUNE NUMBER.

ALFONSO XIII. OF SPAIN. By L. HIGGIN.
GERMANY IN THE MEDITERRANEAN. By J. L. BASHFORD.
IN PRAISE OF ANTHONY TROLLOPE'S NOVELS. By F. G. BETTANY.
THE PRESENT STATE OF RUSSIA. By V. E. MARSDEN.
THE LITERARY ASSOCIATIONS OF THE AMERICAN EMBASSY. By F. S. A. LOWNDES.
THE BULGARIAN ARMY. By Captain VON HERBERT.
THE ETHICS OF DON JUAN. By MAURICE GEROTHWOHL.
"THE TIMES" HISTORY OF THE WAR IN SOUTH AFRICA. By MILITARIST.
THE CASE FOR THE ALIEN. By M. J. LANDA.
TIME'S ABSTRACT AND BRIEF CHRONICLE. V. By G. K. CHESTERTON.
A CENTURY OF EMPIRE. By Major-Gen. Sir THOMAS FRASER, K.C.B.
IMPERIAL RELATIONS: A POLICY. By W. PHILIP GROSER.
PARIS AND ŒNONE. By LAURENCE BINYON.
NOSTALGIA. II. By GRAZIA DELEDDA.

SOME PRESS OPINIONS OF THE JUNE "FORTNIGHTLY."

"The coming of the youngest king in Europe to visit King Edward VII. naturally excites much interest in London. Mr. L. Higgin contributes to the 'Fortnightly Review' for June an interesting sketch of the young monarch."—REVIEW OF REVIEWS.

"A great deal is done to define the personality of our royal guest, and some delightful stories are told about him in the June number of the 'Fortnightly Review.'"—DAILY MIRROR.

"The 'Fortnightly Review' is fortunate this month in having a character sketch of Alfonso XIII. by one who appears to have made a close study of the young monarch."—WESTERN MERCURY.

"The place of honour in the 'Fortnightly Review' is very properly given to an article of historical and biographical interest, suggested by the coming of the young King of Spain, who is to enjoy the hospitality of our Royal House. Of Alfonso's personality we get a good account. . . . Another personal up-to-date note is struck on the eve of the arrival of the new American Ambassador. It is a welcome to Mr. Whitelaw Reid and an appreciation of his literary work, at the same time suggesting associations of the American Embassy."—NEWCASTLE WEEKLY JOURNAL.

"Mr. Victor Marsden writes forcibly and picturesquely on 'The Present State of Russia.' . . . The most valuable contribution to this number for lovers of literature will be Mr. Laurence Binyon's poem, 'Paris and Œnone,' which in grace of diction and depth of feeling is far above the average poetry which appears in contemporary journals."—DAILY NEWS.

"There is an excellent article by Mr. M. J. Landa in the 'Fortnightly Review,' the unwritten moral of which is that, instead of bringing in a Bill to restrict alien immigration, the true interest of Great Britain, and especially of the British working-man, lies in introducing another Bill for the purpose of attracting more aliens of the Jewish race to this country. Mr. Landa, who writes from close practical acquaintance with the Jews of Whitechapel, proves that the Polish Jewish immigrant is, physically and morally, a better man than the English East-Ender."

BRITISH LIBRARY

SOME PRESS OPINIONS OF THE JUNE "FORTNIGHTLY"—*Continued.*

"The 'Fortnightly Review' for June contains an admirable paper from the pen of Major-General Sir Thomas Fraser, K.C.B., entitled 'A Century of Empire.' The appearance of this able and very readable article during the week in which Empire-day has been celebrated is most apt, and both the writer and the 'Fortnightly Review' are to be congratulated upon a contribution of real Imperial interest."—STANDARD.

"An article that will be found of exceptional interest from a military point of view is one entitled 'The Bulgarian Army,' by Captain von Herbert."
—BROAD ARROW.

"Mr. Groser's article in the 'Fortnightly Review' on the relations that exist between Great Britain and her colonies is eminently worthy of serious thought. . . . Even if nothing practical comes out of Mr. Groser's proposal, he has done a good service in emphasising the fact that the time has come when something practical must be done by way of apportioning the cost of maintaining the Empire."—NORTHERN WHIG.

"A temperate but forcibly-written article from the pen of Mr. M. J. Landa appears in the June number of the 'Fortnightly Review,' under the title 'The Case for the Alien.' He asks for no more than to 'temper the exaggeration of the cry for restriction' in alien immigration, and he presents a case which is at least worthy of examination."—REFEREE.

"Mr. Victor Marsden's paper on 'The Present State of Russia' is melancholy reading, but it is just what is needed to correct misconceptions too readily formed as to the meaning and value of the Czar's promises of internal reform. Mr. Marsden writes evidently from considerable knowledge of things in Russia."—YORKSHIRE POST.

"Mr. F. S. A. Lowndes discourses pleasantly on the literary men who have at one time or another been connected with the American Embassy in London. Anthony Trollope forms the subject of an interesting article, Readers of Trollope will agree with Mr. Bettany that those who do not know Trollope miss much quiet enjoyment. Mr. Chesterton's comments on current affairs are as usual clever and amusing."—ABERDEEN FREE PRESS.

"The 'Fortnightly' for June has, in addition to the usual supply of political articles, several papers of very great interest to the lover of literature. Mr. Maurice Gerothwohl writes a very learned paper on the 'Ethics of Don Juan,' full of history."—COUNTRY LIFE.

"An interesting contribution in view of the centenary of Trafalgar is Major-General Sir Thomas Fraser's 'A Century of Empire,' in which the progress of the nation in the course of the past hundred years, from the point of view of Imperial and colonial development, is carefully surveyed, and compared with that of the rival world-Powers. This article is of special value as supplementing the recent speech of the Prime Minister on Imperial Defence. Mr. F. S. A. Lowndes does well to remind the country of the character of the men whom the United States send to represent her interests at foreign Courts generally and at the Court of St. James's in particular, and his article, 'Literary Associations of the American Embassy,' should be widely read. Literary, political, and international studies complete an altogether admirable issue."—SCOTSMAN.

To His Majesty THE KING. Rubber Tyre Manufacturers. *By Special Appointment.*

ROYAL SIRDAR BUFFER TYRES

The Users say
THE BEST
SOLIDS EXCEL
PNEUMATICS.

Cost ⅛*d.* per mile, with freedom from risks and worries of punctures.

The only comfortable and reliable solids. Beware of experiments.

The Times says:

"Testimonials received by the Sirdar Rubber Company from the Straker Steam Vehicle Company after the 2000 miles trial of their petrol omnibus are of a very satisfactory character, and they have many others."

ROYAL SIRDAR PNEUMATICS

The Motor News says:

"Nipped tubes are a constant source of trouble, especially to a beginner. The Sirdar Air Tube gets over this difficulty. It is vulcanised in a U shape, so that when placed inside the cover it springs naturally into the crown of same, and so keeps clear of the edges of the cover or the tools used for fitting purposes. It is essential, however, that it should **not** be partially inflated when the cover is being replaced. These tubes are made if anything larger than the inside of the cover, and when inflated are compressed both laterally and longitudinally instead of being stretched as the ordinary air tube is. They consequently afford great resistance to puncturing material."

ALL KINDS OF RUBBER GOODS, RUGS, AND GARMENTS SUPPLIED OR MADE TO ORDER.

BRITISH LIBRARY

85, Shaftesbury Avenue,
LONDON, W.

Dear Sir,

Herewith we have pleasure in handing you particulars of a new Voltmeter which we are about to place on the market.

For some time past we have given this subject very great attention, and have now no hesitation in saying that this Meter is the most reliable article yet placed upon the market.

The case is made throughout of white metal, and every metal part used in this Meter is anti-magnetic. Further, we have—what is a most unusual provision in meters, *i.e.* a pivot working in a jewelled hole. This practically does away with the variation commonly found through expansion and contraction of the metals during the changes in temperature.

The spool or coil is scientifically made of the very best wire and insulating material, and the two terminals for communicating to the poles of the accumulator are fastened in a very ingenious manner. The eye-ring contains a set screw, which protects the point and prevents it wearing holes in the pocket.

The other terminal is connected to the coil by the usual flexible wire, which is self-winding. The tension of the spring can be altered by a very ingenious arrangement.

We shall be glad to hear if we may send you one of these instruments, the price of which is 20/-.

Thanking you in anticipation,

We are, Dear Sir,

Yours faithfully,

LAMB BROS. & GARNETT.

"BRAIN SALT"

Is not put forward as an universal remedy, but it is what its name indicates—viz., an Effervescing Medicinal Salt, for the cure or relief of the effects of over-brainwork. Used as directed, it brightens and refreshes the exhausted sufferer, to whom even temporary relief may have seemed an impossibility.

Of Chemists, per bottle, 2s. 9d.

F. NEWBERY & SONS,
27 & 28, CHARTERHOUSE SQ., AND

MANCHESTER: 26, Market Street.

Why Suffer Pain

INDIGESTION, and ILL-HEALTH, when Painless and Perfect Dentistry can relieve and compensate for Nature's failure?

The Pioneer of inexpensive Dentistry, **Dr. G. H. JONES**, has been personally awarded for his Perfect and Painless Dentistry—Gold Medals, London and Paris; Gold Medal, New Zealand Exhibition; Gold Medal, Calcutta; and the Highest Diploma of Merit and Award at Nice and Amsterdam; Awarded the Gold Medal of the Academie Nationale, Paris; and the Highest Award, Antwerp; also the Gold Medal, International Exhibition, London; Gold Medal, Liverpool; Gold Medal, Melbourne.

Her Majesty's Surgeon Dentist says:—

"My mastication is now perfect, and articulation quite distinct. Your teeth are the best, safest, and most life-like; and your system is the perfection of Painless Dentistry. In recognition of your valuable services rendered to me you are at liberty to use my name.
(Signed) "S. G. HUTCHINGS."

The following is one of the many testimonials received from grateful Patients:—

"I am pleased to tell you that, although I am ninety-two years of age, I enjoy excellent health, and I have to thank you for the splendid set of teeth you made for me twenty-six years ago. I can masticate anything, and my digestion is first-rate. The teeth now are as good as when you put them in, and they have not cost me one penny for repairs all that time; in fact, I cannot speak too highly of your work."

Consultations and every information given **FREE** daily, hours 10 to 5.

Please observe only Address: Telephone: 6753 Gerrard.

Lt.-Col. W. H. JAMES, P.S.C. (Honours), late R.E.
BUSHMEAD HALL, BEDFORD.

Lieut.-Col. JAMES is the Author of "Modern Strategy" (the official text-book for the Indian Promotion Examinations) and many other works, and is the Editor and Founder of the "Wolseley Series." He has had twenty years' experience in teaching, and has obtained over

TWO THOUSAND SUCCESSES.

In the subjects of MILITARY HISTORY, TACTICS, and STRATEGY his Pupils have habitually taken the HIGHEST PLACES. Col. JAMES resides at BUSHMEAD HALL, and personally supervises the work of each Pupil.

Specialities:

INDIVIDUAL ATTENTION. NO LARGE CLASSES.

RECENT SUCCESSES (since September, 1903):

STAFF COLLEGE—Four Officers passed, including FIRST on whole list, FIRST on Artillery List, and four others qualified. The AVERAGE MARKS obtained by all was OVER 4,000.

PROMOTION—Thirty-two Officers passed, including the only SPECIAL CERTIFICATE given in May.

MILITIA COMPETITIVE—H. M. Imbert-Terry (2nd on Artillery List), G. V. C. Irwin, N. F. Stewart, E. S. Vicary, N. Hudson, W. F. Panton, W. M. Richardson, O. C. Downes. All these read with Col. JAMES at the time they passed.

MILITIA LITERARY—G. V. C. Irwin, A. St. J. Wright, M. C. Coote, R. Lechmere.

WOOLWICH—A. G. Bannatyne, 14th; O. E. Fane, 37th.

SANDHURST—C. G. Porter, 19th; R. B. Wodehouse, 67th.

INDIAN POLICE—E. L. Skinner, 12th (the Only Candidate).

Some of the places taken by the above Candidates in various subjects include Mathematics, 5th (twice), 6th; Mathematics III., Woolwich, 2nd; French, 1st (twice); German, 1st; Latin, 2nd and 4th; Greek, 2nd; Geology, 5th (twice); 1st Geometrical Drawing. **Telegrams: "Colonel, Bedford." Telephone: 64 Bedford.**

MOORE, SCANTLEBURY, & COOTE,
TAILORS.

Inventors of the Registered "MOREESE" Jacket, the most adaptable garment ever designed in every possible position.

Do not fail to call and see it before you place your order.

M. S. & C. will have great pleasure in showing its many points.

47, CONDUIT STREET, LONDON, W.

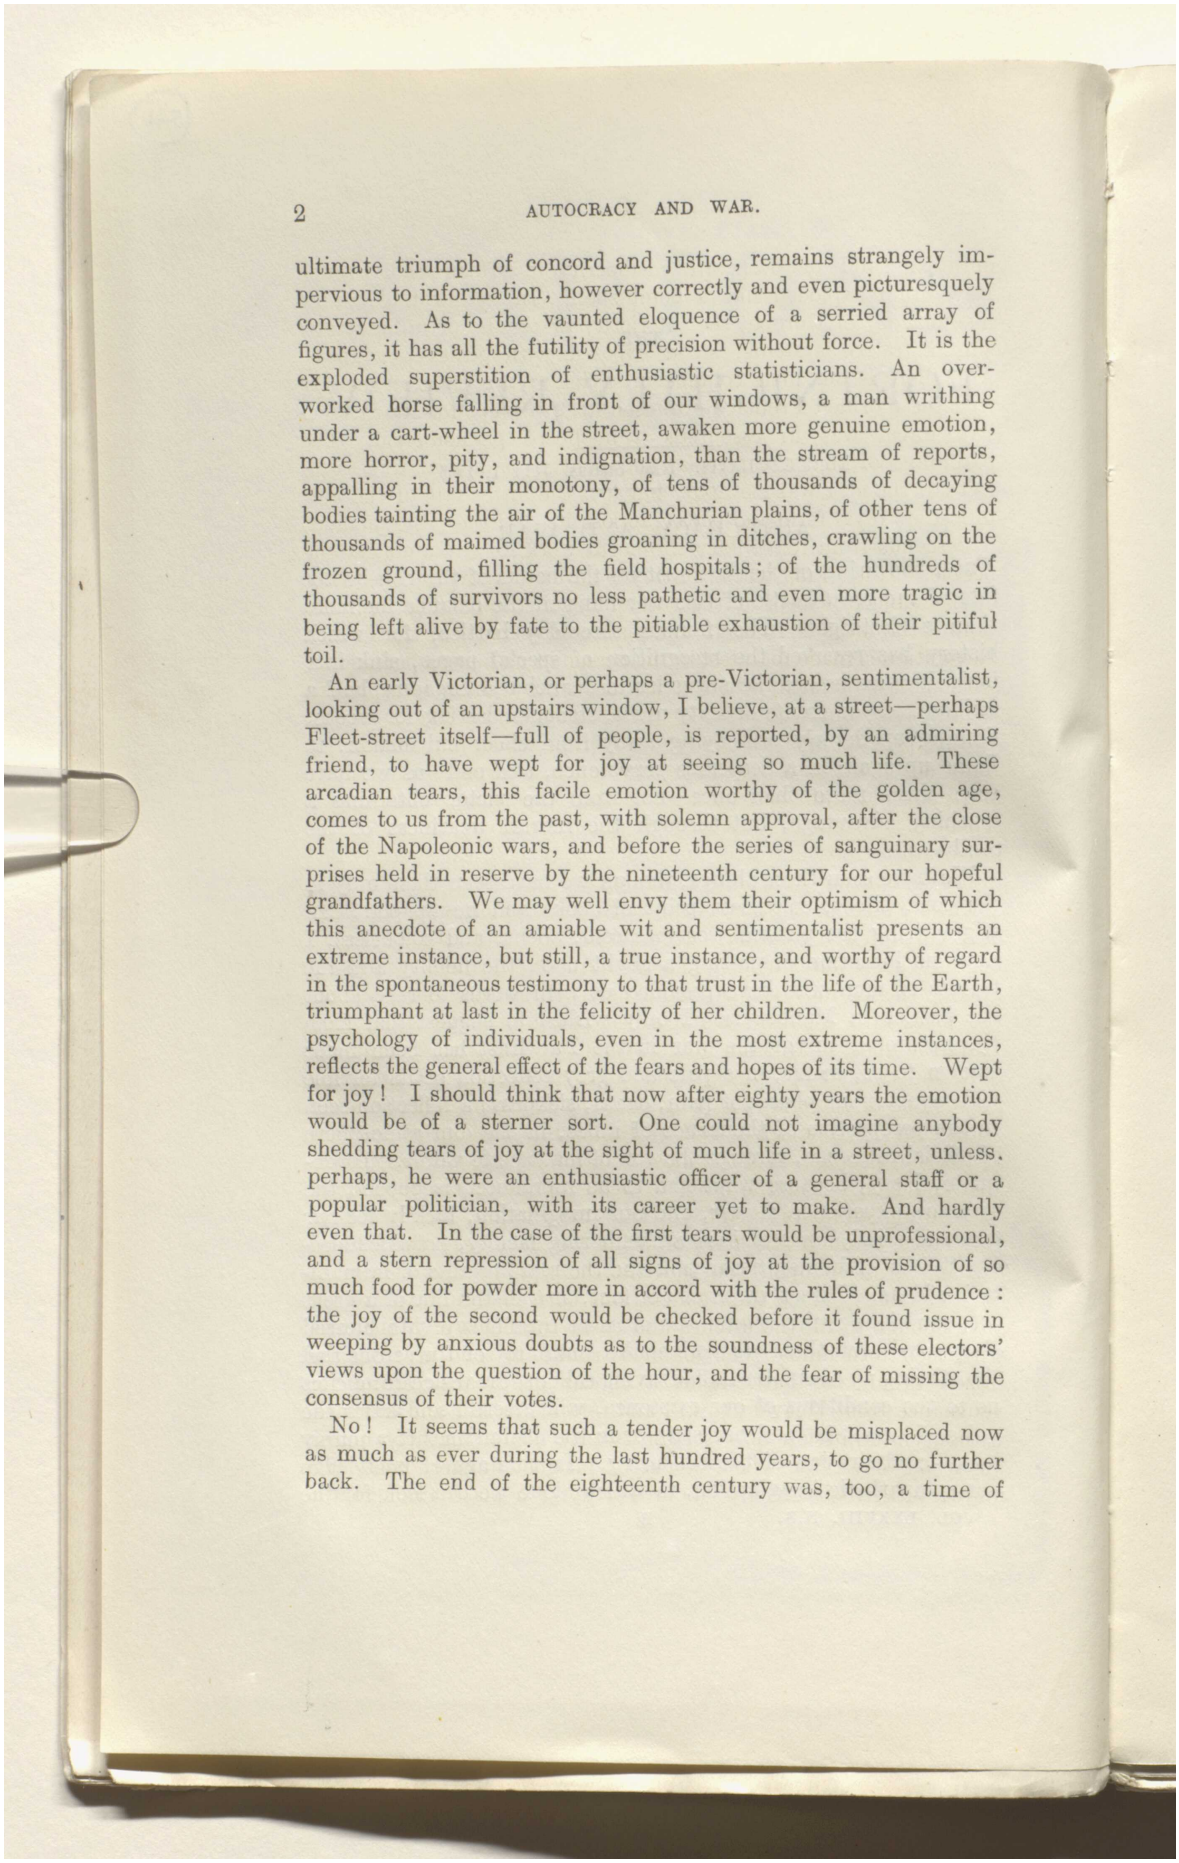
THE

FORTNIGHTLY REVIEW.

No. CCCCLXIII. New Series, July 1, 1905.

AUTOCRACY AND WAR.



From the firing of the first shot on the banks of the Sha-ho the fate of *the* great battle of this war hung in the balance for more than a fortnight. The famous three-day battles, for which history has reserved the recognition of special pages, sink into insignificance before the struggles in Manchuria engaging half a million men on fronts of sixty miles, struggles lasting for weeks, flaming up fiercely and dying away from sheer exhaustion, to flame up again in a desperate persistence, and end—as we have seen them more than once—not from the victor obtaining a crushing advantage, but through the mortal weariness of the combatants.

We have seen these things, though we have seen them only in the cold, silent, colourless print of books and newspapers. In stigmatising the printed world as cold, silent, and colourless, I have no intention of putting a slight upon the fidelity and the talents of men who have provided us with words to read about the battles in Manchuria. I only wished to suggest that from the nature of things the war in the Far East has been made known to us, so far, in a pale and grey reflection of its terrible and monotonous phases of pain, death, sickness; a reflection seen in the perspective of thousands of miles, in the dim atmosphere of official reticence, through the veil of inadequate words. Inadequate, I say, because what had to be reproduced is beyond the common experience of war, and our imagination, luckily for our peace of mind, has remained a slumbering faculty, notwithstanding the din of humanitarian talk and the real progress of humanitarian ideas. Direct vision of the fact, or the stimulus of a great art, can alone make it turn and open its eyes heavy with blessed sleep; and even there, as against the testimony of the senses and the stirring up of emotion, that saving callousness which reconciles us to the conditions of our existence, will assert itself under the guise of assent to fatal necessity or in the enthusiasm of a purely esthetic admiration of the rendering. In this age of knowledge our sympathetic imagination, to which alone we can look for the

BRITISH LIBRARY

ultimate triumph of concord and justice, remains strangely impervious to information, however correctly and even picturesquely conveyed. As to the vaunted eloquence of a serried array of figures, it has all the futility of precision without force. It is the exploded superstition of enthusiastic statisticians. An overworked horse falling in front of our windows, a man writhing under a cart-wheel in the street, awaken more genuine emotion, more horror, pity, and indignation, than the stream of reports, appalling in their monotony, of tens of thousands of decaying bodies tainting the air of the Manchurian plains, of other tens of thousands of maimed bodies groaning in ditches, crawling on the frozen ground, filling the field hospitals; of the hundreds of thousands of survivors no less pathetic and even more tragic in being left alive by fate to the pitiable exhaustion of their pitiful toil.

An early Victorian, or perhaps a pre-Victorian, sentimentalist, looking out of an upstairs window, I believe, at a street—perhaps Fleet-street itself—full of people, is reported, by an admiring friend, to have wept for joy at seeing so much life. These arcadian tears, this facile emotion worthy of the golden age, comes to us from the past, with solemn approval, after the close of the Napoleonic wars, and before the series of sanguinary surprises held in reserve by the nineteenth century for our hopeful grandfathers. We may well envy them their optimism of which this anecdote of an amiable wit and sentimentalist presents an extreme instance, but still, a true instance, and worthy of regard in the spontaneous testimony to that trust in the life of the Earth, triumphant at last in the felicity of her children. Moreover, the psychology of individuals, even in the most extreme instances, reflects the general effect of the fears and hopes of its time. Wept for joy! I should think that now after eighty years the emotion would be of a sterner sort. One could not imagine anybody shedding tears of joy at the sight of much life in a street, unless, perhaps, he were an enthusiastic officer of a general staff or a popular politician, with its career yet to make. And hardly even that. In the case of the first tears would be unprofessional, and a stern repression of all signs of joy at the provision of so much food for powder more in accord with the rules of prudence: the joy of the second would be checked before it found issue in weeping by anxious doubts as to the soundness of these electors' views upon the question of the hour, and the fear of missing the consensus of their votes.

No! It seems that such a tender joy would be misplaced now as much as ever during the last hundred years, to go no further back. The end of the eighteenth century was, too, a time of

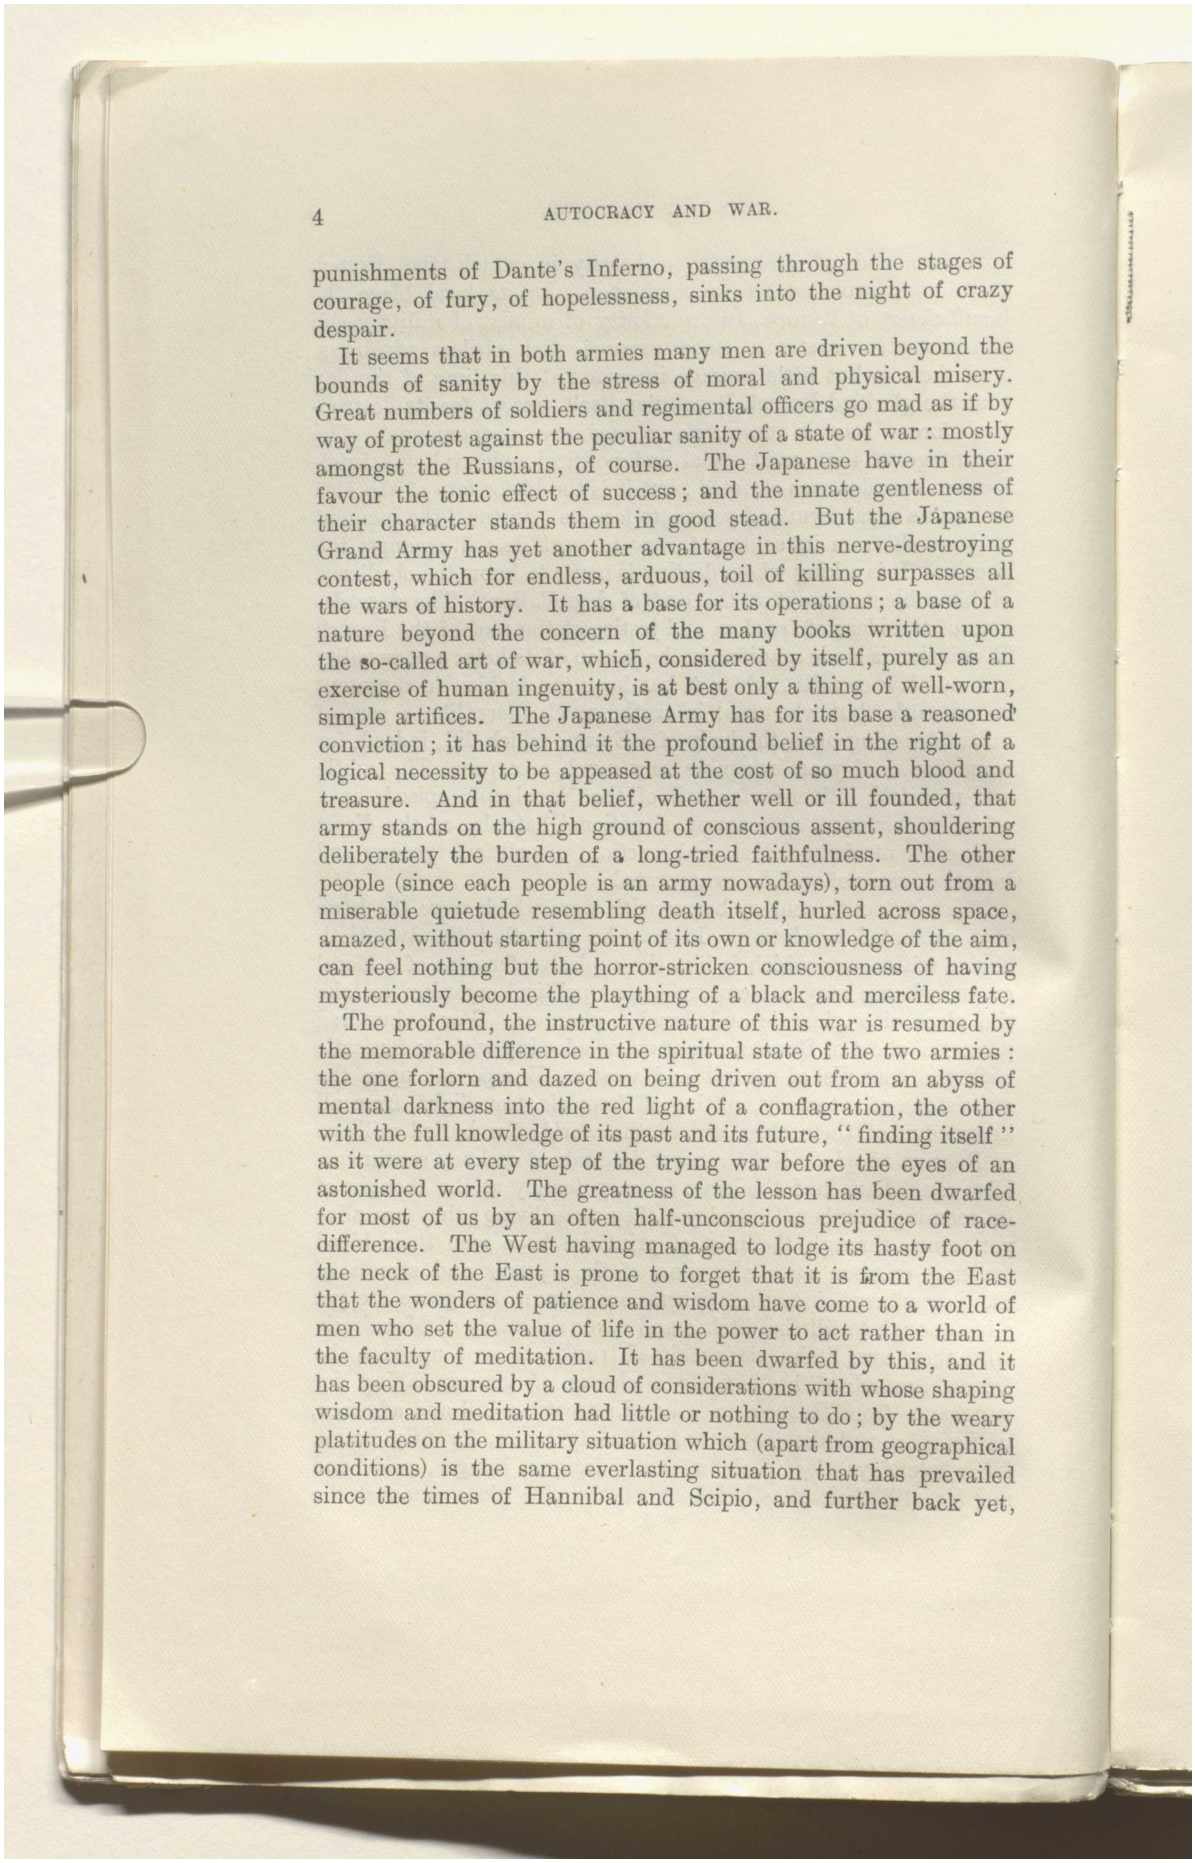
BRITISH LIBRARY



optimism and of desperate mediocrity in which the French Revolution exploded like a bomb-shell. In its lurid blaze the insufficiency of Europe, the inferiority of minds, of military and administrative systems, stood exposed with pitiless vividness. And there is but little courage in saying at this time of the day that the glorified French Revolution itself, except for its destructive force, was in essentials a mediocre phenomenon. The parentage of that great social and political upheaval was intellectual, the idea was elevated : but it is the bitter fate of the idea to lose its royal form and power, to lose its " virtue " the moment it descends from its solitary throne to work its will amongst the people. It is a king whose destiny is never to know the obedience of his subjects except at the cost of degradation. The degradation of the ideas of freedom and justice at the root of the French Revolution is made manifest in the person of its heir ; a personality without law or faith, whom it has been the fashion to represent as an eagle, but who was, in truth, much more like a sort of vulture preying upon the body of a Europe which did, indeed, for some dozen of years resemble very much a corpse. The subtle and manifold influence for evil of the Napoleonic episode as a school of violence, as a sower of national hatreds, as the direct provocator of obscurantism and reaction, of political tyranny and injustice, can not well be exaggerated.

The nineteenth century began with wars which were the issue of a corrupted revolution. It may be said that the twentieth begins with a war which is like the explosive ferment of a moral grave, whence may yet emerge a new political organism to take the place of a gigantic and dreaded phantom. For a hundred years the ghost of Russian might overshadowing with its fantastic bulk the councils of central and western Europe sat upon the gravestone of autocracy, cutting off from air, from light, from all knowledge of themselves and of the world, the buried millions of Russian people. Not the most determined cockney sentimentalist could have had the heart to weep for joy at the thought of its teeming numbers! And yet they were living, they are alive yet, since through the mist of print we have seen their blood freezing crimson upon the snow of the squares and streets of St. Petersburg, since their generations born in the grave are yet alive enough to fill the ditches and cover the fields of Manchuria with their torn limbs, their maimed trunks, to send up from the frozen ground of battle-fields a chorus of groans calling for vengeance from Heaven, to kill and retreat, or kill and advance, without intermission or rest, for twenty hours, for fifty hours, for whole days, for whole weeks of fatigue, hunger, cold, and murder—till their ghastly labour worthy of a place amongst the

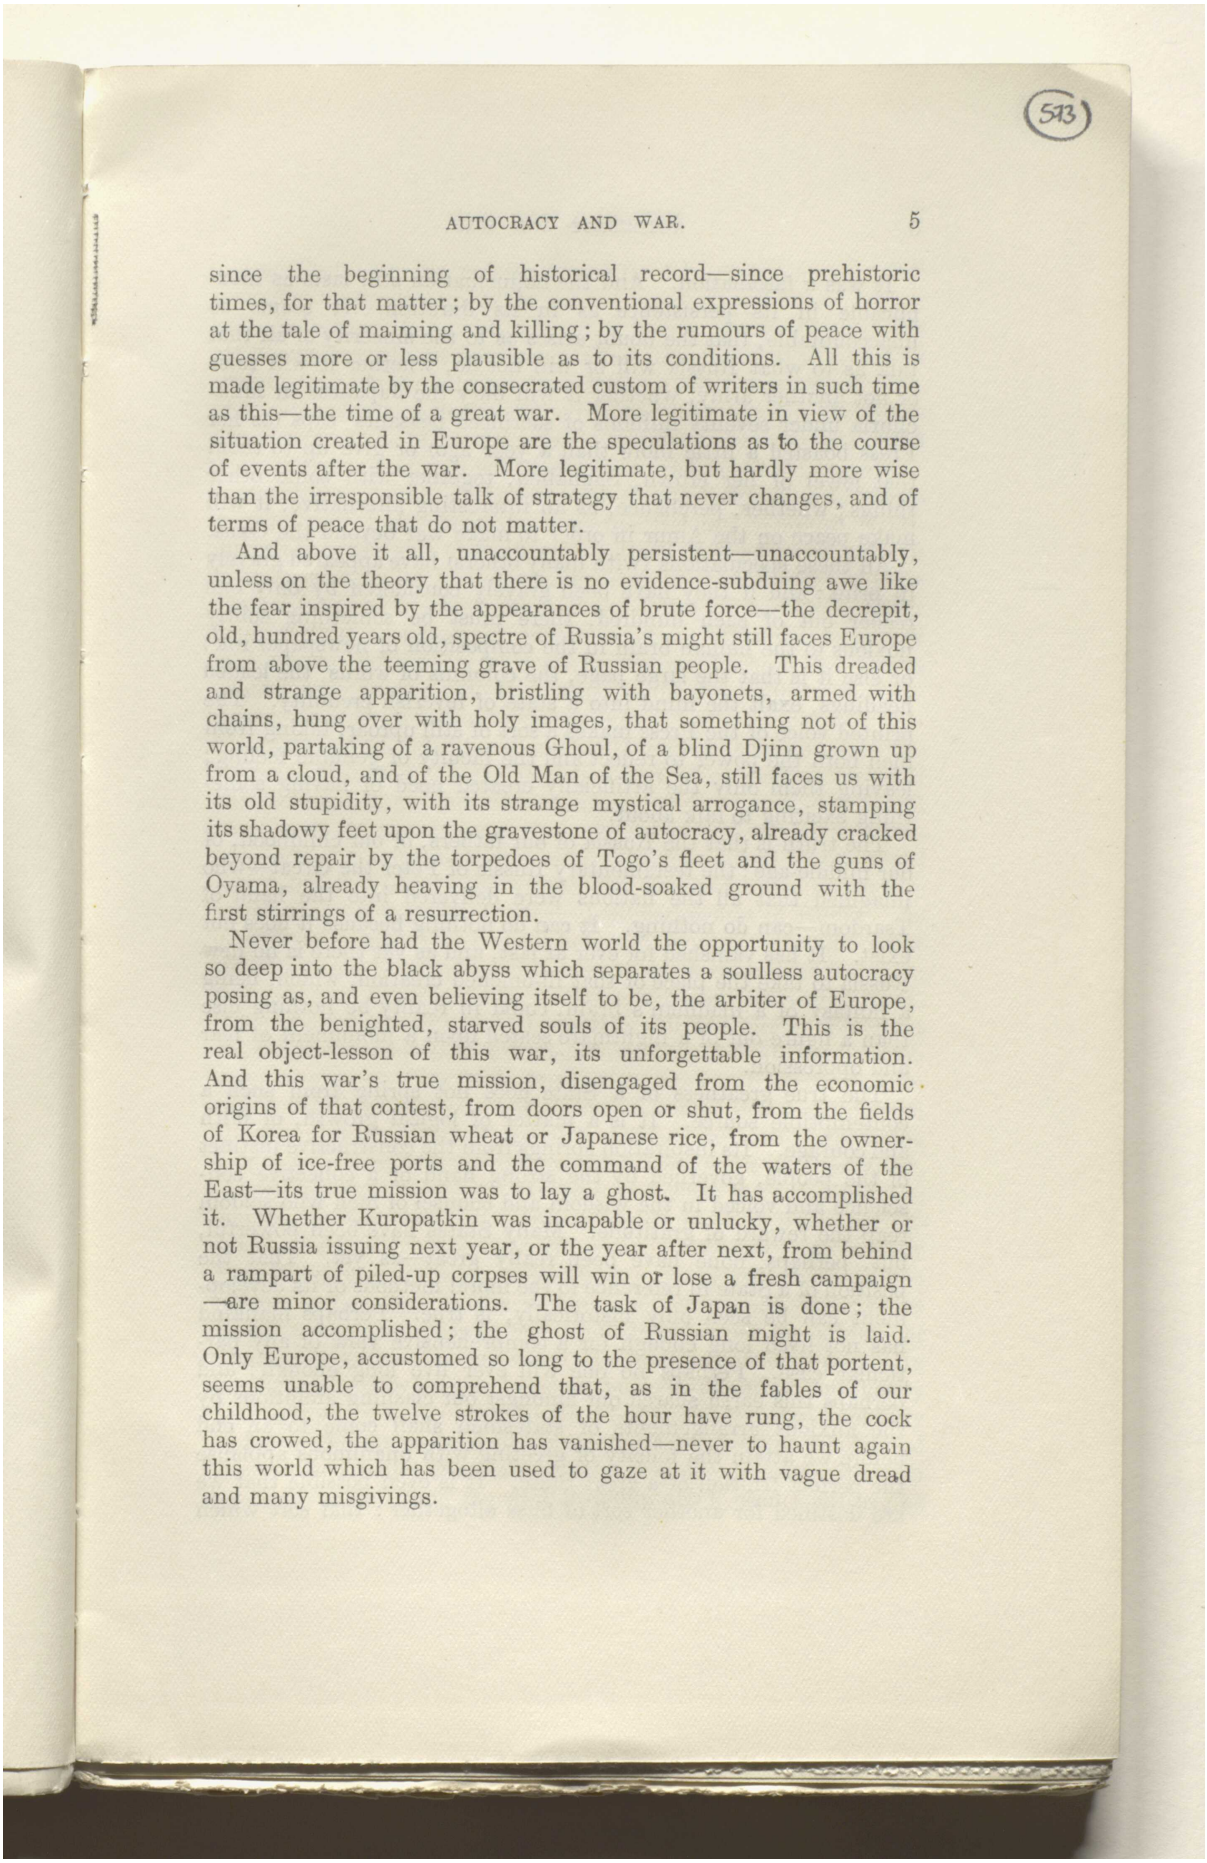
BRITISH LIBRARY

punishments of Dante's Inferno, passing through the stages of courage, of fury, of hopelessness, sinks into the night of crazy despair.



It seems that in both armies many men are driven beyond the bounds of sanity by the stress of moral and physical misery. Great numbers of soldiers and regimental officers go mad as if by way of protest against the peculiar sanity of a state of war: mostly amongst the Russians, of course. The Japanese have in their favour the tonic effect of success; and the innate gentleness of their character stands them in good stead. But the Japanese Grand Army has yet another advantage in this nerve-destroying contest, which for endless, arduous, toil of killing surpasses all the wars of history. It has a base for its operations; a base of a nature beyond the concern of the many books written upon the so-called art of war, which, considered by itself, purely as an exercise of human ingenuity, is at best only a thing of well-worn, simple artifices. The Japanese Army has for its base a reasoned conviction; it has behind it the profound belief in the right of a logical necessity to be appeased at the cost of so much blood and treasure. And in that belief, whether well or ill founded, that army stands on the high ground of conscious assent, shouldering deliberately the burden of a long-tried faithfulness. The other people (since each people is an army nowadays), torn out from a miserable quietude resembling death itself, hurled across space, amazed, without starting point of its own or knowledge of the aim, can feel nothing but the horror-stricken consciousness of having mysteriously become the plaything of a black and merciless fate.

The profound, the instructive nature of this war is resumed by the memorable difference in the spiritual state of the two armies: the one forlorn and dazed on being driven out from an abyss of mental darkness into the red light of a conflagration, the other with the full knowledge of its past and its future, "finding itself" as it were at every step of the trying war before the eyes of an astonished world. The greatness of the lesson has been dwarfed for most of us by an often half-unconscious prejudice of race-difference. The West having managed to lodge its hasty foot on the neck of the East is prone to forget that it is from the East that the wonders of patience and wisdom have come to a world of men who set the value of life in the power to act rather than in the faculty of meditation. It has been dwarfed by this, and it has been obscured by a cloud of considerations with whose shaping wisdom and meditation had little or nothing to do; by the weary platitudes on the military situation which (apart from geographical conditions) is the same everlasting situation that has prevailed since the times of Hannibal and Scipio, and further back yet,

BRITISH LIBRARY

since the beginning of historical record—since prehistoric times, for that matter; by the conventional expressions of horror at the tale of maiming and killing; by the rumours of peace with guesses more or less plausible as to its conditions. All this is made legitimate by the consecrated custom of writers in such time as this—the time of a great war. More legitimate in view of the situation created in Europe are the speculations as to the course of events after the war. More legitimate, but hardly more wise than the irresponsible talk of strategy that never changes, and of terms of peace that do not matter.

And above it all, unaccountably persistent—unaccountably, unless on the theory that there is no evidence-subduing awe like the fear inspired by the appearances of brute force—the decrepit, old, hundred years old, spectre of Russia's might still faces Europe from above the teeming grave of Russian people. This dreaded and strange apparition, bristling with bayonets, armed with chains, hung over with holy images, that something not of this world, partaking of a ravenous Ghoul, of a blind Djinn grown up from a cloud, and of the Old Man of the Sea, still faces us with its old stupidity, with its strange mystical arrogance, stamping its shadowy feet upon the gravestone of autocracy, already cracked beyond repair by the torpedoes of Togo's fleet and the guns of Oyama, already heaving in the blood-soaked ground with the first stirrings of a resurrection.

Never before had the Western world the opportunity to look so deep into the black abyss which separates a soulless autocracy posing as, and even believing itself to be, the arbiter of Europe, from the benighted, starved souls of its people. This is the real object-lesson of this war, its unforgettable information. And this war's true mission, disengaged from the economic origins of that contest, from doors open or shut, from the fields of Korea for Russian wheat or Japanese rice, from the ownership of ice-free ports and the command of the waters of the East—its true mission was to lay a ghost. It has accomplished it. Whether Kuropatkin was incapable or unlucky, whether or not Russia issuing next year, or the year after next, from behind a rampart of piled-up corpses will win or lose a fresh campaign—are minor considerations. The task of Japan is done; the mission accomplished; the ghost of Russian might is laid. Only Europe, accustomed so long to the presence of that portent, seems unable to comprehend that, as in the fables of our childhood, the twelve strokes of the hour have rung, the cock has crowed, the apparition has vanished—never to haunt again this world which has been used to gaze at it with vague dread and many misgivings.

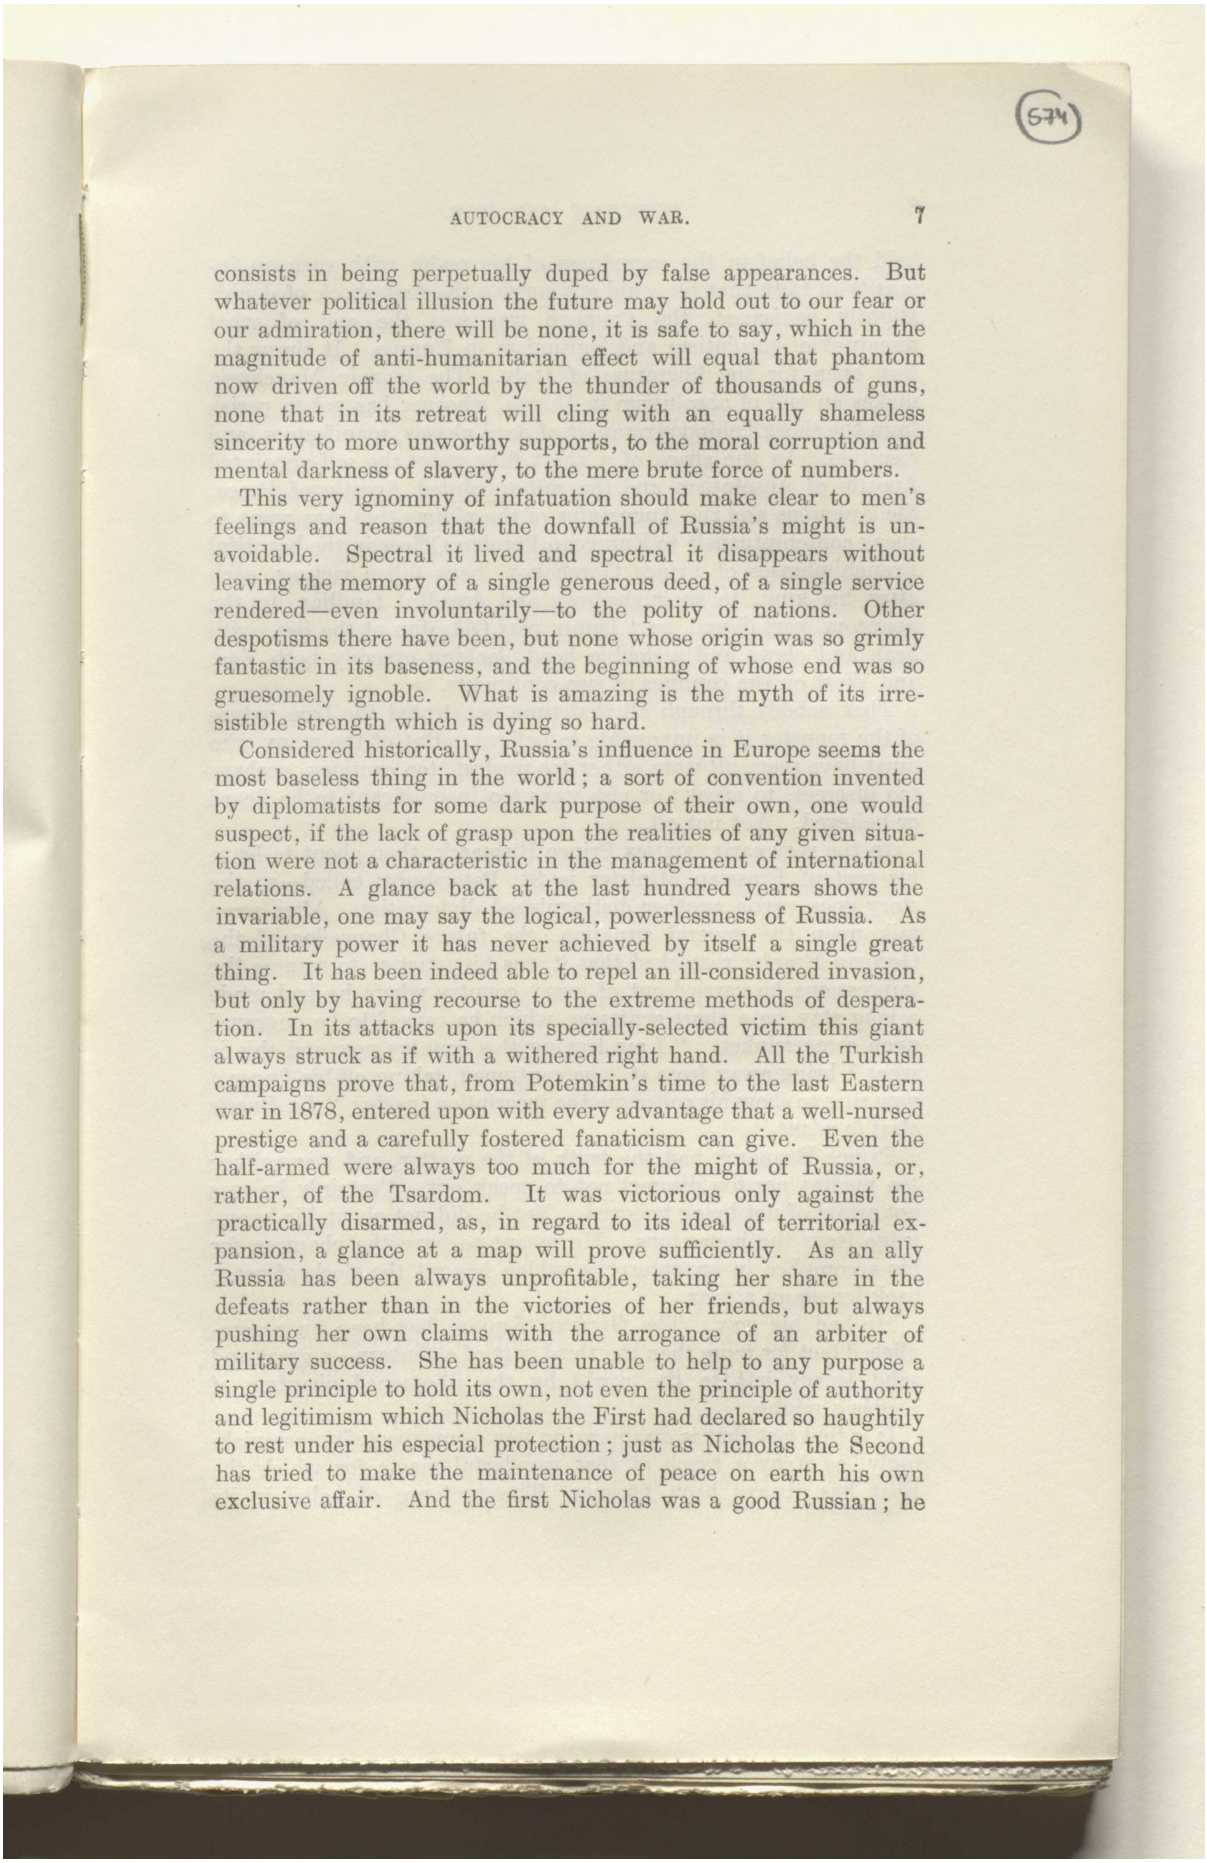
It was a fascination. And the hallucination still lasts as inexplicable in its persistence as in its duration. It seems so unaccountable, that the doubt arises as to the sincerity of all that talk as to what Russia will or will not do, whether it will raise or not another army, whether it will bury the Japanese in Manchuria under seventy millions of sacrificed peasants' caps (as her Press boasted a little more than a year ago) or give up to them that jewel of her crown, Saghalien, together with some other things; whether, perchance, as an interesting alternative, it will make peace on the Amur in order to make war beyond the Oxus.

All these speculations (with many others) have appeared gravely in print; and if they have been gravely considered by only one reader out of each hundred, there must be something subtly noxious to the human brain in the composition of newspaper ink; or else it is that the large page, the columns of words, the leaded headings, exalt the mind into a state of feverish credulity. The printed voice of the Press makes a sort of still uproar, taking from men both the power to reflect and the faculty of genuine feeling; leaving them only the artificially created need of having something exciting to talk about.



The truth is that the Russia of our fathers, of our childhood, of our middle-age; the testamentary Russia of Peter the Great—who imagined that all the nations were delivered into the hand of Tsardom—can do nothing. It can do nothing because it does not exist. It has vanished for ever at last, and as yet there is no new Russia to take the place of that ill-omened creation, which, being a fantasy of a madman's brain, could in reality be nothing else than a figure out of a nightmare seated upon a monument of fear and oppression.

The true greatness of a State does not spring from such a contemptible source. It is a matter of logical growth, of faith and courage. Its inspiration springs from the constructive instinct of the people, governed by the strong hand of a collective conscience and voiced in the wisdom and counsel of men who seldom reap the reward of gratitude. Many States have been powerful, but, perhaps, none have been really great—as yet. That the position of a State in reference to the moral methods of its development can be seen only historically, is true. Perhaps mankind has not lived long enough for a comprehensive view of any particular case. Perhaps no one will ever live long enough; and perhaps this earth shared out amongst our clashing ambitions by the anxious arrangements of statesmen shall come to an end before we attain the felicity of greeting with unanimous applause the perfect fruition of a great State. It is even possible that we are destined for another sort of bliss altogether: that sort which

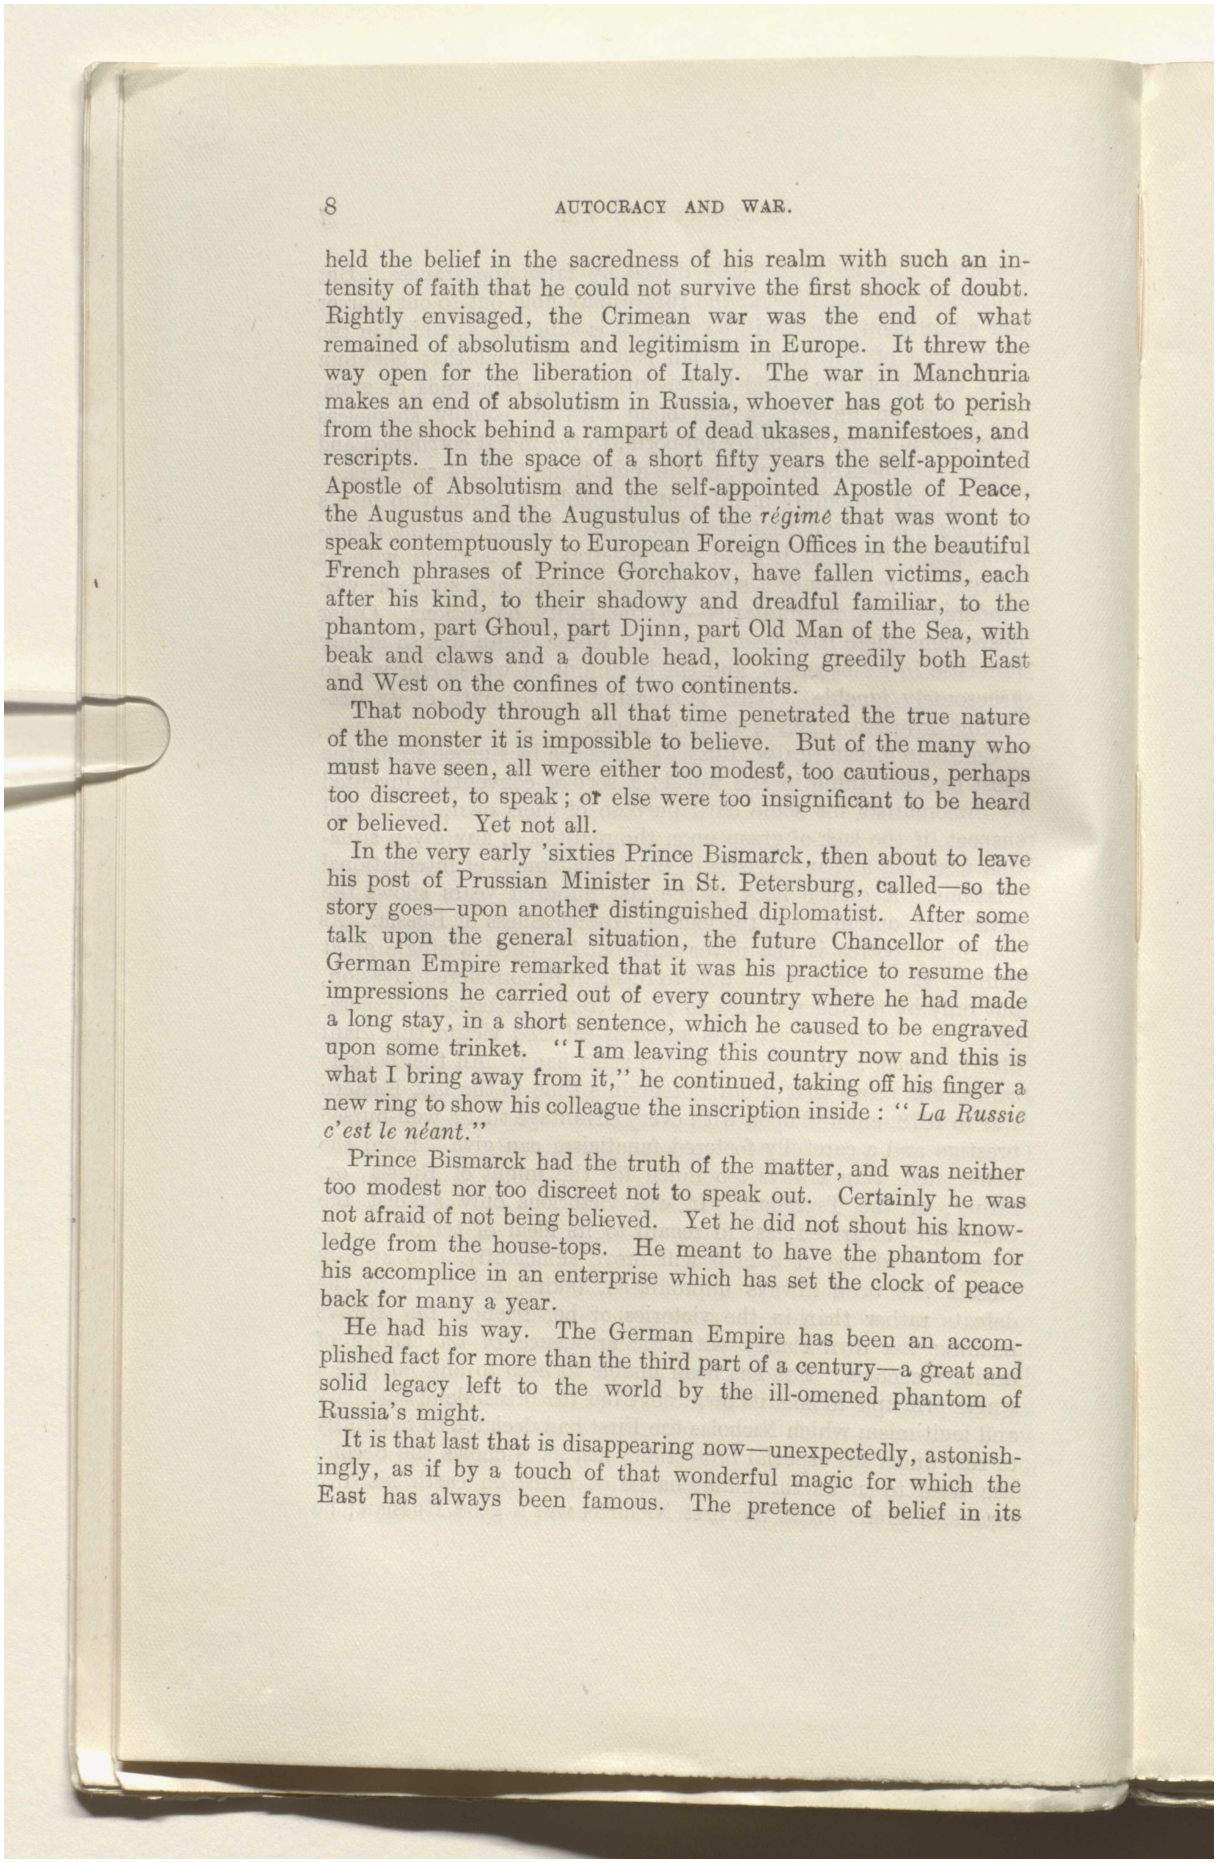
BRITISH LIBRARY

consists in being perpetually duped by false appearances. But whatever political illusion the future may hold out to our fear or our admiration, there will be none, it is safe to say, which in the magnitude of anti-humanitarian effect will equal that phantom now driven off the world by the thunder of thousands of guns, none that in its retreat will cling with an equally shameless sincerity to more unworthy supports, to the moral corruption and mental darkness of slavery, to the mere brute force of numbers.



This very ignominy of infatuation should make clear to men's feelings and reason that the downfall of Russia's might is unavoidable. Spectral it lived and spectral it disappears without leaving the memory of a single generous deed, of a single service rendered—even involuntarily—to the polity of nations. Other despotisms there have been, but none whose origin was so grimly fantastic in its baseness, and the beginning of whose end was so gruesomely ignoble. What is amazing is the myth of its irresistible strength which is dying so hard.

Considered historically, Russia's influence in Europe seems the most baseless thing in the world; a sort of convention invented by diplomatists for some dark purpose of their own, one would suspect, if the lack of grasp upon the realities of any given situation were not a characteristic in the management of international relations. A glance back at the last hundred years shows the invariable, one may say the logical, powerlessness of Russia. As a military power it has never achieved by itself a single great thing. It has been indeed able to repel an ill-considered invasion, but only by having recourse to the extreme methods of desperation. In its attacks upon its specially-selected victim this giant always struck as if with a withered right hand. All the Turkish campaigns prove that, from Potemkin's time to the last Eastern war in 1878, entered upon with every advantage that a well-nursed prestige and a carefully fostered fanaticism can give. Even the half-armed were always too much for the might of Russia, or, rather, of the Tsardom. It was victorious only against the practically disarmed, as, in regard to its ideal of territorial expansion, a glance at a map will prove sufficiently. As an ally Russia has been always unprofitable, taking her share in the defeats rather than in the victories of her friends, but always pushing her own claims with the arrogance of an arbiter of military success. She has been unable to help to any purpose a single principle to hold its own, not even the principle of authority and legitimism which Nicholas the First had declared so haughtily to rest under his especial protection; just as Nicholas the Second has tried to make the maintenance of peace on earth his own exclusive affair. And the first Nicholas was a good Russian; he

held the belief in the sacredness of his realm with such an intensity of faith that he could not survive the first shock of doubt. Rightly envisaged, the Crimean war was the end of what remained of absolutism and legitimism in Europe. It threw the way open for the liberation of Italy. The war in Manchuria makes an end of absolutism in Russia, whoever has got to perish from the shock behind a rampart of dead ukases, manifestoes, and rescripts. In the space of a short fifty years the self-appointed Apostle of Absolutism and the self-appointed Apostle of Peace, the Augustus and the Augustulus of the *régime* that was wont to speak contemptuously to European Foreign Offices in the beautiful French phrases of Prince Gorchakov, have fallen victims, each after his kind, to their shadowy and dreadful familiar, to the phantom, part Ghoul, part Djinn, part Old Man of the Sea, with beak and claws and a double head, looking greedily both East and West on the confines of two continents.

That nobody through all that time penetrated the true nature of the monster it is impossible to believe. But of the many who must have seen, all were either too modest, too cautious, perhaps too discreet, to speak; or else were too insignificant to be heard or believed. Yet not all.

In the very early 'sixties Prince Bismarck, then about to leave his post of Prussian Minister in St. Petersburg, called—so the story goes—upon another distinguished diplomatist. After some talk upon the general situation, the future Chancellor of the German Empire remarked that it was his practice to resume the impressions he carried out of every country where he had made a long stay, in a short sentence, which he caused to be engraved upon some trinket. "I am leaving this country now and this is what I bring away from it," he continued, taking off his finger a new ring to show his colleague the inscription inside: "*La Russie c'est le néant.*"

Prince Bismarck had the truth of the matter, and was neither too modest nor too discreet not to speak out. Certainly he was not afraid of not being believed. Yet he did not shout his knowledge from the house-tops. He meant to have the phantom for his accomplice in an enterprise which has set the clock of peace back for many a year.

He had his way. The German Empire has been an accomplished fact for more than the third part of a century—a great and solid legacy left to the world by the ill-omened phantom of Russia's might.

It is that last that is disappearing now—unexpectedly, astonishingly, as if by a touch of that wonderful magic for which the East has always been famous. The pretence of belief in its

existence will no longer answer anybody's purposes (now Prince Bismarck is dead) unless the purposes of the writers of sensational paragraphs as to this *Néant* making an armed descent upon the plains of India. That sort of folly would be beneath notice if it did not distract attention from the real problem created for Europe by the war in the Far East.

For good or evil in the working-out of her destiny, Russia is bound to remain a *Néant* for many long years, in a more even than the Bismarckian sense. The very fear of this spectre being gone it behoves us to consider its legacy—the fact (no phantom that) accomplished in Central Europe by its help and connivance.

The German Empire may feel at bottom the loss of an old accomplice always amenable to confidential whispers of a bargain; but in the first instance it cannot but rejoice at the fundamental weakening of a possible obstacle to its instincts of territorial expansion. There is a removal of that latent feeling of restraint which the presence of a powerful neighbour, however implicated with you in a sense of common guilt, is bound to inspire. The common guilt of the two Empires is defined precisely by their frontier line running through the Polish provinces. Without indulging in excessive feelings of indignation at that country's partition, or going so far as to believe—with a late French politician—in the "immanent justice of things," it is clear that a material situation, based upon an essentially immoral transaction, contains the germ of fatal differences in the temperament of the two partners in iniquity—whatever it is. Germany has been the evil counsellor of Russia on all the questions of her Polish problem. Always urging the adoption of the most repressive measures with a perfectly logical duplicity, Prince Bismarck's Empire has taken care to couple the neighbourly offers of military assistance with its merciless advice. The thought of the Polish provinces accepting a frank reconciliation with a humanised Russia and bringing the weight of homogeneous loyalty to within a few score of miles of Berlin has been always intensely distasteful to the arrogant Germanising tendencies of the other partner in iniquity. And, besides, the way to the Baltic provinces leads over the Niemen and over the Vistula.

And now, when there is a possibility of serious internal disturbances destroying the sort of order autocracy has kept in Russia, the road over these rivers is seen wearing a more inviting aspect. At any moment the pretext of armed intervention may be found in a revolutionary outbreak provoked by socialists, perhaps—but at any rate by the political immaturity of the enlightened classes and by the political barbarism of the Russian people. The throes of Russian resurrection will be long and

painful. This is not the place to speculate upon the nature of these convulsions; but there must be some violent break-up of the lamentable tradition, a shattering of the social, of the administrative—perhaps of the territorial—unity.

Voices have been heard saying that the time for reforms in Russia is already past. This is the superficial view of a more profound truth that for Russia there has never been such a time within the memory of mankind. It is impossible to initiate any sort of reform upon a phase of blind absolutism, and in Russia there has never been anything else to which the faintest tradition could, after ages of error, go back as to a parting of the ways.

In Europe the monarchical principle stands justified in its struggle with the growth of political liberty by the evolution of the idea of nationality as we see it concreted at the present time, by the inception of that wider solidarity grouping together around the standard of absolute power these larger agglomerations of mankind. This service of unification, creating close-knit communities possessing the ability, the will, and the power to pursue a common ideal, has prepared the ground for the advent of a still larger understanding: for the solidarity of Europeanism, which must be the next step towards the advent of Concord and Justice; an advent that, however delayed by the cowardly worship of force and the evil passions of national selfishness, has been, and remains, the only possible goal of our progress.

The conceptions of legality, of larger patriotism, of national duties and aspirations have grown under the shadow of the unlimited monarchies of Europe, which were the creations of historical necessity. There were seeds of wisdom in their very violences and abuses. They had a past and a future; they were human. But under the shadow of Russian autocracy nothing could grow. Russian autocracy succeeded to nothing; it had no historical past, and it cannot hope for a historical future. It can only end. By no industry of investigation, by no fantastic stretch of benevolence, can it be presented as a phase of development through which a society, a State, must pass on the way to the full consciousness of its destiny. It lies outside the stream of progress. This despotism has been utterly un-European. And neither has it been Asiatic in its nature. Oriental despotisms belong to the history of mankind; they have left their trace on our minds and our imagination by their splendour, by their culture, by their art, by the exploits of great conquerors. The record of their rise and decay has an intellectual value; they are in their origins and their course the manifestations of human needs, the instruments of racial temperament, of conquering force, of faith and fanaticism. The Russian autocracy as we see it now is a thing apart. It is im-

BRITISH LIBRARY

possible to assign to it any rational origin in the vices, the misfortunes, the necessities, or the passions of mankind. This despotism has neither an European nor an Oriental parentage; more, it seems to have no root either in the institutions or the follies of this earth. What strikes one with a sort of awe is just this something inhuman in its character. It is like a visitation, like a curse from Heaven falling in the darkness of ages upon the immense plains of forest and steppe lying dumbly on the confines of two continents: a true desert harbouring no spirit either of the East or of the West.

This pitiful fate of a country held by an evil spell, suffering from an awful visitation for which the responsibility cannot be traced either to her sins or her follies, has made Russia as a nation so difficult to understand by Europe. From the very first ghastly dawn of her existence as a State she had to breathe the atmosphere of despotism; she found nothing but the arbitrary will of an obscure autocrat at the beginning and end of her organisation. Hence arises her impenetrability to whatever is true in Western thought. Western thought, when it crosses her frontier, falls under the spell of her autocracy and becomes a noxious parody of itself. Hence the contradictions, the riddles of her national life, which are looked upon with such curiosity by the rest of the world. The curse had entered her very soul; autocracy, and nothing else in the world, has moulded her institutions, and with the poison of slavery drugged the national temperament into the apathy of a hopeless fatalism. It seems to have gone into the blood, tainting every mental activity in its source by a half-mystical, insensate, fascinating assertion of purity and holiness. The Government of Holy Russia, arrogating to itself the supreme power to torment and slaughter the bodies of its subjects like a God-sent scourge, has been most cruel to those whom it allowed to live under the shadow of its dispensation. The worst crime against humanity of that system we behold now crouching at bay behind vast heaps of mangled corpses is the ruthless destruction of innumerable minds. The greatest horror of the world—madness—walked faithfully in its train. Some of the best intellects of Russia, after struggling in vain against the spell, ended by throwing themselves at the feet of that hopeless despotism as a giddy man leaps into an abyss. An attentive survey of Russia's literature, of her church, of her administration, and the cross-currents of her thought, must end in the verdict that the Russia of to-day has not the right to give her voice on a single question touching the future of humanity, because from the very inception of her being the brutal destruction of dignity, of truth, of rectitude, of all that is fruitful in human nature has been made the imperative condition of her existence. The great governmental secret of that imperium which Prince Bismarck had the

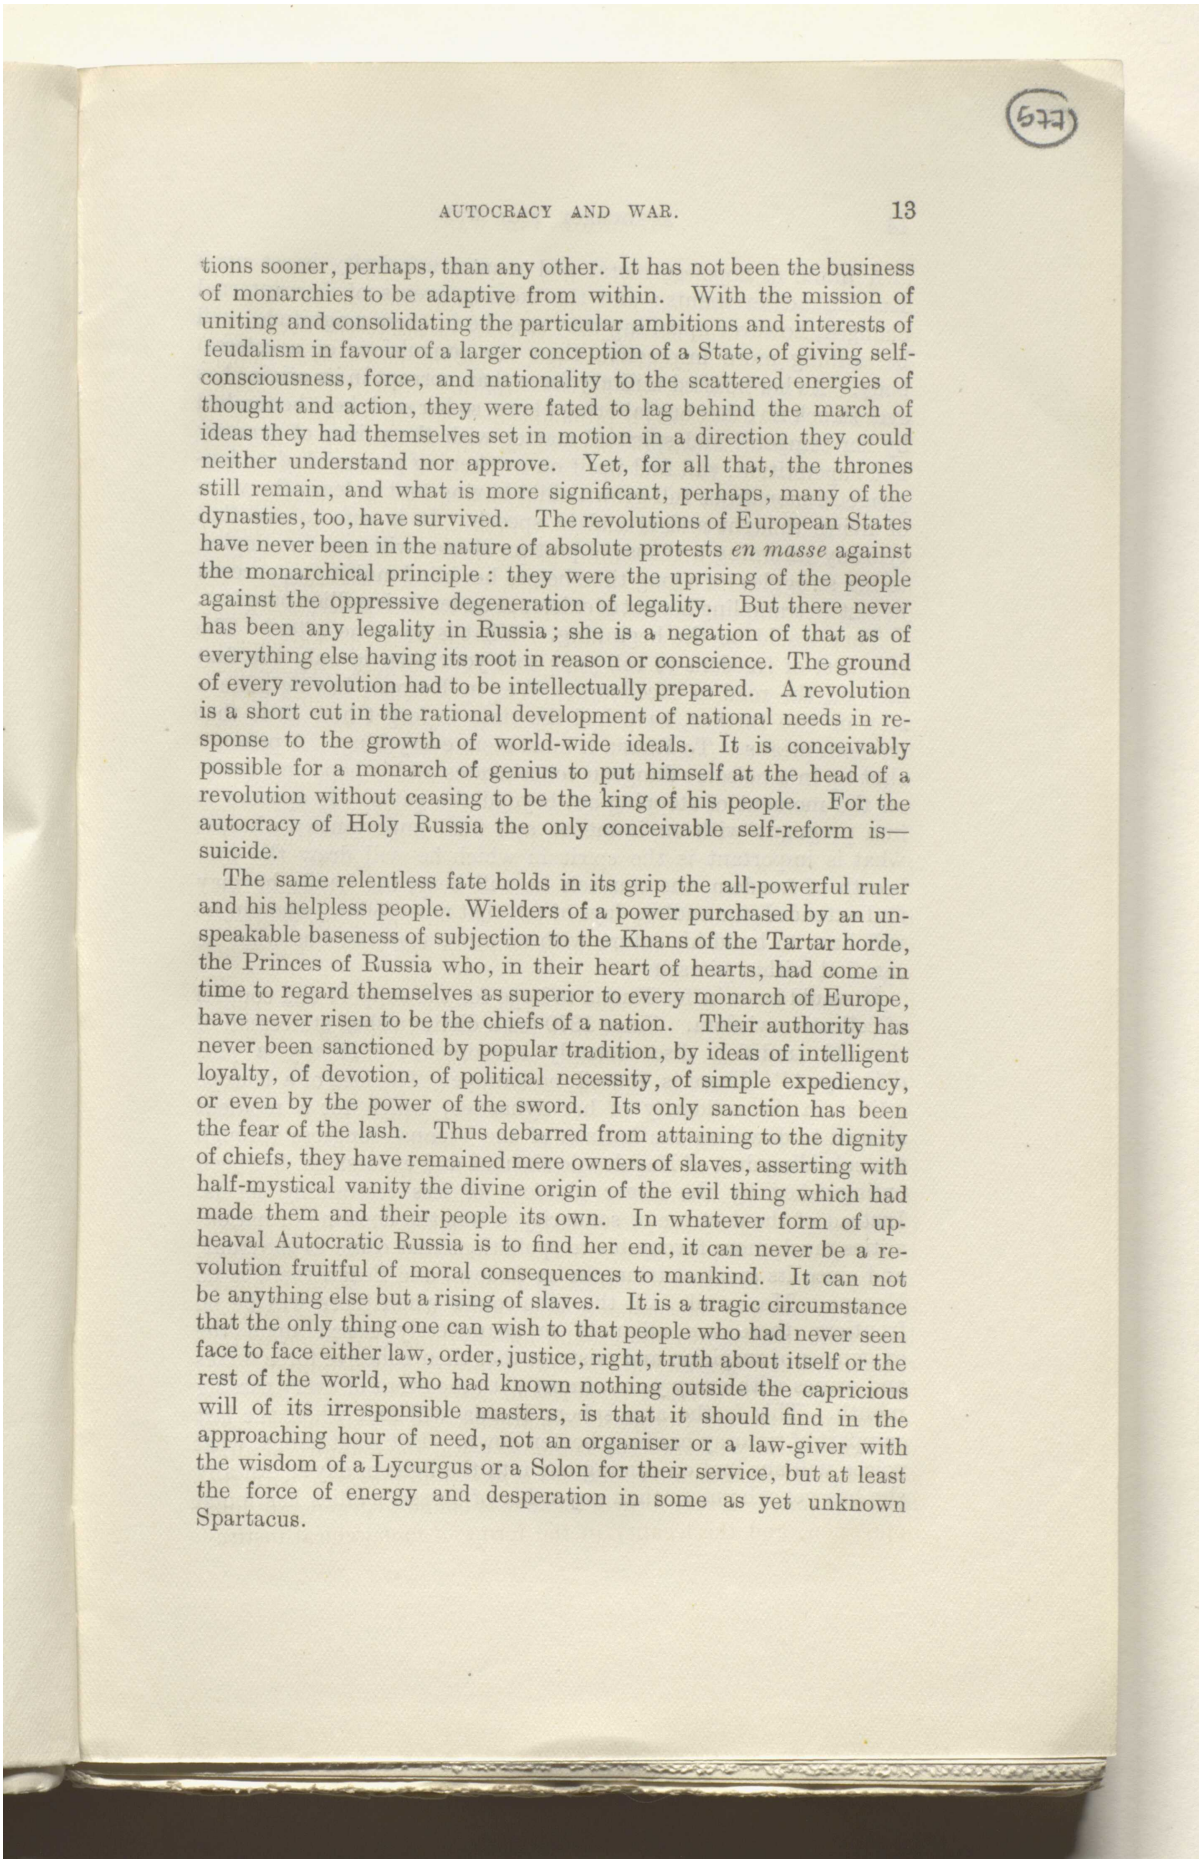
BRITISH LIBRARY

insight and the courage to call *Le Néant*, has been the extirpation of every intellectual hope. To pronounce in the face of such a past the word Evolution, which is precisely the expression of the highest intellectual hope, is a gruesome pleasantry. There can be no evolution out of a grave. Another word of less scientific sound has been very much pronounced of late in connection with Russia's future, a word of more vague import, a word of dread as much as of hope—Revolution.

In the face of the events of the last four months, this word has sprung instinctively, as it were, on grave lips, and has been heard with solemn forebodings. More or less consciously Europe is preparing herself for a spectacle of much violence and perhaps of an inspiring nobility of greatness. And there will be nothing of what she expects. She will see neither the anticipated character of the violence nor yet any signs of generous greatness. Her expectations, more or less vaguely expressed, give the measure of her ignorance of that *Néant* which for so many years had remained hidden behind the phantom of invincible armies.



Néant! In a way, yes! And yet perhaps Prince Bismarck has let himself be led away by the seduction of a good phrase into the use of an inexact term. The form of his judgment had to be pithy, striking, engraved within a ring. If he erred, then, no doubt, he erred deliberately. The saying was near enough the truth to serve, and perhaps he did not want to destroy utterly by a more severe definition the prestige of the sham that could not deceive his genius. Prince Bismarck has been really complimentary to the useful phantom of the autocratic might. There is an awe-inspiring idea of infinity conveyed in the word *Néant*—and in Russia there is no idea. She is not a *Néant;* she is and has been simply the negation of everything worth living for. She is not an empty void, she is a yawning chasm open between East and West; a bottomless abyss that has swallowed up every hope of mercy, every aspiration towards personal dignity, towards freedom, towards knowledge; every ennobling desire of the heart, every redeeming whisper of conscience. Those that have peered into that abyss, where the dreams of Panslavism, of universal conquest, mingled with the hate and contempt for Western ideas, drifted impotently like shapes of mist, know well that it is bottomless; that there is in it no ground for anything that could in the remotest degree serve even the lowest interests of mankind—and certainly no ground ready for a revolution.

The sin of the old European Monarchies was not the absolutism inherent in every form of government; it was the inability to alter the forms of their legality, grown narrow and oppressive with the march of time. Every form of legality is bound to degenerate into oppression, and the legality in the forms of monarchical institu-

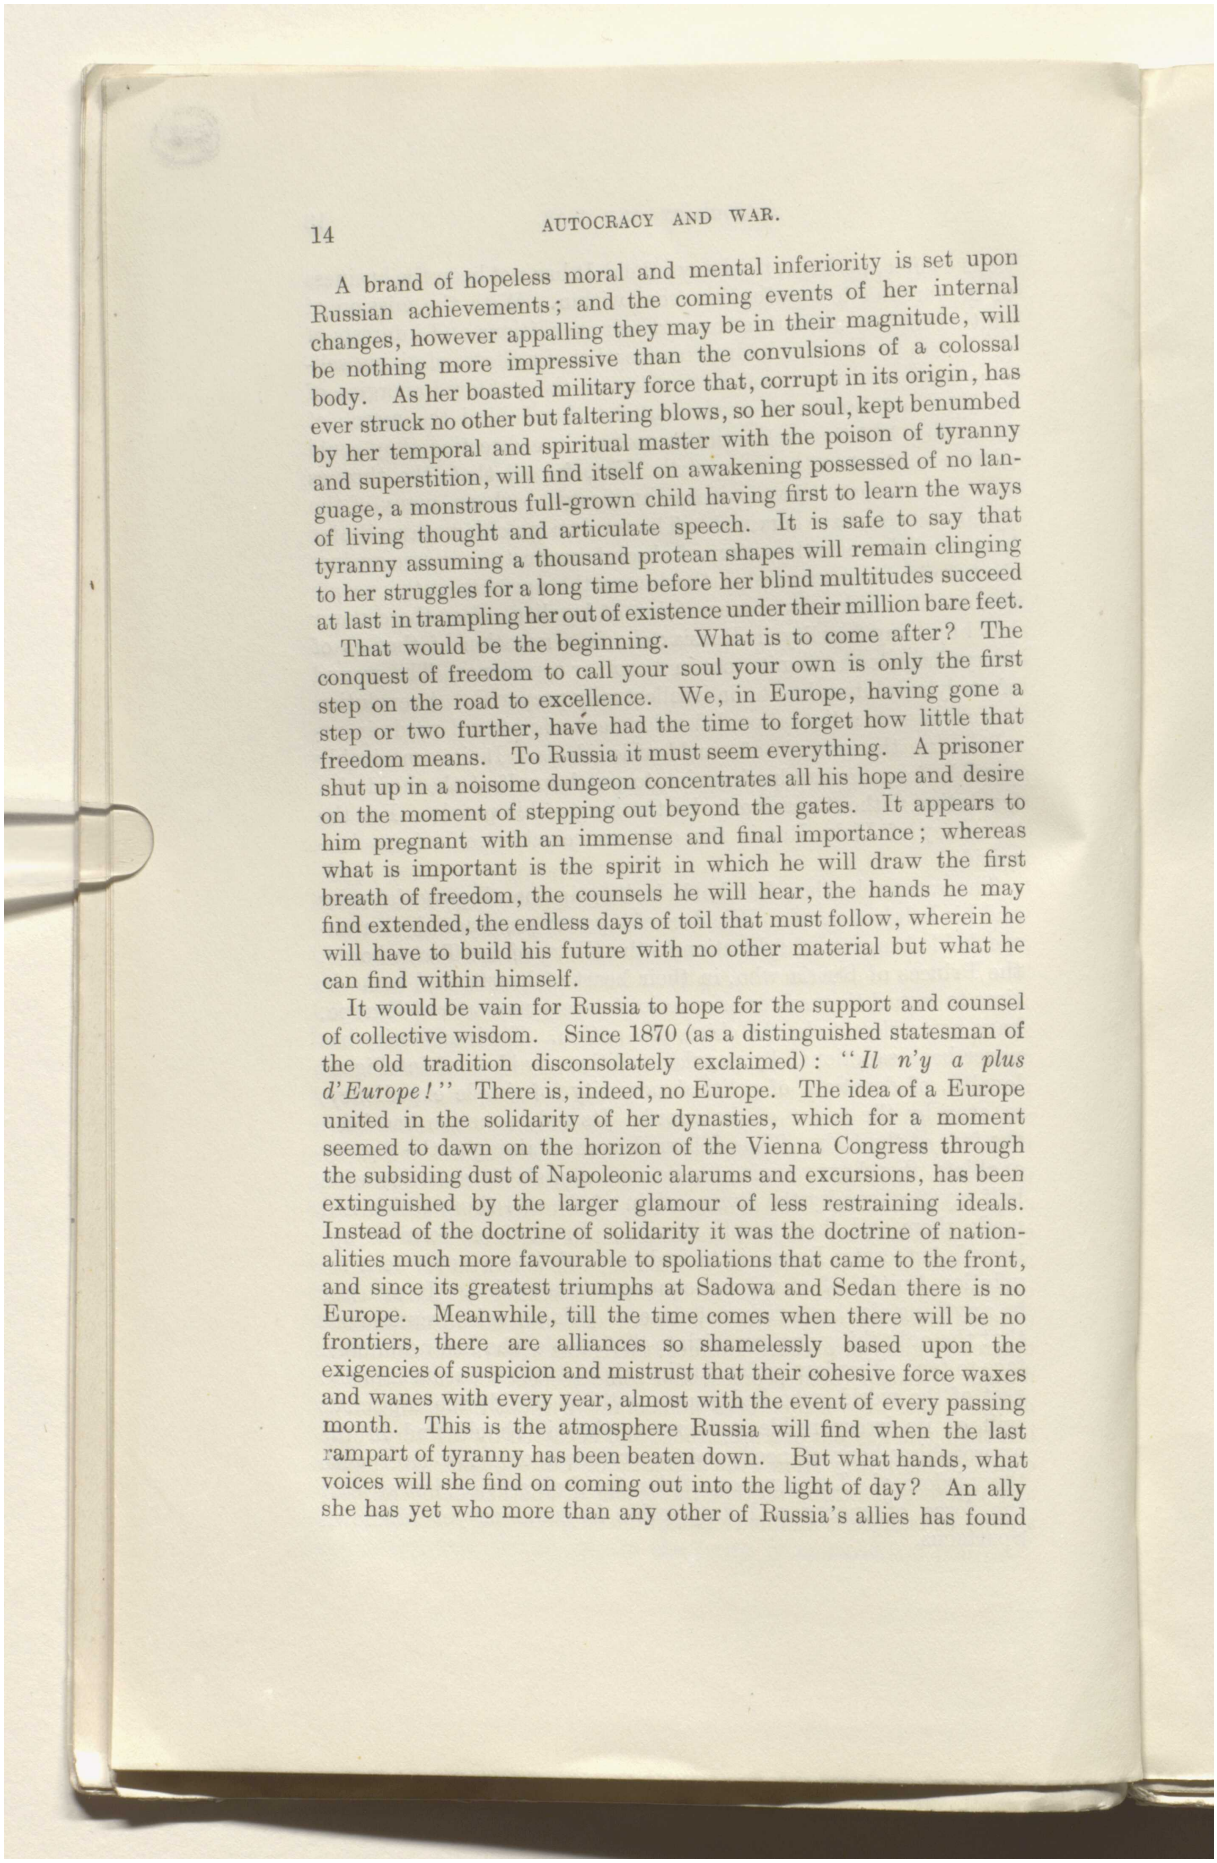
BRITISH LIBRARY



tions sooner, perhaps, than any other. It has not been the business of monarchies to be adaptive from within. With the mission of uniting and consolidating the particular ambitions and interests of feudalism in favour of a larger conception of a State, of giving self-consciousness, force, and nationality to the scattered energies of thought and action, they were fated to lag behind the march of ideas they had themselves set in motion in a direction they could neither understand nor approve. Yet, for all that, the thrones still remain, and what is more significant, perhaps, many of the dynasties, too, have survived. The revolutions of European States have never been in the nature of absolute protests *en masse* against the monarchical principle: they were the uprising of the people against the oppressive degeneration of legality. But there never has been any legality in Russia; she is a negation of that as of everything else having its root in reason or conscience. The ground of every revolution had to be intellectually prepared. A revolution is a short cut in the rational development of national needs in response to the growth of world-wide ideals. It is conceivably possible for a monarch of genius to put himself at the head of a revolution without ceasing to be the king of his people. For the autocracy of Holy Russia the only conceivable self-reform is—suicide.

The same relentless fate holds in its grip the all-powerful ruler and his helpless people. Wielders of a power purchased by an unspeakable baseness of subjection to the Khans of the Tartar horde, the Princes of Russia who, in their heart of hearts, had come in time to regard themselves as superior to every monarch of Europe, have never risen to be the chiefs of a nation. Their authority has never been sanctioned by popular tradition, by ideas of intelligent loyalty, of devotion, of political necessity, of simple expediency, or even by the power of the sword. Its only sanction has been the fear of the lash. Thus debarred from attaining to the dignity of chiefs, they have remained mere owners of slaves, asserting with half-mystical vanity the divine origin of the evil thing which had made them and their people its own. In whatever form of upheaval Autocratic Russia is to find her end, it can never be a revolution fruitful of moral consequences to mankind. It can not be anything else but a rising of slaves. It is a tragic circumstance that the only thing one can wish to that people who had never seen face to face either law, order, justice, right, truth about itself or the rest of the world, who had known nothing outside the capricious will of its irresponsible masters, is that it should find in the approaching hour of need, not an organiser or a law-giver with the wisdom of a Lycurgus or a Solon for their service, but at least the force of energy and desperation in some as yet unknown Spartacus.

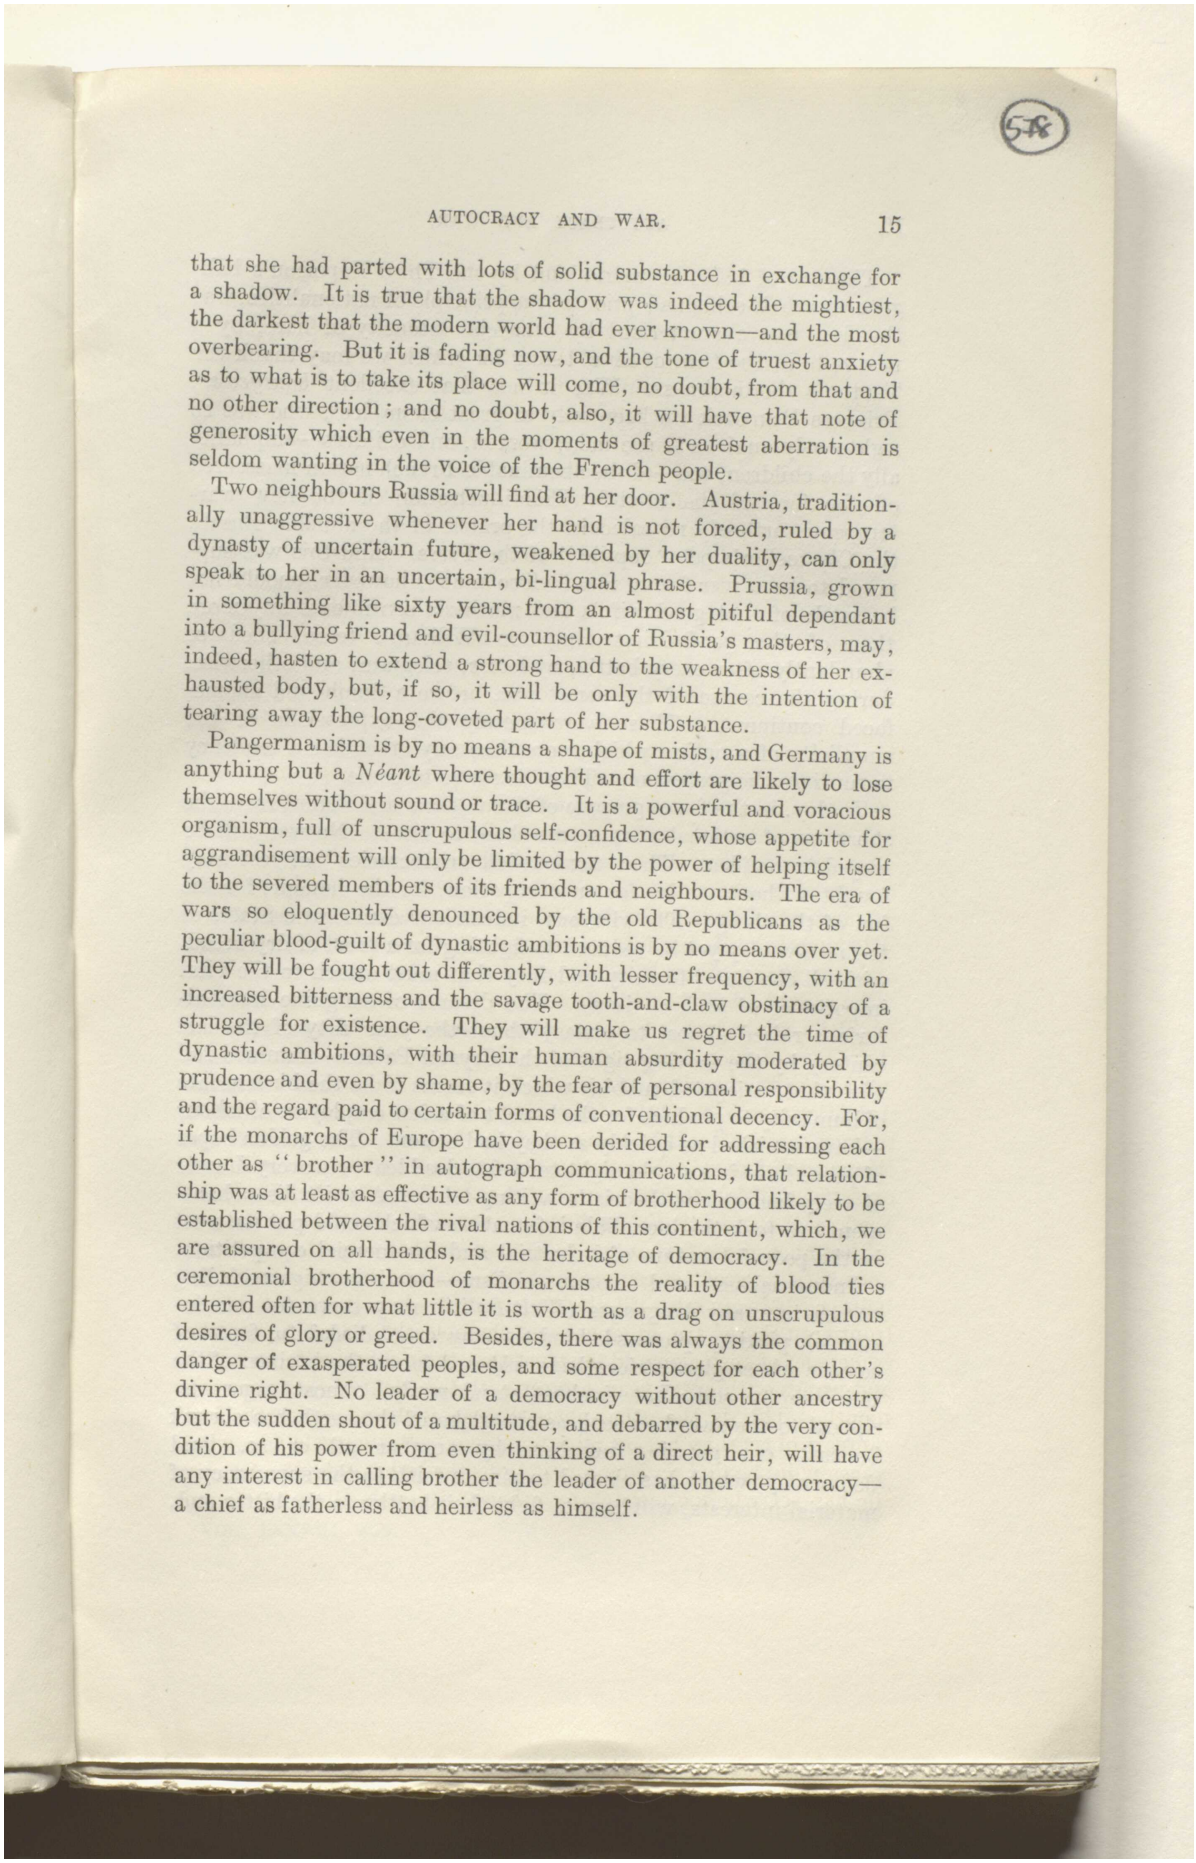
A brand of hopeless moral and mental inferiority is set upon Russian achievements; and the coming events of her internal changes, however appalling they may be in their magnitude, will be nothing more impressive than the convulsions of a colossal body. As her boasted military force that, corrupt in its origin, has ever struck no other but faltering blows, so her soul, kept benumbed by her temporal and spiritual master with the poison of tyranny and superstition, will find itself on awakening possessed of no language, a monstrous full-grown child having first to learn the ways of living thought and articulate speech. It is safe to say that tyranny assuming a thousand protean shapes will remain clinging to her struggles for a long time before her blind multitudes succeed at last in trampling her out of existence under their million bare feet.



That would be the beginning. What is to come after? The conquest of freedom to call your soul your own is only the first step on the road to excellence. We, in Europe, having gone a step or two further, have had the time to forget how little that freedom means. To Russia it must seem everything. A prisoner shut up in a noisome dungeon concentrates all his hope and desire on the moment of stepping out beyond the gates. It appears to him pregnant with an immense and final importance; whereas what is important is the spirit in which he will draw the first breath of freedom, the counsels he will hear, the hands he may find extended, the endless days of toil that must follow, wherein he will have to build his future with no other material but what he can find within himself.

It would be vain for Russia to hope for the support and counsel of collective wisdom. Since 1870 (as a distinguished statesman of the old tradition disconsolately exclaimed): "*Il n'y a plus d'Europe!*" There is, indeed, no Europe. The idea of a Europe united in the solidarity of her dynasties, which for a moment seemed to dawn on the horizon of the Vienna Congress through the subsiding dust of Napoleonic alarums and excursions, has been extinguished by the larger glamour of less restraining ideals. Instead of the doctrine of solidarity it was the doctrine of nationalities much more favourable to spoliations that came to the front, and since its greatest triumphs at Sadowa and Sedan there is no Europe. Meanwhile, till the time comes when there will be no frontiers, there are alliances so shamelessly based upon the exigencies of suspicion and mistrust that their cohesive force waxes and wanes with every year, almost with the event of every passing month. This is the atmosphere Russia will find when the last rampart of tyranny has been beaten down. But what hands, what voices will she find on coming out into the light of day? An ally she has yet who more than any other of Russia's allies has found

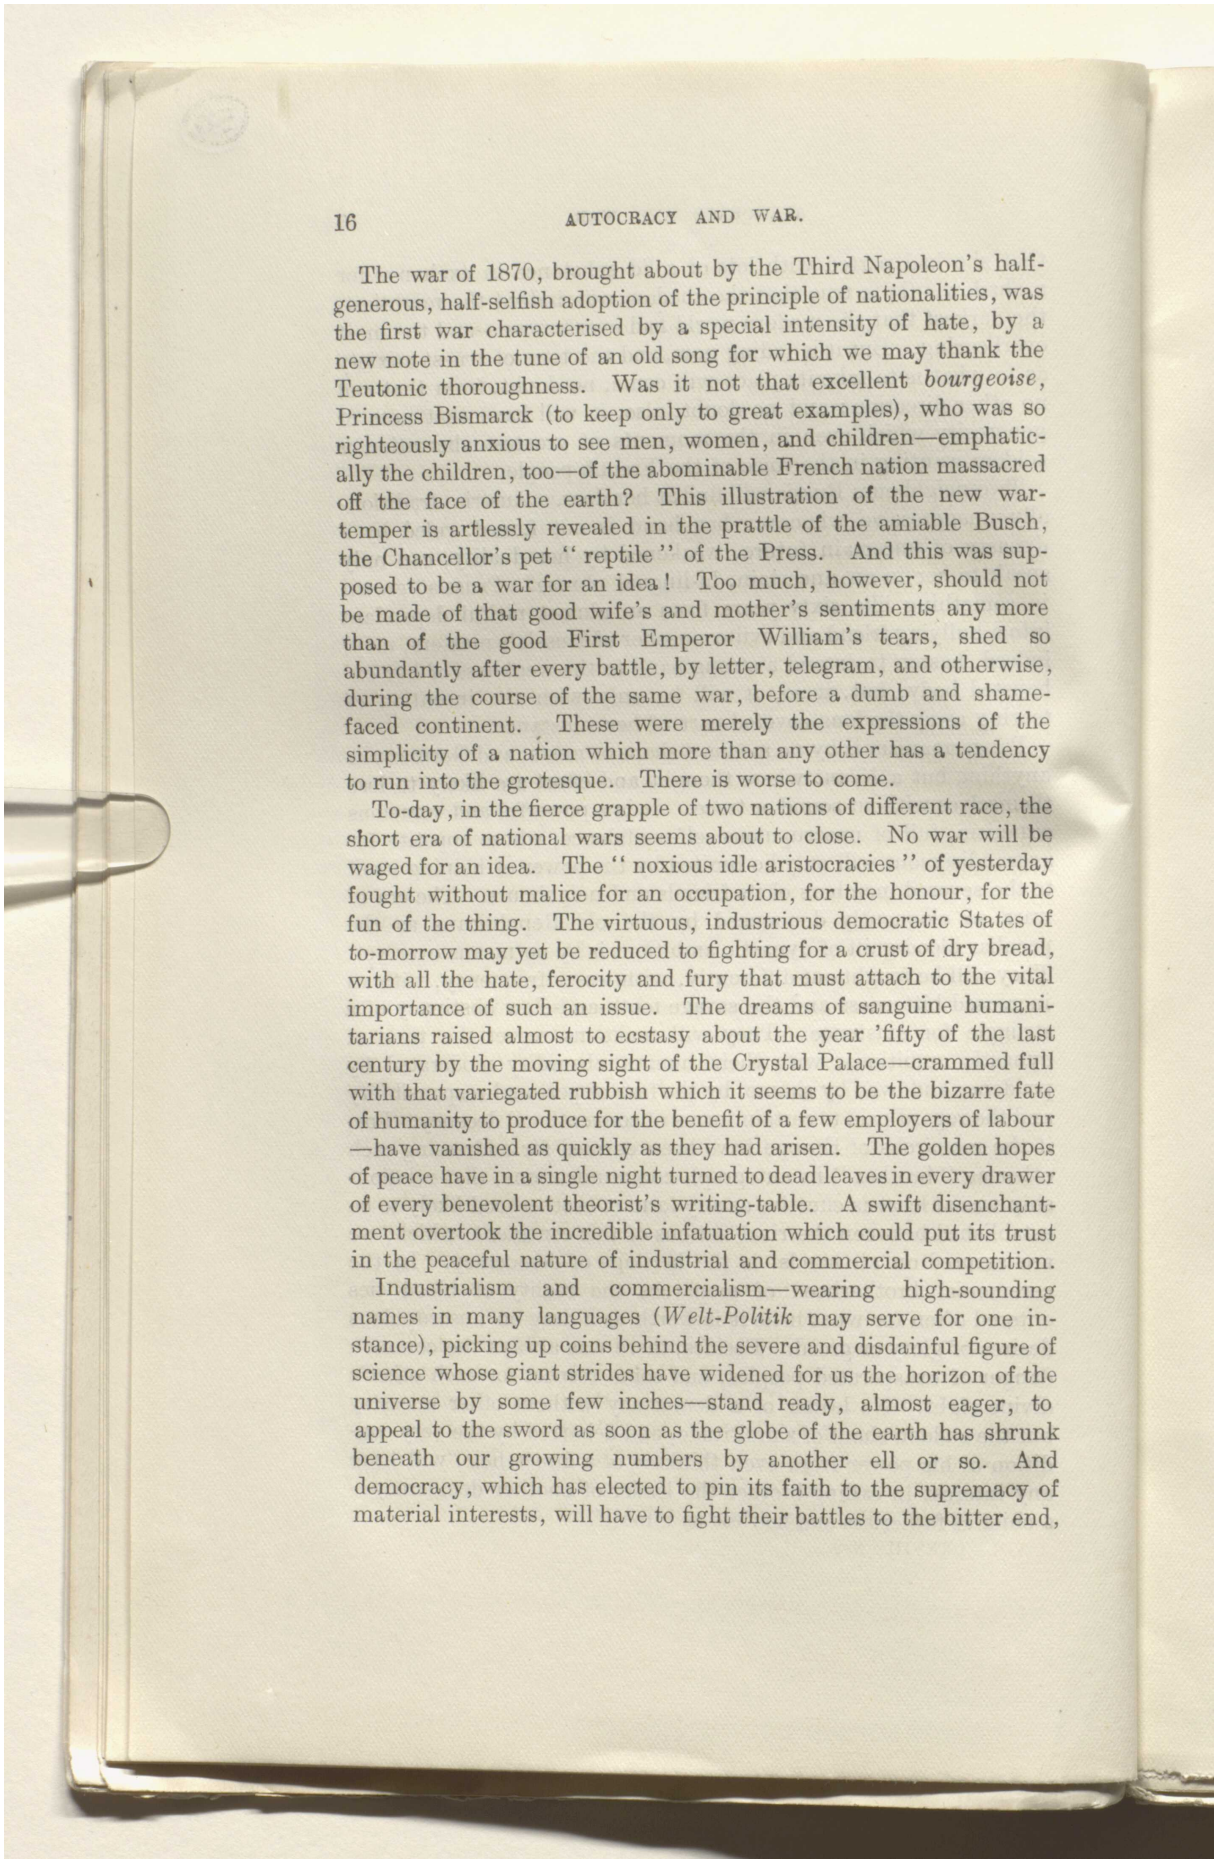
that she had parted with lots of solid substance in exchange for a shadow. It is true that the shadow was indeed the mightiest, the darkest that the modern world had ever known—and the most overbearing. But it is fading now, and the tone of truest anxiety as to what is to take its place will come, no doubt, from that and no other direction; and no doubt, also, it will have that note of generosity which even in the moments of greatest aberration is seldom wanting in the voice of the French people.



Two neighbours Russia will find at her door. Austria, traditionally unaggressive whenever her hand is not forced, ruled by a dynasty of uncertain future, weakened by her duality, can only speak to her in an uncertain, bi-lingual phrase. Prussia, grown in something like sixty years from an almost pitiful dependant into a bullying friend and evil-counsellor of Russia's masters, may, indeed, hasten to extend a strong hand to the weakness of her exhausted body, but, if so, it will be only with the intention of tearing away the long-coveted part of her substance.

Pangermanism is by no means a shape of mists, and Germany is anything but a *Néant* where thought and effort are likely to lose themselves without sound or trace. It is a powerful and voracious organism, full of unscrupulous self-confidence, whose appetite for aggrandisement will only be limited by the power of helping itself to the severed members of its friends and neighbours. The era of wars so eloquently denounced by the old Republicans as the peculiar blood-guilt of dynastic ambitions is by no means over yet. They will be fought out differently, with lesser frequency, with an increased bitterness and the savage tooth-and-claw obstinacy of a struggle for existence. They will make us regret the time of dynastic ambitions, with their human absurdity moderated by prudence and even by shame, by the fear of personal responsibility and the regard paid to certain forms of conventional decency. For, if the monarchs of Europe have been derided for addressing each other as "brother" in autograph communications, that relationship was at least as effective as any form of brotherhood likely to be established between the rival nations of this continent, which, we are assured on all hands, is the heritage of democracy. In the ceremonial brotherhood of monarchs the reality of blood ties entered often for what little it is worth as a drag on unscrupulous desires of glory or greed. Besides, there was always the common danger of exasperated peoples, and some respect for each other's divine right. No leader of a democracy without other ancestry but the sudden shout of a multitude, and debarred by the very condition of his power from even thinking of a direct heir, will have any interest in calling brother the leader of another democracy—a chief as fatherless and heirless as himself.

The war of 1870, brought about by the Third Napoleon's half-generous, half-selfish adoption of the principle of nationalities, was the first war characterised by a special intensity of hate, by a new note in the tune of an old song for which we may thank the Teutonic thoroughness. Was it not that excellent *bourgeoise*, Princess Bismarck (to keep only to great examples), who was so righteously anxious to see men, women, and children—emphatically the children, too—of the abominable French nation massacred off the face of the earth? This illustration of the new war-temper is artlessly revealed in the prattle of the amiable Busch, the Chancellor's pet "reptile" of the Press. And this was supposed to be a war for an idea! Too much, however, should not be made of that good wife's and mother's sentiments any more than of the good First Emperor William's tears, shed so abundantly after every battle, by letter, telegram, and otherwise, during the course of the same war, before a dumb and shame-faced continent. These were merely the expressions of the simplicity of a nation which more than any other has a tendency to run into the grotesque. There is worse to come.

To-day, in the fierce grapple of two nations of different race, the short era of national wars seems about to close. No war will be waged for an idea. The "noxious idle aristocracies" of yesterday fought without malice for an occupation, for the honour, for the fun of the thing. The virtuous, industrious democratic States of to-morrow may yet be reduced to fighting for a crust of dry bread, with all the hate, ferocity and fury that must attach to the vital importance of such an issue. The dreams of sanguine humanitarians raised almost to ecstasy about the year 'fifty of the last century by the moving sight of the Crystal Palace—crammed full with that variegated rubbish which it seems to be the bizarre fate of humanity to produce for the benefit of a few employers of labour—have vanished as quickly as they had arisen. The golden hopes of peace have in a single night turned to dead leaves in every drawer of every benevolent theorist's writing-table. A swift disenchantment overtook the incredible infatuation which could put its trust in the peaceful nature of industrial and commercial competition.

Industrialism and commercialism—wearing high-sounding names in many languages (*Welt-Politik* may serve for one instance), picking up coins behind the severe and disdainful figure of science whose giant strides have widened for us the horizon of the universe by some few inches—stand ready, almost eager, to appeal to the sword as soon as the globe of the earth has shrunk beneath our growing numbers by another ell or so. And democracy, which has elected to pin its faith to the supremacy of material interests, will have to fight their battles to the bitter end,

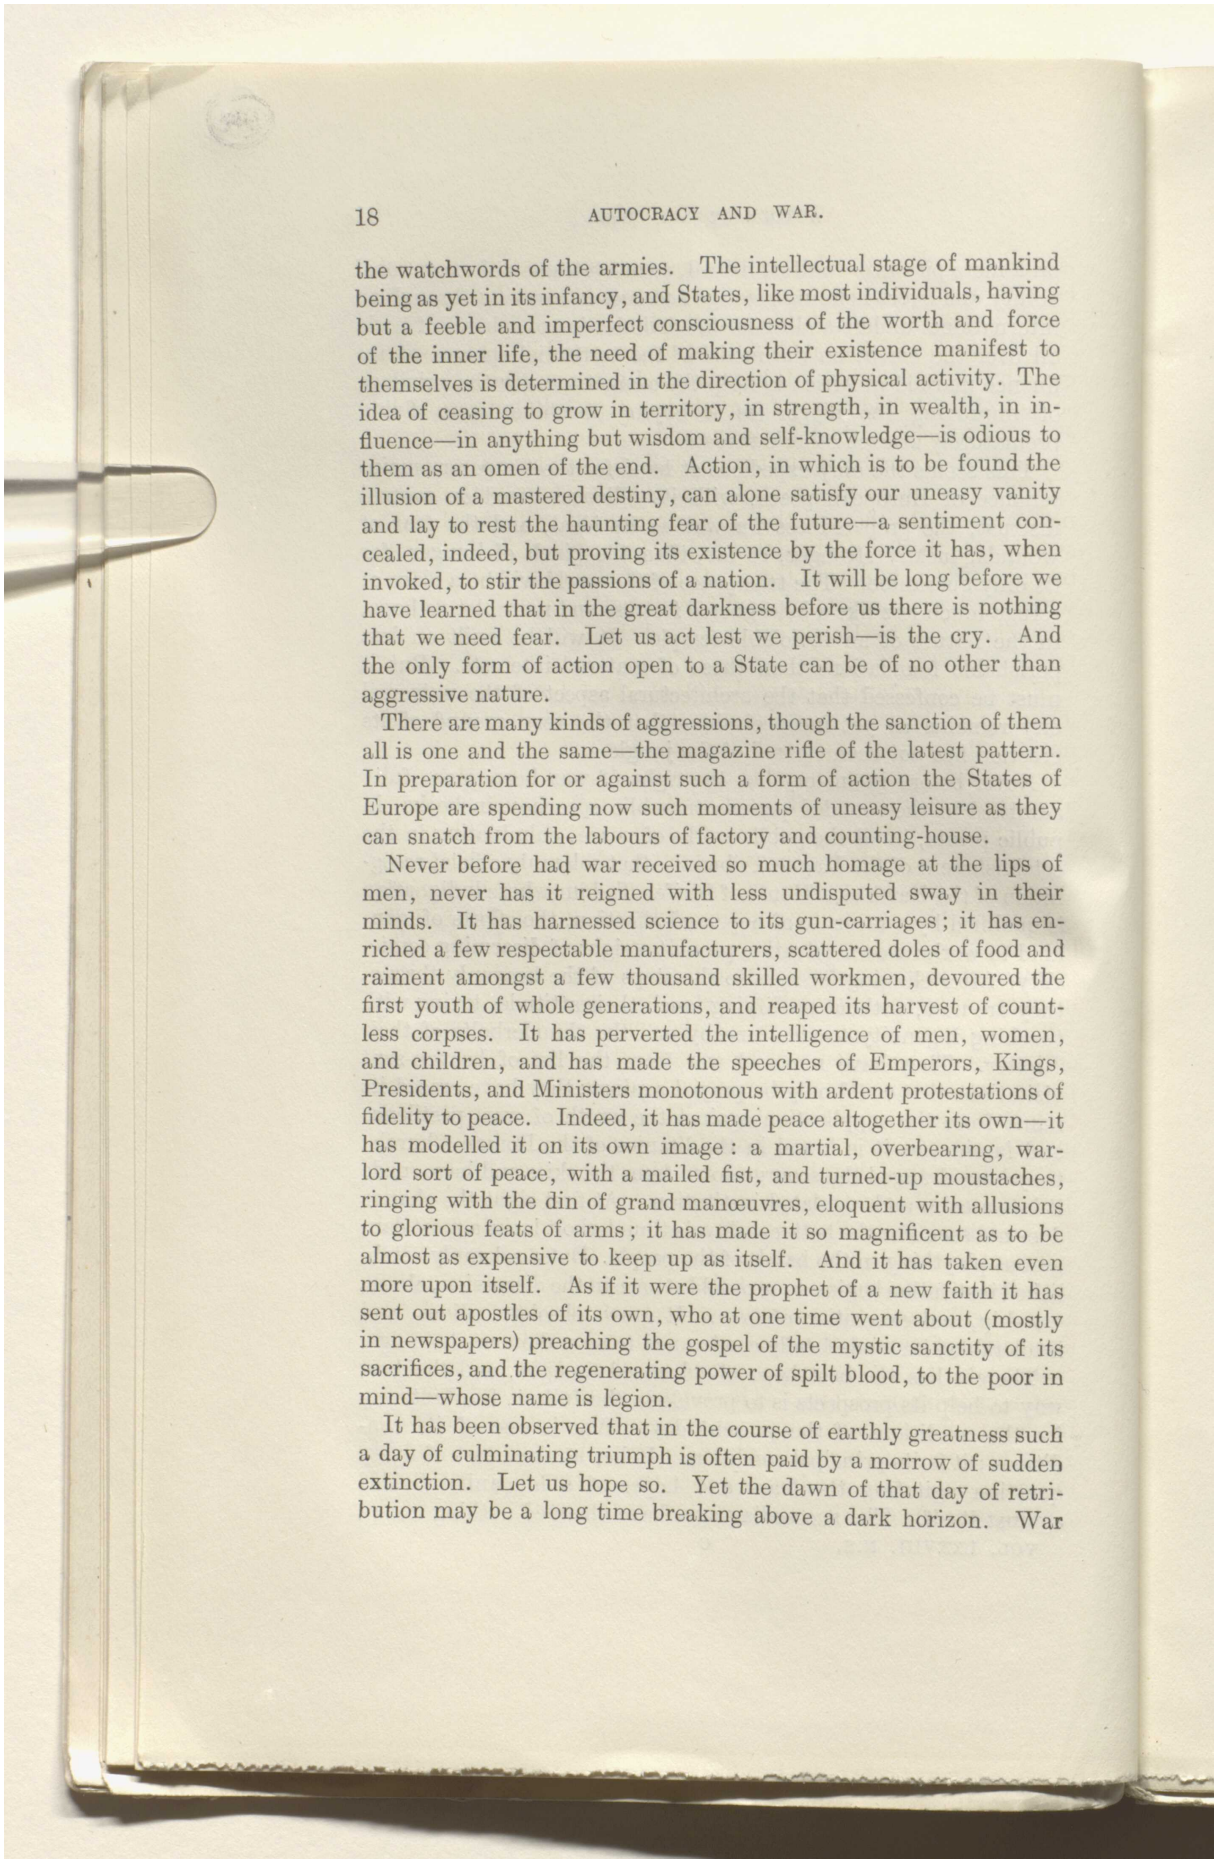
on a mere pittance—unless, indeed, some statesman of exceptional ability and overwhelming prestige succeeds in carrying through an international understanding for the delimitation of spheres of trade all over the earth, on the model of the territorial spheres of influence marked in Africa to keep the competitors for the privilege of improving the nigger (as a buying machine) from flying prematurely at each other's throats.

This seems the only expedient at hand for the temporary maintenance of European peace, with its alliances based on mutual distrust, the preparedness for war as its ideal, and the fear of wounds, luckily stronger, so far, than the pinch of hunger, for its only guarantee. The true peace of the world will be a place of refuge much less like a beleaguered fortress and more, let us hope, in the nature of an inviolable temple. It will be built on less perishable foundations than those of material interests. But it must be confessed that the architectural aspect of the universal city remains as yet inconceivable—that the very ground of its erection has not been cleared of the jungle.



Never before in history has the right of war been more fully admitted in the rounded periods of public speeches, in books, in public prints, in all the public works of peace, culminating in the establishment of the Hague Tribunal—that solemnly official recognition of the Earth as a House of Strife. To him whose indignation is qualified by a measure of hope and affection, the efforts of mankind to work its own salvation present a sight of disarming comicality. After clinging for ages to the steps of the heavenly throne, they are now, without modifying much their attitude, trying with touching ingenuity to steal one by one the thunderbolts of their Jupiter. They have removed war from the list of heaven-sent visitations that could only be prayed against; they have erased its name from the supplication against the wrath of war, pestilence and famine, as it is found in the litanies of the Roman Church; they have dragged the scourge down from the skies and have made it into a calm and regulated institution. At first sight the change does not seem for the better. Jove's thunderbolt looks a most dangerous plaything in the hands of the people. But a solemnly established institution begins to grow old at once in the discussion, abuse, worship, and execration of men. It grows obsolete, odious, and intolerable; it stands fatally condemned to an unhonoured old age.

Therein lies the best hope of advanced thought, and the best way to help its prospects is to provide in the fullest, frankest way for the conditions of the present day. War is one of its conditions; it is its principal condition. It lies at the heart of every question agitating the fears and hopes of a humanity divided against itself. The succeeding ages have changed nothing except

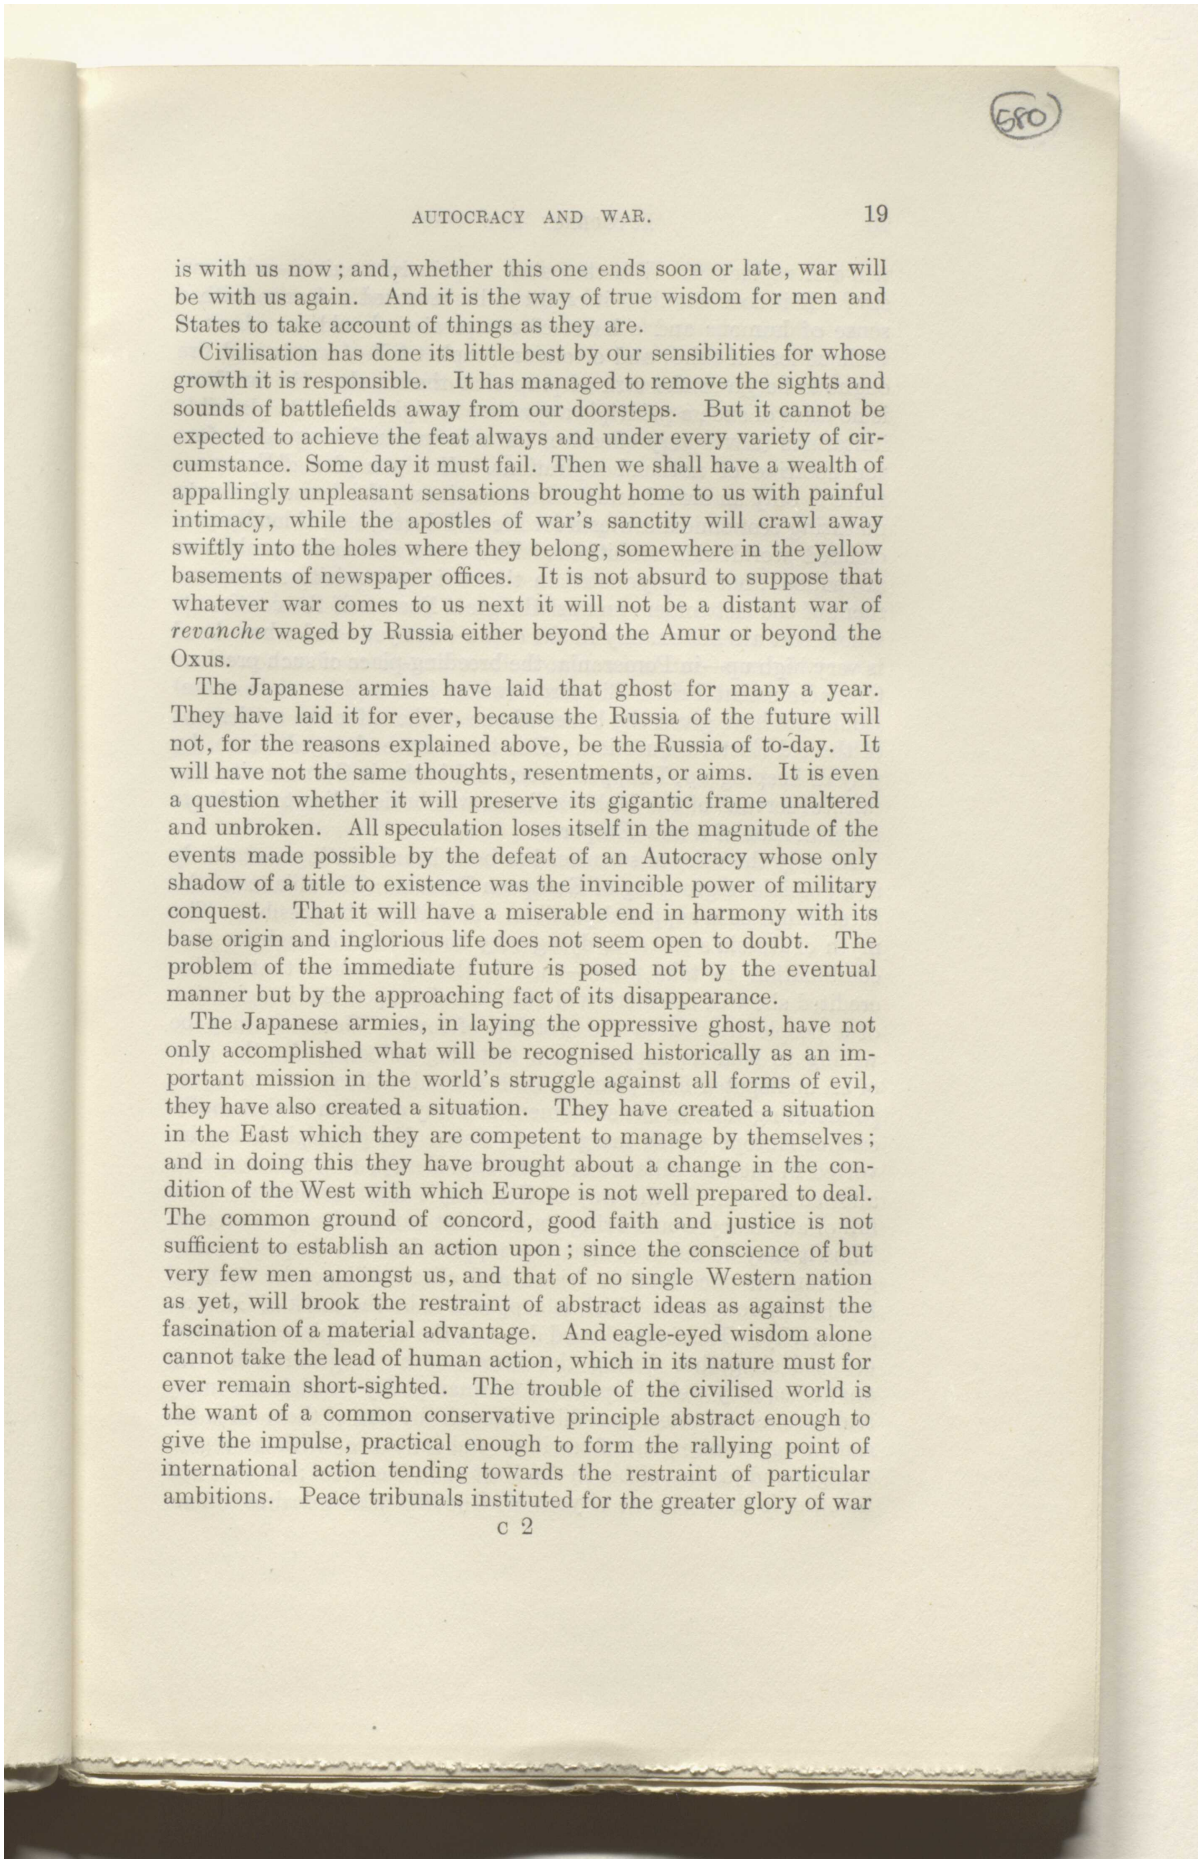
the watchwords of the armies. The intellectual stage of mankind being as yet in its infancy, and States, like most individuals, having but a feeble and imperfect consciousness of the worth and force of the inner life, the need of making their existence manifest to themselves is determined in the direction of physical activity. The idea of ceasing to grow in territory, in strength, in wealth, in influence—in anything but wisdom and self-knowledge—is odious to them as an omen of the end. Action, in which is to be found the illusion of a mastered destiny, can alone satisfy our uneasy vanity and lay to rest the haunting fear of the future—a sentiment concealed, indeed, but proving its existence by the force it has, when invoked, to stir the passions of a nation. It will be long before we have learned that in the great darkness before us there is nothing that we need fear. Let us act lest we perish—is the cry. And the only form of action open to a State can be of no other than aggressive nature.

There are many kinds of aggressions, though the sanction of them all is one and the same—the magazine rifle of the latest pattern. In preparation for or against such a form of action the States of Europe are spending now such moments of uneasy leisure as they can snatch from the labours of factory and counting-house.



Never before had war received so much homage at the lips of men, never has it reigned with less undisputed sway in their minds. It has harnessed science to its gun-carriages; it has enriched a few respectable manufacturers, scattered doles of food and raiment amongst a few thousand skilled workmen, devoured the first youth of whole generations, and reaped its harvest of countless corpses. It has perverted the intelligence of men, women, and children, and has made the speeches of Emperors, Kings, Presidents, and Ministers monotonous with ardent protestations of fidelity to peace. Indeed, it has made peace altogether its own—it has modelled it on its own image: a martial, overbearing, warlord sort of peace, with a mailed fist, and turned-up moustaches, ringing with the din of grand manœuvres, eloquent with allusions to glorious feats of arms; it has made it so magnificent as to be almost as expensive to keep up as itself. And it has taken even more upon itself. As if it were the prophet of a new faith it has sent out apostles of its own, who at one time went about (mostly in newspapers) preaching the gospel of the mystic sanctity of its sacrifices, and the regenerating power of spilt blood, to the poor in mind—whose name is legion.

It has been observed that in the course of earthly greatness such a day of culminating triumph is often paid by a morrow of sudden extinction. Let us hope so. Yet the dawn of that day of retribution may be a long time breaking above a dark horizon. War

is with us now; and, whether this one ends soon or late, war will be with us again. And it is the way of true wisdom for men and States to take account of things as they are.

Civilisation has done its little best by our sensibilities for whose growth it is responsible. It has managed to remove the sights and sounds of battlefields away from our doorsteps. But it cannot be expected to achieve the feat always and under every variety of circumstance. Some day it must fail. Then we shall have a wealth of appallingly unpleasant sensations brought home to us with painful intimacy, while the apostles of war's sanctity will crawl away swiftly into the holes where they belong, somewhere in the yellow basements of newspaper offices. It is not absurd to suppose that whatever war comes to us next it will not be a distant war of *revanche* waged by Russia either beyond the Amur or beyond the Oxus.

The Japanese armies have laid that ghost for many a year. They have laid it for ever, because the Russia of the future will not, for the reasons explained above, be the Russia of to-day. It will have not the same thoughts, resentments, or aims. It is even a question whether it will preserve its gigantic frame unaltered and unbroken. All speculation loses itself in the magnitude of the events made possible by the defeat of an Autocracy whose only shadow of a title to existence was the invincible power of military conquest. That it will have a miserable end in harmony with its base origin and inglorious life does not seem open to doubt. The problem of the immediate future is posed not by the eventual manner but by the approaching fact of its disappearance.

The Japanese armies, in laying the oppressive ghost, have not only accomplished what will be recognised historically as an important mission in the world's struggle against all forms of evil, they have also created a situation. They have created a situation in the East which they are competent to manage by themselves; and in doing this they have brought about a change in the condition of the West with which Europe is not well prepared to deal. The common ground of concord, good faith and justice is not sufficient to establish an action upon; since the conscience of but very few men amongst us, and that of no single Western nation as yet, will brook the restraint of abstract ideas as against the fascination of a material advantage. And eagle-eyed wisdom alone cannot take the lead of human action, which in its nature must for ever remain short-sighted. The trouble of the civilised world is the want of a common conservative principle abstract enough to give the impulse, practical enough to form the rallying point of international action tending towards the restraint of particular ambitions. Peace tribunals instituted for the greater glory of war

will not replace it. Whether such a principle exists—who can say? If it does not then it ought to be invented. A sage with a sense of humour and a heart of compassion should set about it without loss of time, and a solemn prophet full of words and fire ought to be given the task of preparing the minds. So far there is no trace of such a principle anywhere in sight; even its plausible imitations (never very effective) have disappeared long ago before the doctrine of national aspirations. *Il n'y a plus d'Europe*—there is only an armed and trading continent, the home of slowly maturing economical contests for life and death, and of loudly-proclaimed world-wide ambitions. There are also other ambitions not so loud, but deeply rooted in the envious acquisitive temperament of the last comer amongst the great Powers of the continent, whose feet are not exactly in the ocean—not yet—and whose head is very high up—in Pomerania, the breeding-place of such precious Grenadiers that Prince Bismarck (whom it is a pleasure to quote) would not have given the bones of one of them for the settlement of the old Eastern Question. But times have changed, since, by way of keeping up, I suppose, some old barbaric German rite, the faithful servant of the Hohenzollerns was buried alive to celebrate the accession of a new Emperor.

Already the voice of surmises has been heard hinting tentatively at a possible re-grouping of European Powers. The alliance of the three Empires is supposed possible. And it may be possible. The myth of Russia's power is dying very hard—hard enough for that combination to take place—such is the fascination that a discredited show of numbers will still exercise upon the imagination of a people trained to the worship of force. Germany may be willing to lend its support to a tottering autocracy for the sake of an undisputed first place in such a combination—and of a preponderating voice in the settlement of every question in that south-east of Europe which merges into Asia. No principle being involved in such an alliance of mere expediency, it would never be allowed to stand in the way of Germany's other ambitions. The fall of autocracy would bring its restraint automatically to an end. Thus it may be believed that the support Russian despotism may get from its once humble friend and client will not be stamped by that thoroughness which is supposed to be the mark of German superiority. Russia weakened down to the second place, or Russia eclipsed altogether during the throes of her regeneration, will answer equally well the plans of German policy—which are many and various and often incredible, though the aim of them all is the same: aggrandisement of territory and influence, with no regard to right and justice, either in the East or in the West; for that and no other is the true note of your *Welt-politik* which desires to live.

The German eagle with a Prussian head looks all round the horizon not so much for something to do that would count for good in the records of the earth, as simply for something good to get. He gazes upon the land and upon the sea with the same covetous steadiness, for he has become of late a maritime eagle, and has learned to box the compass. He gazes north and south, and east and west, and is inclined to look intemperately upon the waters of the Mediterranean when they are blue. The disappearance of the Russian phantom has given a foreboding of unwonted freedom to the *Welt-politik*. According to the national tendency this assumption of Imperial impulses would run into the grotesque were it not for the spikes of the pickelhaubes peeping out grimly from behind. Germany's attitude proves that no peace for the earth can be found in the expansion of material interests which she seems to have adopted exclusively as her only aim, ideal, and watchword. For the use of those who gaze half-unbelieving at the passing away of the Russian phantom, part Ghoul, part Djinn, part Old Man of the Sea, and wait half-doubting for the birth of a nation's soul in this age which knows no miracles, the once famous saying of poor Gambetta, tribune of the people (who was simple and believed in the "immanent justice of things") may be adapted in the shape of a warning that, so far as a future of liberty, concord and justice is concerned: "*Le Prussianisme—voilà l'ennemi!*"

JOSEPH CONRAD.

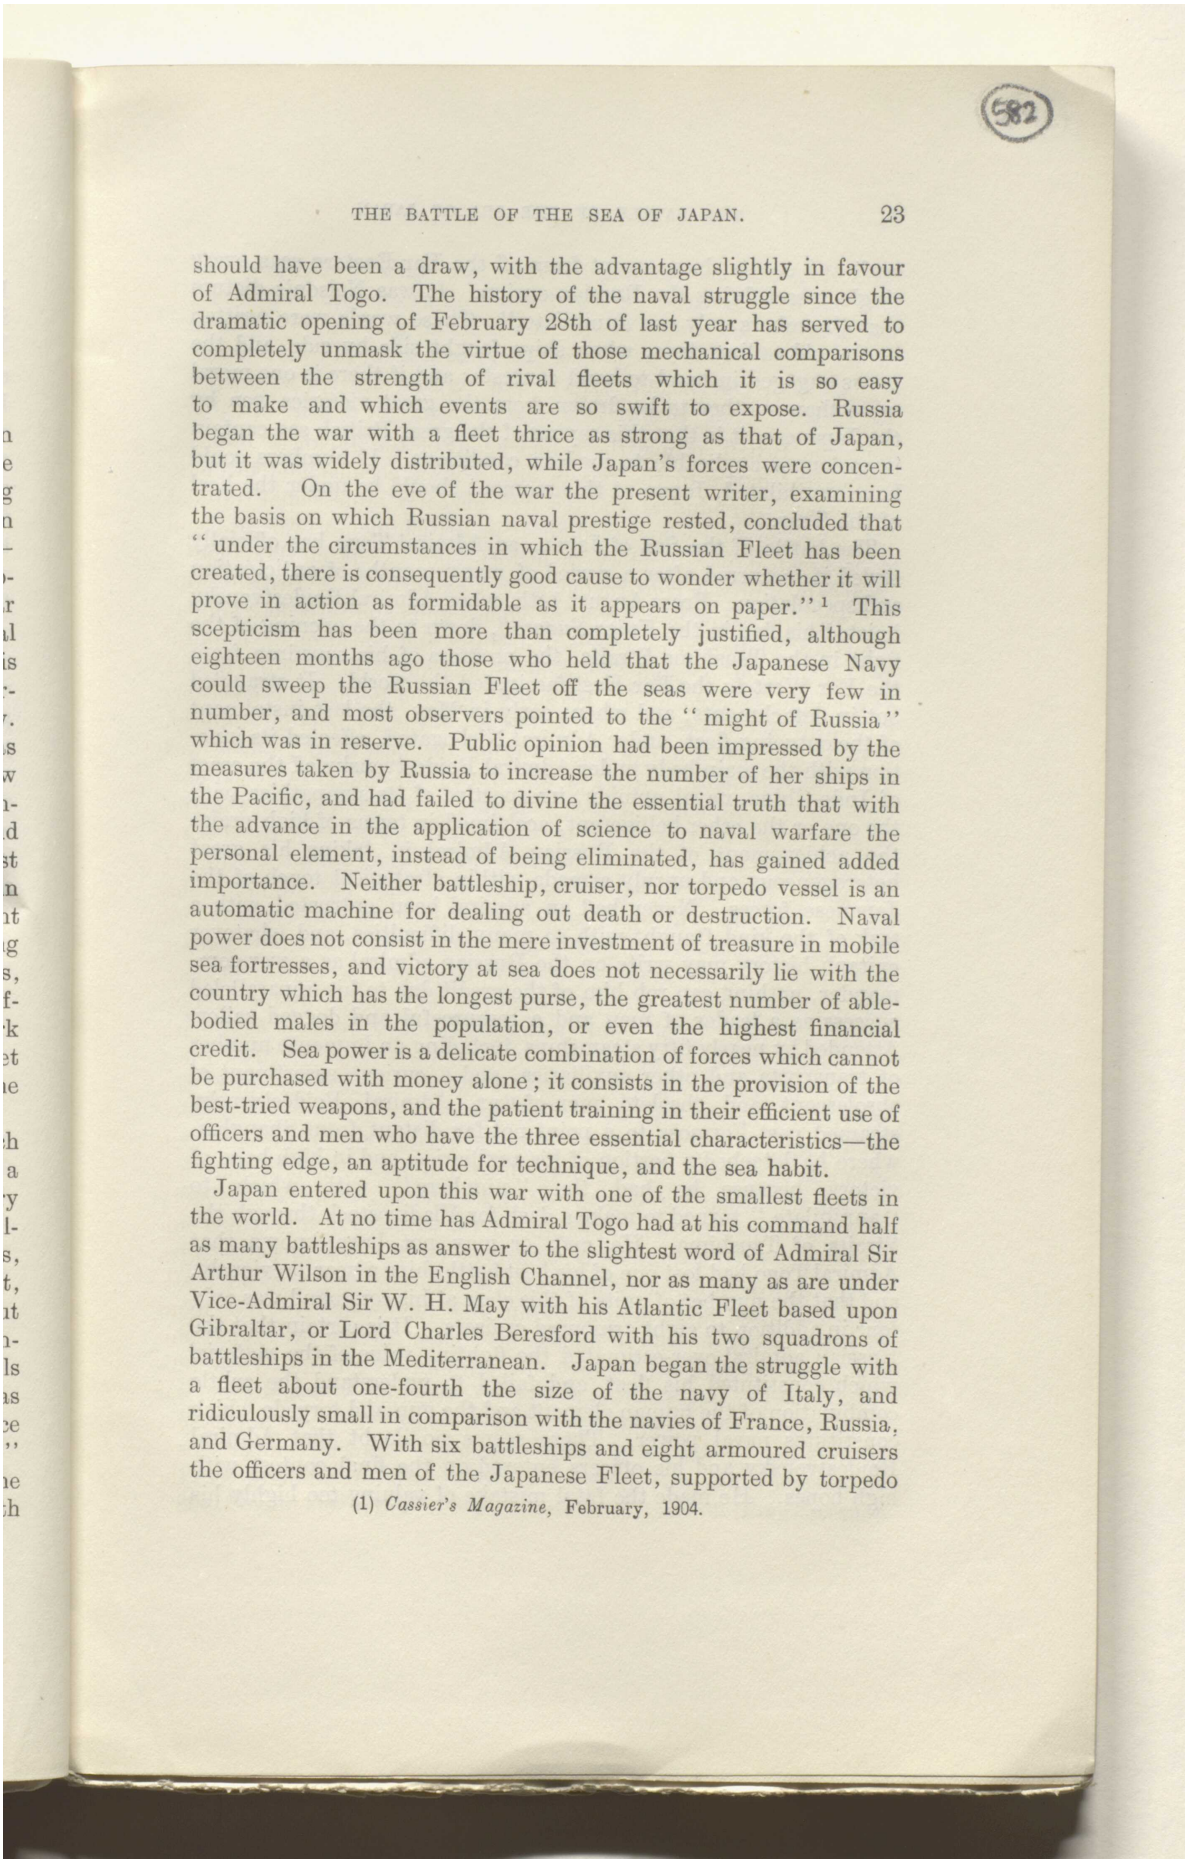
THE BATTLE OF THE SEA OF JAPAN.



To the British people the achievement of the Japanese Fleet in the great battle in the Sea of Japan is of peculiar and intimate interest. An admiral who received his early professional training in England, and who served afloat in British men-of-war, has won the greatest naval victory in history—not excepting Trafalgar—with men-of-war constructed almost exclusively in British shipyards, and using as weapons of offence guns and torpedoes similar to those employed by the British fleets and squadrons. Admiral Togo's chief of staff, Captain Shimamura, like many of his colleagues, served in the British Fleet, and he had the good fortune to be one of Rear-Admiral Percy Scott's pupils in gunnery. Years ago, when Japan was adopting Western methods, she was the pupil in naval matters of Admiral Sir Archibald Douglas, now Commander-in-Chief at Portsmouth, who was director of the Imperial Naval College at Yeddo, and had round him a devoted band of British naval officers and men. In later years, in fact almost down to the opening of the war with China, Rear-Admiral John Ingles was lent by the Admiralty to the Japanese Government as naval adviser. While the Japanese authorities were shaping their systems of training and administration on British models, orders were despatched to British shipbuilding yards for men-of-war, and in every respect the young Navy was given the hall-mark "made in Great Britain." The triumph of the Mikado's Fleet —small, but homogeneous—surely reflects some lustre upon the British Fleet.

Admiral Togo handled his ships in the Sea of Japan with such complete success that what the best opinion thought would be a hard-fought battle resolved itself into a battue. In the long story of sea warfare there is no parallel to the series of events which culminated in this fight. With a fleet far inferior in battleships, but with a superiority in armoured cruisers and torpedo craft, the Japanese swept practically out of existence, in a period of about forty hours, the forces under the control of the Russian Commander-in-Chief. In thirty-seven minutes, Admiral Togo tells us, the issue was decided, and the remainder of the time was devoted to "rounding off" the victory. If any importance could be attached to those elaborate "paper comparisons" which are used to indicate the standard of strength of the great naval Powers, the result of the action of May 27–28th

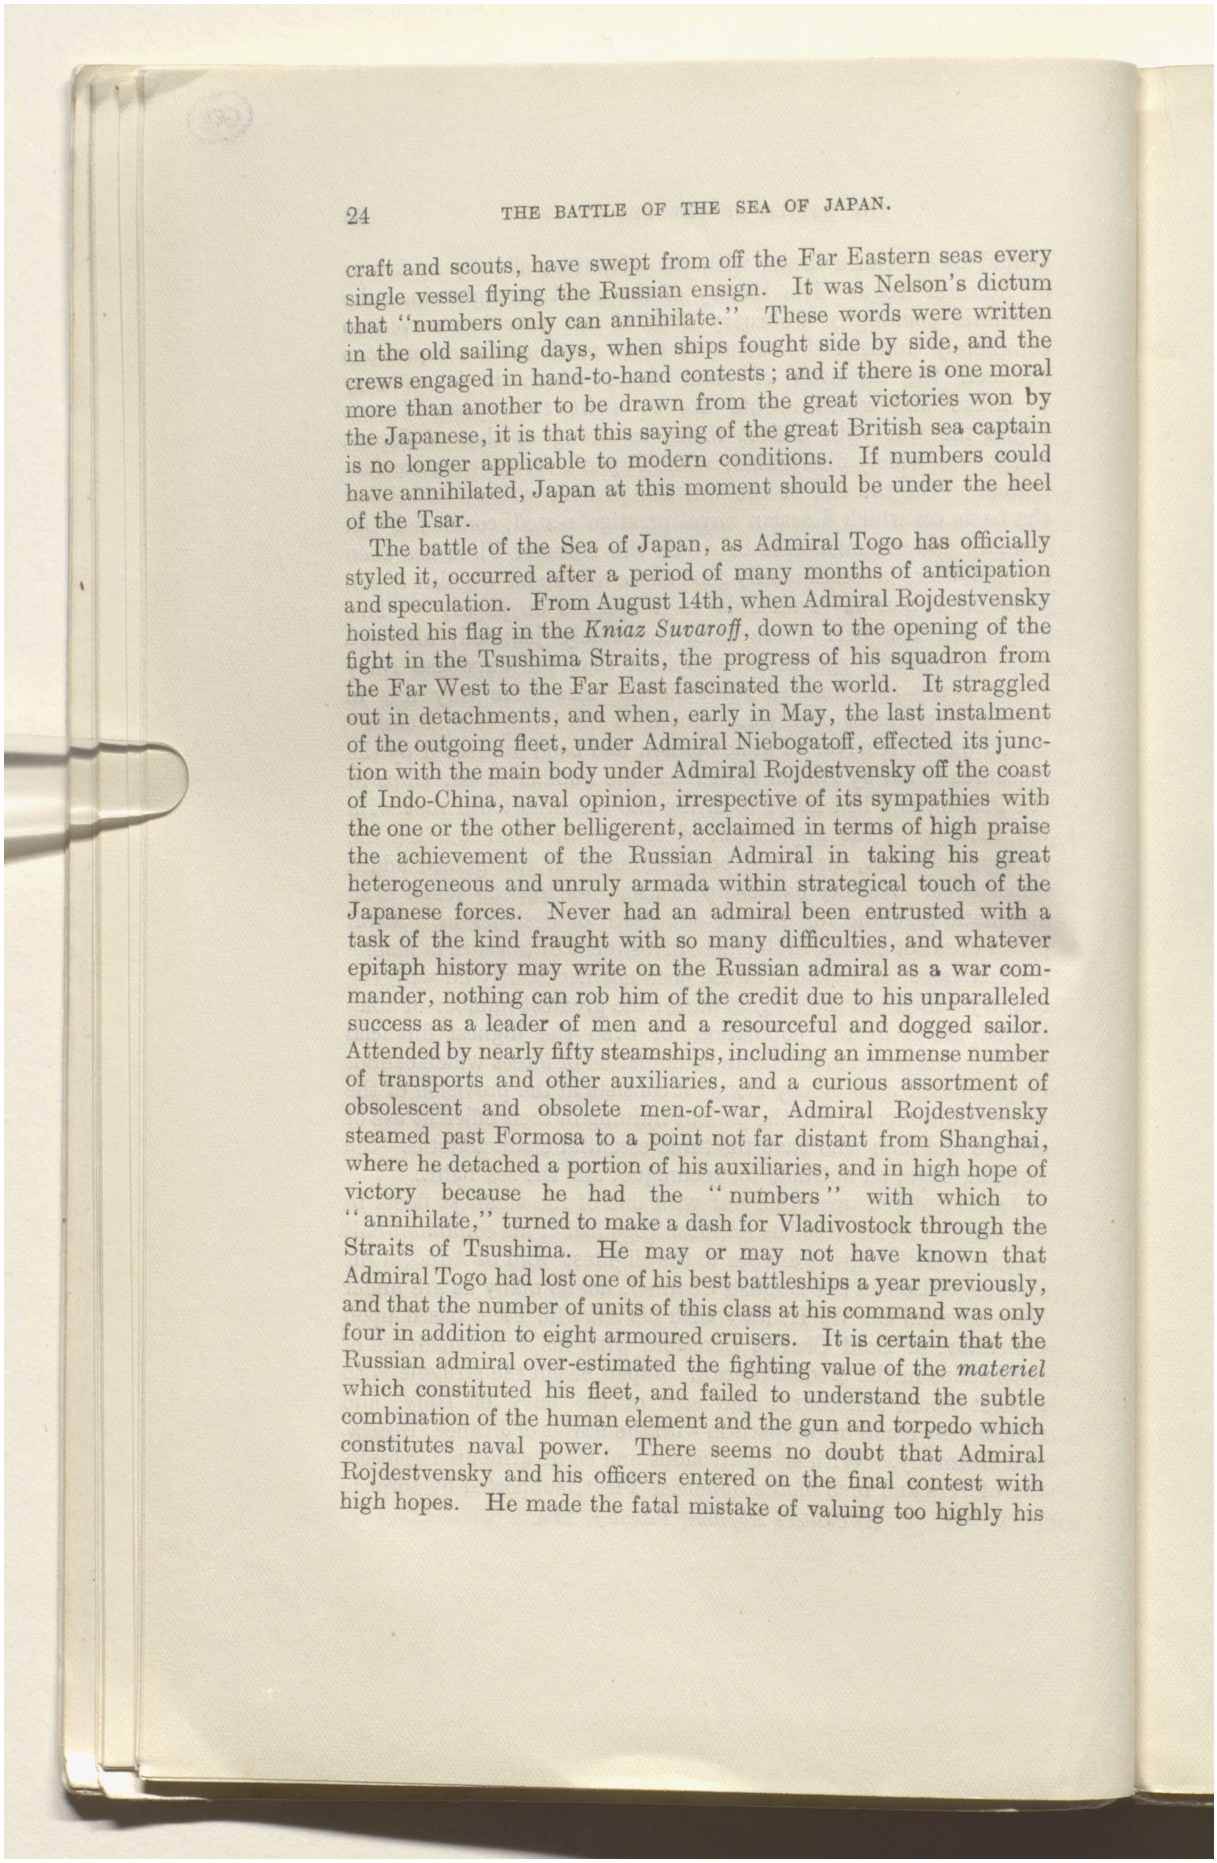
should have been a draw, with the advantage slightly in favour of Admiral Togo. The history of the naval struggle since the dramatic opening of February 28th of last year has served to completely unmask the virtue of those mechanical comparisons between the strength of rival fleets which it is so easy to make and which events are so swift to expose. Russia began the war with a fleet thrice as strong as that of Japan, but it was widely distributed, while Japan's forces were concentrated. On the eve of the war the present writer, examining the basis on which Russian naval prestige rested, concluded that "under the circumstances in which the Russian Fleet has been created, there is consequently good cause to wonder whether it will prove in action as formidable as it appears on paper."[1] This scepticism has been more than completely justified, although eighteen months ago those who held that the Japanese Navy could sweep the Russian Fleet off the seas were very few in number, and most observers pointed to the "might of Russia" which was in reserve. Public opinion had been impressed by the measures taken by Russia to increase the number of her ships in the Pacific, and had failed to divine the essential truth that with the advance in the application of science to naval warfare the personal element, instead of being eliminated, has gained added importance. Neither battleship, cruiser, nor torpedo vessel is an automatic machine for dealing out death or destruction. Naval power does not consist in the mere investment of treasure in mobile sea fortresses, and victory at sea does not necessarily lie with the country which has the longest purse, the greatest number of able-bodied males in the population, or even the highest financial credit. Sea power is a delicate combination of forces which cannot be purchased with money alone; it consists in the provision of the best-tried weapons, and the patient training in their efficient use of officers and men who have the three essential characteristics—the fighting edge, an aptitude for technique, and the sea habit.



Japan entered upon this war with one of the smallest fleets in the world. At no time has Admiral Togo had at his command half as many battleships as answer to the slightest word of Admiral Sir Arthur Wilson in the English Channel, nor as many as are under Vice-Admiral Sir W. H. May with his Atlantic Fleet based upon Gibraltar, or Lord Charles Beresford with his two squadrons of battleships in the Mediterranean. Japan began the struggle with a fleet about one-fourth the size of the navy of Italy, and ridiculously small in comparison with the navies of France, Russia, and Germany. With six battleships and eight armoured cruisers the officers and men of the Japanese Fleet, supported by torpedo

craft and scouts, have swept from off the Far Eastern seas every single vessel flying the Russian ensign. It was Nelson's dictum that "numbers only can annihilate." These words were written in the old sailing days, when ships fought side by side, and the crews engaged in hand-to-hand contests; and if there is one moral more than another to be drawn from the great victories won by the Japanese, it is that this saying of the great British sea captain is no longer applicable to modern conditions. If numbers could have annihilated, Japan at this moment should be under the heel of the Tsar.

The battle of the Sea of Japan, as Admiral Togo has officially styled it, occurred after a period of many months of anticipation and speculation. From August 14th, when Admiral Rojdestvensky hoisted his flag in the *Kniaz Suvaroff*, down to the opening of the fight in the Tsushima Straits, the progress of his squadron from the Far West to the Far East fascinated the world. It straggled out in detachments, and when, early in May, the last instalment of the outgoing fleet, under Admiral Niebogatoff, effected its junction with the main body under Admiral Rojdestvensky off the coast of Indo-China, naval opinion, irrespective of its sympathies with the one or the other belligerent, acclaimed in terms of high praise the achievement of the Russian Admiral in taking his great heterogeneous and unruly armada within strategical touch of the Japanese forces. Never had an admiral been entrusted with a task of the kind fraught with so many difficulties, and whatever epitaph history may write on the Russian admiral as a war commander, nothing can rob him of the credit due to his unparalleled success as a leader of men and a resourceful and dogged sailor. Attended by nearly fifty steamships, including an immense number of transports and other auxiliaries, and a curious assortment of obsolescent and obsolete men-of-war, Admiral Rojdestvensky steamed past Formosa to a point not far distant from Shanghai, where he detached a portion of his auxiliaries, and in high hope of victory because he had the "numbers" with which to "annihilate," turned to make a dash for Vladivostock through the Straits of Tsushima. He may or may not have known that Admiral Togo had lost one of his best battleships a year previously, and that the number of units of this class at his command was only four in addition to eight armoured cruisers. It is certain that the Russian admiral over-estimated the fighting value of the *materiel* which constituted his fleet, and failed to understand the subtle combination of the human element and the gun and torpedo which constitutes naval power. There seems no doubt that Admiral Rojdestvensky and his officers entered on the final contest with high hopes. He made the fatal mistake of valuing too highly his

BRITISH LIBRARY

own strength in ships and under-estimating the strength of his foe, and he appears to have attributed to Admiral Togo the false strategy of dividing his force so as to guard the other straits through the Japanese archipelago leading to Vladivostock. As the Japanese had the interior line it was unnecessary for Admiral Togo to change the disposition he had already made until by the actual movements of the enemy he was assured that Admiral Rojdestvensky had decided not to take the short cut to Vladivostock by way of the Tsushima Straits.

The story of the battle is incomplete in some details, but the main outline has been revealed in Admiral Togo's despatches, supplemented as these have been by the unique series of graphic reports cabled immediately after the battle to the *Daily Telegraph* by its correspondents in Japan; by Admiral Enquist's story of the fight, and by an excellent message received by the *Times* from its Tokio correspondent on June 10th. Early on the morning of Saturday, May 27th, the Russian Fleet approached the Straits of Tsushima, lying between Korea and the island of Kiusiu. Admiral Rojdestvensky was still under the impression that Admiral Togo had so divided his forces that only a small squadron would be on guard at this point. He seems to have sent out no scouts to "feel" for the enemy, but steamed ahead in two columns, his cruisers on the right and his battleships on the left, with his auxiliaries between and tailing off in the rear. He had got his head well into the danger zone before he realised his mistake. A small force of Japanese cruisers appeared ahead of him, and opened the fight with a desultory fire, and apparently the Russian admiral believed that this small decoy force comprised the only Japanese men-of-war in the vicinity. Undismayed, he pressed forward, the Japanese cruisers flying before him. Meantime Admiral Togo, with the main fleets, lay hidden from view among the islands which bestrew the Korean littoral. His whereabouts were not known even to most of the officers in the subsidiary squadrons, much less to the people of Japan. In Japan, at least, it is recognised that a surprise is the essential factor in success, and that, therefore, success depends on secrecy. Admiral Togo had issued his orders to his subordinate admirals, and kept in wireless communication with them, but his exact place of hiding was known, outside the main fleets, to only a small circle of officers. When the Russians had entered the battle zone which he had prepared for them with such patience and self-constraint in the weary months of waiting, the scheme was dramatically developed. The whole fleet of Japan, as though by the ringing up of a curtain, revealed itself in fighting trim, and the greatest sea battle ever fought had commenced. When the Russians

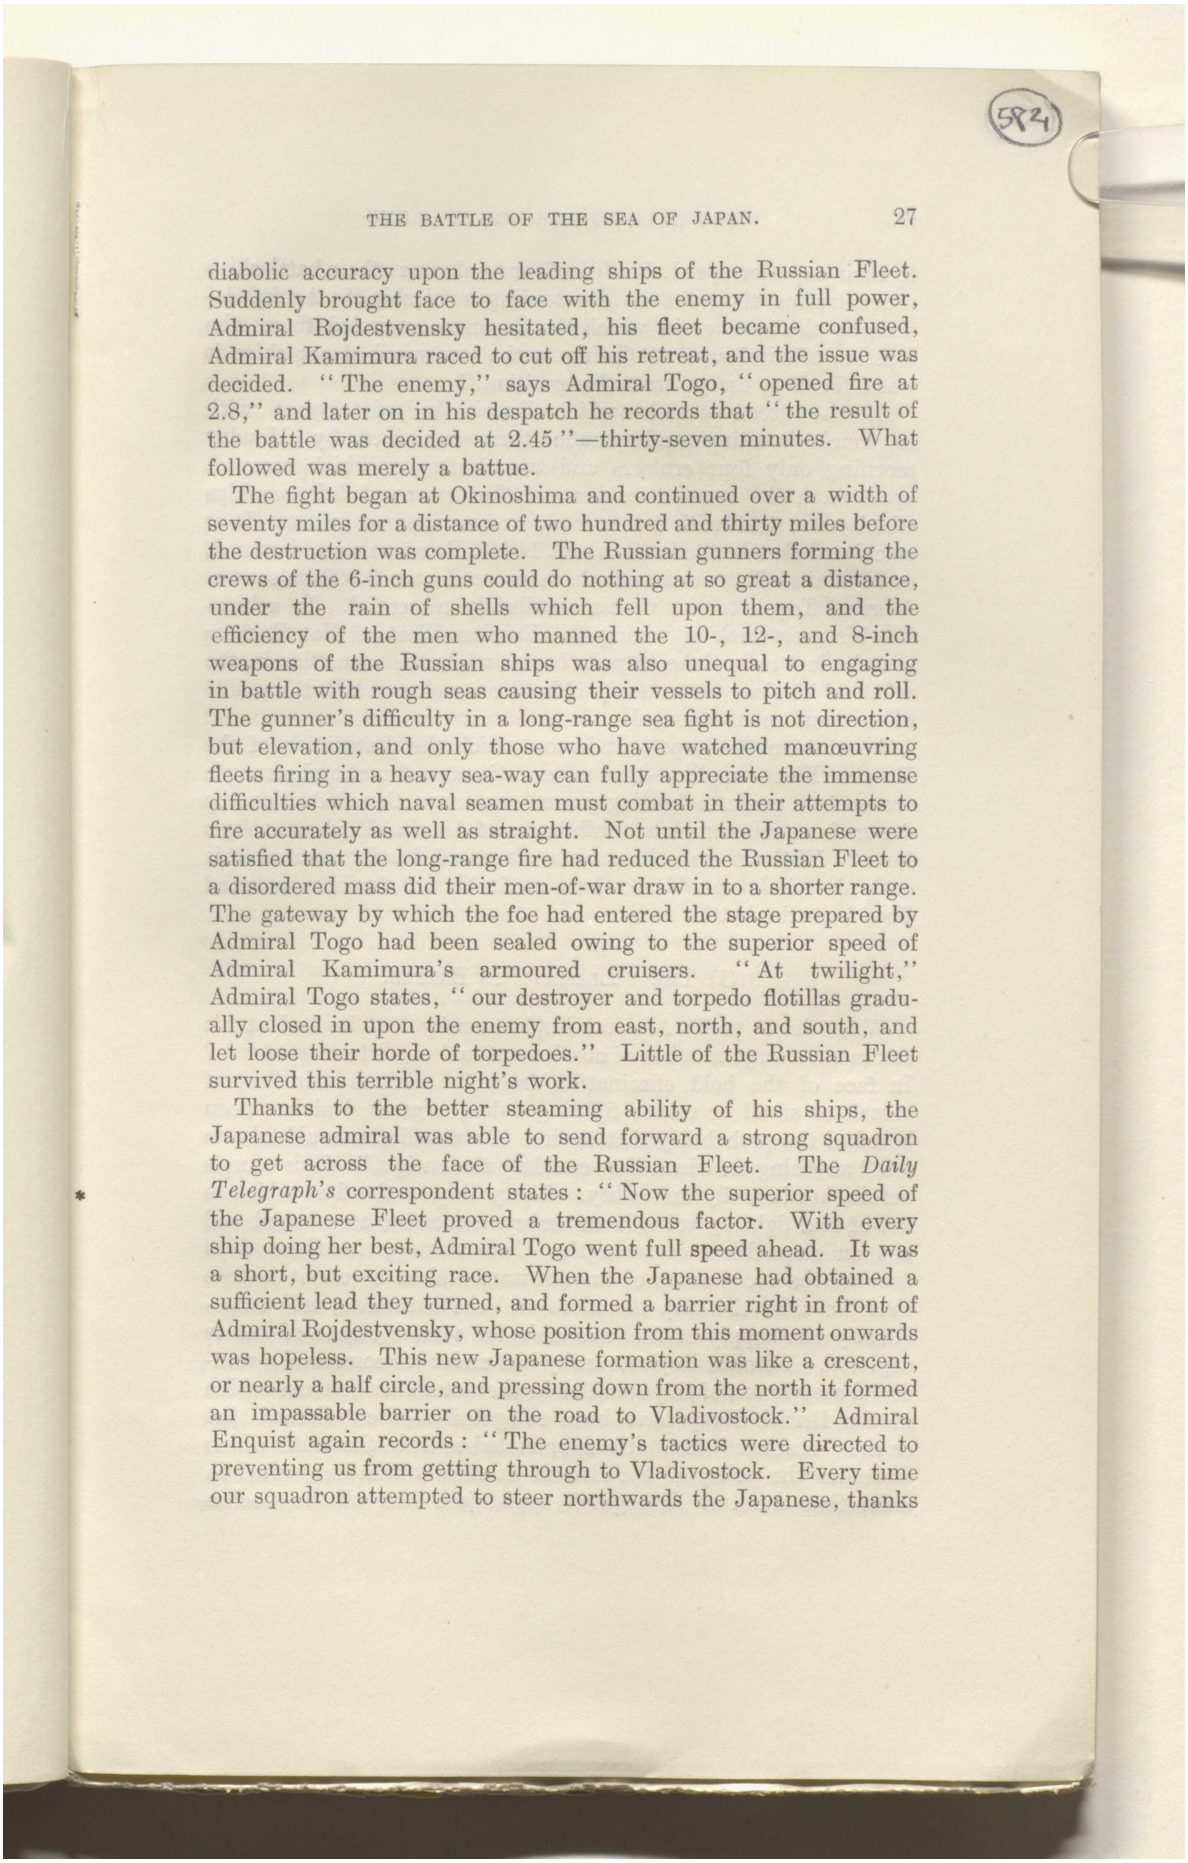
BRITISH LIBRARY

were well in the Channel between Tsushima Island and Japan, with the "decoy" squadron ahead, Admiral Togo, with four battleships and two armoured cruisers, appeared round the northern end of the island followed by Admiral Kamimura with the other six armoured cruisers. After a feint, the whole twelve armoured ships steered diagonally across the face of the enemy so as to bring their broadside to bear in a concentrated fire on the leading Russian ships. When by this manœuvre the preliminary demoralisation had been produced—the Russian battleship *Oslabia* taking fire—Admiral Kamimura raced to the rear of the enemy, while three light cruiser divisions worried his flanks, and in a special degree attacked the transports. Thus were the Russians hemmed in owing to Admiral Togo's bold tactics—"Demoralisation and then destruction," might have been the Japanese motto. They were determined to have a fight to a finish, and they acted on Nelson's dictum, "out-manœuvre a Russian."

In this wise did the battle open. Could Admiral Togo win? Those who care to read again the anticipations of qualified writers may see that even to the last it was held that though the odds were in favour of Admiral Togo the outcome of a set battle was uncertain to this extent, that the fighting might prove so desperate, the losses on both sides be so great, that the victor, to whichever side the laurels fell, would be so shattered and even decimated that he might emerge from the conflict with a fleet only in a complimentary sense ruling the Far Eastern seas. Assessed by every tangible fighting asset the comparative strength of the two fleets approached something of an equality. In guns and torpedo equipment they contrasted thus:—



Calibre of guns.	Number of guns. Russian.		Japanese.	
12 in.	26		23	
10 in.	7		3	
9 in.	12	32	4	41
8 in.	13		34	
6 in.	147		196	
Number of torpedo tubes (about)	124		200	

Judged on this basis, there was no reason why the two fleets should not emerge in something of the condition of the Kilkenny cats after their famous encounter. How completely were all prognostications falsified in a matter of thirty-seven fateful minutes. While still about eight miles distant, the Russian ships opened a quite ineffective fire. The Japanese waited in patience. At a range of three and three-quarter miles, so as to give full play to the main armaments of his battleships and armoured cruisers, Admiral Togo began a terrific cannonade and rained shells with

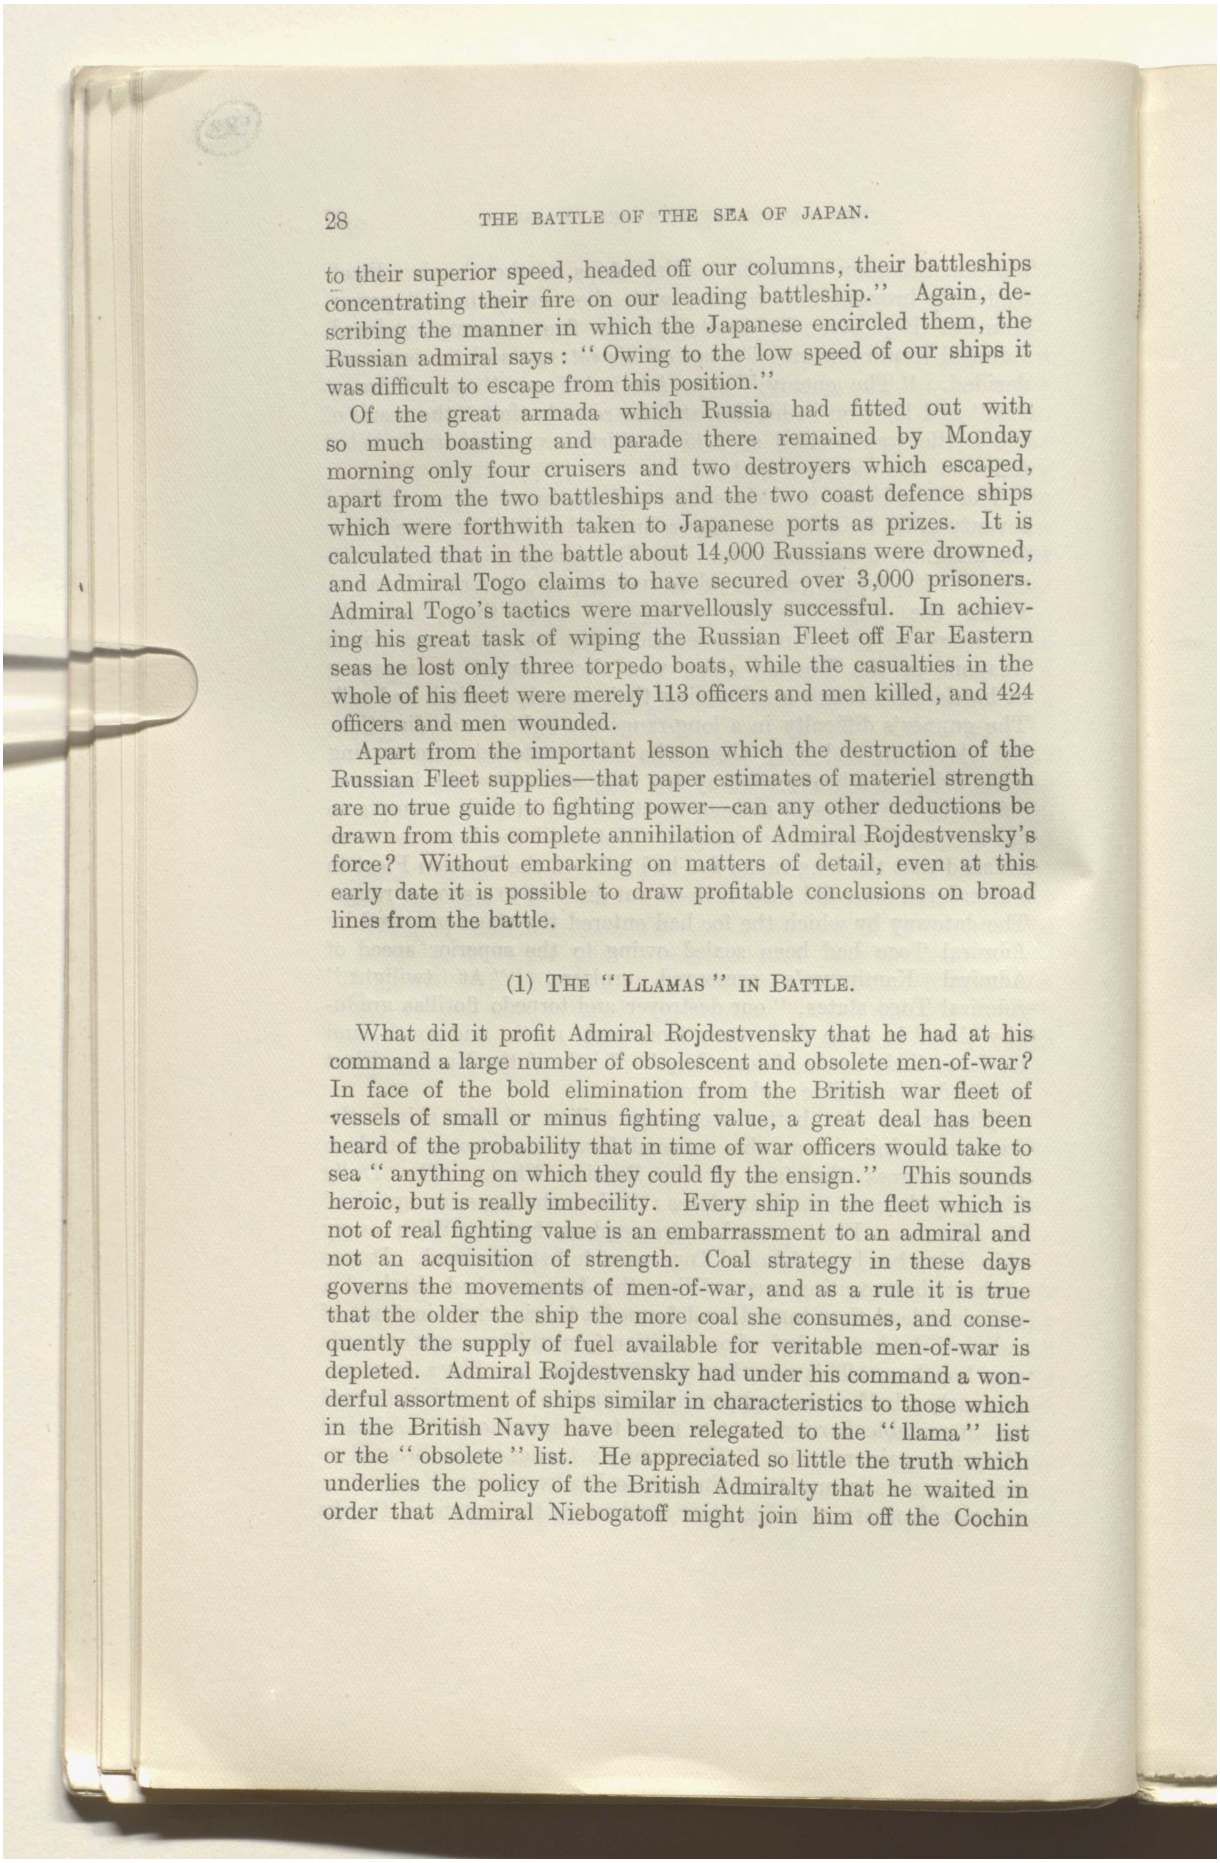
BRITISH LIBRARY

diabolic accuracy upon the leading ships of the Russian Fleet. Suddenly brought face to face with the enemy in full power, Admiral Rojdestvensky hesitated, his fleet became confused, Admiral Kamimura raced to cut off his retreat, and the issue was decided. "The enemy," says Admiral Togo, "opened fire at 2.8," and later on in his despatch he records that "the result of the battle was decided at 2.45"—thirty-seven minutes. What followed was merely a battue.



The fight began at Okinoshima and continued over a width of seventy miles for a distance of two hundred and thirty miles before the destruction was complete. The Russian gunners forming the crews of the 6-inch guns could do nothing at so great a distance, under the rain of shells which fell upon them, and the efficiency of the men who manned the 10-, 12-, and 8-inch weapons of the Russian ships was also unequal to engaging in battle with rough seas causing their vessels to pitch and roll. The gunner's difficulty in a long-range sea fight is not direction, but elevation, and only those who have watched manœuvring fleets firing in a heavy sea-way can fully appreciate the immense difficulties which naval seamen must combat in their attempts to fire accurately as well as straight. Not until the Japanese were satisfied that the long-range fire had reduced the Russian Fleet to a disordered mass did their men-of-war draw in to a shorter range. The gateway by which the foe had entered the stage prepared by Admiral Togo had been sealed owing to the superior speed of Admiral Kamimura's armoured cruisers. "At twilight," Admiral Togo states, "our destroyer and torpedo flotillas gradually closed in upon the enemy from east, north, and south, and let loose their horde of torpedoes." Little of the Russian Fleet survived this terrible night's work.

Thanks to the better steaming ability of his ships, the Japanese admiral was able to send forward a strong squadron to get across the face of the Russian Fleet. The *Daily Telegraph's* correspondent states: "Now the superior speed of the Japanese Fleet proved a tremendous factor. With every ship doing her best, Admiral Togo went full speed ahead. It was a short, but exciting race. When the Japanese had obtained a sufficient lead they turned, and formed a barrier right in front of Admiral Rojdestvensky, whose position from this moment onwards was hopeless. This new Japanese formation was like a crescent, or nearly a half circle, and pressing down from the north it formed an impassable barrier on the road to Vladivostock." Admiral Enquist again records: "The enemy's tactics were directed to preventing us from getting through to Vladivostock. Every time our squadron attempted to steer northwards the Japanese, thanks

BRITISH LIBRARY

to their superior speed, headed off our columns, their battleships concentrating their fire on our leading battleship." Again, describing the manner in which the Japanese encircled them, the Russian admiral says: "Owing to the low speed of our ships it was difficult to escape from this position."

Of the great armada which Russia had fitted out with so much boasting and parade there remained by Monday morning only four cruisers and two destroyers which escaped, apart from the two battleships and the two coast defence ships which were forthwith taken to Japanese ports as prizes. It is calculated that in the battle about 14,000 Russians were drowned, and Admiral Togo claims to have secured over 3,000 prisoners. Admiral Togo's tactics were marvellously successful. In achieving his great task of wiping the Russian Fleet off Far Eastern seas he lost only three torpedo boats, while the casualties in the whole of his fleet were merely 113 officers and men killed, and 424 officers and men wounded.

Apart from the important lesson which the destruction of the Russian Fleet supplies—that paper estimates of materiel strength are no true guide to fighting power—can any other deductions be drawn from this complete annihilation of Admiral Rojdestvensky's force? Without embarking on matters of detail, even at this early date it is possible to draw profitable conclusions on broad lines from the battle.

(1) The "Llamas" in Battle.

What did it profit Admiral Rojdestvensky that he had at his command a large number of obsolescent and obsolete men-of-war? In face of the bold elimination from the British war fleet of vessels of small or minus fighting value, a great deal has been heard of the probability that in time of war officers would take to sea "anything on which they could fly the ensign." This sounds heroic, but is really imbecility. Every ship in the fleet which is not of real fighting value is an embarrassment to an admiral and not an acquisition of strength. Coal strategy in these days governs the movements of men-of-war, and as a rule it is true that the older the ship the more coal she consumes, and consequently the supply of fuel available for veritable men-of-war is depleted. Admiral Rojdestvensky had under his command a wonderful assortment of ships similar in characteristics to those which in the British Navy have been relegated to the "llama" list or the "obsolete" list. He appreciated so little the truth which underlies the policy of the British Admiralty that he waited in order that Admiral Niebogatoff might join him off the Cochin

BRITISH LIBRARY

China coast. This officer had with him the second-class battleship *Nicholas I.*, an old armoured cruiser, the *Vladimir Monomach*, and the three coast defence ships *Admiral Seniavin*, *Admiral Oushakoff*, and *Admiral Apraxine*. These last four vessels were so old, so unsuited to the battle line in all respects, that in the great struggle they could neither fight effectively nor run away; two of them were sunk and the other two, with the *Nicholas I.*, surrendered. When we get the full story of the battle it will probably be found that these vessels, owing to their poverty in fighting power and in mobility, not only added nothing to the strength of the Russian Fleet, but contributed materially to the disorder and demoralisation. He will be indeed a courageous critic of Admiralty policy who will now join Sir William White in defence of the obsolete and inefficient, or express agreement with the anonymous writer in *Blackwood* in the claim "that the work (of the Fleet) will be so multifarious that place will always be found for every ship which carries a gun." In judging the efficiency of this mythical and typical ship we should want to know something of the "gun" and its power, of the engines and boilers, and the quality of the armour, if it has any. The British men-of-war which have been struck off the "war list" have been weighed in this way, one by one, and condemned, and the lesson which Admiral Rojdestvensky's debacle conveys is that in this policy the Admiralty have been right. We cannot afford to send British officers and men, highly trained at great expense, and therefore valuable national assets, to sea in a ship the only justification for which is that it "carries a gun." Such action would be inhuman, apart from its imbecility.

(2) The Value of Speed.

What advantage did Japan gain from the possession of superior speed? Admiral Sir Cyprian Bridge and Rear-Admiral Sir R. N. Custance have no belief in speed. In the *Naval Annual* for the present year, the former Commander-in-Chief of the British China Squadron condemns the big armoured cruiser, holding that "a true conception of cruiser tactics indicates that multiplicity rather than a small number of powerful individual ships would be needed." Again, "that no great value as a factor in tactics could be assigned to speed superiority had long been suspected by officers who had made a close study of tactical questions." And Sir Cyprian even minimises the strategical importance of high speed; he holds that "speed is of small tactical or strategical value." No one can read the story of the battle of the Sea of Japan and fail to recognise how completely Sir Cyprian Bridge's conclusions

have been belied by events. When the Japanese set themselves to create a navy they attached the greatest importance to speed, far greater than was attributed to it by any of the great Powers. This conclusion led them to the creation of a navy which in its main fighting units was swifter than that of any other nation. They built six battleships ranging in speed from eighteen to nineteen knots, and a similar number of armoured cruisers able to steam at from twenty to twenty-three knots. No other navy contained at that time anything approaching this proportion of armoured cruisers to battleships, for, in agreement with Sir Cyprian Bridge, the naval authorities of the world believed in "multiplicity" of weak ships. At a time when the British Admiralty was still building slow ships without armoured belts, Japan led the way in the construction of big cruisers with thick belts, a heavy armament of guns, and great speed —in fact, vessels such as are now being added to the British Fleet by the present Board, which, we are told, is a "retrograde Admiralty." So far as the result of gun fire was concerned in the late action the victory lay with the Japanese because they possessed these swift ships of great offensive power, and Admiral Togo was able to pursue the successful tactics already revealed in broad outline because he had under his command a fleet immensely superior to that of Russia in speed. Owing to their superior speed the Japanese, to use a colloquialism, were able to make rings round the Russians, and almost completely to cut off the avenues of escape. If the Russians had had the advantage of speed, the action would have been indecisive, and they might have got through with a considerable portion of the armada.

(3) The Rôle of the Torpedo.

What part in the battle did the torpedo take? The most casual observer of the trend of naval policy in Great Britain must have observed that increased importance has been given to the torpedo as an offensive and defensive arm. According to Admiral Sir Cyprian Bridge, again writing on the naval actions of the war, "perhaps nothing stands out more clearly in the campaign than the insignificance of the results effected by the locomotive torpedo. . . . The conclusion should be that it is a weapon of limited efficiency to be depended upon only in special circumstances of infrequent occurrence." The facts prior to the last battle do not support Admiral Bridge's conclusion as to the inefficiency of the torpedo. It was owing to the effective use of this weapon and not to the gun that the Japanese first crippled the Russians off Port Arthur in February, 1904. Admiral Togo was acting

BRITISH LIBRARY

under exceptional limitations in that he was not permitted to risk any of his big ships. He relied in the initial attacks upon the Russian Fleet almost entirely upon torpedo craft supported by cruisers. His first operations were so completely successful that from the date of his first attack by torpedoes the Russian Fleet was demoralised, and so seriously crippled that it was practically useless. Far from the torpedo having proved inefficient, three of the main ships of the Russian squadron were seriously damaged even while anchored under the shore guns at Port Arthur, and would probably have been completely destroyed but for the protection afforded by the land defences and the close proximity of the harbour of Port Arthur, into which they were able to limp for repairs. So long as the Port Arthur squadron was a fleet in being, it was the torpedo, adequately supported by the gun, which rendered it ineffective. That the Russian ships injured by torpedo attack were patched up, thanks to the resourcefulness of a Scotsman, and were able subsequently to put to sea was merely due to the good fortune which enabled them to creep into the neighbouring port. The Russian squadron in Port Arthur, however, never recovered in *moral* the effects of the torpedo attacks. The battle of the Sea of Japan supplies even more conclusive evidence as to the falseness of the conclusion that the torpedo is ineffective. The battle was opened by long-range firing by the Japanese which seems to have completely unnerved the Russian sailors. Then as darkness fell the torpedo craft, again supported by the gun-ships, well in the rear, swarmed round the disordered fleet, and practically completed its destruction. How many ships were actually sunk by the action of the torpedo we do not know, but the inference to be drawn from Admiral Togo's despatches and other information is that this weapon was responsible for the sinkng of several of the battleships and cruisers. One morai to be drawn from the battle is that the policy of the Admiralty in regarding the gun and torpedo as complementary weapons, each having its place in the battle tactics of a fleet, is well founded. If the Japanese had accepted Admiral Bridge's conclusion that the torpedo is a weapon of limited usefulness and only to be infrequently employed, they would not have provided themselves with one hundred torpedo craft, and the battle of the Sea of Japan would have had quite another ending.

(4) The Importance of Gunnery.

A feature of the fight which stands out in the most striking manner is the accuracy with which the Japanese gunners must have shot. A man-of-war is not a yacht, and the Japanese, while

attaching due importance to cleanliness and order on board ship, have never made paint and polish their idol. The Japanese ships were built to fight, and the main preoccupation of officers and men has been persistent training in the use of the gun as well as the torpedo. The manner in which both these weapons were employed points to long and persistent training in which officers and men profited by all the assistance to be obtained from the mechanical contrivances of Rear-Admiral Percy Scott; they adopted the "spotter," the loading-tray, and other appliances before even the British Admiralty had done so. They have their reward in the most complete naval victory recorded in history. This unique success was achieved by the use of instruments made in England on the same principles as those mounted in the British Fleet, and, in view of the recent "scare" as to British guns, the battle of the Sea of Japan must be consolatory to the British public. The Japanese by their triumph have given a testimonial to the heavy guns of the British Fleet which should set at rest any fears which may have been aroused.

(5) The Personal Element.

The completeness of the Japanese victory may be traced in large measure to the different characters of the crews of the two fleets. If we read between the lines of the story of the battle it will be realised that the Russians were demoralised almost from the first brush with the enemy. Brave though they are in close contests, they seem to have lost all ability to defend themselves when fired at by a determined foe three or four miles away, and to have been reduced to human pulp—without power of thought, initiative, or action. Only on this assumption can the extraordinary absence of Japanese casualties be explained, for Russian sailors, however deficient their war training, have never lacked courage—a courage without intelligence, such as a bull shows when he is at bay in the ring after the matador has driven him to frenzy. Courage of this character in the hand-to-hand fighting of the old sailing days was an asset of immense value as ships lay broadside to broadside, and the men swarmed over the bulwarks and fought hand-to-hand. But to-day the fight is between weapons which operate at a distance, and the destruction which they can effect depends not on brute courage, but on a clear eye, steady hand, and cool head trained to act in mechanical unison. The modern sailor who loses his nerve is a danger to his country, because "jumpiness" spreads like an infection. The Russian sailors had the guns, but we cannot doubt that they lost the coolness requisite to their use even had they been adequately trained. Indeed, the armament of the "lost fleet" was in no way incomparable to that mounted in the Japanese ships, because at least half a dozen of the Russian vessels

BRITISH LIBRARY

carried guns of the very latest types, while most of the Japanese weapons were of older design. The essential difference between the fleets did not lie in the gun or torpedo equipment, nor in any numerical deficiencies to be discovered by "paper" contrasts, but it lay mainly in the crews—in the training which the Japanese had undergone under fair and foul weather conditions, and in the absence of training in the poor fellows who were sent, willy-nilly, to the Russian ships; many of them were dragged from the plough in inland provinces and ordered to become naval gunners and torpedo men. Even an autocrat cannot work miracles, and the Tsar and his advisers failed.

The Japanese Navy after the War.

Japan entered upon this war as the smallest of the seven naval Powers of the world, and she will emerge with a naval force which will be well able to dictate peace in Far Eastern waters. Her navy on the day when peace is signed will in any event be nearly twice as powerful as that with which she began the struggle. Never did any nation in modern warfare acquire such valuable prizes as have fallen to Admiral Togo and his colleagues. In the course of the fifteen months he has lost two battleships—though efforts to raise the *Yashima* are being made, it is said—and two effective cruisers, besides a few torpedo craft and many merchant ships. This is one side of the account, and on the other we have a long list of trophies, even if we exclude for the moment the Russian vessels which have been interned. The credit side of the Japanese war ledger, showing the Russian men-of-war which she has actually obtained already, reads as follows:—

Battleships.

	Displacement. Tons.	Port.	Remarks.
Orel	13,560	Taken to Maisuru	Captured on May 28.
Nicolas I.	9,700	Taken to Sasebo..	Captured on May 28.
Peresviet	12,674	Port Arthur	Both these ships, which were sunk in shallow water, are being raised.
Poltava	10,950		
Retvizan	12,700	Port Arthur	These two vessels, it is feared, cannot be salved; they are, at least, doubtful.
Pobieda	12,674		

Coast Defence Ships.

Gen. Adm. Apraxine, Adm. Seniavin	4,126	Taken to Sasebo..	Captured on May 28.

Cruisers.

Bayan (armoured)	7,800	Port Arthur	Sunk in shallow water, and will be salved.
Variag	6,500	Chemulpo	Will be, it is reported, raised and repaired.
Pallada	6,630	Port Arthur	This swift ship is being salved.

Destroyer.

Bedovy	300	Sasebo	Captured on May 29.

Reference: Mss Eur F111/393. Copyright for this page: Public Domain

Qatar National Library

Japan, consequently, has every prospect, even if we eliminate such doubtful ships as the *Retvizan* and *Pobieda*, which were very badly damaged, of repairing and adding to her fighting fleet four battleships, two coast defence ships, and three cruisers.

Then there are the interned ships of the Russian Fleet. They are under the shelter of neutral flags, and when the war closes will, in ordinary circumstances, be handed back to the Tsar's Government, but under the treaty of peace the Japanese may insist on these men-of-war being ceded to them, since they escaped Admiral Togo's meshes only by flying within the sanctuary of neutral waters. These vessels, therefore, may possibly be added to the Mikado's Fleet. They include the following men-of-war :—

Type.	Name.	Displacement.	Port of internment.
Battleship	Tzarevitch	13,100	Kiao-chau.
Cruiser	Askold	6,500	Shanghai.
,, ...	Diana	6,630	Saigon.
,, ...	Aurora	6,630	Manila.
,, ...	Oleg	6,675	,,
,, ...	Jemchug	3,100	,,
Gunboat	Mandjour.....	1,416	Shanghai.
Destroyers	Smely, Boiki, Bespochtchadni, Beschumni, Bestrachtni	240 to 300	Kiao-chau.
,, ...	Grosovoi	—	Shanghai.
,, ...	Skory, Stratni, Serdity, Vlastni...	—	Chefoo.

But the story of Japan's Fleet as it will exist after peace is declared is not fully revealed. While war has been in progress she has been busy fortifying herself to protect all she may gain by the strength of her arms. Apart from a large number of torpedo craft, which have been built in native yards since the war commenced, she has under construction, and approaching completion, the following powerful ships :—

	Displacement in tons.		Where building.
Battleship Kashima	16,400	.....	Elswick.
,, Katori	15,940	.....	Barrow.
Two armoured cruisers...	13,500	.....	Kuré (Japan).

Both the armoured cruisers building in Japan have been launched, and on one the armour belt has been placed. Russia emerges from the war practically without a fleet, while, deducting the *Hatsuse* and *Yashima*, lost at sea, but including the interned ships and those now building, Japan will be stronger by five battleships, two coast defence ships, three armoured cruisers (including the *Bayan*), seven protected cruisers, a gunboat, and eleven destroyers. Such a triumph is the most extraordinary in the world's history.

ARCHIBALD S. HURD.

A MORNING IN THE GALLERIES.

In Dialogue.

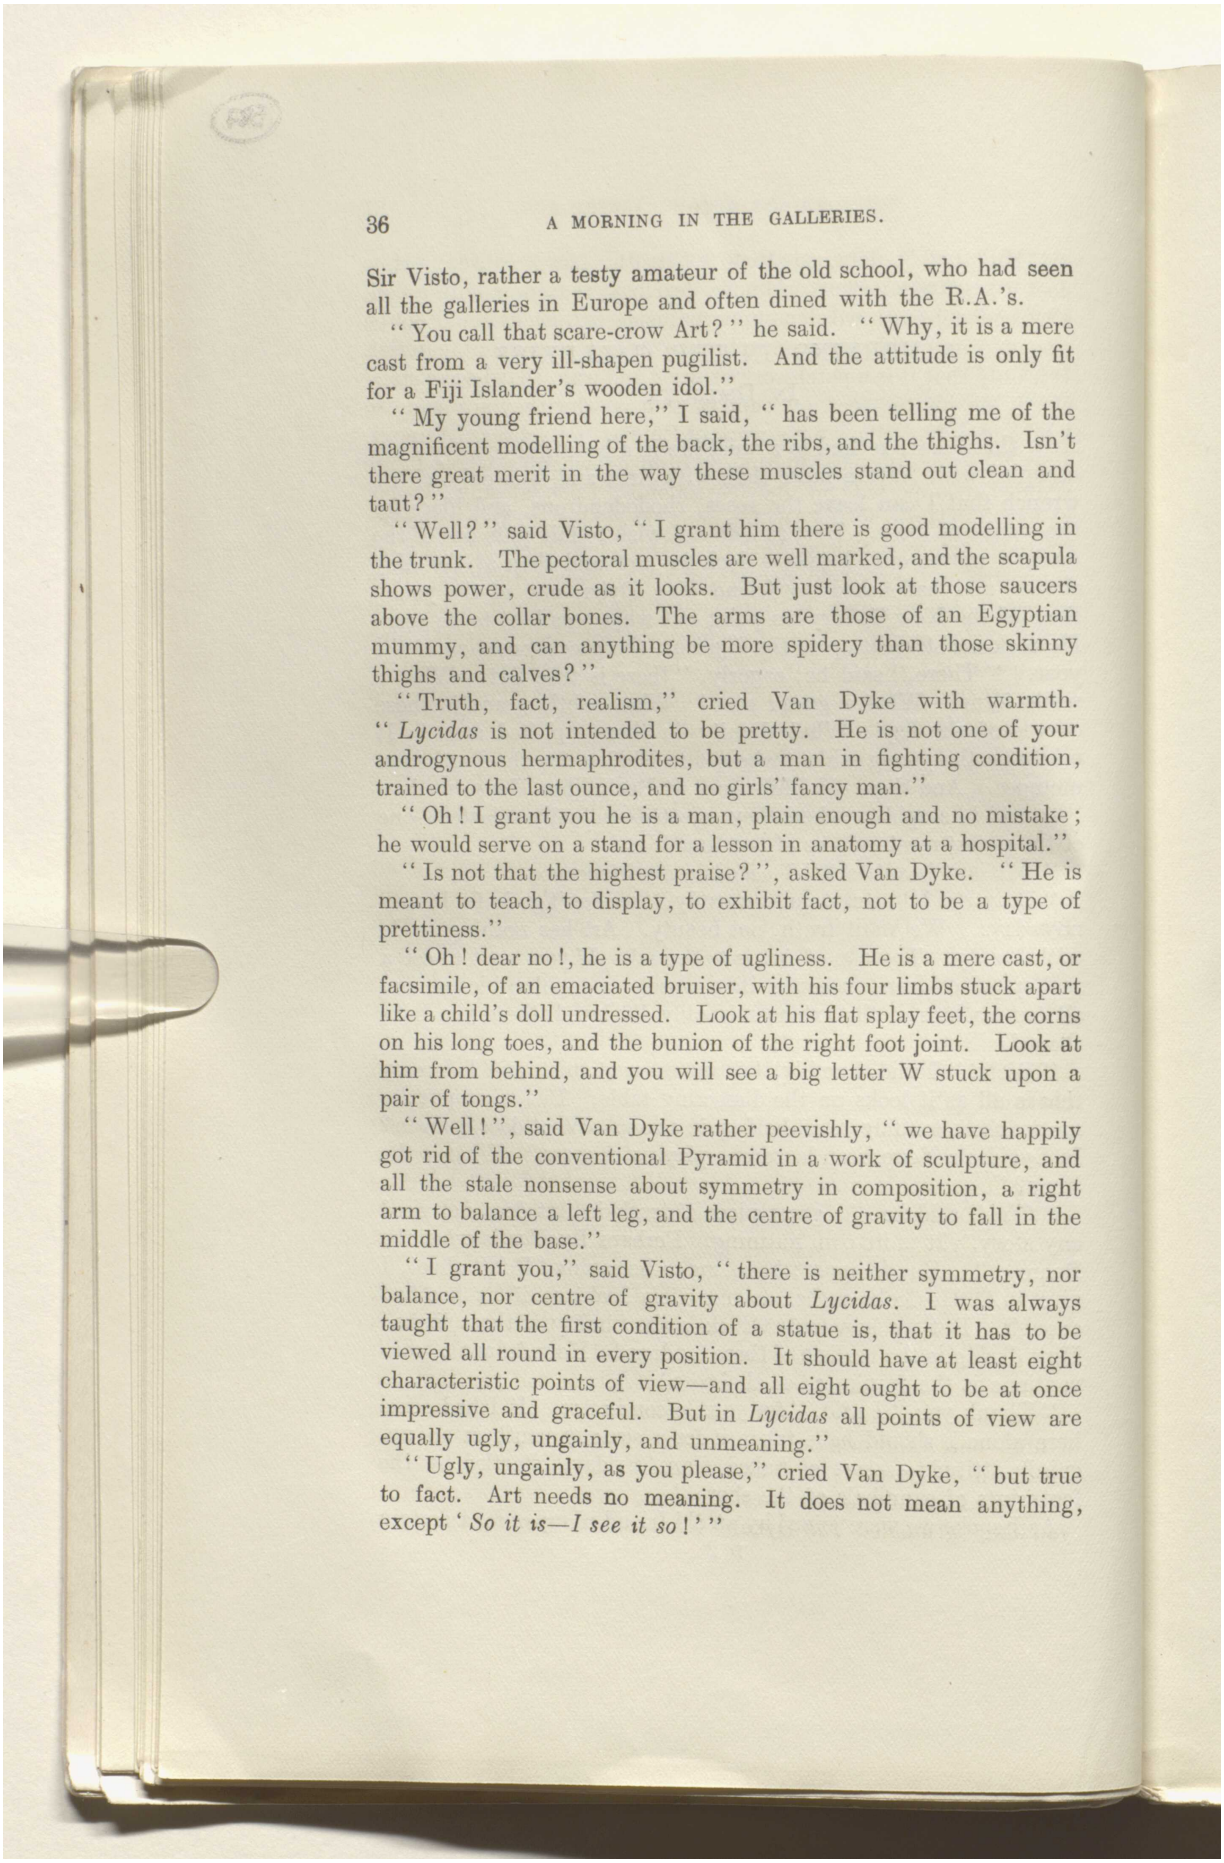
Now that I have retired to a quiet life in a beautiful country I am occupied with Nature more than with Art; and it is only with a wrench that I can leave the roses, rhododendrons, and lilacs for the smoke of town. But, as I do not wish to fall quite out of the modern movement, I take a look in now and then at the May shows, and had asked my friend Van Dyke, one of the young lions of the New Gallery, to point out what was best to be seen. He took me straight up to the *Lycidas*, the great sensation of the year. "There," said he, eagerly, "there is true Art. What a noble form! What a grand pose! What subtle grace in those curves of the leg! What dignity in those uplifted arms! It might be the young athlete who sat to Phidias for the Parthenon metopes. And those old Philistines at Burlington House made a 'record' in stupidity when they rejected—actually rejected—one of the purest masterpieces of our time!"

"But is it beautiful?" I asked in my innocence.

"Beautiful?" he said quite warmly, "we don't go in for beauty nowadays. We want truth, not beauty. Art has nothing to do with beauty. The aim of Art is to be real. If you want to see a real spinal column, an honest iliac muscle, a genuine biceps, and all ten tendons of the extensor frankly displayed, there you have them."

"Well!" I said, humbly, "I am no anatomist, and I daresay this is all as it looks on the dissecting table. But what puzzles me are those ten fingers all held up in a row. What does it mean? Is *Lycidas* a Neapolitan lazzarone playing at *mora*? What is the story?"

"Oh!" said he, "a great piece of truth in Art does not need any story. It is its own meaning. Perhaps *Lycidas* is what the Boers call a *Hands-upper*; he seems to be saying 'Don't shoot, I give in.' He looks rather down on his luck, as if he has had enough. But see how truly Greek is the vitality of those limbs! How daring is the realism of those tendons! How defiant of conventions is the frankness of the pose!"



"Thank you," I said, "for your lesson in Art. If I had come here alone I should have taken it for a scraggy youth in an ungainly attitude—a sort of naked man 'Friday,' startled by the footprints of cannibals on the shore."

As I spoke we were joined by an old friend of my own, a certain

BRITISH LIBRARY

Sir Visto, rather a testy amateur of the old school, who had seen all the galleries in Europe and often dined with the R.A.'s.

"You call that scare-crow Art?" he said. "Why, it is a mere cast from a very ill-shapen pugilist. And the attitude is only fit for a Fiji Islander's wooden idol."

"My young friend here," I said, "has been telling me of the magnificent modelling of the back, the ribs, and the thighs. Isn't there great merit in the way these muscles stand out clean and taut?"

"Well?" said Visto, "I grant him there is good modelling in the trunk. The pectoral muscles are well marked, and the scapula shows power, crude as it looks. But just look at those saucers above the collar bones. The arms are those of an Egyptian mummy, and can anything be more spidery than those skinny thighs and calves?"

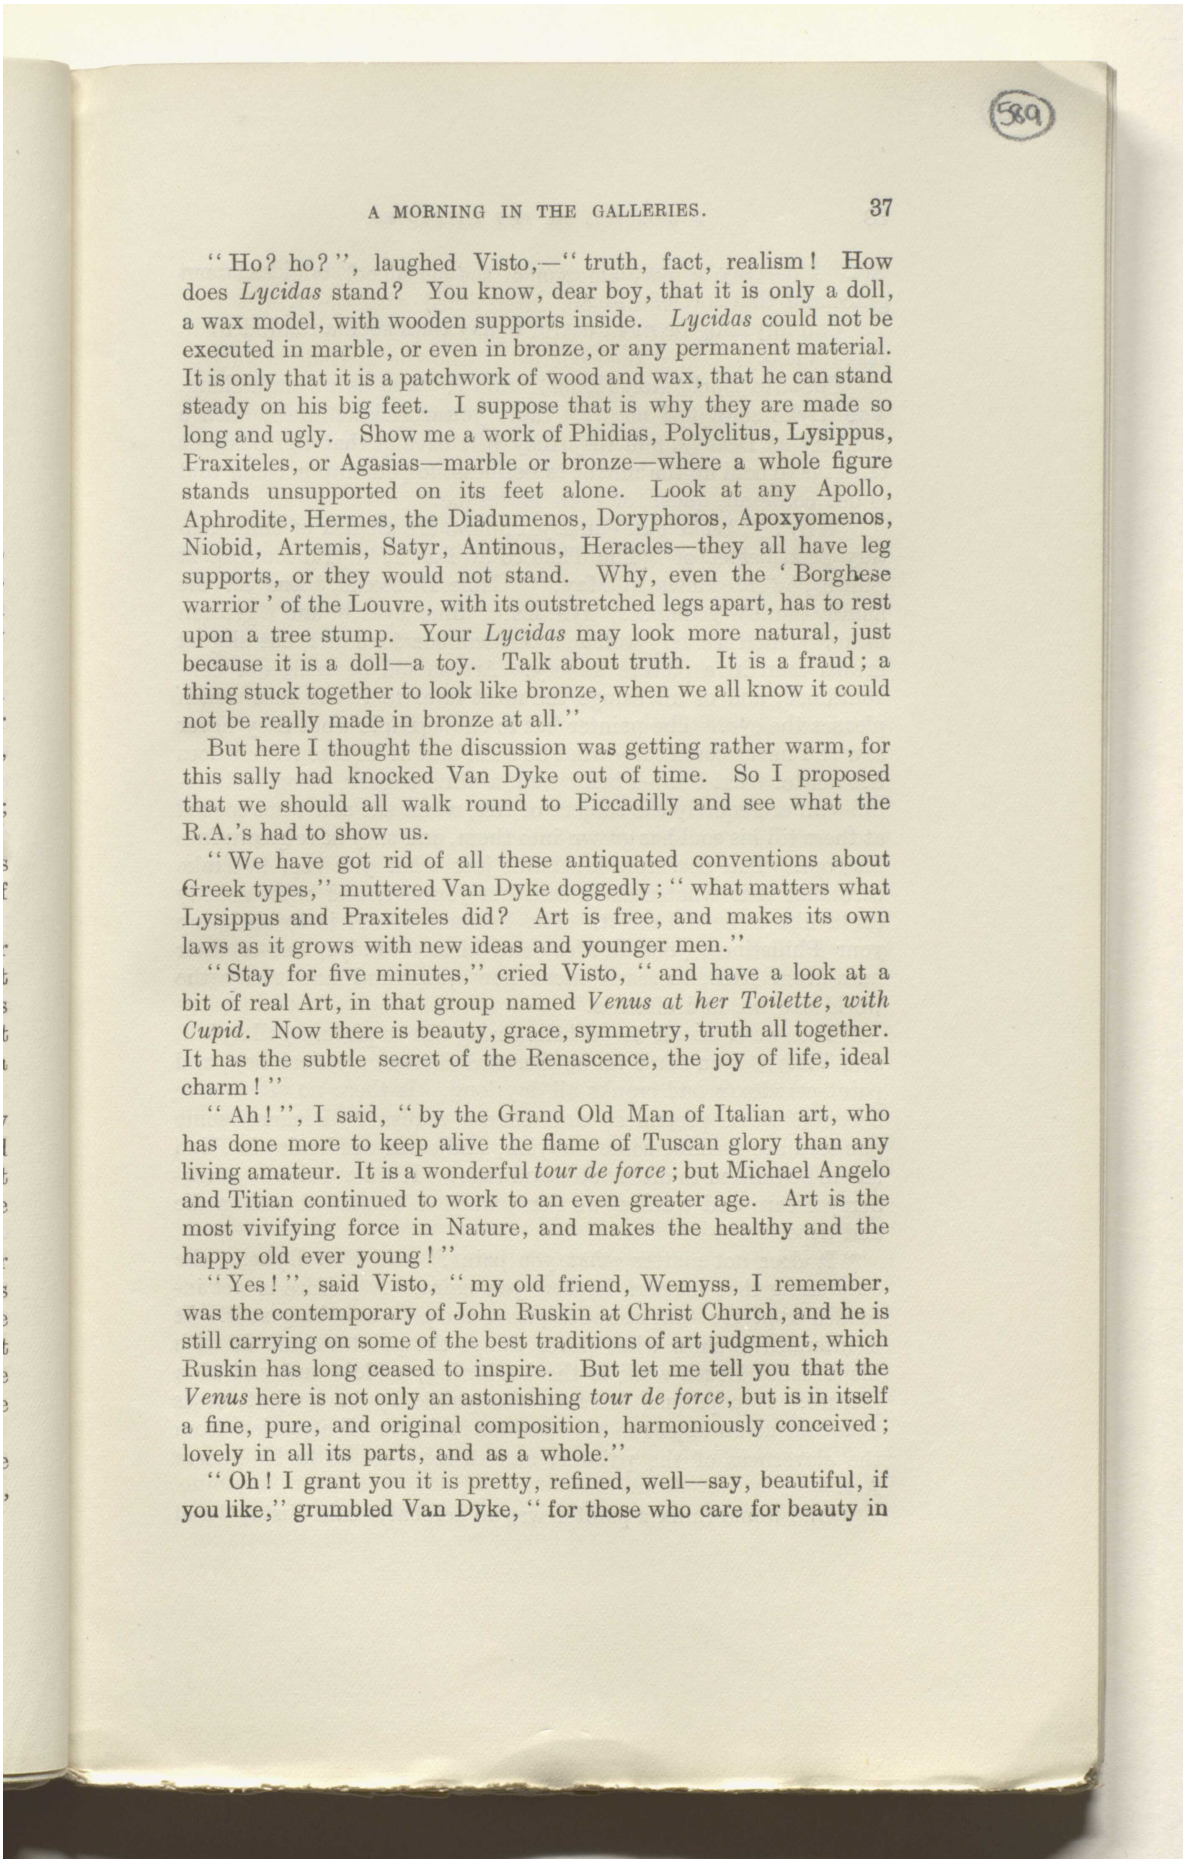
"Truth, fact, realism," cried Van Dyke with warmth. "*Lycidas* is not intended to be pretty. He is not one of your androgynous hermaphrodites, but a man in fighting condition, trained to the last ounce, and no girls' fancy man."

"Oh! I grant you he is a man, plain enough and no mistake; he would serve on a stand for a lesson in anatomy at a hospital."

"Is not that the highest praise?", asked Van Dyke. "He is meant to teach, to display, to exhibit fact, not to be a type of prettiness."

"Oh! dear no!, he is a type of ugliness. He is a mere cast, or facsimile, of an emaciated bruiser, with his four limbs stuck apart like a child's doll undressed. Look at his flat splay feet, the corns on his long toes, and the bunion of the right foot joint. Look at him from behind, and you will see a big letter W stuck upon a pair of tongs."

"Well!", said Van Dyke rather peevishly, "we have happily got rid of the conventional Pyramid in a work of sculpture, and all the stale nonsense about symmetry in composition, a right arm to balance a left leg, and the centre of gravity to fall in the middle of the base."



"I grant you," said Visto, "there is neither symmetry, nor balance, nor centre of gravity about *Lycidas*. I was always taught that the first condition of a statue is, that it has to be viewed all round in every position. It should have at least eight characteristic points of view—and all eight ought to be at once impressive and graceful. But in *Lycidas* all points of view are equally ugly, ungainly, and unmeaning."

"Ugly, ungainly, as you please," cried Van Dyke, "but true to fact. Art needs no meaning. It does not mean anything, except '*So it is—I see it so!*'"

BRITISH LIBRARY

"Ho? ho?", laughed Visto,—"truth, fact, realism! How does *Lycidas* stand? You know, dear boy, that it is only a doll, a wax model, with wooden supports inside. *Lycidas* could not be executed in marble, or even in bronze, or any permanent material. It is only that it is a patchwork of wood and wax, that he can stand steady on his big feet. I suppose that is why they are made so long and ugly. Show me a work of Phidias, Polyclitus, Lysippus, Praxiteles, or Agasias—marble or bronze—where a whole figure stands unsupported on its feet alone. Look at any Apollo, Aphrodite, Hermes, the Diadumenos, Doryphoros, Apoxyomenos, Niobid, Artemis, Satyr, Antinous, Heracles—they all have leg supports, or they would not stand. Why, even the 'Borghese warrior' of the Louvre, with its outstretched legs apart, has to rest upon a tree stump. Your *Lycidas* may look more natural, just because it is a doll—a toy. Talk about truth. It is a fraud; a thing stuck together to look like bronze, when we all know it could not be really made in bronze at all."

But here I thought the discussion was getting rather warm, for this sally had knocked Van Dyke out of time. So I proposed that we should all walk round to Piccadilly and see what the R.A.'s had to show us.

"We have got rid of all these antiquated conventions about Greek types," muttered Van Dyke doggedly; "what matters what Lysippus and Praxiteles did? Art is free, and makes its own laws as it grows with new ideas and younger men."

"Stay for five minutes," cried Visto, "and have a look at a bit of real Art, in that group named *Venus at her Toilette, with Cupid*. Now there is beauty, grace, symmetry, truth all together. It has the subtle secret of the Renascence, the joy of life, ideal charm!"

"Ah!", I said, "by the Grand Old Man of Italian art, who has done more to keep alive the flame of Tuscan glory than any living amateur. It is a wonderful *tour de force*; but Michael Angelo and Titian continued to work to an even greater age. Art is the most vivifying force in Nature, and makes the healthy and the happy old ever young!"

"Yes!", said Visto, "my old friend, Wemyss, I remember, was the contemporary of John Ruskin at Christ Church, and he is still carrying on some of the best traditions of art judgment, which Ruskin has long ceased to inspire. But let me tell you that the *Venus* here is not only an astonishing *tour de force*, but is in itself a fine, pure, and original composition, harmoniously conceived; lovely in all its parts, and as a whole."

"Oh! I grant you it is pretty, refined, well—say, beautiful, if you like," grumbled Van Dyke, "for those who care for beauty in

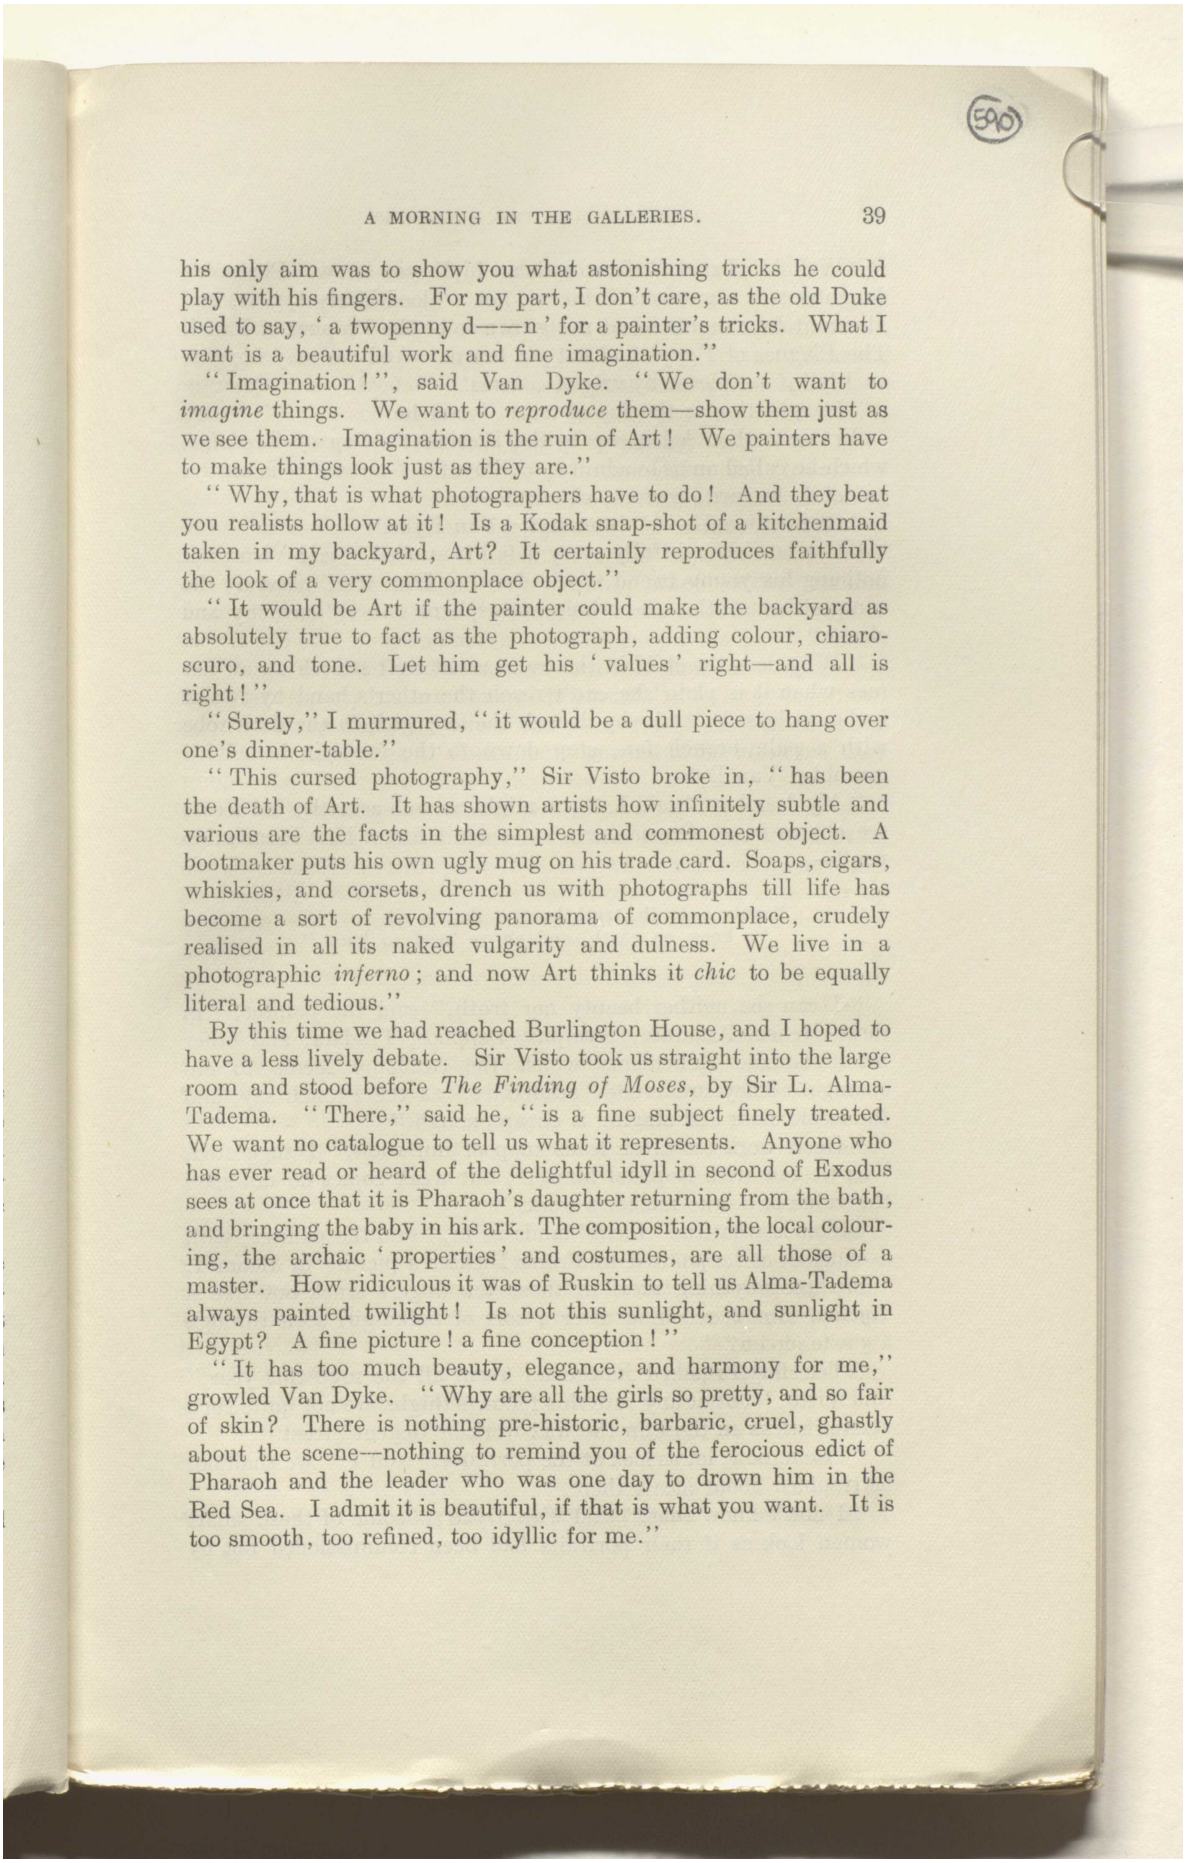
Art. I daresay it reminds people of the old artists' idea about grace and that sort of thing."

"Can anything be more useful to-day than such a reminder?", asked Visto.

"Come to Burlington House," said I, "and as we walk along, Van Dyke shall tell us why these young fellows make such a dead set at Beauty, and why they will have it that the business of Art is to hold up the mirror to ugliness, to pourtray nothing that is not common, queer, or even grotesque."

"Why!", broke out Van Dyke, "we are all sick of these tea-tray prettinesses of "The Thames at Dawn," "Pine woods at Sunset," "Meadows in May," "June Blossoms," and all the namby-pamby goddesses, nymphs, "blue eyes," and "golden locks," which are very well on a bon-bon box for a girl, but disgust grown men in a picture gallery. Art should be real, not conventional; and of all things the most fatal to Art is that which pleases the eye. The painter has to show people what they never saw and never could see—what he sees, and as he sees it. It does not matter what it is—a brick wall, a blind beggar, a hog, a dung-hill—all are equally the subject of Art, when the artist has looked at them till his soul has grown into them, and they have grown into his soul. The new rule is—Paint just what you see, but take care that it is what nobody sees but yourself, and what nobody could like if he did see it. The business of Art is to shake up your Philistines, your Bottles, and Mrs. Grundys, out of their hum-drum lives, to teach them how queer and how nasty the world can be, and often is."

"You want us all to go 'slumming' in a picture gallery?", said Visto, "you can't all be Bernard Shaws, my dear boy, and paint paradoxes and cranks all day long. Is there no alternative between weak prettiness and coarse realism? Because some painters are finikin, some babyish, and some academic, is High Art to be limited to ditchwater and rags? If we are sick of strawberry cream and truffles, we don't want to be stuffed with garlic and tripe."



"It does not matter *what* you paint," said Van Dyke, "the only thing that matters is, *how* you paint. A picture is not intended to *please*—ought not to *please* the person looking at it. It is intended to show what clever things the painter could do with his brush. Brush-work is the beginning, middle and end of a picture. If a picture interests the public by its subject, or is beautiful as an object to view, so far it draws off attention from the cleverness of the painter, and thereby ceases to be sincere Art."

"One would think a painter was an acrobat," said Visto, "and

BRITISH LIBRARY

his only aim was to show you what astonishing tricks he could play with his fingers. For my part, I don't care, as the old Duke used to say, 'a twopenny d——n' for a painter's tricks. What I want is a beautiful work and fine imagination."

"Imagination!", said Van Dyke. "We don't want to *imagine* things. We want to *reproduce* them—show them just as we see them. Imagination is the ruin of Art! We painters have to make things look just as they are."

"Why, that is what photographers have to do! And they beat you realists hollow at it! Is a Kodak snap-shot of a kitchenmaid taken in my backyard, Art? It certainly reproduces faithfully the look of a very commonplace object."

"It would be Art if the painter could make the backyard as absolutely true to fact as the photograph, adding colour, chiaro-scuro, and tone. Let him get his 'values' right—and all is right!"

"Surely," I murmured, "it would be a dull piece to hang over one's dinner-table."

"This cursed photography," Sir Visto broke in, "has been the death of Art. It has shown artists how infinitely subtle and various are the facts in the simplest and commonest object. A bootmaker puts his own ugly mug on his trade card. Soaps, cigars, whiskies, and corsets, drench us with photographs till life has become a sort of revolving panorama of commonplace, crudely realised in all its naked vulgarity and dulness. We live in a photographic *inferno*; and now Art thinks it *chic* to be equally literal and tedious."

By this time we had reached Burlington House, and I hoped to have a less lively debate. Sir Visto took us straight into the large room and stood before *The Finding of Moses*, by Sir L. Alma-Tadema. "There," said he, "is a fine subject finely treated. We want no catalogue to tell us what it represents. Anyone who has ever read or heard of the delightful idyll in second of Exodus sees at once that it is Pharaoh's daughter returning from the bath, and bringing the baby in his ark. The composition, the local colouring, the archaic 'properties' and costumes, are all those of a master. How ridiculous it was of Ruskin to tell us Alma-Tadema always painted twilight! Is not this sunlight, and sunlight in Egypt? A fine picture! a fine conception!"

"It has too much beauty, elegance, and harmony for me," growled Van Dyke. "Why are all the girls so pretty, and so fair of skin? There is nothing pre-historic, barbaric, cruel, ghastly about the scene—nothing to remind you of the ferocious edict of Pharaoh and the leader who was one day to drown him in the Red Sea. I admit it is beautiful, if that is what you want. It is too smooth, too refined, too idyllic for me."

"Well!", I said, "the story is an Idyll, you know. Pharaoh's daughter was a gracious Princess, not a bloodthirsty tyrant, and Moses at four months had not grown to be the Prophet of Israel. The Plagues of Egypt had not yet begun. And we may imagine an Idyll if we please by way of contrast."

"Imagination is the foe of truth," said he.

Sir Visto then led us up to the President's *Cup of Tantalus*, which he called on us to admire. "Poynter," he said, "is always graceful, learned, correct, classical—— "

"Conventional—— " interrupted Van Dyke.

"See how thoughtfully every detail is studied," said Visto, not noticing his young friend, "the drawing firm, true, natural; the composition subtle; the whole atmosphere one of harmony and charm?"

"Why does the child in the transparent shift stretch up on her toes when it is plain she can't reach the other's hand by twelve inches at least? And why doesn't the long girl, in the dark robe with a palm-branch fan, step down to the fountain herself?" grumbled Van Dyke.

"My dear boy," said I, "you might as well ask why did Keats see charm in a 'Grecian urn,' you don't forget how it ends, do you?—

> Beauty is truth, truth beauty, that is all
> Ye know on earth, and all ye need to know."

"I can see neither beauty nor truth," said the painter, "in these Hebes, Ariadnes, Nymphs, Sapphos, Pindars, and other machine-made Hellenisms which the Academy seems to encourage. They are crude 'academies,' as the French say, and the local colour and staging is cheap enough."

"Good work too often leads to poor imitation," I suggested, "as we saw with Raphael himself; but weak copies do not spoil the value of a true master's work."

"This is what the 'Ideal' lands us in," said the painter, with a chuckle, as he pointed to Frank Dicksee's picture in Room I. "Is there anything ideal in those ten fingers stuck out like a *Lycidas* No. 2, reaching after a sort of ballet-girl seen through a gauze screen?"

"Ten fingers poked in the air seem all the rage this year," said Visto, "but at any rate this fellow's thighs are not quite such starved sticks as those in the wax-work in Regent Street."

"Come, now, let us look at the portraits," said I, "we shall not be troubled about ideals there."

"I don't know that," said Van Dyke; "some of these smart women look as if their portraits had been commissioned not by

BRITISH LIBRARY

their husbands, but by their dressmakers as trade advertisements to puff their 'creations.'"

"There is a portrait, indeed," cried Sir Visto with enthusiasm, taking us to Sargent's *Signior Garcia*, "power, truth, character, in every line. That is a portrait which Velasquez might have owned."

"Agreed, agreed, we shan't quarrel over that," said Van Dyke; "Sargent is the one man to-day who dominates both Academy and New Gallery at once, the man who unites mastery of his brush to originality of conception—for sheer skill of hand he is matchless and unerring."

"A really great painter," said Visto, "when he chooses, and does not play tricks, or is not poking fun at his sitters."

"When does he not choose?", asked the painter.

"When he dashes off a satin gown in an hour, and flings in a lace furbelow with three dabs of his brush."

"And if he does," retorted the painter, "who could do it as well in a week's work? Besides, the gown and the furbelow have to be looked at at least fifty feet away."

"That is scene-painting, not portraiture," said Visto; "I quite agree that he has a marvellous gift of *technique*, but why does he dab his shadows in with vermilion, and why are his women rouged on the lips? Hung on a gallery wall twenty yards off, the effect is brilliant, but I call it a trick, when you look close into the handling."

"You don't mean to say that he makes game of his own sitter?", I asked quite simply.

"Well!", said Visto, "you remember the old dealer with the thick red lips and the dog putting out his tongue to mimic his master. And see how he bedizens his other multi-millionaire sitters as if he said with his tongue in his cheek—what figures of fun they are! But just come across to the grand Blenheim group."

"Surely," I said, "that is a superb piece for a great historic palace. It reminds me of the Vandykes at Genoa. What a grandiose group! The mighty Marlbrook, with the conquered banners of lilies and his descendants to the tenth generation. What life in the two boys, in the spaniels, what *bravura* in the whole composition!"

"Oh! *bravura* indeed," said Van Dyke, "perhaps a trifle over-done, rather too pompously majestic."

"Why do you say making game of his sitters?", I asked simply.

"Well," said Sir Visto, "you see that, by the artifice of placing the Duchess on the step and the Duke below it, the impression is

Qatar National Library

produced that she is about ten inches taller than her husband. I have not the honour of their acquaintance, but I doubt if the difference is as much as that. The Duke seems rather embarrassed by the weight of his robes, and the beautiful head of her Grace is stuck upon an elongated neck which reminds one of the new saurian, *Diplodocus Carnegii*."

"Yes!", said Van Dyke, "he has the defects of his qualities. He can't resist a sensation; and the millionaires with their big prices are leading him to scamp it. But when he tries his best, as in his *Mrs. Raphael*, he is as serious as Rembrandt himself."

"It's a fatal snare to a painter to become the rage in the smart world," said I, "especially when the smart world is vulgar and tasteless. Even Vandyke and Reynolds had too many sitters, though their sitters had beauty, manners, and refinement."

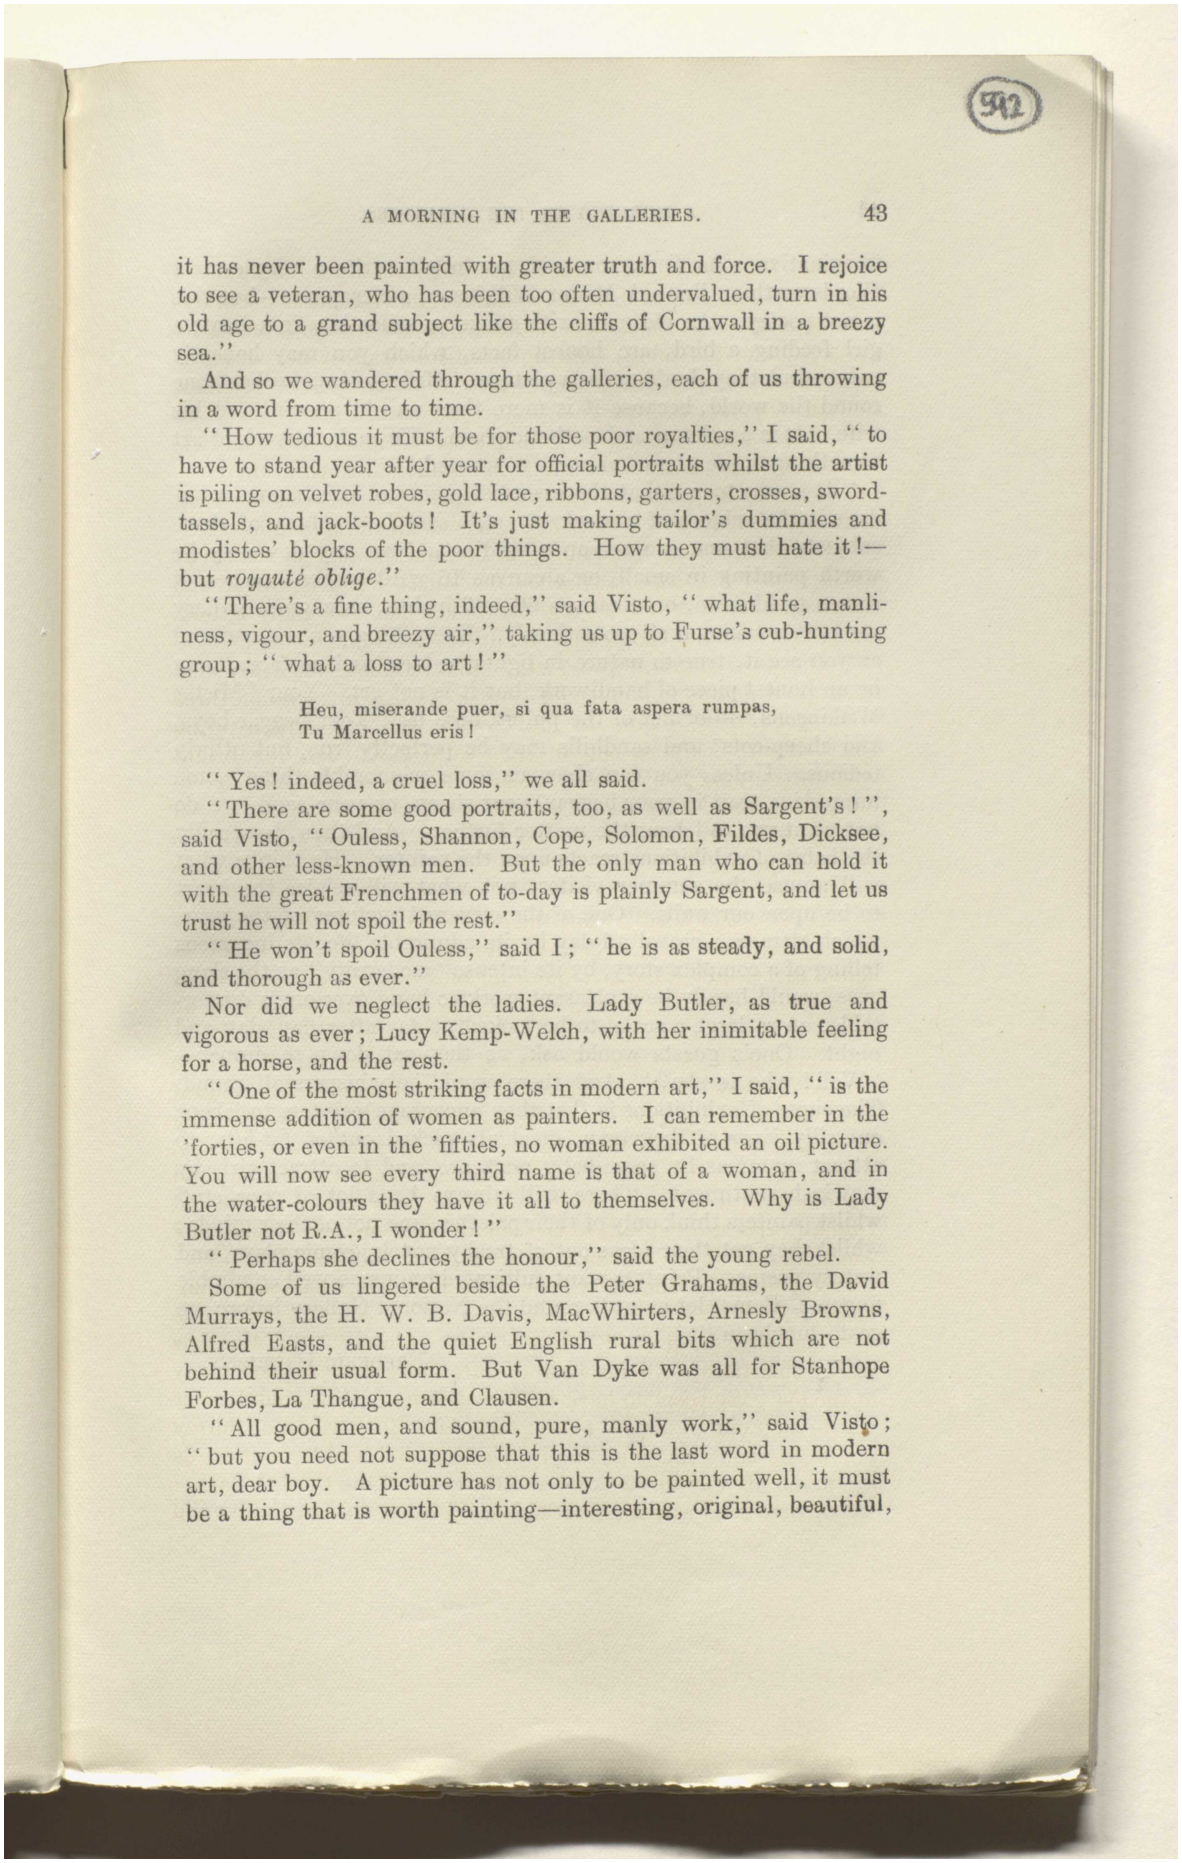
"The worst of it is," said Visto, "that Sargent, like every man of original genius and splendid success, is teaching two or three other good men to imitate his *bravura* and his scene-painting legerdemain. Sargent can make a satin gown dazzling bright with fifteen sweeps of a thick brush. But when other men try to do it, they seem to be using a mop or a broom."

"He is the greatest master of portrait we have had since Millais stormed the town," said Van Dyke, "and has an even subtler eye for character."

"Yes!", said Visto, "but the genius he has for characteristic points is so keen that it betrays him now and then to make an actual caricature—I daresay quite unconsciously. He sees a trait in a sitter's face or figure, and in his eagerness to catch it he makes it almost ridiculous."

"Come and look at the *Burghers of Landsberg*," said I; "there is a solid piece of work indeed. Look at it across the Central Hall, and you might fancy at a first glance the R.A.'s were sitting in council. One feels that there are the very Bavarian citizens, simple, serious, thoughtful men of business—full of character, and composed with skill and truth. It is no bad revival of the old Dutch Corporation groups to be seen at Haarlem, the Hague, and Amsterdam. It is a real success in a difficult subject."

"Not much of the ideal, not quite high art," said the Connoisseur.



"The ideal be d——d," laughed the painter; "the Von has scored this time. All his portraits are first-rate. A good many of the old gang seem to have been waked up. Why, old Leader has broken out in a new place; and, after fifty years of Surrey pinewoods and commons, silvery Thames, and such serenities, he has found his way to the coast and the crags of the Cornish bays."

"A very good way it is," I added, "I know the cove well; and

it has never been painted with greater truth and force. I rejoice to see a veteran, who has been too often undervalued, turn in his old age to a grand subject like the cliffs of Cornwall in a breezy sea."

And so we wandered through the galleries, each of us throwing in a word from time to time.

"How tedious it must be for those poor royalties," I said, "to have to stand year after year for official portraits whilst the artist is piling on velvet robes, gold lace, ribbons, garters, crosses, sword-tassels, and jack-boots! It's just making tailor's dummies and modistes' blocks of the poor things. How they must hate it!—but *royauté oblige*."

"There's a fine thing, indeed," said Visto, "what life, manliness, vigour, and breezy air," taking us up to Furse's cub-hunting group; "what a loss to art!"

> Heu, miserande puer, si qua fata aspera rumpas,
> Tu Marcellus eris!

"Yes! indeed, a cruel loss," we all said.

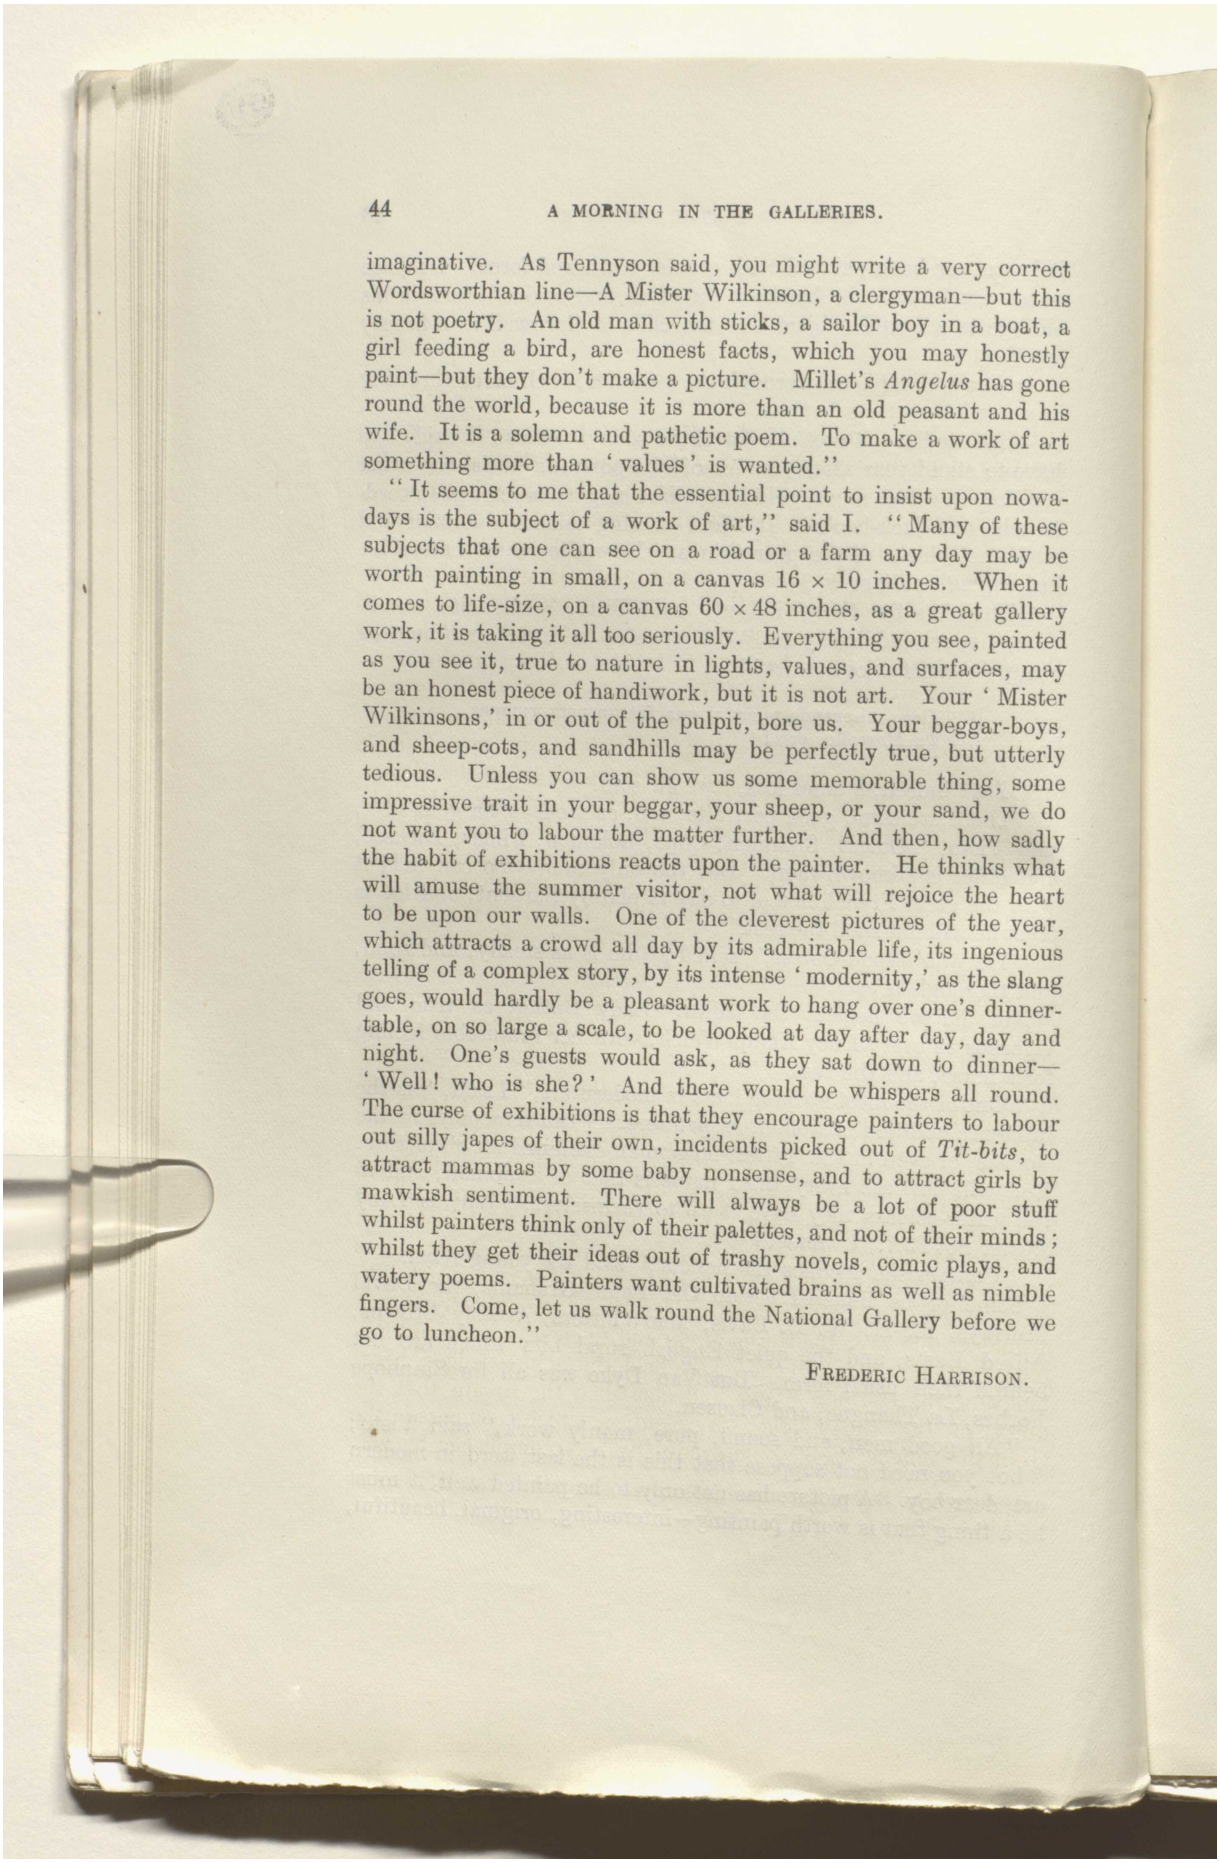
"There are some good portraits, too, as well as Sargent's!", said Visto, "Ouless, Shannon, Cope, Solomon, Fildes, Dicksee, and other less-known men. But the only man who can hold it with the great Frenchmen of to-day is plainly Sargent, and let us trust he will not spoil the rest."

"He won't spoil Ouless," said I; "he is as steady, and solid, and thorough as ever."

Nor did we neglect the ladies. Lady Butler, as true and vigorous as ever; Lucy Kemp-Welch, with her inimitable feeling for a horse, and the rest.

"One of the most striking facts in modern art," I said, "is the immense addition of women as painters. I can remember in the 'forties, or even in the 'fifties, no woman exhibited an oil picture. You will now see every third name is that of a woman, and in the water-colours they have it all to themselves. Why is Lady Butler not R.A., I wonder!"

"Perhaps she declines the honour," said the young rebel.



Some of us lingered beside the Peter Grahams, the David Murrays, the H. W. B. Davis, MacWhirters, Arnesly Browns, Alfred Easts, and the quiet English rural bits which are not behind their usual form. But Van Dyke was all for Stanhope Forbes, La Thangue, and Clausen.

"All good men, and sound, pure, manly work," said Visto; "but you need not suppose that this is the last word in modern art, dear boy. A picture has not only to be painted well, it must be a thing that is worth painting—interesting, original, beautiful,

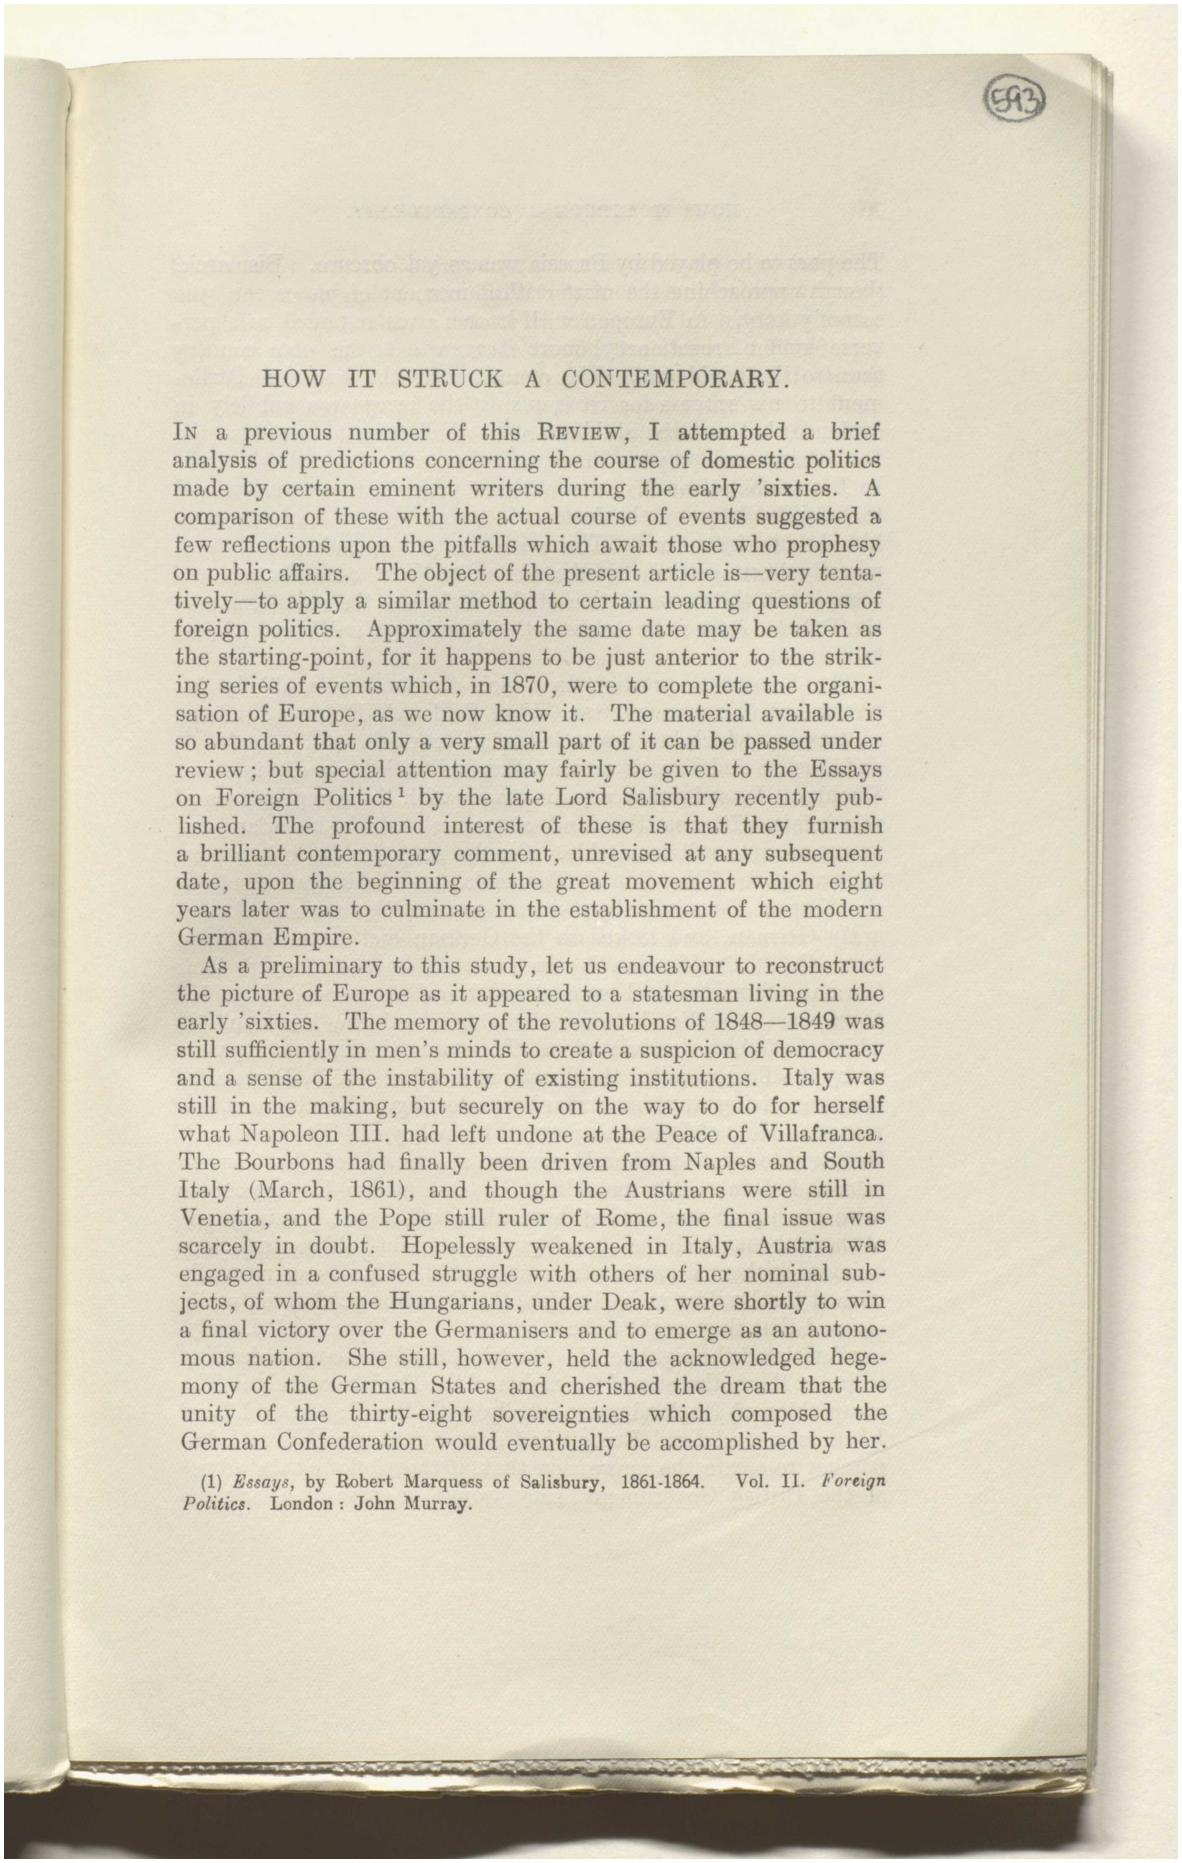
imaginative. As Tennyson said, you might write a very correct Wordsworthian line—A Mister Wilkinson, a clergyman—but this is not poetry. An old man with sticks, a sailor boy in a boat, a girl feeding a bird, are honest facts, which you may honestly paint—but they don't make a picture. Millet's *Angelus* has gone round the world, because it is more than an old peasant and his wife. It is a solemn and pathetic poem. To make a work of art something more than 'values' is wanted."



"It seems to me that the essential point to insist upon nowadays is the subject of a work of art," said I. "Many of these subjects that one can see on a road or a farm any day may be worth painting in small, on a canvas 16 × 10 inches. When it comes to life-size, on a canvas 60 × 48 inches, as a great gallery work, it is taking it all too seriously. Everything you see, painted as you see it, true to nature in lights, values, and surfaces, may be an honest piece of handiwork, but it is not art. Your 'Mister Wilkinsons,' in or out of the pulpit, bore us. Your beggar-boys, and sheep-cots, and sandhills may be perfectly true, but utterly tedious. Unless you can show us some memorable thing, some impressive trait in your beggar, your sheep, or your sand, we do not want you to labour the matter further. And then, how sadly the habit of exhibitions reacts upon the painter. He thinks what will amuse the summer visitor, not what will rejoice the heart to be upon our walls. One of the cleverest pictures of the year, which attracts a crowd all day by its admirable life, its ingenious telling of a complex story, by its intense 'modernity,' as the slang goes, would hardly be a pleasant work to hang over one's dinner-table, on so large a scale, to be looked at day after day, day and night. One's guests would ask, as they sat down to dinner—'Well! who is she?' And there would be whispers all round. The curse of exhibitions is that they encourage painters to labour out silly japes of their own, incidents picked out of *Tit-bits*, to attract mammas by some baby nonsense, and to attract girls by mawkish sentiment. There will always be a lot of poor stuff whilst painters think only of their palettes, and not of their minds; whilst they get their ideas out of trashy novels, comic plays, and watery poems. Painters want cultivated brains as well as nimble fingers. Come, let us walk round the National Gallery before we go to luncheon."

FREDERIC HARRISON.

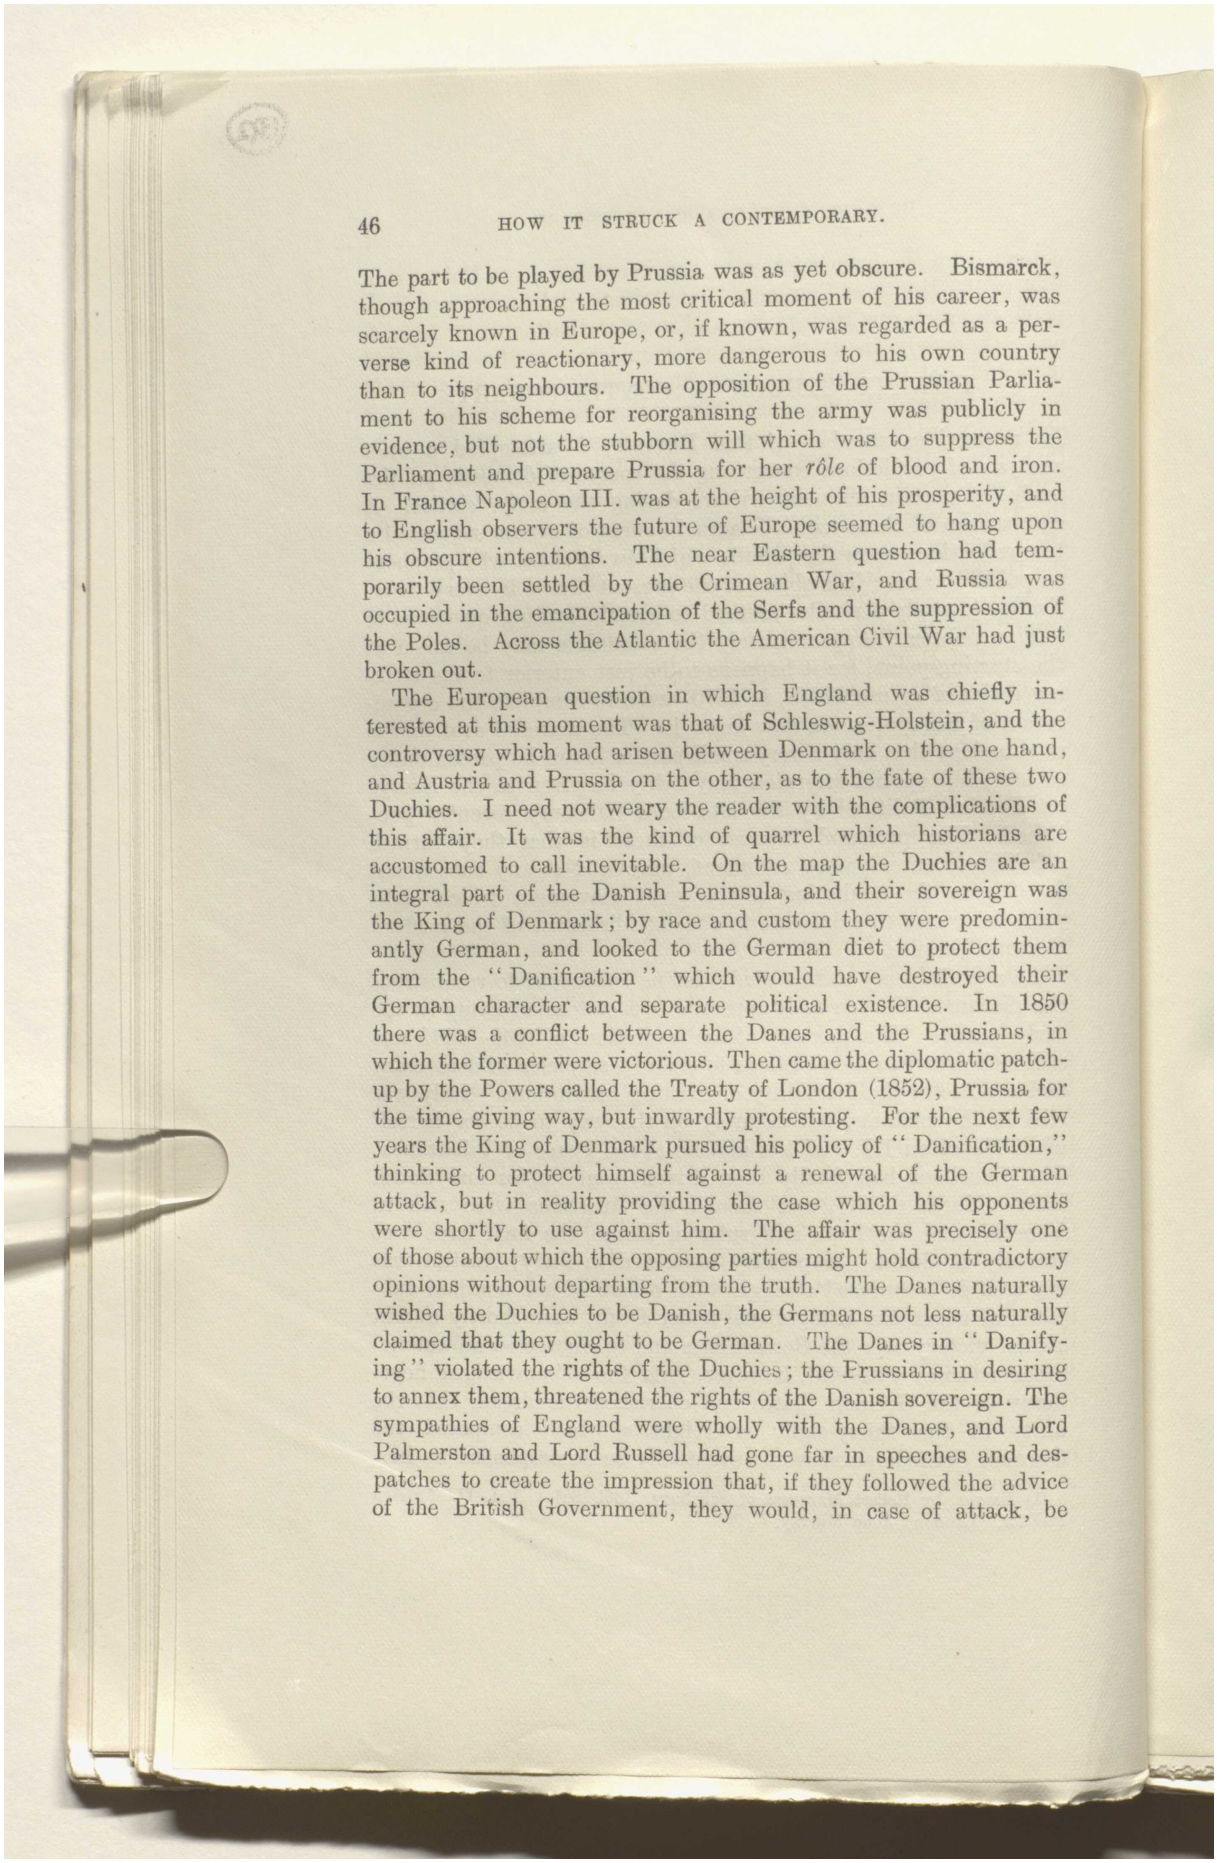
HOW IT STRUCK A CONTEMPORARY.

In a previous number of this Review, I attempted a brief analysis of predictions concerning the course of domestic politics made by certain eminent writers during the early 'sixties. A comparison of these with the actual course of events suggested a few reflections upon the pitfalls which await those who prophesy on public affairs. The object of the present article is—very tentatively—to apply a similar method to certain leading questions of foreign politics. Approximately the same date may be taken as the starting-point, for it happens to be just anterior to the striking series of events which, in 1870, were to complete the organisation of Europe, as we now know it. The material available is so abundant that only a very small part of it can be passed under review; but special attention may fairly be given to the Essays on Foreign Politics[1] by the late Lord Salisbury recently published. The profound interest of these is that they furnish a brilliant contemporary comment, unrevised at any subsequent date, upon the beginning of the great movement which eight years later was to culminate in the establishment of the modern German Empire.



As a preliminary to this study, let us endeavour to reconstruct the picture of Europe as it appeared to a statesman living in the early 'sixties. The memory of the revolutions of 1848—1849 was still sufficiently in men's minds to create a suspicion of democracy and a sense of the instability of existing institutions. Italy was still in the making, but securely on the way to do for herself what Napoleon III. had left undone at the Peace of Villafranca. The Bourbons had finally been driven from Naples and South Italy (March, 1861), and though the Austrians were still in Venetia, and the Pope still ruler of Rome, the final issue was scarcely in doubt. Hopelessly weakened in Italy, Austria was engaged in a confused struggle with others of her nominal subjects, of whom the Hungarians, under Deak, were shortly to win a final victory over the Germanisers and to emerge as an autonomous nation. She still, however, held the acknowledged hegemony of the German States and cherished the dream that the unity of the thirty-eight sovereignties which composed the German Confederation would eventually be accomplished by her.

The part to be played by Prussia was as yet obscure. Bismarck, though approaching the most critical moment of his career, was scarcely known in Europe, or, if known, was regarded as a perverse kind of reactionary, more dangerous to his own country than to its neighbours. The opposition of the Prussian Parliament to his scheme for reorganising the army was publicly in evidence, but not the stubborn will which was to suppress the Parliament and prepare Prussia for her *rôle* of blood and iron. In France Napoleon III. was at the height of his prosperity, and to English observers the future of Europe seemed to hang upon his obscure intentions. The near Eastern question had temporarily been settled by the Crimean War, and Russia was occupied in the emancipation of the Serfs and the suppression of the Poles. Across the Atlantic the American Civil War had just broken out.

The European question in which England was chiefly interested at this moment was that of Schleswig-Holstein, and the controversy which had arisen between Denmark on the one hand, and Austria and Prussia on the other, as to the fate of these two Duchies. I need not weary the reader with the complications of this affair. It was the kind of quarrel which historians are accustomed to call inevitable. On the map the Duchies are an integral part of the Danish Peninsula, and their sovereign was the King of Denmark; by race and custom they were predominantly German, and looked to the German diet to protect them from the "Danification" which would have destroyed their German character and separate political existence. In 1850 there was a conflict between the Danes and the Prussians, in which the former were victorious. Then came the diplomatic patch-up by the Powers called the Treaty of London (1852), Prussia for the time giving way, but inwardly protesting. For the next few years the King of Denmark pursued his policy of "Danification," thinking to protect himself against a renewal of the German attack, but in reality providing the case which his opponents were shortly to use against him. The affair was precisely one of those about which the opposing parties might hold contradictory opinions without departing from the truth. The Danes naturally wished the Duchies to be Danish, the Germans not less naturally claimed that they ought to be German. The Danes in "Danifying" violated the rights of the Duchies; the Prussians in desiring to annex them, threatened the rights of the Danish sovereign. The sympathies of England were wholly with the Danes, and Lord Palmerston and Lord Russell had gone far in speeches and despatches to create the impression that, if they followed the advice of the British Government, they would, in case of attack, be

BRITISH LIBRARY

defended by the armed forces of this country. Lord Palmerston said in the House of Commons that "if any violent attempt were made to overthrow their rights and interfere with their independence, those who made the attempt would find in the result that it would not be with Denmark alone with which they would have to contend." Only one interpretation could fairly be placed on those words, but, nevertheless, when Austria and Prussia made their joint attack in 1864, it was with Denmark alone that the issue was fought out, and except in one unimportant sea-fight, the Danes were utterly worsted. England was now out of the affair, and in a peace concluded at Berlin, the Danes surrendered the Duchies into the hands of the allies. The cession of Holstein to Austria provided—and was no doubt intended to provide—the ground for the quarrel between Prussia and Austria, which was the next of Bismarck's remorseless designs.

The second volume of Lord Salisbury's *Essays* is mainly occupied with this question. It is the chief theme of two of the essays, the third deals with the cognate question of Poland, which had exercised Europe during the previous year, and in which also Great Britain had played the part of ineffective remonstrant. Lord Salisbury's argument takes the form of a controversial dilemma, and is driven home with unsparing logic. Either Lord Palmerston and Lord Russell should not have used the language of menace to Prussia and Austria, or they should have made good their words when Prussia and Austria defied them. Either they should not have led Denmark to expect assistance, or they should have stood by her when she was attacked. Whether Lord Salisbury himself was in favour of armed intervention, has been debated since these Essays appeared, but the natural inference from the closing passage of the Essay entitled *The Danish Duchies* is certainly that he was.[1] That, however, is immaterial for present purposes. His argument, as it stands, is unanswerable. There is no defence for the diplomacy which threatens without counting the cost, and though his invective is fiercer than the manner of these times, and could hardly have been agreeable reading to those of his contemporaries who cherished illusions about their country, yet its effect is salutary, and it clears the ground for a new departure in British policy. From henceforth Great Britain was not to interfere in the politics of Western Europe, but to devote her whole energy to sea-power, and to expansion over-sea.

For the purposes of current controversy, nothing could have been more effective than Lord Salisbury's line of argument. Yet, in looking back on it, we are struck with the limitations in the

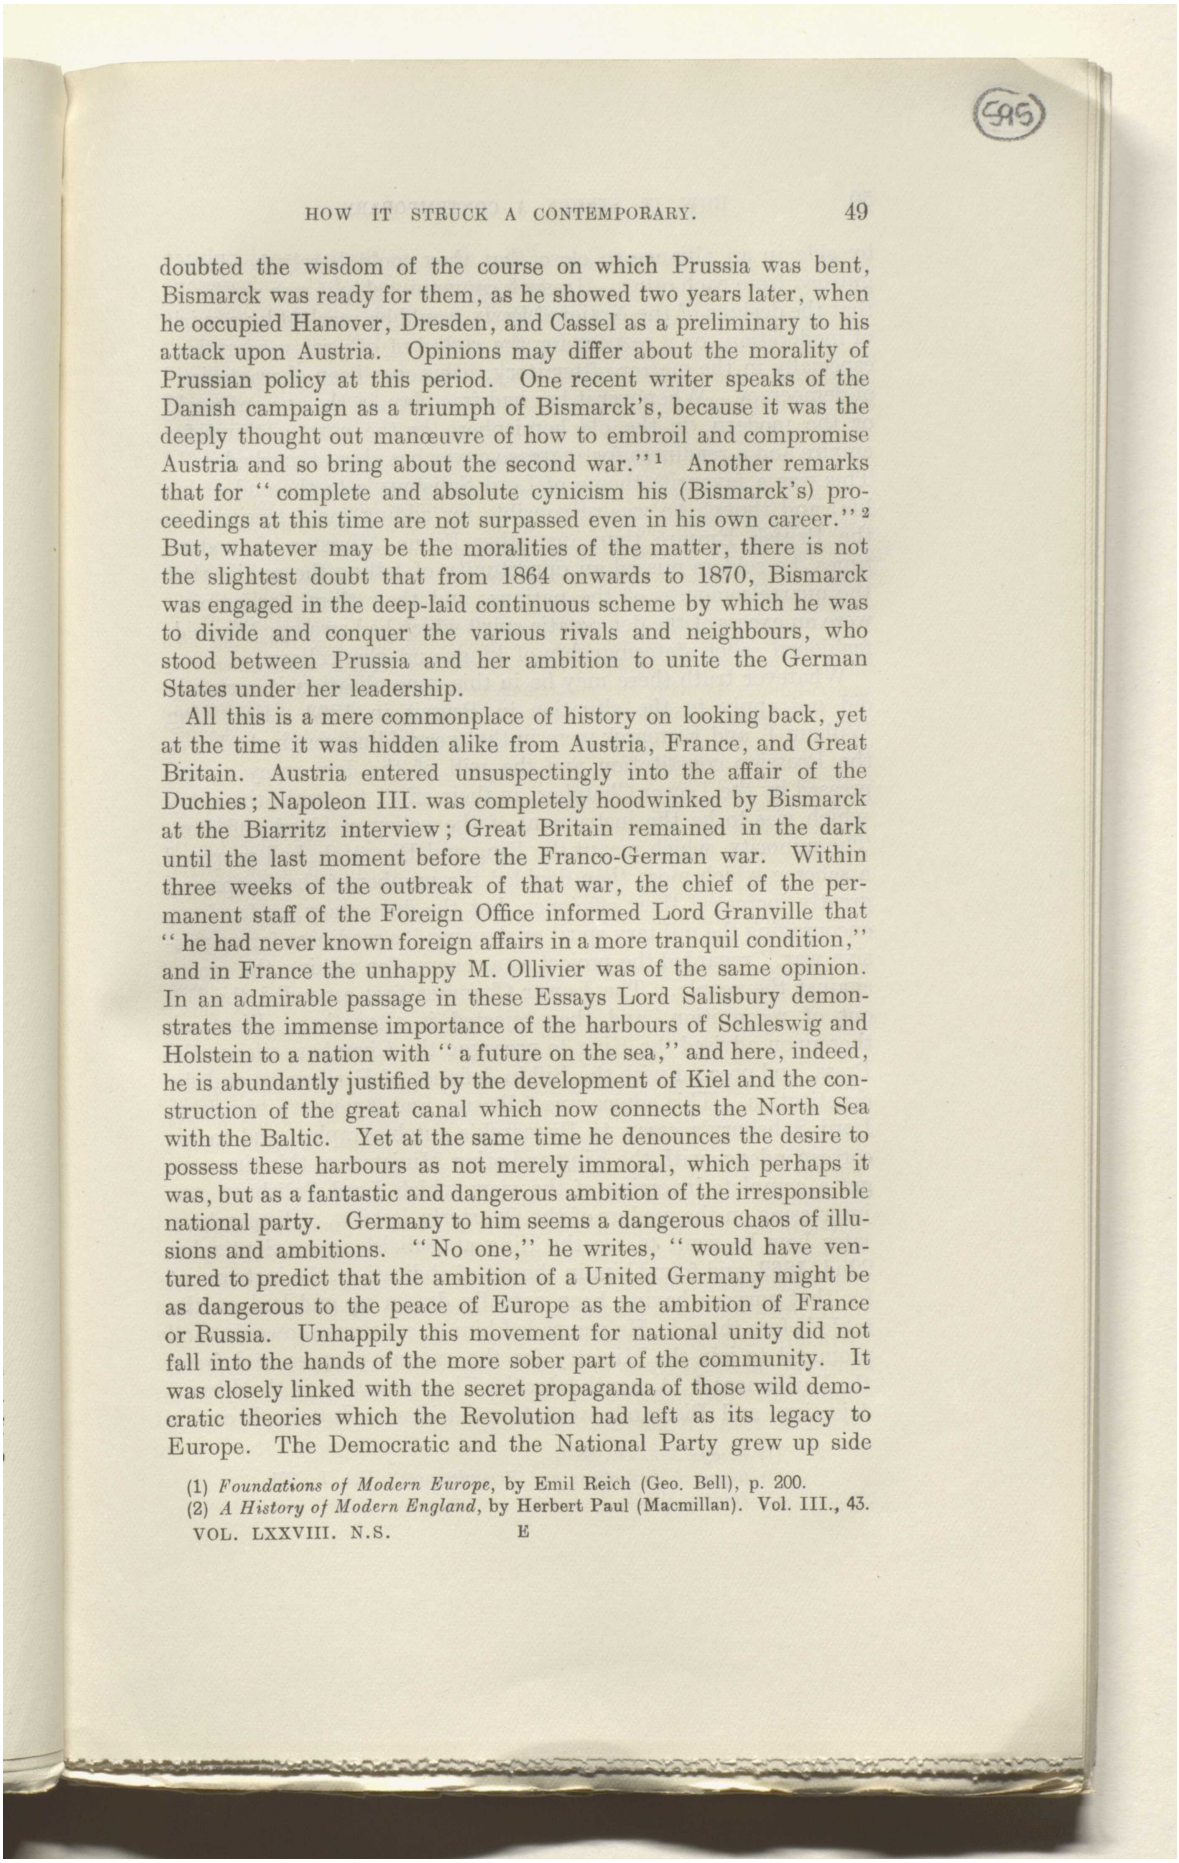
BRITISH LIBRARY

point of view. The relation of the affair to the national politics of Germany, and the seeds which it contained of the subsequent quarrel between Austria and Prussia, escaped Lord Salisbury, as indeed, it escaped Lord Palmerston and Lord Russell. We look in vain for the name of Bismarck either in these Essays or in any contemporary English comment. To Lord Salisbury the attitude of the Germans is a piece of the "German madness" and he warns them accordingly :—

> There is so far method in the German madness that the excitement is wildest in some of the smaller States, which are tolerably safe from punishment. Their wisdom in trying to precipitate a conflict in which, individually, they can hardly lose, and may possibly gain, may perhaps be justified by the event. Saxony, for instance, will probably in any case reverse the fate of Francis I., and escape with everything except her honour. But it is not easy to understand how any reflecting men in the larger States can blind themselves to the danger upon which they are rushing. Germany has no friend on any frontier. All around her are lying enemies covetous of some possession that belongs to a German crown, and only waiting for an opportune moment to attack. The first sign that the lengthy Danish controversy was drawing towards actual war has brought out a proclamation from Garibaldi to the Italians, and from Kossuth to the Hungarians. Russia is probably in no mood to forgive Austria the base of operations which the Poles have found upon the Galician frontier; and the Servians will have little affection for the staunch upholders of the Ottoman Empire. The hardihood of an Austrian statesman, who is eager to bring on war upon the Eyder, has something in it of antique grandeur.
>
> * * * * * * *
>
> But Austria will not be the only sufferer. On the left bank of the Rhine lie provinces of Bavaria and of Prussia, which for half a century have been at once a temptation and a reproach to France. They offer a prize to ambition, and at the same time they suggest memories of humiliation and hopes of revenge. The sovereign who should reunite them to the French Empire would build his dynasty upon a foundation which neither Liberal nor Legitimist could shake. They are already half French in laws, and more than half French in sympathy. They would be easy for the French to conquer; and the barrier of the Rhine would make it difficult for the Germans to regain them.[1]



Germany in this connection must be read as including Austria, and, so far as she was concerned, there was reason in the warning. Austria, indeed, was to pay heavily for her part in this enterprise, but in a manner quite unforeseen by the author of this article. But, as regards Prussia, advice and warning were wholly superfluous. Never was a policy undertaken with such precise appreciation of its consequences, or with a more dogged determination to make it serve an ulterior purpose as yet unavowed. If there were any "reflecting men in the larger States" who

doubted the wisdom of the course on which Prussia was bent, Bismarck was ready for them, as he showed two years later, when he occupied Hanover, Dresden, and Cassel as a preliminary to his attack upon Austria. Opinions may differ about the morality of Prussian policy at this period. One recent writer speaks of the Danish campaign as a triumph of Bismarck's, because it was the deeply thought out manœuvre of how to embroil and compromise Austria and so bring about the second war."[1] Another remarks that for "complete and absolute cynicism his (Bismarck's) proceedings at this time are not surpassed even in his own career."[2] But, whatever may be the moralities of the matter, there is not the slightest doubt that from 1864 onwards to 1870, Bismarck was engaged in the deep-laid continuous scheme by which he was to divide and conquer the various rivals and neighbours, who stood between Prussia and her ambition to unite the German States under her leadership.

All this is a mere commonplace of history on looking back, yet at the time it was hidden alike from Austria, France, and Great Britain. Austria entered unsuspectingly into the affair of the Duchies; Napoleon III. was completely hoodwinked by Bismarck at the Biarritz interview; Great Britain remained in the dark until the last moment before the Franco-German war. Within three weeks of the outbreak of that war, the chief of the permanent staff of the Foreign Office informed Lord Granville that "he had never known foreign affairs in a more tranquil condition," and in France the unhappy M. Ollivier was of the same opinion. In an admirable passage in these Essays Lord Salisbury demonstrates the immense importance of the harbours of Schleswig and Holstein to a nation with "a future on the sea," and here, indeed, he is abundantly justified by the development of Kiel and the construction of the great canal which now connects the North Sea with the Baltic. Yet at the same time he denounces the desire to possess these harbours as not merely immoral, which perhaps it was, but as a fantastic and dangerous ambition of the irresponsible national party. Germany to him seems a dangerous chaos of illusions and ambitions. "No one," he writes, "would have ventured to predict that the ambition of a United Germany might be as dangerous to the peace of Europe as the ambition of France or Russia. Unhappily this movement for national unity did not fall into the hands of the more sober part of the community. It was closely linked with the secret propaganda of those wild democratic theories which the Revolution had left as its legacy to Europe. The Democratic and the National Party grew up side

BRITISH LIBRARY

by side in an alliance so close that they could barely be distinguished from each other. In such companionship it was not likely that the designs of the National Party would be marked by a spirit of moderation, or a respect for the rights of others; moderation, especially in the matter of territory, has never been characteristic of democracy. Whenever it has had free play, in the ancient world or the modern, in the old hemisphere or the new, a thirst for empire and a readiness for aggressive war has always marked it."[1] This was a favourite theme of Lord Salisbury's to the end of his life, and though he was responsible for adding more territory to the British Empire than any other Prime Minister of modern times, he seldom missed an opportunity of telling the public that the quarrelsomeness of the nations, and their thirst for empire, were an excess of the democratic spirit which had swamped the old-fashioned sober statesmanship of kings and chancellors.

Whatever truth there may be in this generalisation it certainly did not apply to the situation in Prussia in 1863. For King William I. and Bismarck were in that year riding rough-shod over the Prussian constitution and the will of the democracy as expressed by the Lower Chamber, in their effort to create the army which was to be the instrument of the policy of blood and iron. The minority, which meant the King and Bismarck, had proposed a scheme which more than doubled the number of the troops and greatly increased their efficiency, but the democracy, so far from encouraging the military spirit or showing "a readiness for aggressive war," regarded the project as a scheme for arming the crown against the people. The Lower Chamber first amended the Bill out of recognition, and then rejected it altogether. Bismarck thereupon advised the King to prorogue the Chamber, silence the Press, and proceed with the Bill in defiance of Parliament and the constitution. This advice was followed, and if now we turn from Lord Salisbury's essay to Bismarck's autobiography, and to his correspondence with the King and other Ministers at this time, we get a complete inversion of the view which Lord Salisbury was impressing on the readers of the *Quarterly Review*. Bismarck relates how he went to see the King at Babelsberg on September 22nd, 1862, and found him in the act of abdicating, the instrument for that purpose having been actually drawn up and laid on the table before them.[2] He persuaded him to continue, however, and promised to join the Ministry for the express purpose of defying the Parliament.[3] A month later the King was again in the deepest dejection, and Bismarck went to meet him at Juterbogk on his

BRITISH LIBRARY

return from Baden-Baden, and they talked in the railway carriage on the way to Berlin. "I can perfectly well see where all this will end," said the King; "over there in front of the Opera House, under my windows they will cut off your head, and mine a little while afterwards." "*Et après*, Sire," answered Bismarck. "*Après?* indeed we shall be dead," replied the King. "Yes," continued Bismarck, "we shall be dead; but we must all die sooner or later, and can we perish more honourably?" Bismarck goes on to tell us how the King recovered himself as the talk proceeded, and "assumed the part of an officer fighting for kingdom and fatherland," an officer "who has orders to hold a certain position to the death, no matter whether he perishes in the task or not." And thus, when they arrived at Berlin he received the ministers and officials who awaited him with a "joyous and combative" disposition.[1] In the correspondence we have the frankest avowal of the aims of these autocratic personages. "Therefore, my noble bear-hunter," writes von Roon, in January, 1869, "be coolly calm and keep the aim—preservation from democratic anarchy—in view; away with fretful agitation!"[2] The Crown Prince vehemently took the other view and got himself into a sad scrape in consequence. "I will tell you," he writes to Bismarck on June 30th, 1863, "what results of your policy I foresee: You will tamper with the constitution until it loses its value in the people's eyes, and in this way you will incite anarchist endeavours which go beyond the constitution. You will also be driven, whether you wish it or not, from one venturesome interpretation to another, until finally the naked, undisguised breach of the constitution is recommended."[3] The Prince accurately reflected the views of German Liberals and Democrats, who regarded the military movement as hostile to German unity, and many of whom actively opposed the invasion of the Duchies in the belief that Bismarck's intention was to expel Prince Frederick of Augustenburg, and to hand back Schleswig to Christian IX. of Denmark.

There could scarcely be a more instructive study of opinion than is furnished by a comparison of Lord Salisbury's Essays with the Bismarck letters and reminiscences of this period. The first give us the contemporary European view; the second show the real design and intention as it was actually carried out. To Lord Salisbury German politics seemed hopelessly chaotic. "It is, of course, not possible," he writes, in 1863, "to forecast the political form into which the seething mass of German populations will ultimately crystallise. But one of two alternatives may safely be

predicted of the destiny of Germany as a European Power. Either the present subdivision which neutralises her natural resources will cease and she will become one of the most powerful Empires in the world; or else—a far likelier issue—the present enthusiasm will exhaust the energies of a people so unpractical, without leading to any definite result, and Germany will fall back into her old condition, more divided, more stagnant, more impotent than before, and more helplessly the slave of Russia."[1] "I had indicated plainly enough the direction in which I was going," says Bismarck of his action in 1862. "Prussia—such was the point of my speech (to the Budget Commission on September 30th, 1862)—as a glance at the map will show, could no longer wear unaided on its long, narrow figure the panoply which Germany required for its security; that must be equally distributed over all German peoples. We should get no nearer the goal by speeches, associations, decisions of majorities; we should be unable to avoid a serious contest, a contest which could only be settled by blood and iron. In order to secure our success in this, the deputies must place the greatest possible weight of blood and iron in the hands of the King of Prussia, in order that, according to his judgment, he might throw it into one scale or the other."[2] And in another passage he speaks of the King being "helped across the bridge of the Danish question to the point of view of 1866, *i.e.*, from speaking to doing, from phrase to action." The "far likelier issue," as Lord Salisbury calls it, "that Germany would fall back into her old condition," had at that very moment become the least probable, and the "seething mass of German populations" were from henceforth in the grip of the most masterful statesman of the nineteenth century. And the wars which followed, so far from being the random outbreaks of democratic passion, were each in turn engineered by one man, who with consummate skill and foresight imposed his master-plan upon King and people. "The zeal for German nationality," writes Lord Salisbury, "if it appears to us hot, is at least invariably safe. Once convince them that the raid on Denmark is not safe, and the excitement will subside with a marvellous rapidity. . . . Let Germany see distinctly that war with Denmark means war with England, and the Governments that are now weakly yielding will draw courage to free their subjects from the imminence of a greater danger." That, it must be said, with all respect, is a disastrous passage. We are uncomfortably struck in reading the Bismarck letters to find how little weight was attached at Berlin to the threat from England. There is a curious letter from Bismarck to the King,

dated December 11th, 1863—eleven days before Holstein was occupied by German troops—in which he "begs most respectfully that your Majesty will be gracious enough to receive Lord Wodehouse" (on his way from Copenhagen, where he had been sent to offer good advice to King Christian), "so as not at once to deprive him of the hopes set by England on the result of the Copenhagen negotiations."[1] Prussia, in other words, had made up her mind to act, whatever England might say or do, though it was more convenient not to disclose her intention until the allied troops were actually in possession of the Duchies. It must by this time have been as clear to Bismarck, as it was a fortnight later to our own Government, that England could not act single-handed, nor obtain the assistance either of Russia or France, except on terms which it was impossible for her to accept. The Prussian Minister never missed a point in the European game, and he was well aware of the estrangement which had arisen between England and France from the coolness of Lord Palmerston towards the Emperor's grandiose project of a European Congress and from the fiasco of the joint remonstrance of the two Powers against the Russian treatment of Poland. This extraordinary man at all times in his career knew twice as much about the affairs of his neighbours as any of them knew about the designs of Germany, and it must have been plain to him at this moment that England never was in a worse position to gain European assistance.

Lord Salisbury was wrong in yet another respect. It did not dispose of the question of the Duchies to speak of it as a German "raid on Denmark." Though Prussia had tied herself in a knot by her adhesion to the Treaty of London—that "terrible treaty," as the Prussian King kept calling it—which guaranteed the succession of Christian IX. and his suzerainty over the Duchies, the German Confederation which forced the question was not bound by that treaty, and the Federal Diet had always protested against the Danish constitution of 1855 (which incorporated the Duchies with Denmark) as an infraction of its rights. More than this, Holstein had always been a part of Germany, and the inhabitants, even of Schleswig, were to a large extent German-speaking. These circumstances may, or may not, have justified Prussia in picking holes in the Treaty of London, but they explain the excitement in Germany and the strong exception taken by Germans to the "Danification" of the Duchies. It was a mistake to interpret these feelings as the aimless excitement of a democracy bent on aggression which could be checked by plain speaking on the part of the British Government. At the same time, a contemporary observer had every excuse for misreading the signs of the times in the early

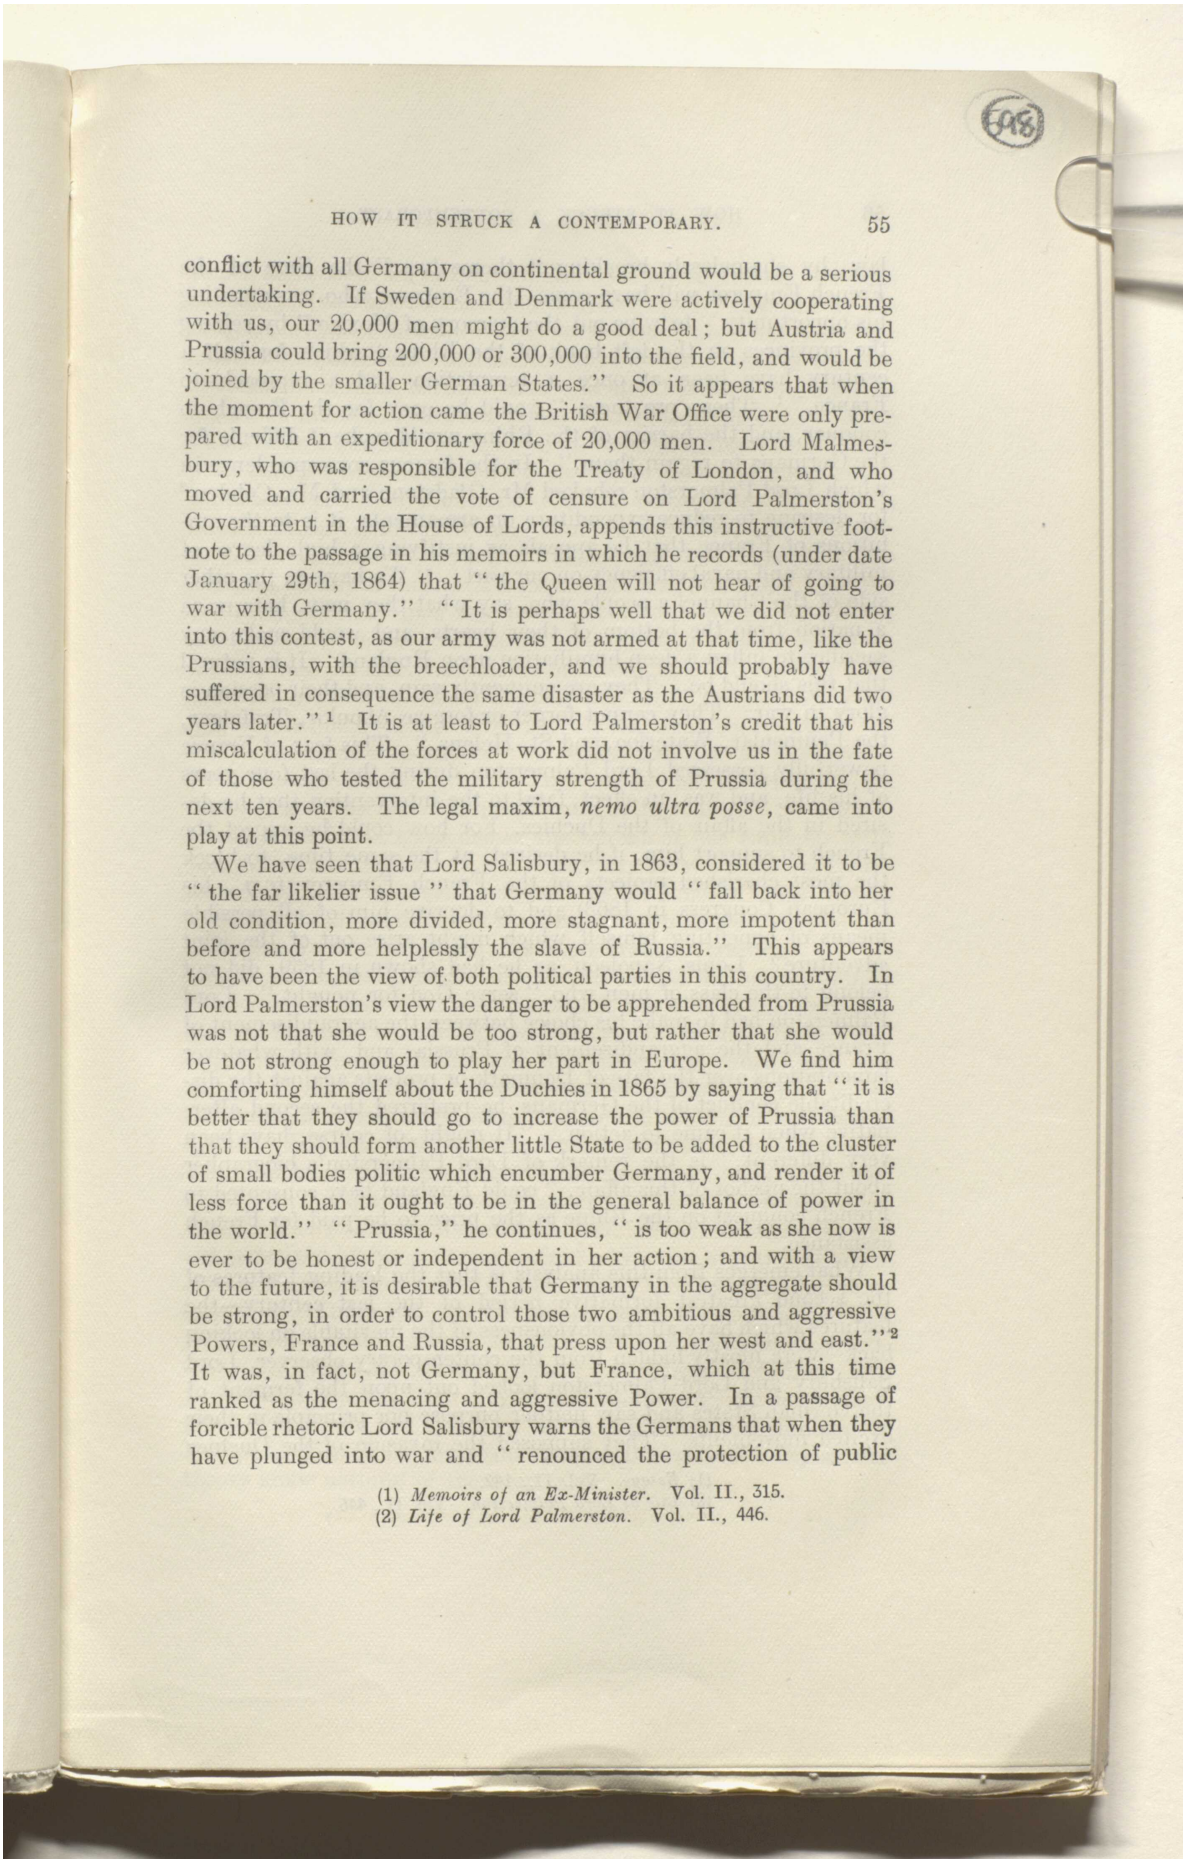
'sixties. Germany had certainly during the previous years been in a ferment of confused policies and combinations. The previous twelve years had witnessed the revolutions of 1848, the abortive experiment of the national Parliament, the refusal of the King of Prussia to accept the imperial dignity, the re-establishment of the Confederation, and the overthrow of the Liberals, and much vague and apparently purposeless agitation on the part of National Unions and Reform Unions. So far as the outward seeming went, Lord Salisbury had every warrant for speaking of the "seething mass of German populations," and their unpractical energies. What he missed, and what all foreign observers missed, was the strong creative impulse which was at work beneath these agitations on the surface, and which, directed by a statesman of genius, was to weld the fluid material into one of the most powerful Empires in the world. The affair of the Duchies was the beginning of this final consolidation, and it restored to Prussia the opportunity which she had thrown away when King Frederick William refused the leadership offered him in 1849 by the national Parliament.



Let us turn now for one moment to the final part which the British Government played in this affair. It was not heroic, and it fairly lies open to the censure which Lord Salisbury passes on it. The Danish Government had strictly followed the advice which the British Cabinet offered to it, and in so doing had actually furnished Prussia with the handle that she desired for forcible interference. The details are too complicated to enter into at this moment, but Lord Salisbury's analysis of them is searching and just.[1] Yet in the last resort the Danish Government found itself single-handed in presence of Austria and Prussia. It was not that Lord Palmerston and Lord Russell disagreed with Lord Salisbury about the merits of the case. They shared his views about the "raid on Denmark," as is shown in a multitude of speeches and despatches; they considered the conduct of Austria and Prussia to be "discreditably bad."[2] But at the critical moment they were without allies, and intervention to any purpose was a physical impossibility. It has been said in subsequent times that they were beaten in the Cabinet, and—as an alternative explanation—that the Queen forbade the war. Lord Palmerston's letters do, indeed, furnish evidence of dissensions in the Cabinet, and the Queen, no doubt, was personally averse from war with Prussia, but the decisive fact was that the Government was without the force for this enterprise. Lord Palmerston himself avows as much in his letters to Lord John Russell. "The truth is," he writes on February 13th, 1864, "that to enter into a military

conflict with all Germany on continental ground would be a serious undertaking. If Sweden and Denmark were actively cooperating with us, our 20,000 men might do a good deal; but Austria and Prussia could bring 200,000 or 300,000 into the field, and would be joined by the smaller German States." So it appears that when the moment for action came the British War Office were only prepared with an expeditionary force of 20,000 men. Lord Malmesbury, who was responsible for the Treaty of London, and who moved and carried the vote of censure on Lord Palmerston's Government in the House of Lords, appends this instructive footnote to the passage in his memoirs in which he records (under date January 29th, 1864) that "the Queen will not hear of going to war with Germany." "It is perhaps well that we did not enter into this contest, as our army was not armed at that time, like the Prussians, with the breechloader, and we should probably have suffered in consequence the same disaster as the Austrians did two years later."[1] It is at least to Lord Palmerston's credit that his miscalculation of the forces at work did not involve us in the fate of those who tested the military strength of Prussia during the next ten years. The legal maxim, *nemo ultra posse*, came into play at this point.

We have seen that Lord Salisbury, in 1863, considered it to be "the far likelier issue" that Germany would "fall back into her old condition, more divided, more stagnant, more impotent than before and more helplessly the slave of Russia." This appears to have been the view of both political parties in this country. In Lord Palmerston's view the danger to be apprehended from Prussia was not that she would be too strong, but rather that she would be not strong enough to play her part in Europe. We find him comforting himself about the Duchies in 1865 by saying that "it is better that they should go to increase the power of Prussia than that they should form another little State to be added to the cluster of small bodies politic which encumber Germany, and render it of less force than it ought to be in the general balance of power in the world." "Prussia," he continues, "is too weak as she now is ever to be honest or independent in her action; and with a view to the future, it is desirable that Germany in the aggregate should be strong, in order to control those two ambitious and aggressive Powers, France and Russia, that press upon her west and east."[2] It was, in fact, not Germany, but France, which at this time ranked as the menacing and aggressive Power. In a passage of forcible rhetoric Lord Salisbury warns the Germans that when they have plunged into war and "renounced the protection of public

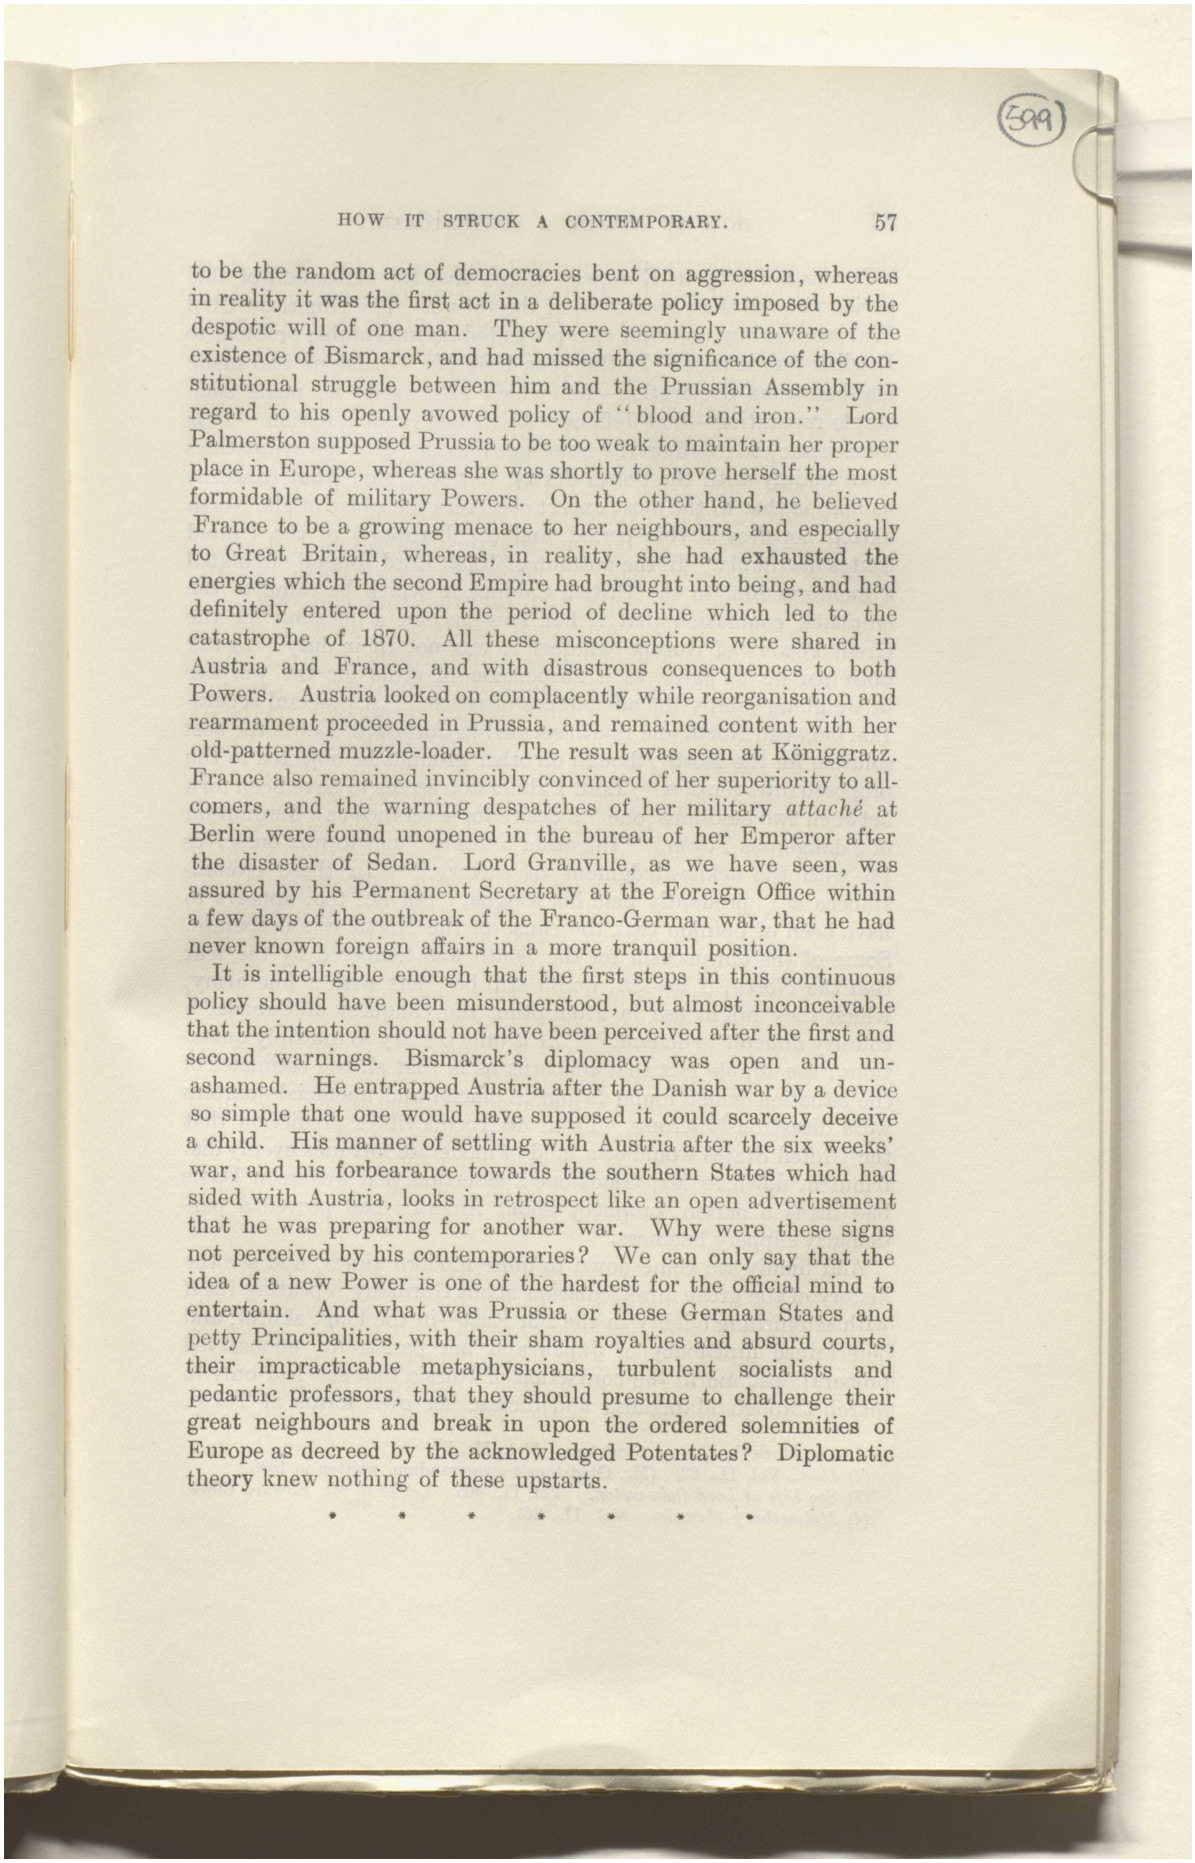
law, by shamelessly breaking it themselves," the time of the French Emperor will have come—the Emperor who was awaiting his opportunity "to wipe out the memory of Mexico" by seizing the provinces on the left bank of the Rhine "which for half a century have been at once a temptation and a reproach to France."[1] These provinces "would be easy for the French to conquer, and the barrier of the Rhine would make it difficult for the Germans to regain them." In the famous correspondence in which Lord Palmerston rebuked Mr. Gladstone and Mr. Cobden[2] for desiring to reduce expenditure on armaments, it is to the ambitions of France that he appeals as justifying a high degree of military and naval efficiency on our part. "We have on the other side of the Channel a people who, say what they may, hate us as a nation from the bottom of their hearts, and would make any sacrifice to inflict a deep humiliation upon England. It is natural that this should be. They are eminently vain, and their passion is glory in war. They cannot forget or forgive Aboukir, Trafalgar, the Peninsular, Waterloo, and St. Helena." This fear of France powerfully possessed Lord Palmerston during the last four years of his life, and was, in effect, fatal to the intervention that he desired in the affair of the Duchies. For how could he expect the French to support him, if he desired, at the same time, to block the most cherished projects of the French Emperor (*e.g.*, his European Congress in 1863) and to deprive him of all possible means of benefiting himself which might arise out of the joint adventure? Louis Napoleon, as he had shown in 1859, did not belong to the class of men who "serve God for nought." Lord Palmerston had to make his choice between the aggrandisement of France and the aggrandisement of Prussia, and, with whatever lamentations over the fate of Denmark or protests against the discreditable conduct of the Germans, he preferred the second alternative when it came to action. "It might, of course, have been very different," is the remark of Lord Palmerston's biographer about the upshot of this affair, "could England have consented to French conquest on the Rhine as the price to be paid for French assistance."



What emerges from this analysis is that the leading features of the second greatest formative period of the last century—the features which have all the obviousness of the inevitable on looking back—were mostly hidden from the contemporary observer. Lord Salisbury and Lord Palmerston looked out upon the ferment of the German States and saw neither purpose nor principle in their excited movements. They supposed the invasion of the Duchies

to be the random act of democracies bent on aggression, whereas in reality it was the first act in a deliberate policy imposed by the despotic will of one man. They were seemingly unaware of the existence of Bismarck, and had missed the significance of the constitutional struggle between him and the Prussian Assembly in regard to his openly avowed policy of "blood and iron." Lord Palmerston supposed Prussia to be too weak to maintain her proper place in Europe, whereas she was shortly to prove herself the most formidable of military Powers. On the other hand, he believed France to be a growing menace to her neighbours, and especially to Great Britain, whereas, in reality, she had exhausted the energies which the second Empire had brought into being, and had definitely entered upon the period of decline which led to the catastrophe of 1870. All these misconceptions were shared in Austria and France, and with disastrous consequences to both Powers. Austria looked on complacently while reorganisation and rearmament proceeded in Prussia, and remained content with her old-patterned muzzle-loader. The result was seen at Königgratz. France also remained invincibly convinced of her superiority to all-comers, and the warning despatches of her military *attaché* at Berlin were found unopened in the bureau of her Emperor after the disaster of Sedan. Lord Granville, as we have seen, was assured by his Permanent Secretary at the Foreign Office within a few days of the outbreak of the Franco-German war, that he had never known foreign affairs in a more tranquil position.

It is intelligible enough that the first steps in this continuous policy should have been misunderstood, but almost inconceivable that the intention should not have been perceived after the first and second warnings. Bismarck's diplomacy was open and unashamed. He entrapped Austria after the Danish war by a device so simple that one would have supposed it could scarcely deceive a child. His manner of settling with Austria after the six weeks' war, and his forbearance towards the southern States which had sided with Austria, looks in retrospect like an open advertisement that he was preparing for another war. Why were these signs not perceived by his contemporaries? We can only say that the idea of a new Power is one of the hardest for the official mind to entertain. And what was Prussia or these German States and petty Principalities, with their sham royalties and absurd courts, their impracticable metaphysicians, turbulent socialists and pedantic professors, that they should presume to challenge their great neighbours and break in upon the ordered solemnities of Europe as decreed by the acknowledged Potentates? Diplomatic theory knew nothing of these upstarts.

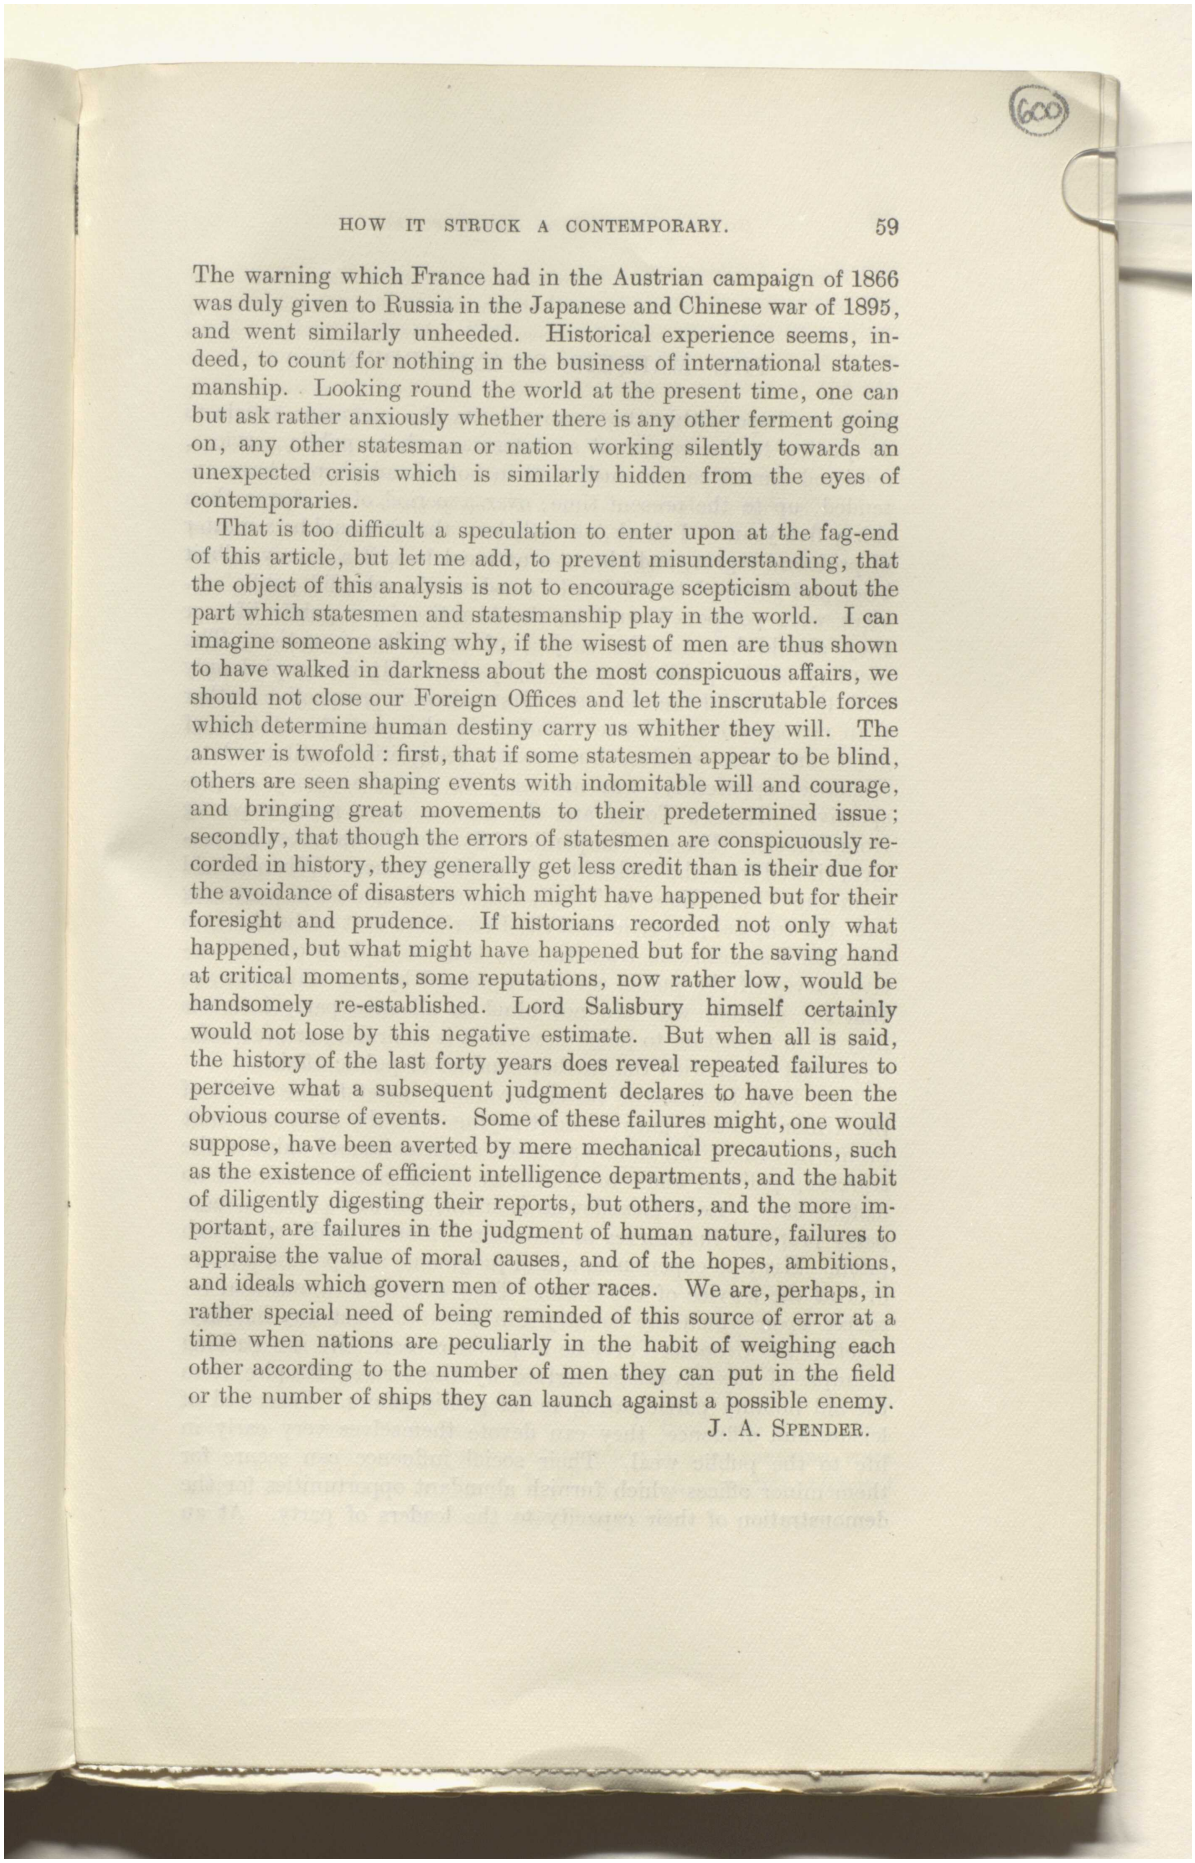
It was not only in European affairs that the statesmen of this period showed their ignorance of the future. The American Civil War was raging, and that also presented an inscrutable problem to English public men. In the year 1862 Mr. Gladstone had made his disastrous declaration—for which afterwards he made such ample reparation—that Jefferson Davis had made a nation. It is unnecessary to dwell on the notorious fact that English sympathies were mainly with the South during this struggle; what concerns us here is that to the most expert observers the cause of the North looked hopeless at this period, and the disruption of the United States inevitable. In the autumn of 1862, Lord Russell circulated a memorandum to the British Cabinet in which he came to the emphatic conclusion that it had now become a question for the Great Powers of Europe whether it was not their duty "to ask both parties to agree to a suspension of arms for the purpose of weighing calmly the advantages of peace." A peaceful separation between North and South seemed to Cornewall Lewis the best solution for the North, though on other grounds he objected to the proposed intervention.[1] Lord Palmerston seems to have been torn between two emotions, one "a desire for severance as a diminution of a dangerous Power,"[2] the other a desire "not to mix ourselves up with the acknowledgment of slavery."[3] In those circumstances he "prudently held his tongue," but he, too, appears to have been of opinion that the cause of the North was desperate. Some of the enthusiasm for the South was tempered by the fear that the North, if beaten, would still be "left with a fine army, which they might use in attempting the conquest of Canada, a country difficult to defend."[4] It is unnecessary to multiply quotations; the simple fact that concerns us is that all the estimates of the situation which found favour in official and unofficial quarters were disastrously wrong. From de Tocqueville's prediction that the United States would be a land of moderate fortunes evenly distributed, down to Mr. Gladstone's assertion that Jefferson Davis had made a nation, prophecy about America had proved a particularly slippery business.



And finally we come down to quite modern times, and see the history of the great miscalculation about Germany repeating itself with astonishing fidelity in the Far East—in the long, skilful, and determined diplomacy of Japan and her persistent, unobserved preparations, and in the conviction of Russia that she had only to march through Manchuria and dictate her own terms at Tokio.

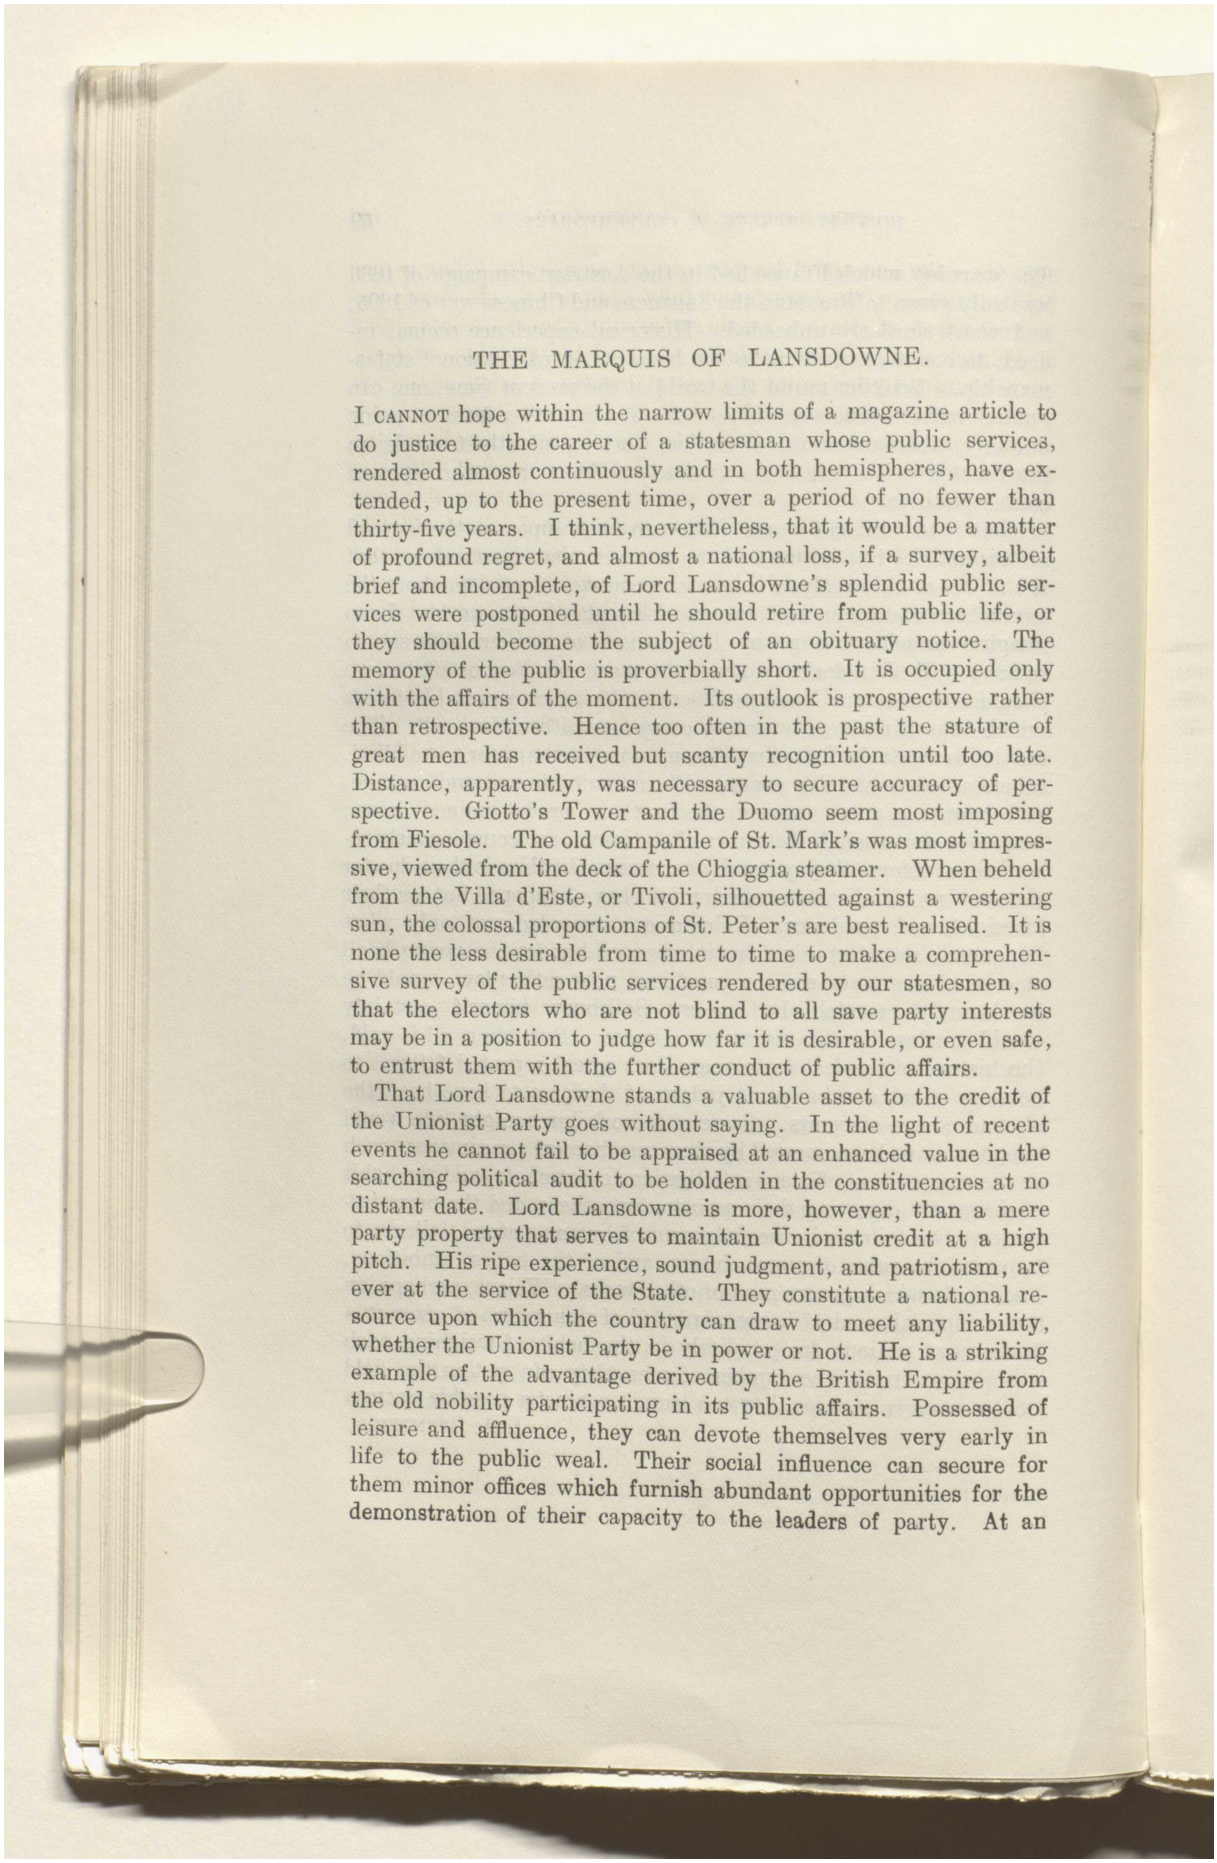
The warning which France had in the Austrian campaign of 1866 was duly given to Russia in the Japanese and Chinese war of 1895, and went similarly unheeded. Historical experience seems, indeed, to count for nothing in the business of international statesmanship. Looking round the world at the present time, one can but ask rather anxiously whether there is any other ferment going on, any other statesman or nation working silently towards an unexpected crisis which is similarly hidden from the eyes of contemporaries.



That is too difficult a speculation to enter upon at the fag-end of this article, but let me add, to prevent misunderstanding, that the object of this analysis is not to encourage scepticism about the part which statesmen and statesmanship play in the world. I can imagine someone asking why, if the wisest of men are thus shown to have walked in darkness about the most conspicuous affairs, we should not close our Foreign Offices and let the inscrutable forces which determine human destiny carry us whither they will. The answer is twofold: first, that if some statesmen appear to be blind, others are seen shaping events with indomitable will and courage, and bringing great movements to their predetermined issue; secondly, that though the errors of statesmen are conspicuously recorded in history, they generally get less credit than is their due for the avoidance of disasters which might have happened but for their foresight and prudence. If historians recorded not only what happened, but what might have happened but for the saving hand at critical moments, some reputations, now rather low, would be handsomely re-established. Lord Salisbury himself certainly would not lose by this negative estimate. But when all is said, the history of the last forty years does reveal repeated failures to perceive what a subsequent judgment declares to have been the obvious course of events. Some of these failures might, one would suppose, have been averted by mere mechanical precautions, such as the existence of efficient intelligence departments, and the habit of diligently digesting their reports, but others, and the more important, are failures in the judgment of human nature, failures to appraise the value of moral causes, and of the hopes, ambitions, and ideals which govern men of other races. We are, perhaps, in rather special need of being reminded of this source of error at a time when nations are peculiarly in the habit of weighing each other according to the number of men they can put in the field or the number of ships they can launch against a possible enemy.

THE MARQUIS OF LANSDOWNE.

I CANNOT hope within the narrow limits of a magazine article to do justice to the career of a statesman whose public services, rendered almost continuously and in both hemispheres, have extended, up to the present time, over a period of no fewer than thirty-five years. I think, nevertheless, that it would be a matter of profound regret, and almost a national loss, if a survey, albeit brief and incomplete, of Lord Lansdowne's splendid public services were postponed until he should retire from public life, or they should become the subject of an obituary notice. The memory of the public is proverbially short. It is occupied only with the affairs of the moment. Its outlook is prospective rather than retrospective. Hence too often in the past the stature of great men has received but scanty recognition until too late. Distance, apparently, was necessary to secure accuracy of perspective. Giotto's Tower and the Duomo seem most imposing from Fiesole. The old Campanile of St. Mark's was most impressive, viewed from the deck of the Chioggia steamer. When beheld from the Villa d'Este, or Tivoli, silhouetted against a westering sun, the colossal proportions of St. Peter's are best realised. It is none the less desirable from time to time to make a comprehensive survey of the public services rendered by our statesmen, so that the electors who are not blind to all save party interests may be in a position to judge how far it is desirable, or even safe, to entrust them with the further conduct of public affairs.

That Lord Lansdowne stands a valuable asset to the credit of the Unionist Party goes without saying. In the light of recent events he cannot fail to be appraised at an enhanced value in the searching political audit to be holden in the constituencies at no distant date. Lord Lansdowne is more, however, than a mere party property that serves to maintain Unionist credit at a high pitch. His ripe experience, sound judgment, and patriotism, are ever at the service of the State. They constitute a national resource upon which the country can draw to meet any liability, whether the Unionist Party be in power or not. He is a striking example of the advantage derived by the British Empire from the old nobility participating in its public affairs. Possessed of leisure and affluence, they can devote themselves very early in life to the public weal. Their social influence can secure for them minor offices which furnish abundant opportunities for the demonstration of their capacity to the leaders of party. At an

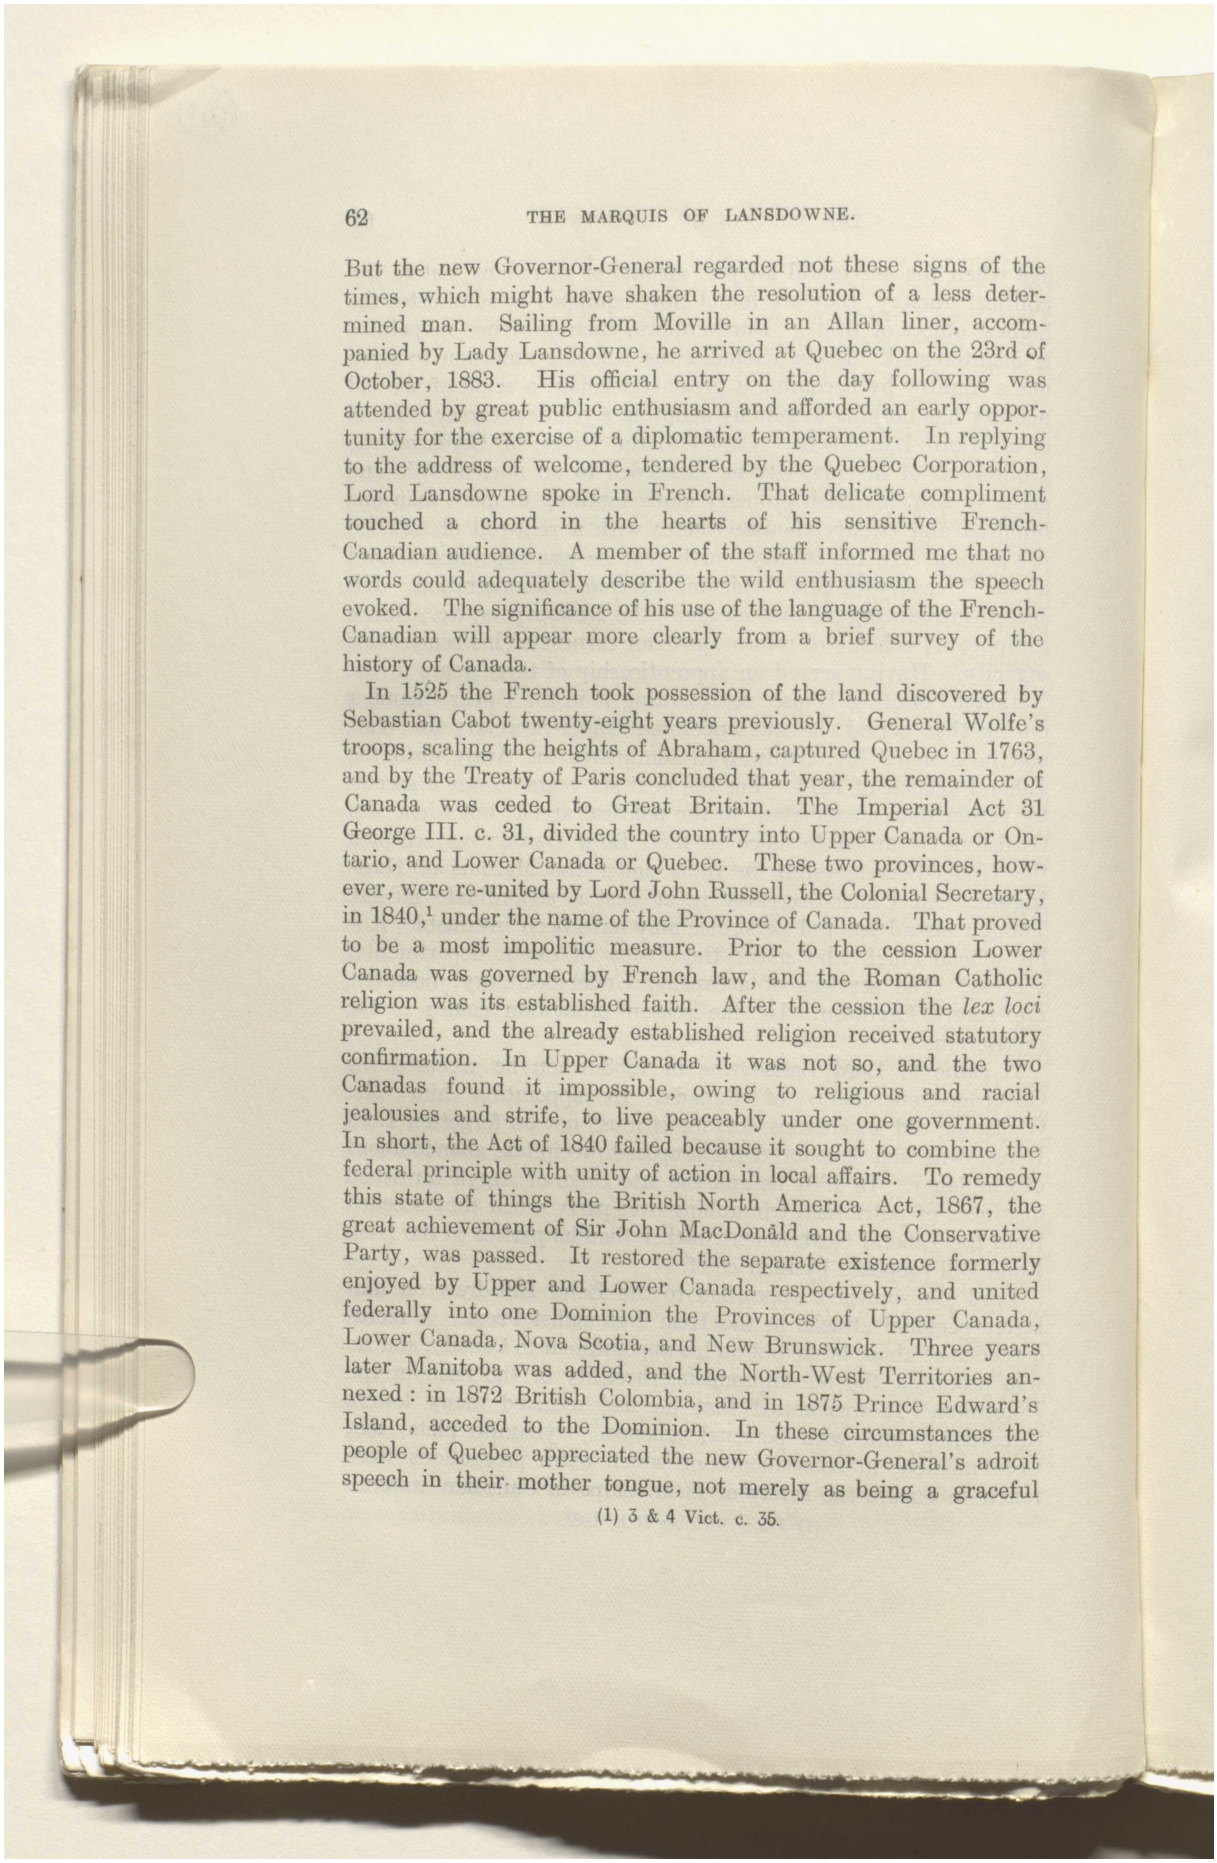
BRITISH LIBRARY

age when the successful lawyer, *savant*, or merchant, enters the political nursery, they are found fully equipped to administer the highest offices of State. Furthermore, their presence in politics is disinterested. If one excludes the laudable ambition to serve one's country by becoming a great statesman, a scion of the old nobility has nothing to gain by adopting a political career. Least of all Lord Lansdowne. Called to the House of Lords on the attainment of his majority he succeeded to an ancient title and great wealth, his Irish property alone totalling to more than one hundred and twenty thousand acres with a rent-roll of £32,000 per annum. In his twenty-fourth year he was appointed a Lord of the Treasury in Mr. Gladstone's second administration. His speech introducing his first measure, the Newspapers, &c., Bill, a complicated scheme of reform, gave an earnest of his remarkable sagacity. Having served an apprenticeship of three years in the National Counting House, representing it in the Upper Chamber during that period, he was appointed Under-Secretary for War, and he assisted Mr. Cardwell to administer the Army until the Liberal *débâcle* of 1874. For the next six years he was a spectator rather than a combatant in the political arena; but when Mr. Gladstone returned to office in 1880 Lord Lansdowne accepted the Under-Secretaryship for India under the Marquis of Hartington. An Under-Secretary is at best a subordinate official. Though his advice and assistance may have been invaluable, it is his official chief who gains the *kudos* of every departmental success. The services of a capable Under-Secretary, however, are rarely forgotten. In due season promotion comes to the meritorious.

It came to Lord Lansdowne in 1883 when he accepted the Governor-Generalship of Canada. In appointing him Mr. Gladstone did a generous act, for it must not be forgotten Lord Lansdowne had denounced the proposed precipitate abandonment of Candahar. In 1881 he and the late Duke of Argyll furnished instances of patriotism triumphing over party when they seceded from the Liberal Government, rather than be parties to the Irish Land Bill proposed by their chief.



Lord Lansdowne's opposition to the Land Bill drew on him bitter personal attacks in the Irish Nationalist Press. A recrudescence of abuse broke out on his appointment to Canada, and he was promised the uncompromising hostility of the Irish in the Dominion. It was stated that he had received many letters threatening him with personal violence. Dynamite plots, too, were mooted, in consequence of which extra precautions were taken to ensure the safety of H.M. ships in Canadian waters.[1]

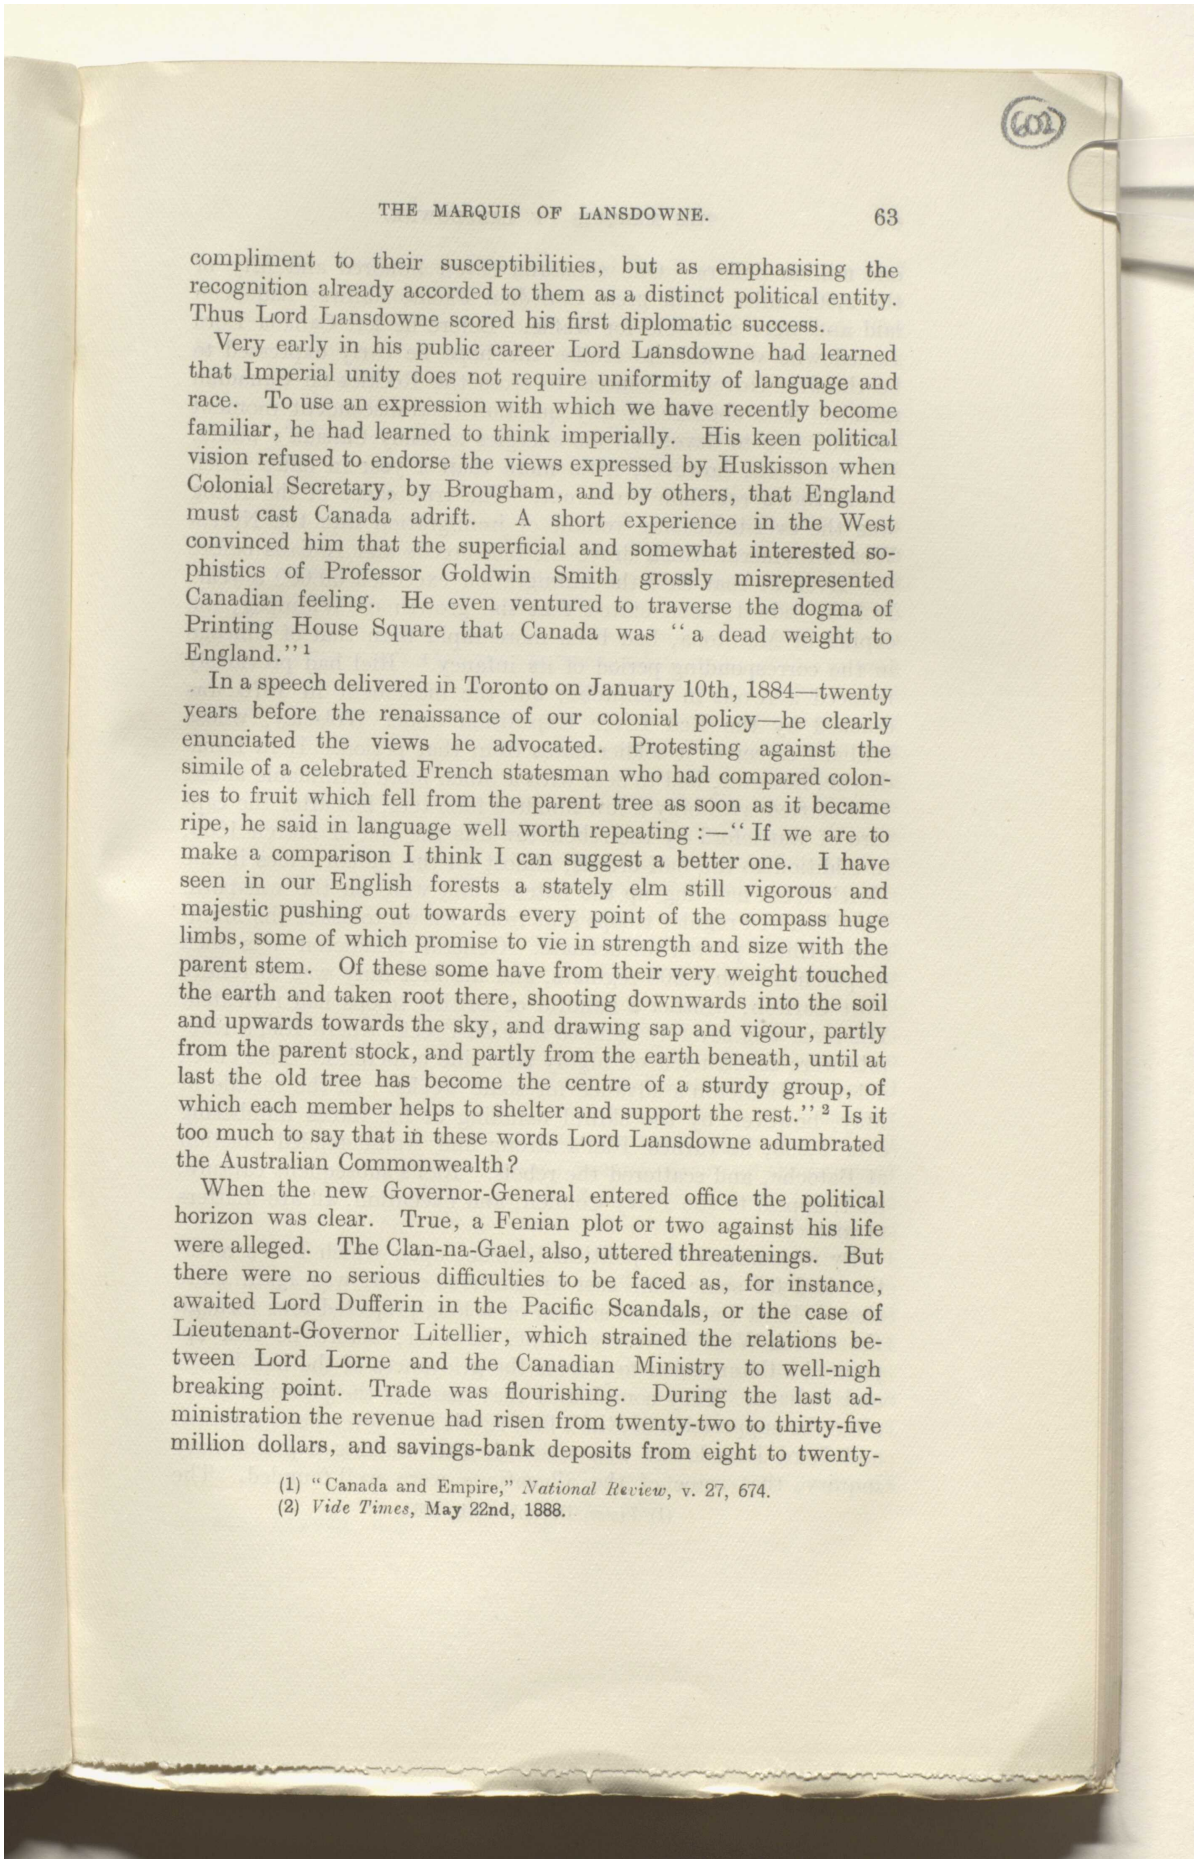
But the new Governor-General regarded not these signs of the times, which might have shaken the resolution of a less determined man. Sailing from Moville in an Allan liner, accompanied by Lady Lansdowne, he arrived at Quebec on the 23rd of October, 1883. His official entry on the day following was attended by great public enthusiasm and afforded an early opportunity for the exercise of a diplomatic temperament. In replying to the address of welcome, tendered by the Quebec Corporation, Lord Lansdowne spoke in French. That delicate compliment touched a chord in the hearts of his sensitive French-Canadian audience. A member of the staff informed me that no words could adequately describe the wild enthusiasm the speech evoked. The significance of his use of the language of the French-Canadian will appear more clearly from a brief survey of the history of Canada.



In 1525 the French took possession of the land discovered by Sebastian Cabot twenty-eight years previously. General Wolfe's troops, scaling the heights of Abraham, captured Quebec in 1763, and by the Treaty of Paris concluded that year, the remainder of Canada was ceded to Great Britain. The Imperial Act 31 George III. c. 31, divided the country into Upper Canada or Ontario, and Lower Canada or Quebec. These two provinces, however, were re-united by Lord John Russell, the Colonial Secretary, in 1840,[1] under the name of the Province of Canada. That proved to be a most impolitic measure. Prior to the cession Lower Canada was governed by French law, and the Roman Catholic religion was its established faith. After the cession the *lex loci* prevailed, and the already established religion received statutory confirmation. In Upper Canada it was not so, and the two Canadas found it impossible, owing to religious and racial jealousies and strife, to live peaceably under one government. In short, the Act of 1840 failed because it sought to combine the federal principle with unity of action in local affairs. To remedy this state of things the British North America Act, 1867, the great achievement of Sir John MacDonald and the Conservative Party, was passed. It restored the separate existence formerly enjoyed by Upper and Lower Canada respectively, and united federally into one Dominion the Provinces of Upper Canada, Lower Canada, Nova Scotia, and New Brunswick. Three years later Manitoba was added, and the North-West Territories annexed: in 1872 British Colombia, and in 1875 Prince Edward's Island, acceded to the Dominion. In these circumstances the people of Quebec appreciated the new Governor-General's adroit speech in their mother tongue, not merely as being a graceful

BRITISH LIBRARY

compliment to their susceptibilities, but as emphasising the recognition already accorded to them as a distinct political entity. Thus Lord Lansdowne scored his first diplomatic success.

Very early in his public career Lord Lansdowne had learned that Imperial unity does not require uniformity of language and race. To use an expression with which we have recently become familiar, he had learned to think imperially. His keen political vision refused to endorse the views expressed by Huskisson when Colonial Secretary, by Brougham, and by others, that England must cast Canada adrift. A short experience in the West convinced him that the superficial and somewhat interested sophistics of Professor Goldwin Smith grossly misrepresented Canadian feeling. He even ventured to traverse the dogma of Printing House Square that Canada was "a dead weight to England."[1]

In a speech delivered in Toronto on January 10th, 1884—twenty years before the renaissance of our colonial policy—he clearly enunciated the views he advocated. Protesting against the simile of a celebrated French statesman who had compared colonies to fruit which fell from the parent tree as soon as it became ripe, he said in language well worth repeating:—"If we are to make a comparison I think I can suggest a better one. I have seen in our English forests a stately elm still vigorous and majestic pushing out towards every point of the compass huge limbs, some of which promise to vie in strength and size with the parent stem. Of these some have from their very weight touched the earth and taken root there, shooting downwards into the soil and upwards towards the sky, and drawing sap and vigour, partly from the parent stock, and partly from the earth beneath, until at last the old tree has become the centre of a sturdy group, of which each member helps to shelter and support the rest."[2] Is it too much to say that in these words Lord Lansdowne adumbrated the Australian Commonwealth?

When the new Governor-General entered office the political horizon was clear. True, a Fenian plot or two against his life were alleged. The Clan-na-Gael, also, uttered threatenings. But there were no serious difficulties to be faced as, for instance, awaited Lord Dufferin in the Pacific Scandals, or the case of Lieutenant-Governor Litellier, which strained the relations between Lord Lorne and the Canadian Ministry to well-nigh breaking point. Trade was flourishing. During the last administration the revenue had risen from twenty-two to thirty-five million dollars, and savings-bank deposits from eight to twenty-

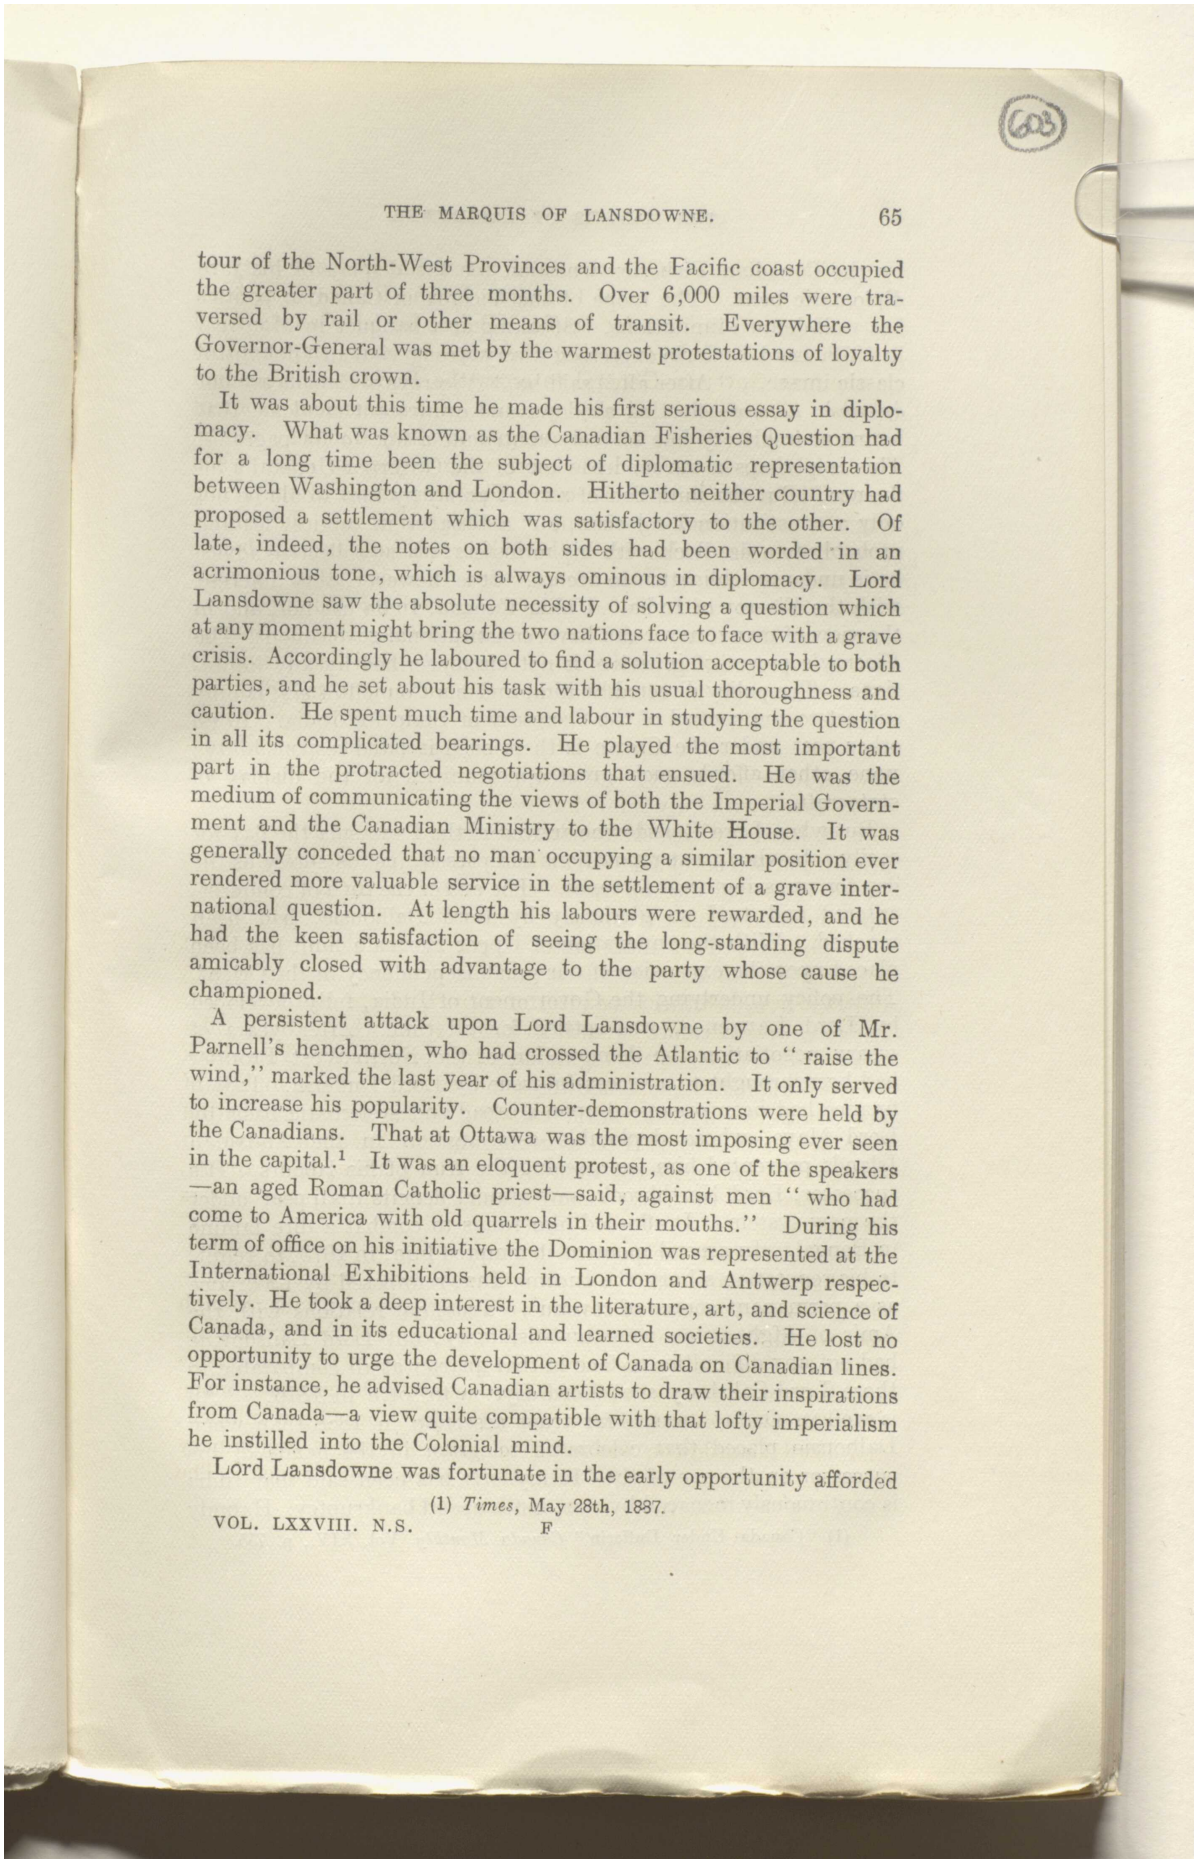
one million dollars. One thousand seven hundred and fifty of the 2,500 miles of the great Canadian Pacific Railway had been laid and were available for traffic. Before he left Canada Lord Lansdowne was able to realise the hope he early expressed to be the first Governor-General to cross the Rockies on Canadian metals. The absence of any question of transcendent moment left him free to devote all his energies to study Canada's wants. He had been, however, little more than a year in office when Louis Riel's rebellion broke out. The true cause of the rising was the ever-increasing volume of immigration into the North-West Provinces, which drove the half-breeds and Indians before it. Even at that date the immigration exceeded 50,000 a year. It has, indeed, been stated that the growth of Winnipeg, the capital of Manitoba, had been more rapid than that of Chicago in the corresponding period of its infancy.[1] Riel had previously induced a revolt in Manitoba, but the movement in 1870 was crushed by the Red River Expedition under Wolseley, whose brilliant career as a soldier dates from that period. Lord Lansdowne, however, had to deal with a much more formidable affair. Riel started with only a few hundred followers, but after the capture of Battleford by the rebels towards the end of March 1885, in addition to the half-breeds, almost all the Indian tribes in the North-West had dug up the hatchet and were on the war-path. Four hundred regular troops sent from Ottawa to assist the Manitoba Militia proved inadequate. General Middleton was then despatched with 1,500 regulars, and his first duty was to relieve Fort Carlton, whither a handful of British troops had retreated. His force was severely handled at Fish Creek, where Riel's rifle-pits were constructed on highly scientific principles. This check delayed Middleton's advance for some weeks. In the middle of May, however, by the skilful handling of his forces numbering over 5,000, he turned Riel's strong and well-defended position at Batoche, and scattered the rebels. Riel's subsequent capture, trial, appeal to the Privy Council, and execution, all are matters of history.



By midsummer the political horizon, upon which Riel's rebellion had for some time cast an ominous cloud, was again quite clear. Lord Lansdowne started on a long-projected tour through the North-West Provinces. Not, however, before he had appointed a Commission to redress the grievances of the half-breeds and Indians. They complained that many of the promises made after the suppression of Riel's first revolt had never been fulfilled, and Lord Lansdowne was satisfied, after making a preliminary inquiry, that some of the allegations were well-founded. The

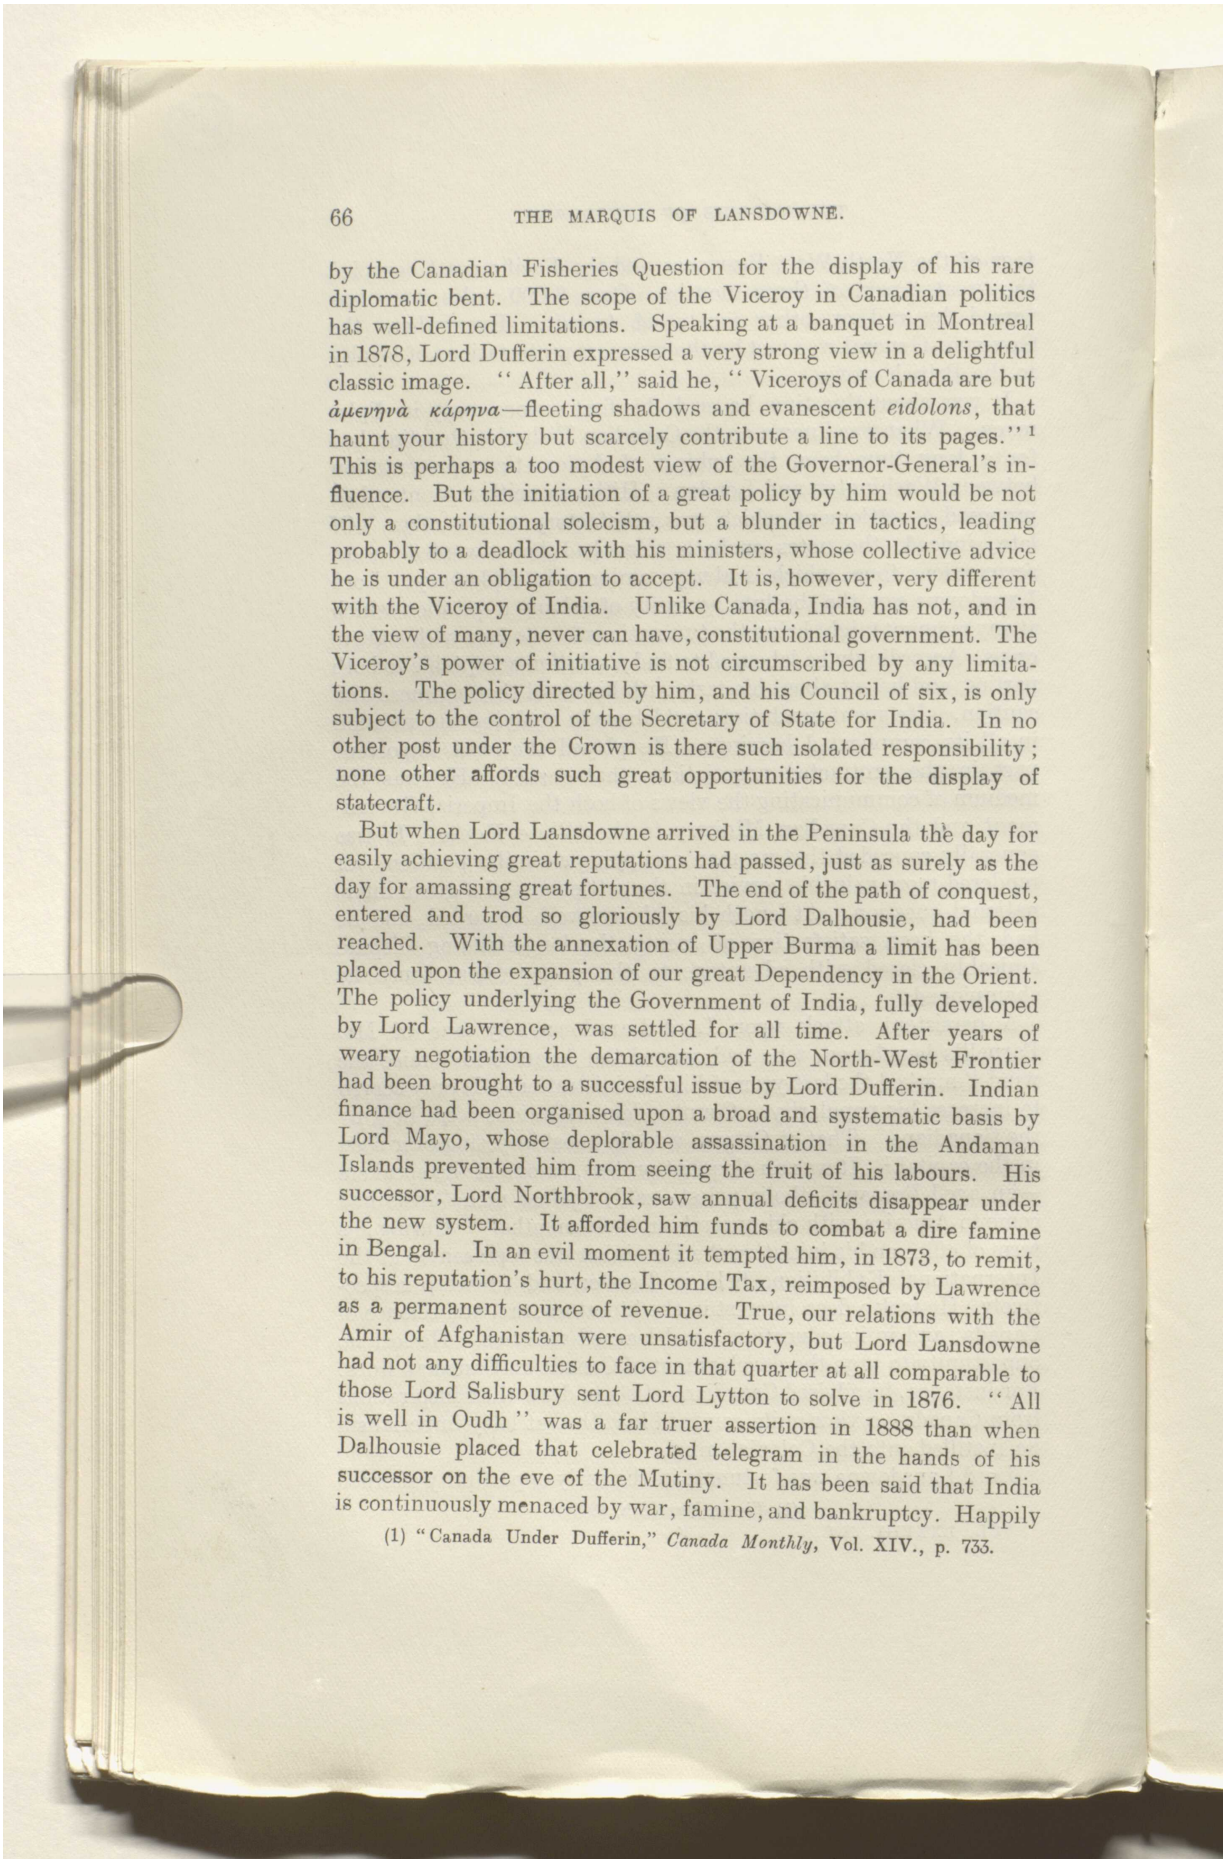
BRITISH LIBRARY

tour of the North-West Provinces and the Pacific coast occupied the greater part of three months. Over 6,000 miles were traversed by rail or other means of transit. Everywhere the Governor-General was met by the warmest protestations of loyalty to the British crown.

It was about this time he made his first serious essay in diplomacy. What was known as the Canadian Fisheries Question had for a long time been the subject of diplomatic representation between Washington and London. Hitherto neither country had proposed a settlement which was satisfactory to the other. Of late, indeed, the notes on both sides had been worded in an acrimonious tone, which is always ominous in diplomacy. Lord Lansdowne saw the absolute necessity of solving a question which at any moment might bring the two nations face to face with a grave crisis. Accordingly he laboured to find a solution acceptable to both parties, and he set about his task with his usual thoroughness and caution. He spent much time and labour in studying the question in all its complicated bearings. He played the most important part in the protracted negotiations that ensued. He was the medium of communicating the views of both the Imperial Government and the Canadian Ministry to the White House. It was generally conceded that no man occupying a similar position ever rendered more valuable service in the settlement of a grave international question. At length his labours were rewarded, and he had the keen satisfaction of seeing the long-standing dispute amicably closed with advantage to the party whose cause he championed.

A persistent attack upon Lord Lansdowne by one of Mr. Parnell's henchmen, who had crossed the Atlantic to "raise the wind," marked the last year of his administration. It only served to increase his popularity. Counter-demonstrations were held by the Canadians. That at Ottawa was the most imposing ever seen in the capital.[1] It was an eloquent protest, as one of the speakers —an aged Roman Catholic priest—said, against men "who had come to America with old quarrels in their mouths." During his term of office on his initiative the Dominion was represented at the International Exhibitions held in London and Antwerp respectively. He took a deep interest in the literature, art, and science of Canada, and in its educational and learned societies. He lost no opportunity to urge the development of Canada on Canadian lines. For instance, he advised Canadian artists to draw their inspirations from Canada—a view quite compatible with that lofty imperialism he instilled into the Colonial mind.



Lord Lansdowne was fortunate in the early opportunity afforded

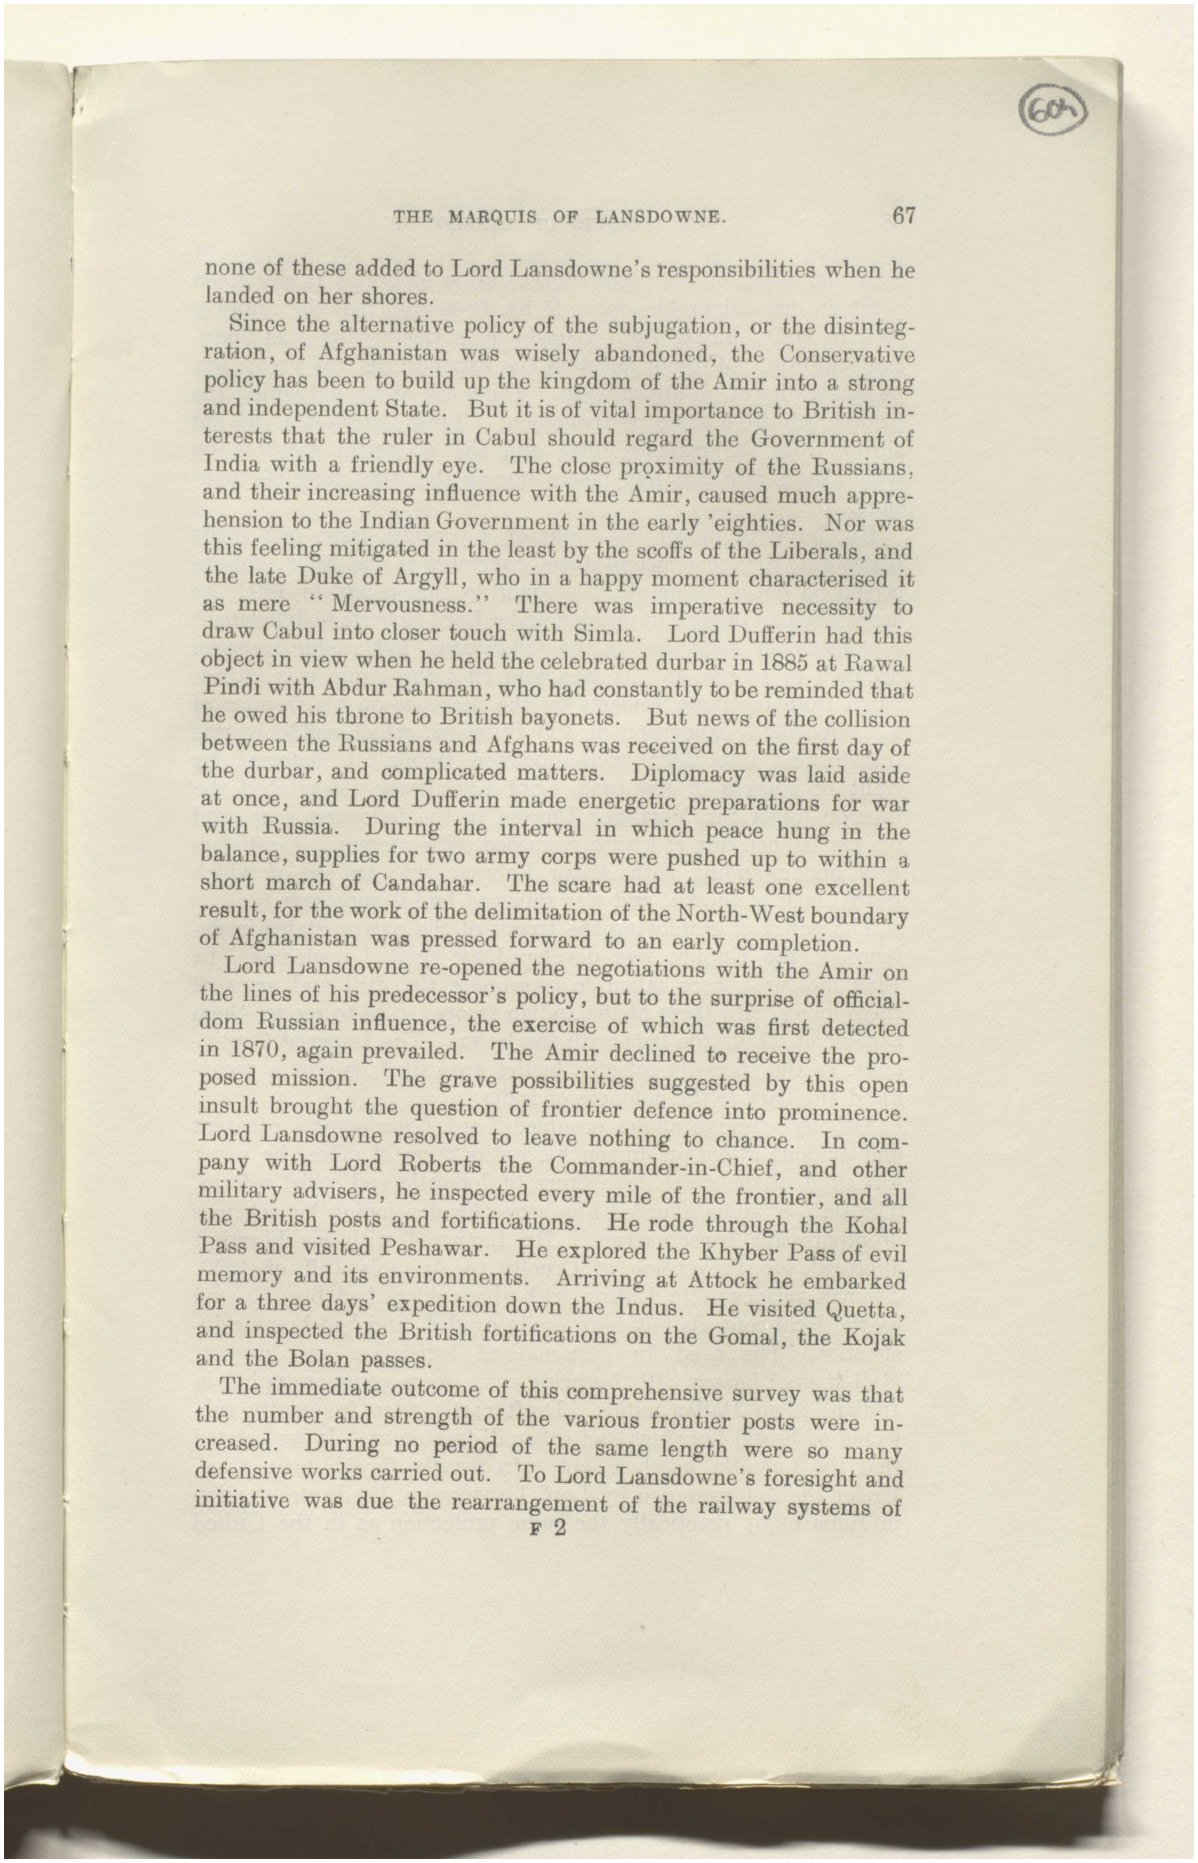
by the Canadian Fisheries Question for the display of his rare diplomatic bent. The scope of the Viceroy in Canadian politics has well-defined limitations. Speaking at a banquet in Montreal in 1878, Lord Dufferin expressed a very strong view in a delightful classic image. "After all," said he, "Viceroys of Canada are but *ἀμενηνὰ κάρηνα*—fleeting shadows and evanescent *eidolons*, that haunt your history but scarcely contribute a line to its pages."[1] This is perhaps a too modest view of the Governor-General's influence. But the initiation of a great policy by him would be not only a constitutional solecism, but a blunder in tactics, leading probably to a deadlock with his ministers, whose collective advice he is under an obligation to accept. It is, however, very different with the Viceroy of India. Unlike Canada, India has not, and in the view of many, never can have, constitutional government. The Viceroy's power of initiative is not circumscribed by any limitations. The policy directed by him, and his Council of six, is only subject to the control of the Secretary of State for India. In no other post under the Crown is there such isolated responsibility; none other affords such great opportunities for the display of statecraft.



But when Lord Lansdowne arrived in the Peninsula the day for easily achieving great reputations had passed, just as surely as the day for amassing great fortunes. The end of the path of conquest, entered and trod so gloriously by Lord Dalhousie, had been reached. With the annexation of Upper Burma a limit has been placed upon the expansion of our great Dependency in the Orient. The policy underlying the Government of India, fully developed by Lord Lawrence, was settled for all time. After years of weary negotiation the demarcation of the North-West Frontier had been brought to a successful issue by Lord Dufferin. Indian finance had been organised upon a broad and systematic basis by Lord Mayo, whose deplorable assassination in the Andaman Islands prevented him from seeing the fruit of his labours. His successor, Lord Northbrook, saw annual deficits disappear under the new system. It afforded him funds to combat a dire famine in Bengal. In an evil moment it tempted him, in 1873, to remit, to his reputation's hurt, the Income Tax, reimposed by Lawrence as a permanent source of revenue. True, our relations with the Amir of Afghanistan were unsatisfactory, but Lord Lansdowne had not any difficulties to face in that quarter at all comparable to those Lord Salisbury sent Lord Lytton to solve in 1876. "All is well in Oudh" was a far truer assertion in 1888 than when Dalhousie placed that celebrated telegram in the hands of his successor on the eve of the Mutiny. It has been said that India is continuously menaced by war, famine, and bankruptcy. Happily

none of these added to Lord Lansdowne's responsibilities when he landed on her shores.

Since the alternative policy of the subjugation, or the disintegration, of Afghanistan was wisely abandoned, the Conservative policy has been to build up the kingdom of the Amir into a strong and independent State. But it is of vital importance to British interests that the ruler in Cabul should regard the Government of India with a friendly eye. The close proximity of the Russians, and their increasing influence with the Amir, caused much apprehension to the Indian Government in the early 'eighties. Nor was this feeling mitigated in the least by the scoffs of the Liberals, and the late Duke of Argyll, who in a happy moment characterised it as mere "Mervousness." There was imperative necessity to draw Cabul into closer touch with Simla. Lord Dufferin had this object in view when he held the celebrated durbar in 1885 at Rawal Pindi with Abdur Rahman, who had constantly to be reminded that he owed his throne to British bayonets. But news of the collision between the Russians and Afghans was received on the first day of the durbar, and complicated matters. Diplomacy was laid aside at once, and Lord Dufferin made energetic preparations for war with Russia. During the interval in which peace hung in the balance, supplies for two army corps were pushed up to within a short march of Candahar. The scare had at least one excellent result, for the work of the delimitation of the North-West boundary of Afghanistan was pressed forward to an early completion.

Lord Lansdowne re-opened the negotiations with the Amir on the lines of his predecessor's policy, but to the surprise of officialdom Russian influence, the exercise of which was first detected in 1870, again prevailed. The Amir declined to receive the proposed mission. The grave possibilities suggested by this open insult brought the question of frontier defence into prominence. Lord Lansdowne resolved to leave nothing to chance. In company with Lord Roberts the Commander-in-Chief, and other military advisers, he inspected every mile of the frontier, and all the British posts and fortifications. He rode through the Kohal Pass and visited Peshawar. He explored the Khyber Pass of evil memory and its environments. Arriving at Attock he embarked for a three days' expedition down the Indus. He visited Quetta, and inspected the British fortifications on the Gomal, the Kojak and the Bolan passes.

The immediate outcome of this comprehensive survey was that the number and strength of the various frontier posts were increased. During no period of the same length were so many defensive works carried out. To Lord Lansdowne's foresight and initiative was due the rearrangement of the railway systems of

India, to admit of the rapid concentration of troops at any given point on our vulnerable side. It has been said that the military pace in India during Lord Lansdowne's vice-royalty was financially killing. Without question the expenditure was great, but he was guilty of no imprudence. The work of strengthening the frontier admitted of no postponement. Lord Lansdowne did not shrink from the responsibility, and the masterful resource by which the strain was met places him in the front rank of financiers.

He, however, never lost sight of a peaceful issue and made persistent, though unostentatious, overtures to the Amir, but received no encouragement. Pursuant to this policy in 1892, he despatched an important mission under Lord Roberts to Jellalabad, diplomatically suggested as the *rendezvous*, but Abdur Rahman declined to receive it. It was said that the Amir was intimidated from receiving Roberts by the presence on his frontier of a "scientific" expedition of 400 Russians, which suddenly was transformed into 2,000 well-appointed troops. Undeterred by want of success in the past, Lord Lansdowne despatched the mission under Sir Mortimer Durand in the following year, and his persistence was at length rewarded with success. A satisfactory understanding with Abdur Rahman was arrived at which lasted until his death, and was renewed by his successor.

The policy of employing the troops of the native States in defence of the Empire was developed by Lord Lansdowne. In 1889 measures were taken to coordinate the drill and arms of these forces with those of the Indian troops, so as to render them capable of taking the field with the latter. The Imperial Contingent, as the specially selected bodies are called, is now a recognised auxiliary to the defences of India.

Although foreign affairs occupied Lord Lansdowne's constant and anxious attention during his entire term of office, he never lost sight of the great importance of domestic and social reform. The state of India afforded him scope for developing his schemes of progressive conservatism. He furthered with his heartiest approval the Prevention of Cruelty to Animals Bill of 1890. Twenty various Acts dealing with this subject had been passed by the local councils but were easily evaded, and had become ineffective. The need for systematised legislation was urgent. Half-starved horses with festering sores were common sights in Indian, as in Italian, cities. Draft cattle were frequently subjected to brutal floggings and other ill-treatment. It was stated that the Calcutta butchers not infrequently flayed goats alive. Under the Act promoted by Lord Lansdowne, the brute creation in India enjoy practically the same protection as in the United

BRITISH LIBRARY

Kingdom. He also was most anxious to see Sir Raymond West's Bill to suppress gambling become law; especially pernicious was the practice of betting upon the rainfall prevalent amongst the Marwari merchants of the Western Presidency. But the East was not yet awake. Lord Lansdowne laboured also to improve the lot of the industrial toilers. Lord Shaftesbury first brought the discreditable state of the Indian Factories before Parliament in 1879. Two years later the Indian Factory Act, 1881, was added to the statute-book. It provided for the appointment of inspectors and certifying medical officers, the fencing of machinery, and prohibited the employment of any child under seven years of age, and children under twelve for more than nine hours a day: each should have one hour's interval daily for rest, and four days' holiday in each month. This excellent measure had, however, serious defects:—no protection was afforded to women, or to young persons over twelve years of age. The period, too, of working the mills was unrestricted: in many instances they were kept going for fifteen hours a day. Notwithstanding tremendous opposition by the Calcutta, Bombay, and other mill-owners, Lord Lansdowne's amending Bill became law, and he saw its satisfactory working before he left India.

For many years the cruelty of Indian child-marriages had shocked the mind and conscience of all right-thinking Anglo-Indians. Criminal records showed that child-wives were frequently done to death by the exercise of marital rights. Anglo-Indians, however, could never hope unaided to effect a change in practices sanctioned by religion and custom for centuries. Reform in this direction could only be effected from within.

> Within yourselves deliverance must be sought
> Each man his prison makes.

It was not until Mr. Malabari, a rich Parsee, publicly inveighed against child-marriages that reform came within the region of practical politics. The outcome was the passing of the Viceroy's age of Consent Bill of 1890, which fixed the minimum age of consent at twelve years.

His attitude towards the Indian Congress was that of a shrewd statesman. Representative government in India is not in sight. The land of the Moguls will not be fit probably for centuries for the slowly developed constitution of England, which is the envy of the civilised world. But Lord Lansdowne did not share Lord Dufferin's contempt for the "microscopic minority" who advocated the Congress. Of late years it appears to have been both large and representative. As early as 1891 it contained 965 Hindus, 221 Mohammedans, 22 native and 15 European Chris-

BRITISH LIBRARY

tians, 11 Jains, 7 Parsis, and 6 Sikhs: it included 6 princes, 4 Rajahs, 17 Nawabs, 3 Sirdars, 54 members of Indian noble families, and 455 lawyers. Early in his administration Lord Lansdowne pronounced it a perfectly legitimate movement. True, it called forth a counter-demonstration. Educated Indians know well that the introduction of representative institutions in existing circumstances in India is absolutely impossible. The Indian serpent is still potential to wound the European heel. But the Congress affords a certain section of British subjects a legal safety-valve for ventilating real or fancied grievances, and thus supplies a want felt some time or another in every civilised community. Lord Lansdowne extended the representative system in order to induce the better classes in India to take a more active part in public affairs. In the Indian Councils Act, 1892, he was careful to proceed with caution, but under it educated Indians can play a more important part in public life than formerly.

The many-sided new departures during Lord Lansdowne's administration involved considerable expenditure. The burden of meeting it was not felt until the last year or so of his viceroyalty, when the financial strain felt was chiefly attributable to the depreciation of the rupee. With a view to enhance the exchange, on the advice of his Council he sanctioned the closing of the Indian mints for the free coinage of silver. But if this measure failed to accomplish the end in view, Lord Lansdowne proved in his speech in the House of Lords in June 1894, on the Indian currency question, that it was not only amply justified in existing circumstances, but economically sound.

During Lord Lansdowne's term of office there were the usual number of punitive expeditions, but the policy of expansion was sternly discountenanced. He refused to annex the State of Manipur after the massacre of Messrs. Quinton and Grimwood had been avenged, and re-established native rule there. Firmness was a distinct feature of his *régime*. He never failed to impress upon the native Rulers that misgovernment would surely be punished, but that if they governed well their thrones and fortunes would be secure. He did not hesitate to depose the Khan of Khelat for cruelty, and set his son on the throne. He made a journey to Kashmir, where no Viceroy had previously visited, and restored to the Maharajah his administrative independence, which, for misgovernment, had been previously curtailed. He refused to ratify an unconstitutional guarantee, given to the corrupt Mamlutdars by Lord Reay, whose immediate resignation did not move him. His emphatic declaration after the sanguinary riots in 1893 in Bombay, that British arms would protect the meanest

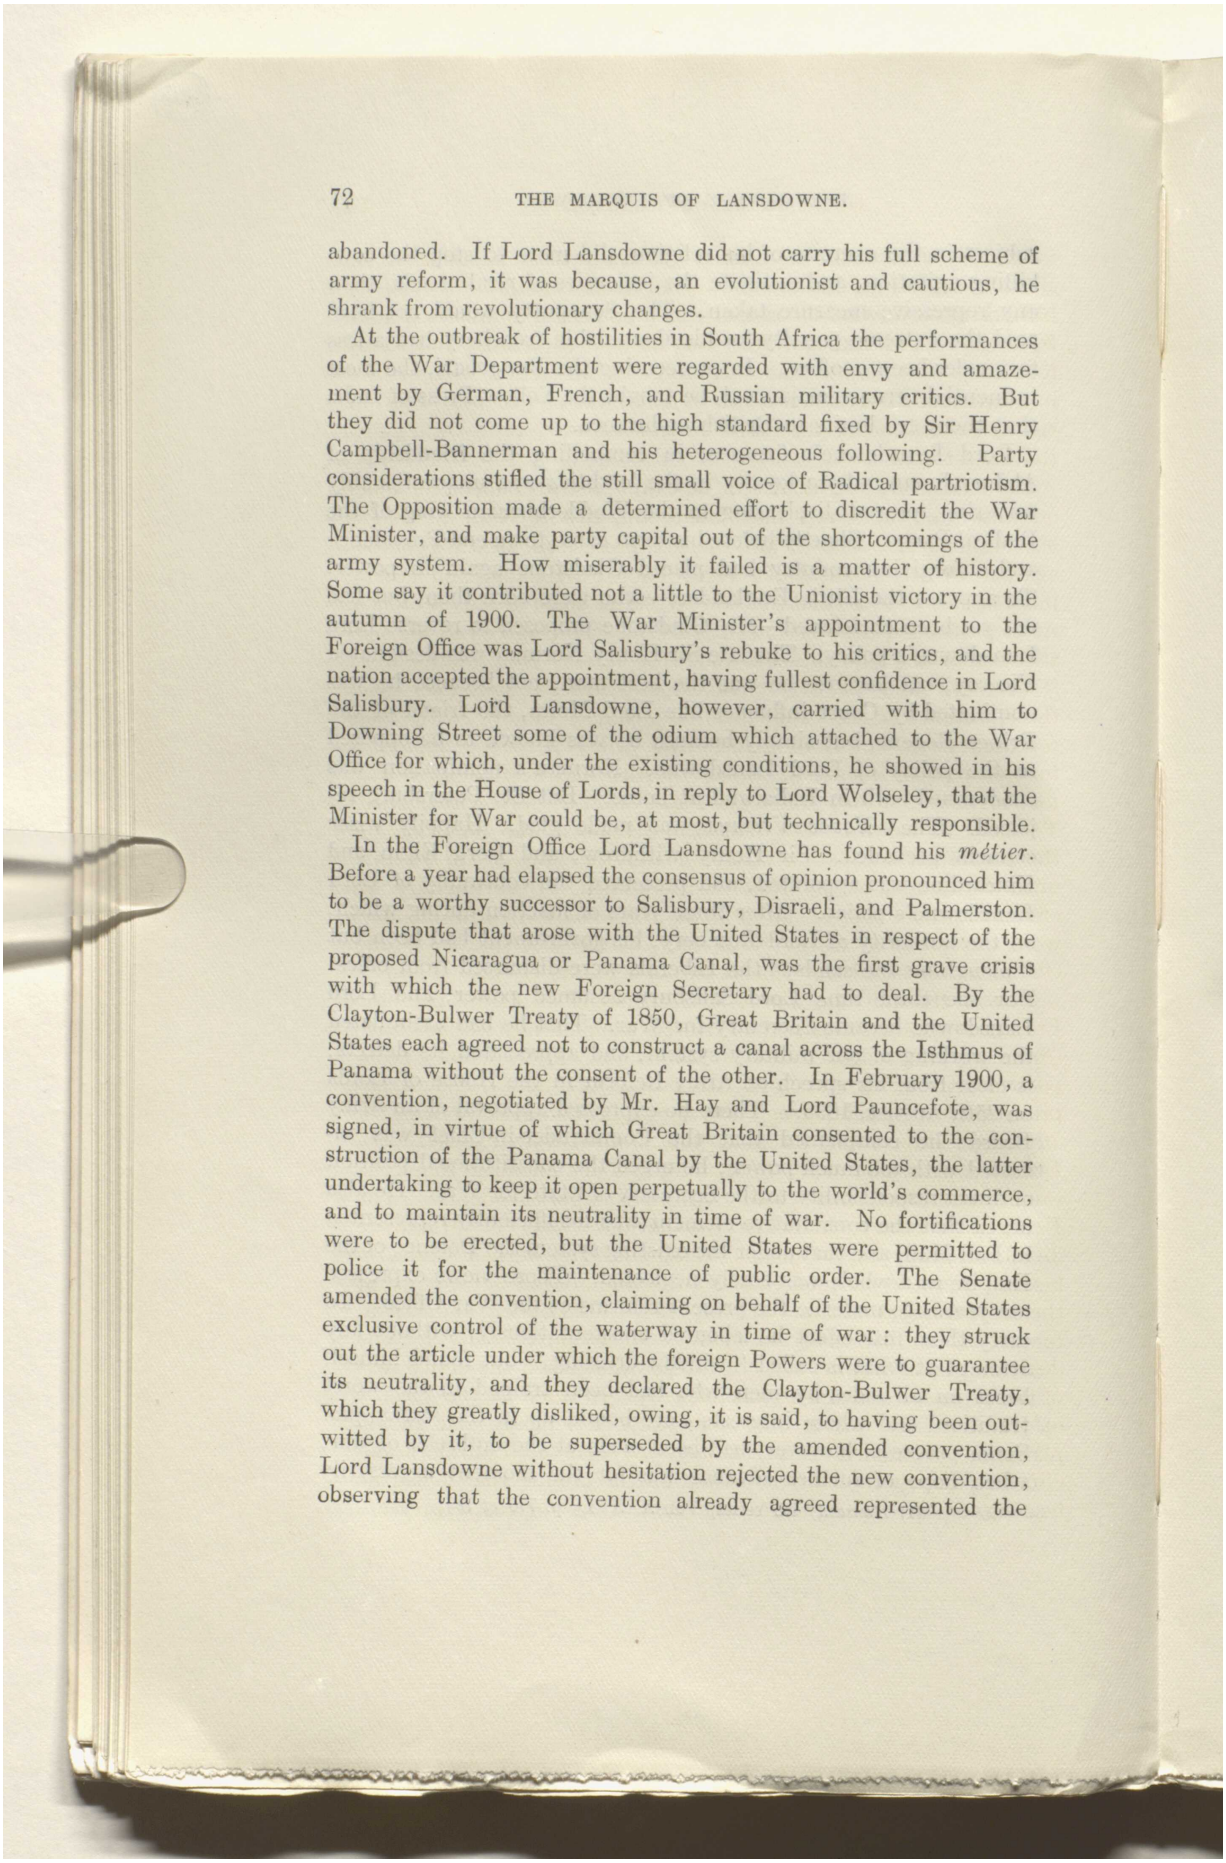
BRITISH LIBRARY

subject in the exercise of his religion, did more to stop the cow-killing agitation, and mitigate the jealousies of rival creeds, than any repressive measure taken. The Senaputty would not have paid the extreme penalty for his abominable treachery had a less firm ruler been in office. In prosecuting the *Bungobasi*, the most influential vernacular journal, he taught the Yellow Press of India that there are limits to British endurance.



Lord Lansdowne's firmness in compelling the friendship of Abdurrahman, whose loyalty in the 'eighties was unquestionably wavering, proved displeasing to the Wedderburnian wing of the Radical Party. Shortly before his term came to an end Providence and a forgiving country had placed Gladstone again in power. To appease the Little Englanders—who were born then, but had not yet been christened—Mr. Gladstone proposed to reverse Lord Lansdowne's policy. The late Sir Henry Norman was designated Viceroy, not because he was the best man, not because he was nominated by Court influence like Lord Moira, the friend of the Prince Regent, but simply because he was known to be opposed to the policy of Lord Lansdowne. Norman's nomination was condemned both in India and at home. But St. Petersburg rejoiced. The *Novöe Vremya* was made glad. Happily wiser councils prevailed. Sir Henry withdrew, and Lord Elgin and Kincardine was appointed, and preserved the continuity of Lord Lansdowne's policy. After three years of inaction during which, on the authority of Lord Rosebery, his government had been but "ploughing the sands," the Liberals were dismissed from office. For the third time Lord Salisbury assumed power, and Lord Lansdowne became Secretary for War. That he had assimilated the working of our military system, and appreciated its defects, is clear from his speech on Army Reform in the House of Lords on 25th August, 1895.[1] There he expressed approval of an Army Board; he complained that the Commander-in-Chief was invested with too much power; he urged the constitutional position of direct responsibility to the Secretary of State for War. He also urged that the consultative element was insufficiently represented in Pall Mall, and that under the existing system the Defence of the Empire as a whole was sorely neglected. Those views expressed ten years ago underlie the present reforms at the War Office. To carry them into effect he laboured unostentatiously, without any attempt at what is called "window-dressing," but found himself beset on all sides by men who had been trained in the worst tradition, and whose interests were bound up in the *status quo*. Some progress, however, had been made at the outbreak of war, when hope of further advance was for the moment necessarily

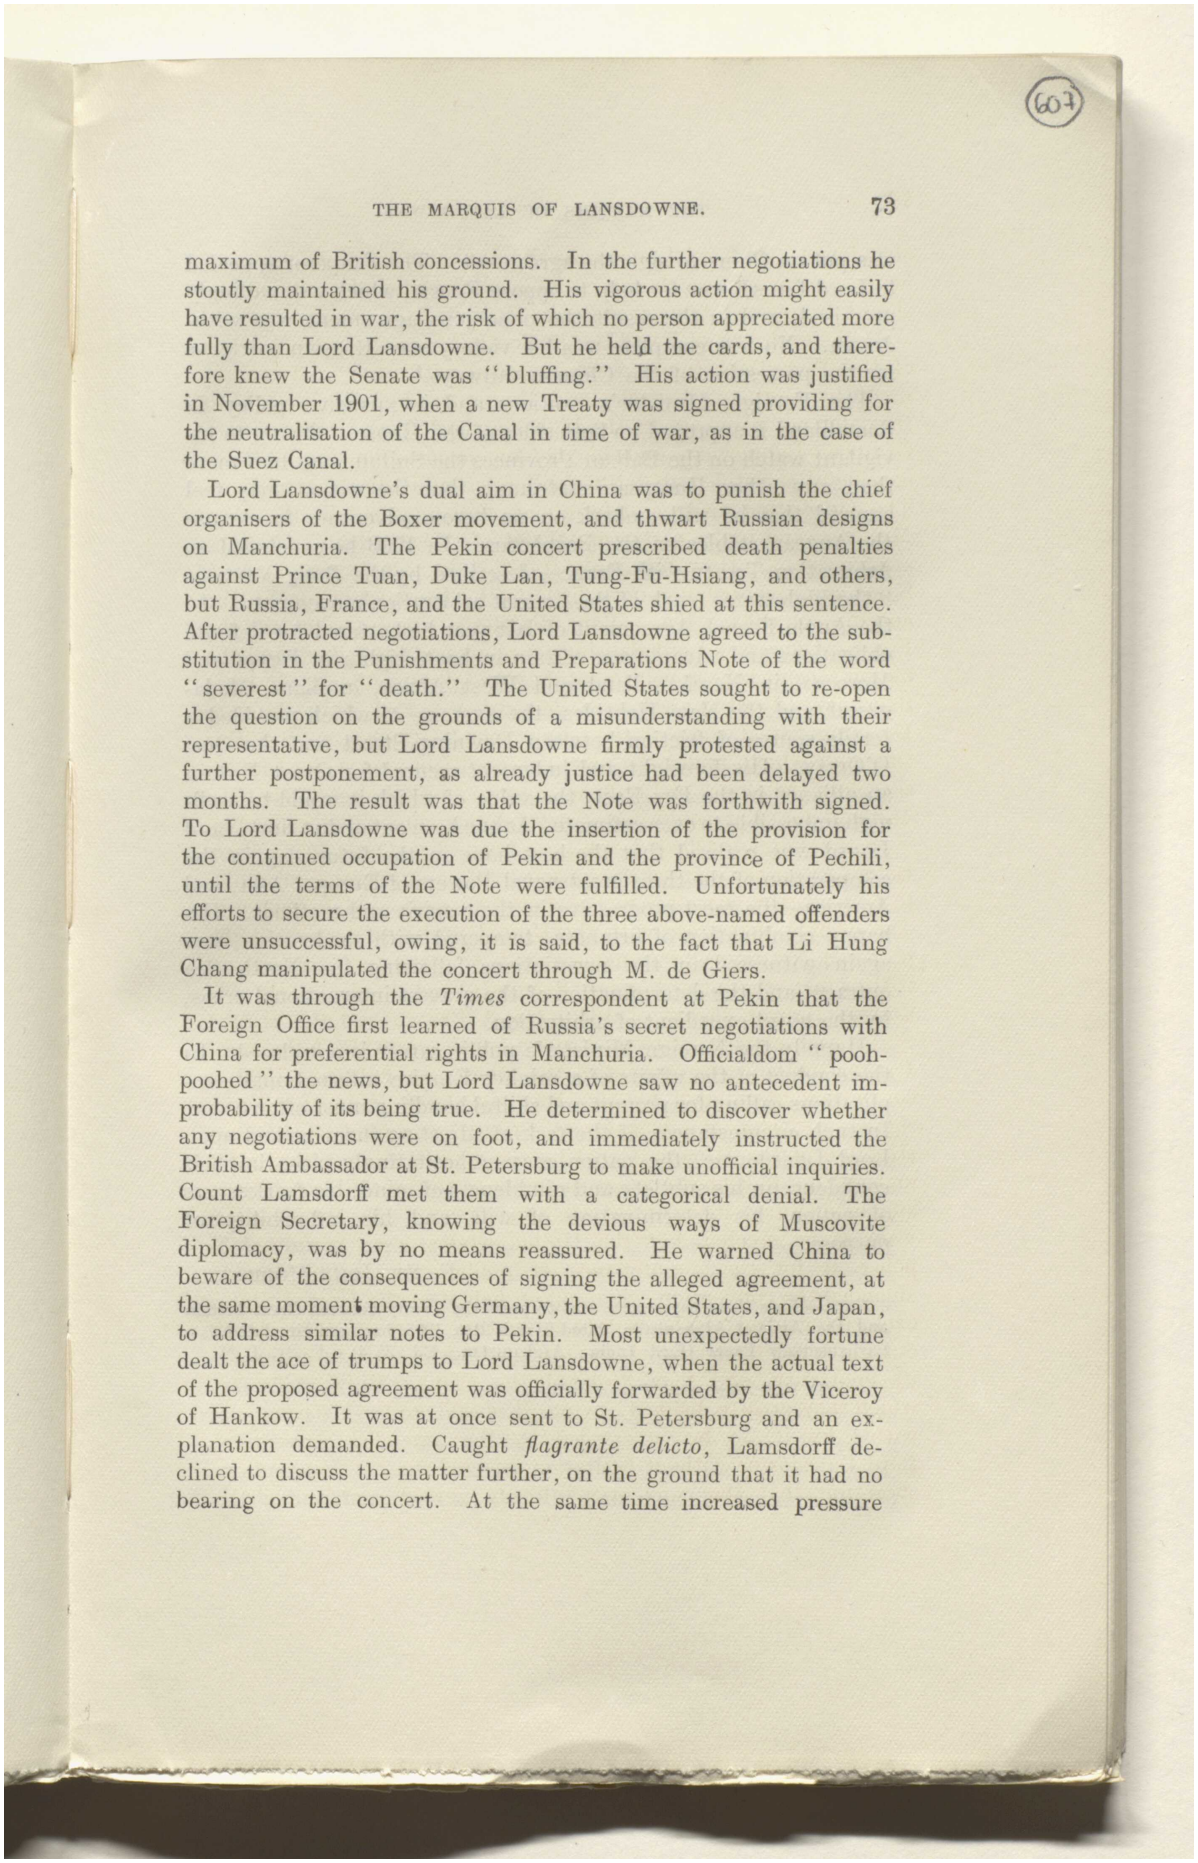
BRITISH LIBRARY

abandoned. If Lord Lansdowne did not carry his full scheme of army reform, it was because, an evolutionist and cautious, he shrank from revolutionary changes.



At the outbreak of hostilities in South Africa the performances of the War Department were regarded with envy and amazement by German, French, and Russian military critics. But they did not come up to the high standard fixed by Sir Henry Campbell-Bannerman and his heterogeneous following. Party considerations stifled the still small voice of Radical partriotism. The Opposition made a determined effort to discredit the War Minister, and make party capital out of the shortcomings of the army system. How miserably it failed is a matter of history. Some say it contributed not a little to the Unionist victory in the autumn of 1900. The War Minister's appointment to the Foreign Office was Lord Salisbury's rebuke to his critics, and the nation accepted the appointment, having fullest confidence in Lord Salisbury. Lord Lansdowne, however, carried with him to Downing Street some of the odium which attached to the War Office for which, under the existing conditions, he showed in his speech in the House of Lords, in reply to Lord Wolseley, that the Minister for War could be, at most, but technically responsible.

In the Foreign Office Lord Lansdowne has found his *métier*. Before a year had elapsed the consensus of opinion pronounced him to be a worthy successor to Salisbury, Disraeli, and Palmerston. The dispute that arose with the United States in respect of the proposed Nicaragua or Panama Canal, was the first grave crisis with which the new Foreign Secretary had to deal. By the Clayton-Bulwer Treaty of 1850, Great Britain and the United States each agreed not to construct a canal across the Isthmus of Panama without the consent of the other. In February 1900, a convention, negotiated by Mr. Hay and Lord Pauncefote, was signed, in virtue of which Great Britain consented to the construction of the Panama Canal by the United States, the latter undertaking to keep it open perpetually to the world's commerce, and to maintain its neutrality in time of war. No fortifications were to be erected, but the United States were permitted to police it for the maintenance of public order. The Senate amended the convention, claiming on behalf of the United States exclusive control of the waterway in time of war: they struck out the article under which the foreign Powers were to guarantee its neutrality, and they declared the Clayton-Bulwer Treaty, which they greatly disliked, owing, it is said, to having been outwitted by it, to be superseded by the amended convention. Lord Lansdowne without hesitation rejected the new convention, observing that the convention already agreed represented the

BRITISH LIBRARY

maximum of British concessions. In the further negotiations he stoutly maintained his ground. His vigorous action might easily have resulted in war, the risk of which no person appreciated more fully than Lord Lansdowne. But he held the cards, and therefore knew the Senate was "bluffing." His action was justified in November 1901, when a new Treaty was signed providing for the neutralisation of the Canal in time of war, as in the case of the Suez Canal.

Lord Lansdowne's dual aim in China was to punish the chief organisers of the Boxer movement, and thwart Russian designs on Manchuria. The Pekin concert prescribed death penalties against Prince Tuan, Duke Lan, Tung-Fu-Hsiang, and others, but Russia, France, and the United States shied at this sentence. After protracted negotiations, Lord Lansdowne agreed to the substitution in the Punishments and Preparations Note of the word "severest" for "death." The United States sought to re-open the question on the grounds of a misunderstanding with their representative, but Lord Lansdowne firmly protested against a further postponement, as already justice had been delayed two months. The result was that the Note was forthwith signed. To Lord Lansdowne was due the insertion of the provision for the continued occupation of Pekin and the province of Pechili, until the terms of the Note were fulfilled. Unfortunately his efforts to secure the execution of the three above-named offenders were unsuccessful, owing, it is said, to the fact that Li Hung Chang manipulated the concert through M. de Giers.

It was through the *Times* correspondent at Pekin that the Foreign Office first learned of Russia's secret negotiations with China for preferential rights in Manchuria. Officialdom "poohpoohed" the news, but Lord Lansdowne saw no antecedent improbability of its being true. He determined to discover whether any negotiations were on foot, and immediately instructed the British Ambassador at St. Petersburg to make unofficial inquiries. Count Lamsdorff met them with a categorical denial. The Foreign Secretary, knowing the devious ways of Muscovite diplomacy, was by no means reassured. He warned China to beware of the consequences of signing the alleged agreement, at the same moment moving Germany, the United States, and Japan, to address similar notes to Pekin. Most unexpectedly fortune dealt the ace of trumps to Lord Lansdowne, when the actual text of the proposed agreement was officially forwarded by the Viceroy of Hankow. It was at once sent to St. Petersburg and an explanation demanded. Caught *flagrante delicto*, Lamsdorff declined to discuss the matter further, on the ground that it had no bearing on the concert. At the same time increased pressure

BRITISH LIBRARY

was put on China to sign the agreement. The Emperor appealed to Lord Lansdowne for help to oppose Russia, which was willingly promised, and in the result the obnoxious agreement was withdrawn. No less complete was his victory over Russian intrigues for the possession of the Chinese railways.[1]

The Foreign Minister's cautious and inexpansive policy in Somaliland is approved on both sides of the House. Owing to his vigilant watch on the Balkan Provinces the Sultan fears him more than any other European statesman, but the nation may feel assured that he will embark on no heroic adventure to cleanse the Augean stables on the Bosphorus. In 1903 he concluded an Arbitration Treaty with France, described by the *Daily News* as "the high-water mark of the present arbitration movement." In the Anglo-French Agreement of last year he bartered for definite obligations and advantages, certain inchoate rights in Egypt and Morocco, in Newfoundland and West Africa, in Siam, Madagascar and the New Hebrides, the exercise of which provided a fertile source of friction between Downing Street and the Quai D'Orsay. His foresight and judgment secured for Great Britain an alliance in the Far East, the value of which it would be well-nigh impossible to over-estimate. As one born out of due time, Lord Lansdowne realised that the best hope in the future lay in the co-operation of the three great naval Powers of Europe, Asia, and America—the most progressive in their spirit and methods. His happy combination of firmness, tempered with moderation, was again witnessed in the negotiations following the North Sea outrage, and the determination of the gravest international crisis, by the novel expedient of arbitration.

Happily the Foreign Minister's public career is not closed. In the conduct of the affairs of a mighty Empire international complications calling for prompt and skilful handling must often occur. In such circumstances, if the task of adjusting them be laid upon Lord Lansdowne, the nation may unhesitatingly place implicit confidence in his subtlety and nimbleness of mind, his fearlessness of action, his determination of will, and his inflexibility of purpose.

F. St. John Morrow.

Note.—Since these pages were sent to press the Treaty between Great Britain and the Amir of Afghanistan, dated March 21st, 1905, has been circulated as a Parliamentary Paper (East India: Afghanistan. Cd. 2534).—F. St. J. M.

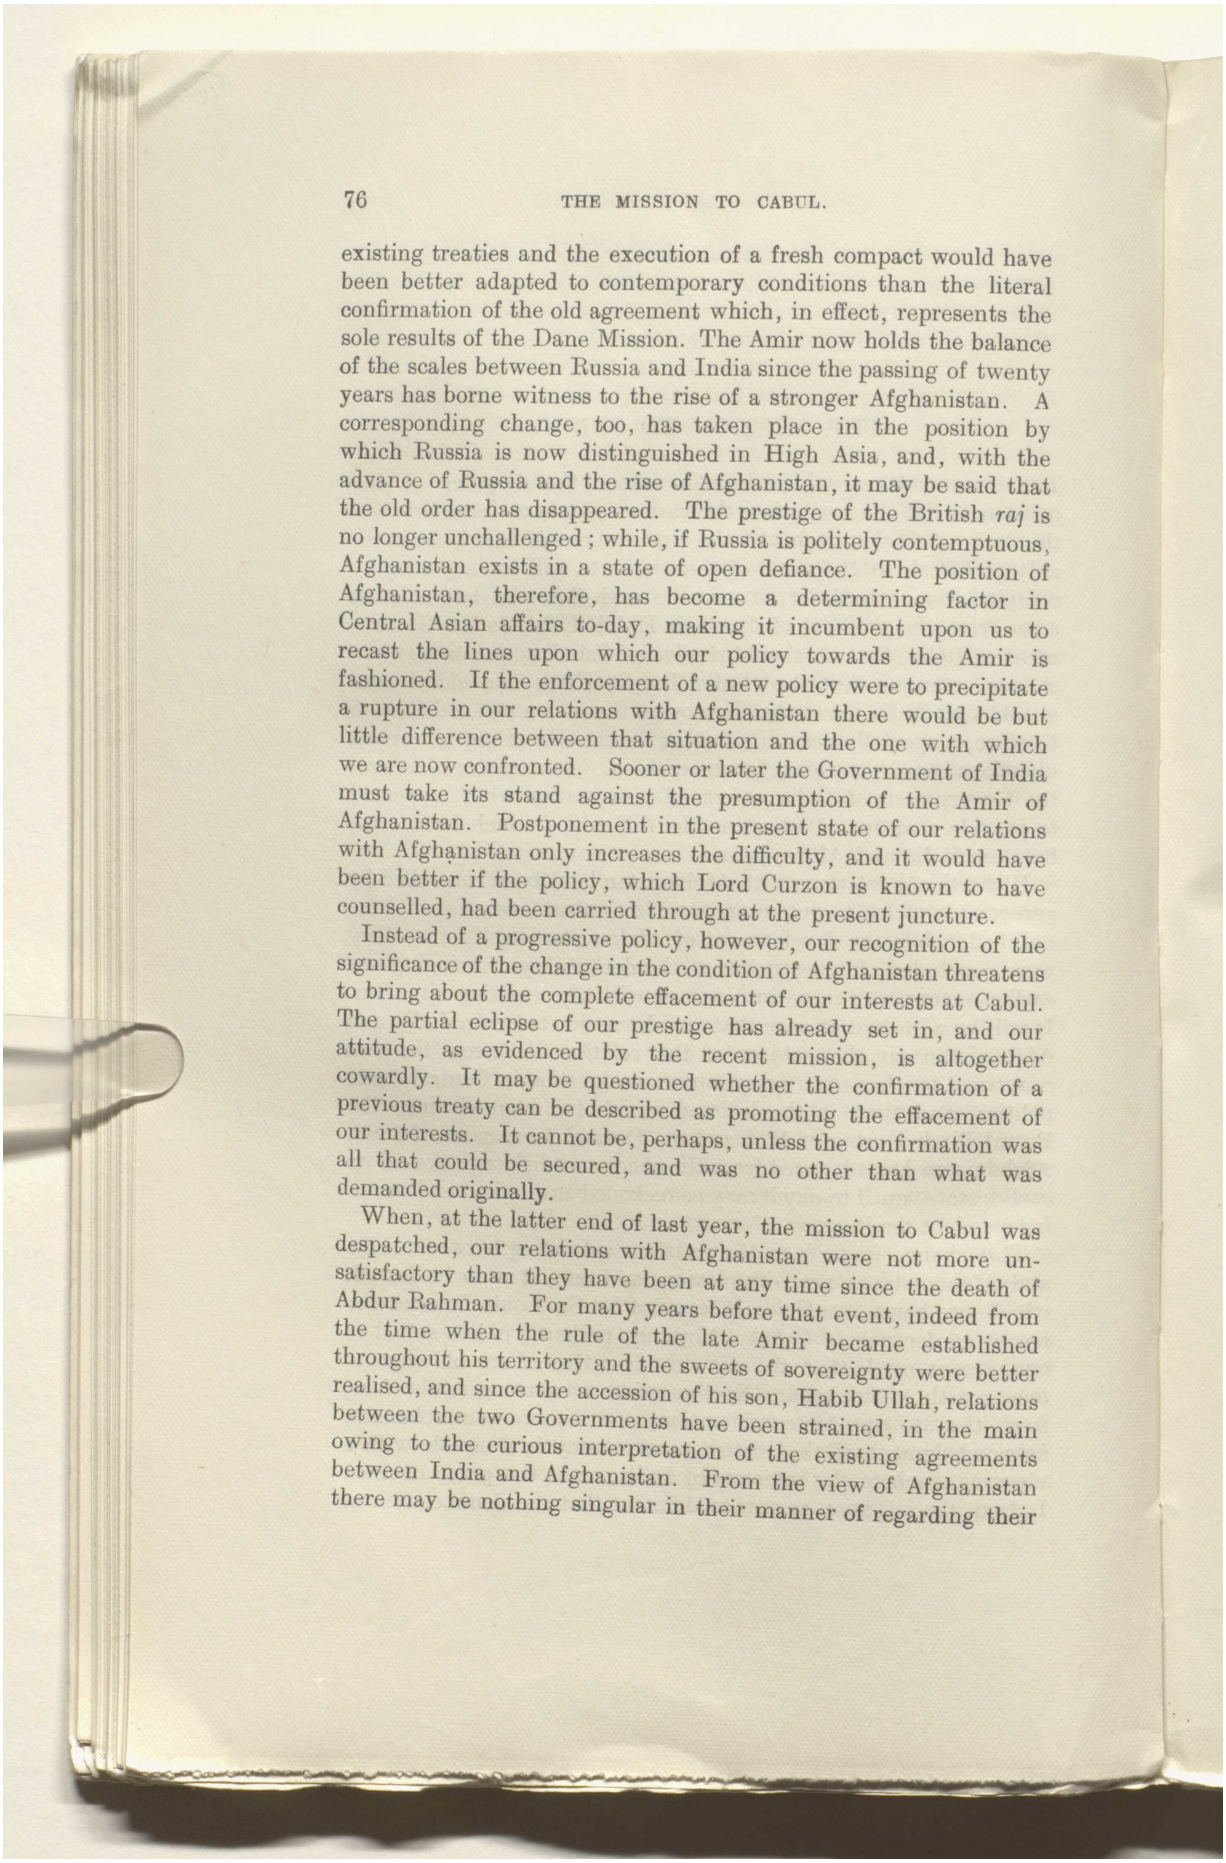
THE MISSION TO CABUL.

THE circumstances which brought about the despatch of the mission to Cabul to negotiate the various points at issue between the Amir of Afghanistan and the Government of India, are probably too fresh in the mind of the public to call for any lengthy recapitulation. In brief, it may be said that the late mission arose from the proposal of the Amir Habib Ullah to the Government of India, that he should receive at Cabul, at the time when it was arranged that the Sirdar Inayat Ullah, his eldest son, should visit India to see the Viceroy on the return of Lord Curzon to office, a specially accredited agent for the discussing of various questions concerning his relations with us. As a matter of course, the Government of India welcomed a suggestion which appeared to provide a means of adjusting the difficulties which had arisen between India and Afghanistan.



Hitherto our relations with Afghanistan have been controlled by agreements which recent occurrences in Central Asia, in part, have nullified, while the development of Afghanistan itself, since they were concluded, further points to the desirability of bringing our earlier enactments more into accord with the existing situation. It will be admitted at once that any discussion between India and Afghanistan on the subject of the relations between the two countries, touches upon every important question in Central Asian politics, and that, in the interval which has elapsed since the Rawal Pindi Durbar of 1885 and the Durand Agreement of 1893, Afghanistan has advanced from the chaos and disintegration of its earlier state, until to-day it may be reckoned as a united and quasi-independent territory.

This change imparts to the relations subsisting between India and Afghanistan a new complexion, and one, it is to be feared, which was borne insufficiently in mind by Sir Louis Dane at the recent conference in Cabul. Nothing, perhaps, is less suited to our present needs than the mere confirmation of our old engagements with Afghanistan. New questions have come to the fore, fresh ties are ripe for consideration, and a more comprehensive acknowledgment of the British paramountcy is desirable with a view, as much to the interests of India, as to the peace of Asia. Indeed, the situation is now so different that the denunciation of

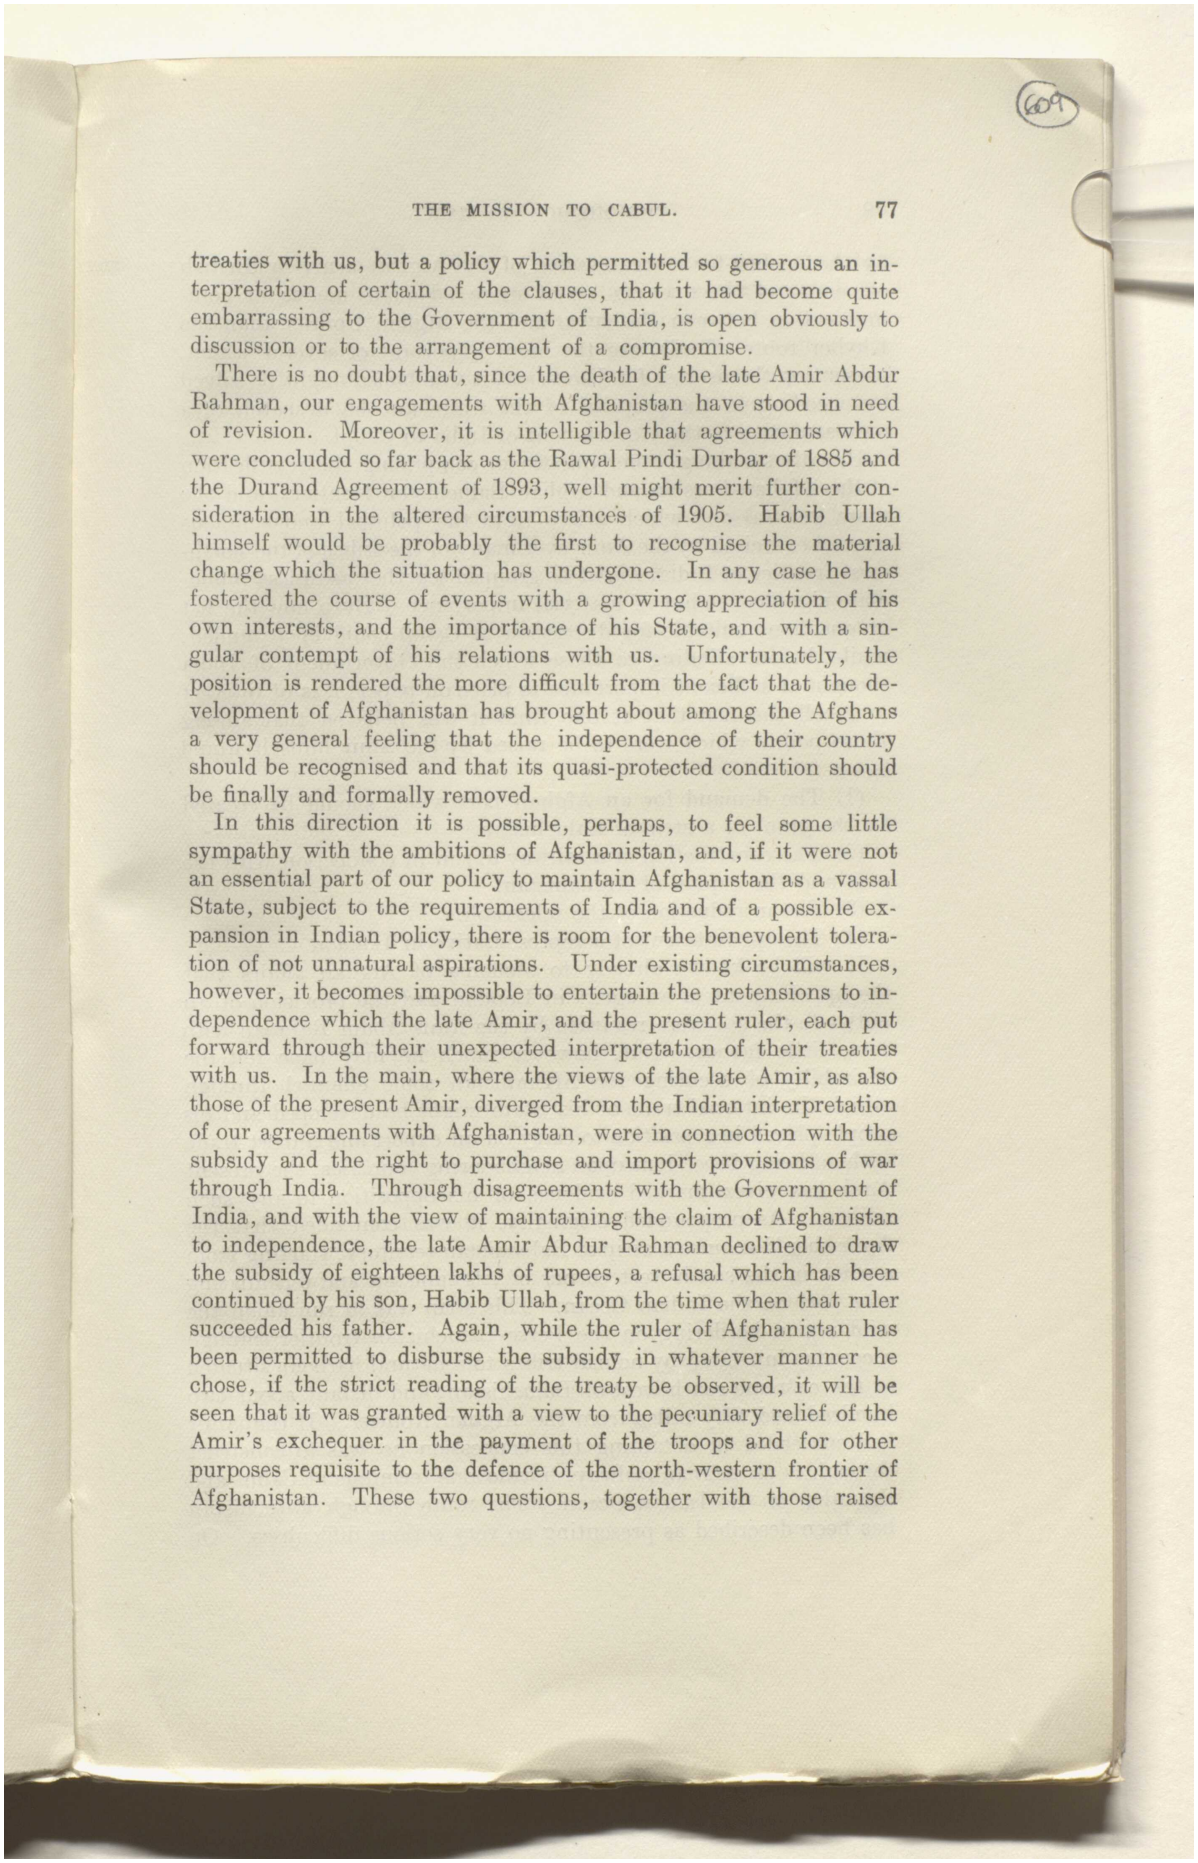
BRITISH LIBRARY

existing treaties and the execution of a fresh compact would have been better adapted to contemporary conditions than the literal confirmation of the old agreement which, in effect, represents the sole results of the Dane Mission. The Amir now holds the balance of the scales between Russia and India since the passing of twenty years has borne witness to the rise of a stronger Afghanistan. A corresponding change, too, has taken place in the position by which Russia is now distinguished in High Asia, and, with the advance of Russia and the rise of Afghanistan, it may be said that the old order has disappeared. The prestige of the British *raj* is no longer unchallenged; while, if Russia is politely contemptuous, Afghanistan exists in a state of open defiance. The position of Afghanistan, therefore, has become a determining factor in Central Asian affairs to-day, making it incumbent upon us to recast the lines upon which our policy towards the Amir is fashioned. If the enforcement of a new policy were to precipitate a rupture in our relations with Afghanistan there would be but little difference between that situation and the one with which we are now confronted. Sooner or later the Government of India must take its stand against the presumption of the Amir of Afghanistan. Postponement in the present state of our relations with Afghanistan only increases the difficulty, and it would have been better if the policy, which Lord Curzon is known to have counselled, had been carried through at the present juncture.



Instead of a progressive policy, however, our recognition of the significance of the change in the condition of Afghanistan threatens to bring about the complete effacement of our interests at Cabul. The partial eclipse of our prestige has already set in, and our attitude, as evidenced by the recent mission, is altogether cowardly. It may be questioned whether the confirmation of a previous treaty can be described as promoting the effacement of our interests. It cannot be, perhaps, unless the confirmation was all that could be secured, and was no other than what was demanded originally.

When, at the latter end of last year, the mission to Cabul was despatched, our relations with Afghanistan were not more unsatisfactory than they have been at any time since the death of Abdur Rahman. For many years before that event, indeed from the time when the rule of the late Amir became established throughout his territory and the sweets of sovereignty were better realised, and since the accession of his son, Habib Ullah, relations between the two Governments have been strained, in the main owing to the curious interpretation of the existing agreements between India and Afghanistan. From the view of Afghanistan there may be nothing singular in their manner of regarding their

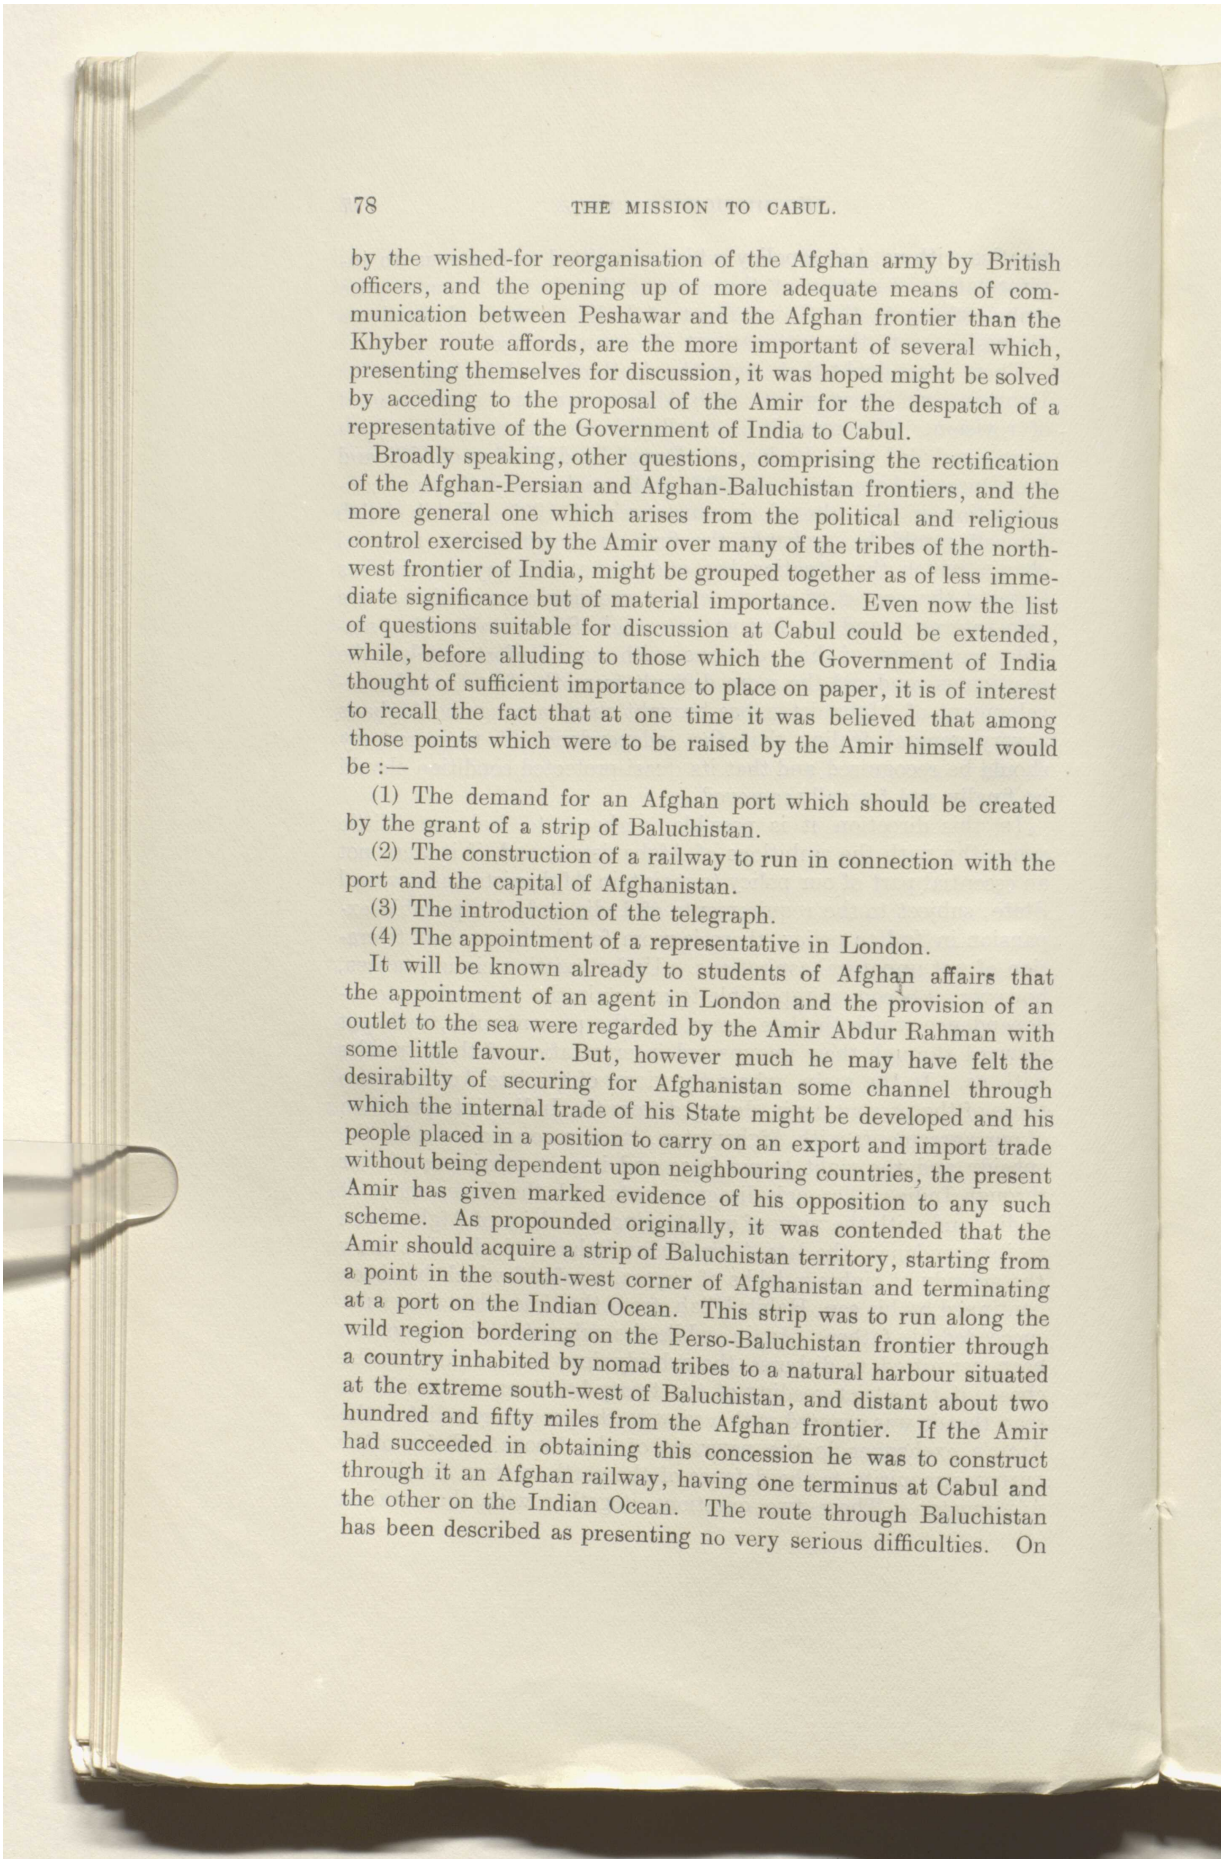
BRITISH LIBRARY

treaties with us, but a policy which permitted so generous an interpretation of certain of the clauses, that it had become quite embarrassing to the Government of India, is open obviously to discussion or to the arrangement of a compromise.



There is no doubt that, since the death of the late Amir Abdur Rahman, our engagements with Afghanistan have stood in need of revision. Moreover, it is intelligible that agreements which were concluded so far back as the Rawal Pindi Durbar of 1885 and the Durand Agreement of 1893, well might merit further consideration in the altered circumstances of 1905. Habib Ullah himself would be probably the first to recognise the material change which the situation has undergone. In any case he has fostered the course of events with a growing appreciation of his own interests, and the importance of his State, and with a singular contempt of his relations with us. Unfortunately, the position is rendered the more difficult from the fact that the development of Afghanistan has brought about among the Afghans a very general feeling that the independence of their country should be recognised and that its quasi-protected condition should be finally and formally removed.

In this direction it is possible, perhaps, to feel some little sympathy with the ambitions of Afghanistan, and, if it were not an essential part of our policy to maintain Afghanistan as a vassal State, subject to the requirements of India and of a possible expansion in Indian policy, there is room for the benevolent toleration of not unnatural aspirations. Under existing circumstances, however, it becomes impossible to entertain the pretensions to independence which the late Amir, and the present ruler, each put forward through their unexpected interpretation of their treaties with us. In the main, where the views of the late Amir, as also those of the present Amir, diverged from the Indian interpretation of our agreements with Afghanistan, were in connection with the subsidy and the right to purchase and import provisions of war through India. Through disagreements with the Government of India, and with the view of maintaining the claim of Afghanistan to independence, the late Amir Abdur Rahman declined to draw the subsidy of eighteen lakhs of rupees, a refusal which has been continued by his son, Habib Ullah, from the time when that ruler succeeded his father. Again, while the ruler of Afghanistan has been permitted to disburse the subsidy in whatever manner he chose, if the strict reading of the treaty be observed, it will be seen that it was granted with a view to the pecuniary relief of the Amir's exchequer in the payment of the troops and for other purposes requisite to the defence of the north-western frontier of Afghanistan. These two questions, together with those raised

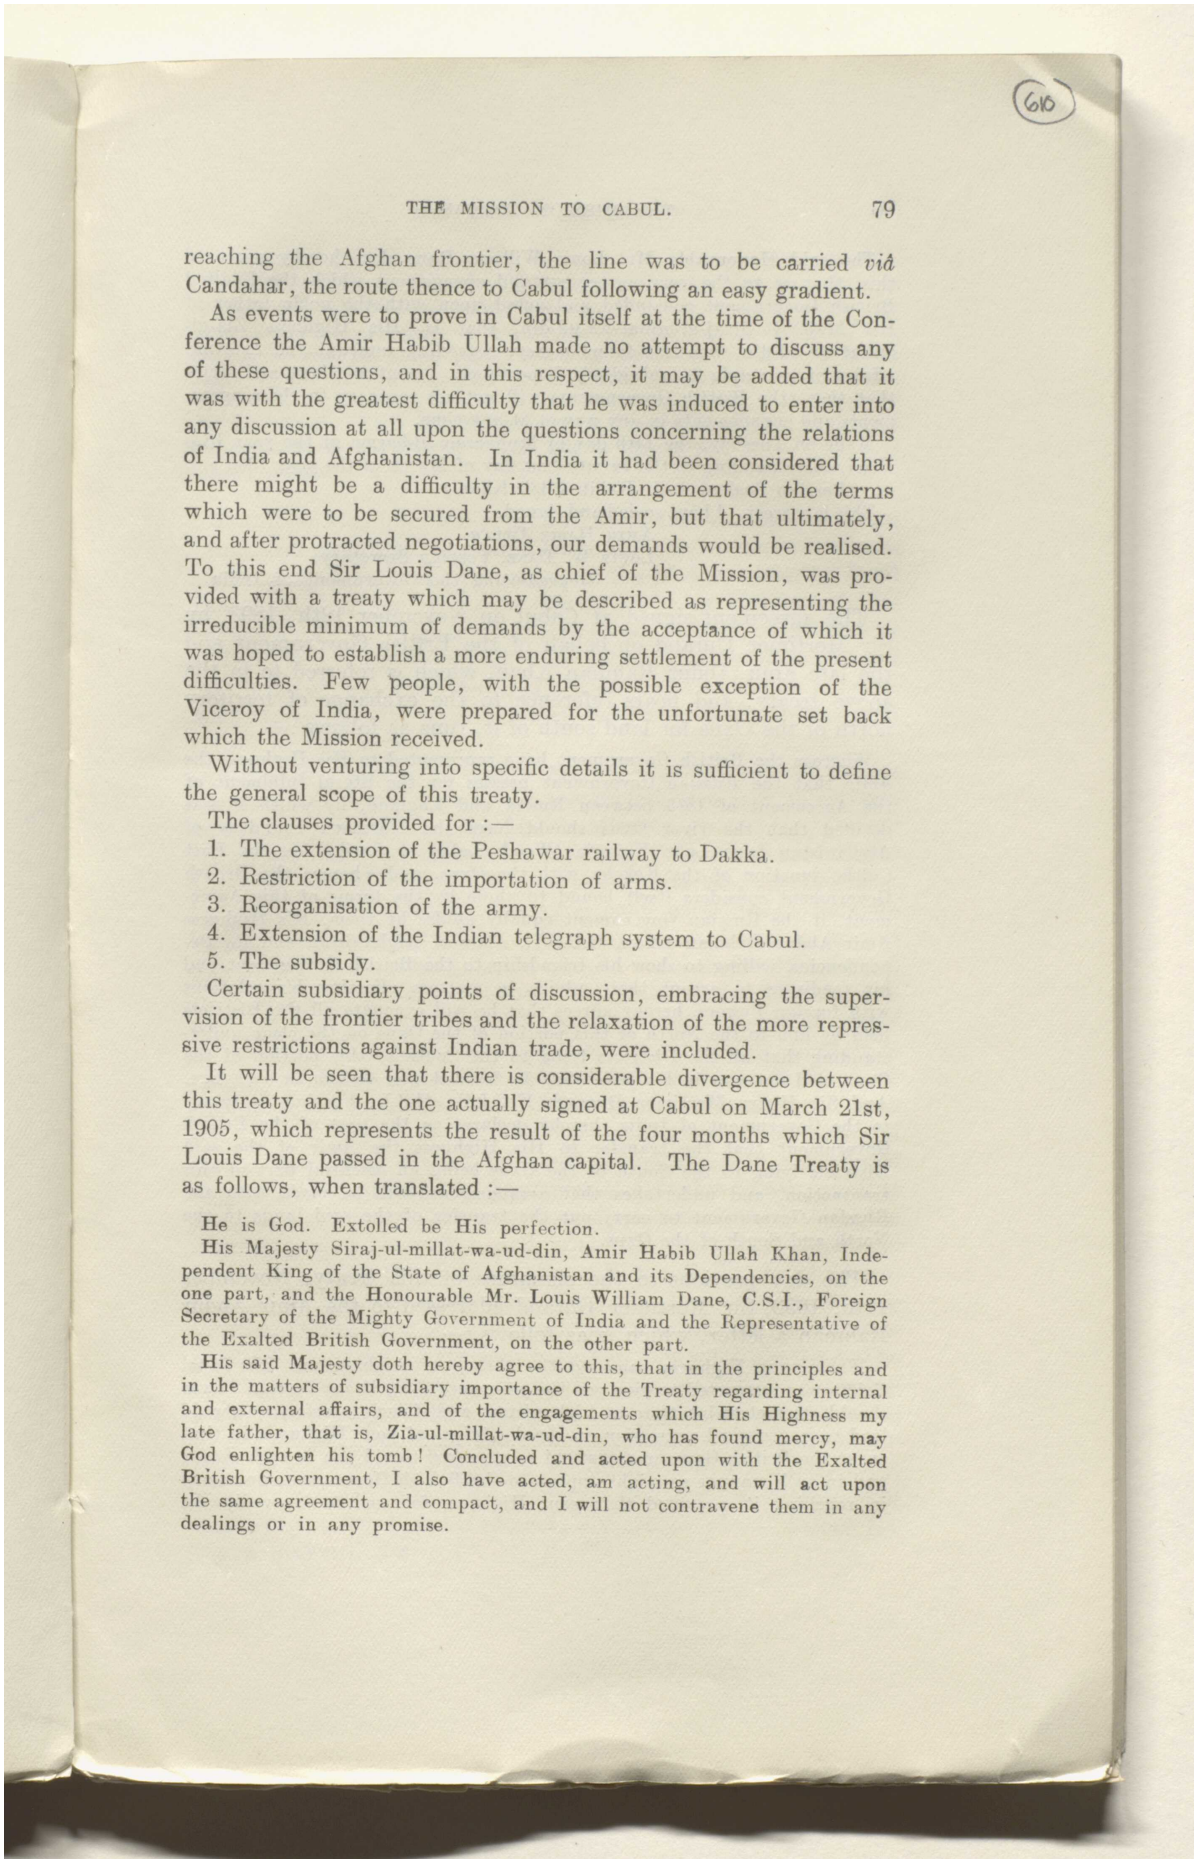
by the wished-for reorganisation of the Afghan army by British officers, and the opening up of more adequate means of communication between Peshawar and the Afghan frontier than the Khyber route affords, are the more important of several which, presenting themselves for discussion, it was hoped might be solved by acceding to the proposal of the Amir for the despatch of a representative of the Government of India to Cabul.

Broadly speaking, other questions, comprising the rectification of the Afghan-Persian and Afghan-Baluchistan frontiers, and the more general one which arises from the political and religious control exercised by the Amir over many of the tribes of the north-west frontier of India, might be grouped together as of less immediate significance but of material importance. Even now the list of questions suitable for discussion at Cabul could be extended, while, before alluding to those which the Government of India thought of sufficient importance to place on paper, it is of interest to recall the fact that at one time it was believed that among those points which were to be raised by the Amir himself would be :—

(1) The demand for an Afghan port which should be created by the grant of a strip of Baluchistan.

(2) The construction of a railway to run in connection with the port and the capital of Afghanistan.

(3) The introduction of the telegraph.



(4) The appointment of a representative in London.

It will be known already to students of Afghan affairs that the appointment of an agent in London and the provision of an outlet to the sea were regarded by the Amir Abdur Rahman with some little favour. But, however much he may have felt the desirabilty of securing for Afghanistan some channel through which the internal trade of his State might be developed and his people placed in a position to carry on an export and import trade without being dependent upon neighbouring countries, the present Amir has given marked evidence of his opposition to any such scheme. As propounded originally, it was contended that the Amir should acquire a strip of Baluchistan territory, starting from a point in the south-west corner of Afghanistan and terminating at a port on the Indian Ocean. This strip was to run along the wild region bordering on the Perso-Baluchistan frontier through a country inhabited by nomad tribes to a natural harbour situated at the extreme south-west of Baluchistan, and distant about two hundred and fifty miles from the Afghan frontier. If the Amir had succeeded in obtaining this concession he was to construct through it an Afghan railway, having one terminus at Cabul and the other on the Indian Ocean. The route through Baluchistan has been described as presenting no very serious difficulties. On

BRITISH LIBRARY

reaching the Afghan frontier, the line was to be carried *viâ* Candahar, the route thence to Cabul following an easy gradient.

As events were to prove in Cabul itself at the time of the Conference the Amir Habib Ullah made no attempt to discuss any of these questions, and in this respect, it may be added that it was with the greatest difficulty that he was induced to enter into any discussion at all upon the questions concerning the relations of India and Afghanistan. In India it had been considered that there might be a difficulty in the arrangement of the terms which were to be secured from the Amir, but that ultimately, and after protracted negotiations, our demands would be realised. To this end Sir Louis Dane, as chief of the Mission, was provided with a treaty which may be described as representing the irreducible minimum of demands by the acceptance of which it was hoped to establish a more enduring settlement of the present difficulties. Few people, with the possible exception of the Viceroy of India, were prepared for the unfortunate set back which the Mission received.

Without venturing into specific details it is sufficient to define the general scope of this treaty.

The clauses provided for :—

1. The extension of the Peshawar railway to Dakka.
2. Restriction of the importation of arms.
3. Reorganisation of the army.
4. Extension of the Indian telegraph system to Cabul.
5. The subsidy.

Certain subsidiary points of discussion, embracing the supervision of the frontier tribes and the relaxation of the more repressive restrictions against Indian trade, were included.

It will be seen that there is considerable divergence between this treaty and the one actually signed at Cabul on March 21st, 1905, which represents the result of the four months which Sir Louis Dane passed in the Afghan capital. The Dane Treaty is as follows, when translated :—

He is God. Extolled be His perfection.

His Majesty Siraj-ul-millat-wa-ud-din, Amir Habib Ullah Khan, Independent King of the State of Afghanistan and its Dependencies, on the one part, and the Honourable Mr. Louis William Dane, C.S.I., Foreign Secretary of the Mighty Government of India and the Representative of the Exalted British Government, on the other part.

His said Majesty doth hereby agree to this, that in the principles and in the matters of subsidiary importance of the Treaty regarding internal and external affairs, and of the engagements which His Highness my late father, that is, Zia-ul-millat-wa-ud-din, who has found mercy, may God enlighten his tomb! Concluded and acted upon with the Exalted British Government, I also have acted, am acting, and will act upon the same agreement and compact, and I will not contravene them in any dealings or in any promise.

The said Honourable Mr. Louis William Dane does hereby agree to this, that as to the very agreement and engagement which the Exalted British Government concluded and acted upon with the noble father of His Majesty Siraj-ul-millat-wa-ud-din, that is, His Highness Zia-ul-millat-wa-ud-din, who has found mercy, regarding internal and external affairs of principle or subsidiary importance, I confirm them and write that they (the British Government) will not act contrary to those agreements and engagements in any way or at any time.

Made on Tuesday, the 14th day of Muharram-ul-haram of the year 1323 Hijri, corresponding to the twenty-first day of March of the year 1905 A.D.

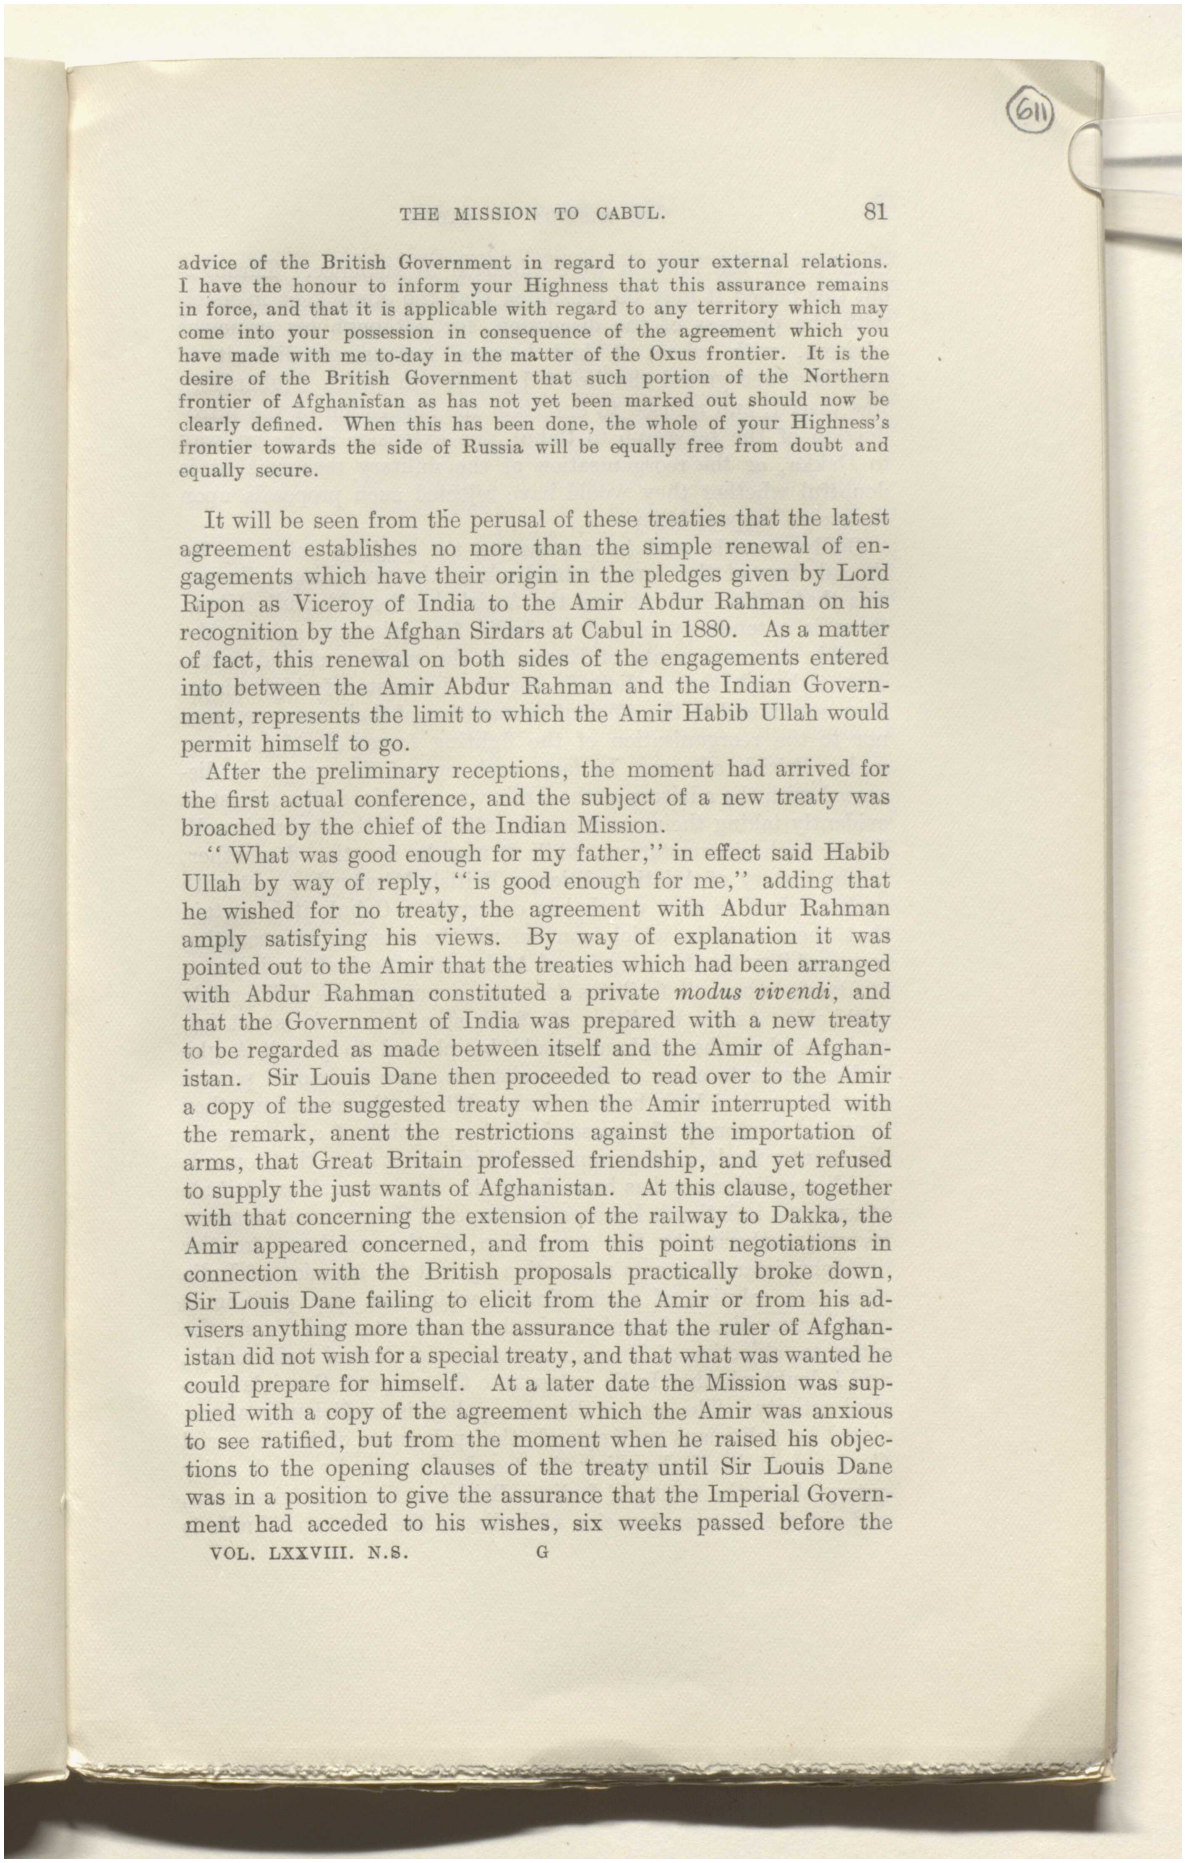
(Persian Seal of Amir Habib Ullah Khan.)

This is correct. I have sealed and signed.

AMIR HABIB ULLAH,
LOUIS W. DANE, Foreign Secretary,
Representing the Government of India.

The agreement signed at Cabul on November 12th, 1893, by Sir Mortimer Durand on behalf of the British Government and the late Amir Abdur Rahman Khan, which is referred to in the above treaty, and bears reference to the exchange of territory north of the Oxus for land south of it, runs as follows :—

Whereas the British Government have represented to His Highness the Amir that the Russian Government presses for the literal fulfilment of the Agreement of 1873 between Russia and England, by which it was decided that the river Oxus should form the Northern boundary of Afghanistan from Lake Victoria (Woods Lake) or Sarikul on the East to the junction of the Kokcha with the Oxus, and whereas the British Government considers itself bound to abide by the terms of this Agreement, if the Russian Government equally abides by them, His Highness Amir Abdur Rahman Khan, G.C.S.I., Amir of Afghanistan and its Dependencies, willing to show his friendship to the British Government and his readiness to accept their advice in matters affecting his relations with foreign Powers, hereby agrees that he will evacuate all the Districts held by him to the North of this portion of the Oxus on the clear understanding that all the Districts lying to the South of this portion of the Oxus, and not now in his possession, be handed over to him in exchange. And Sir Henry Mortimer Durand, K.C.I.E., C.S.I., Foreign Secretary to the Government of India, hereby declares on the part of the British Government that the transfer to His Highness the Amir of the said Districts lying to the South of the Oxus being an essential part of this transaction, and undertakes that arrangements will be made with the Russian Government to carry out the transfer of the said lands to the North and South of the Oxus.



The day previous to the signature of this treaty, November 11th, 1893, Sir Mortimer Durand addressed to the Amir Abdur Rahman a letter, which is as follows :—

When your Highness came to the throne of Afghanistan, Sir Lepel Griffin was instructed to give you the assurance that, if any foreign Power should attempt to interfere in Afghanistan, and if such interference should lead to unprovoked aggression on the dominions of your Highness, in that event the British Government would be prepared to aid you to such extent and in such manner as might appear to the British Government necessary in repelling it, provided that your Highness followed unreservedly the

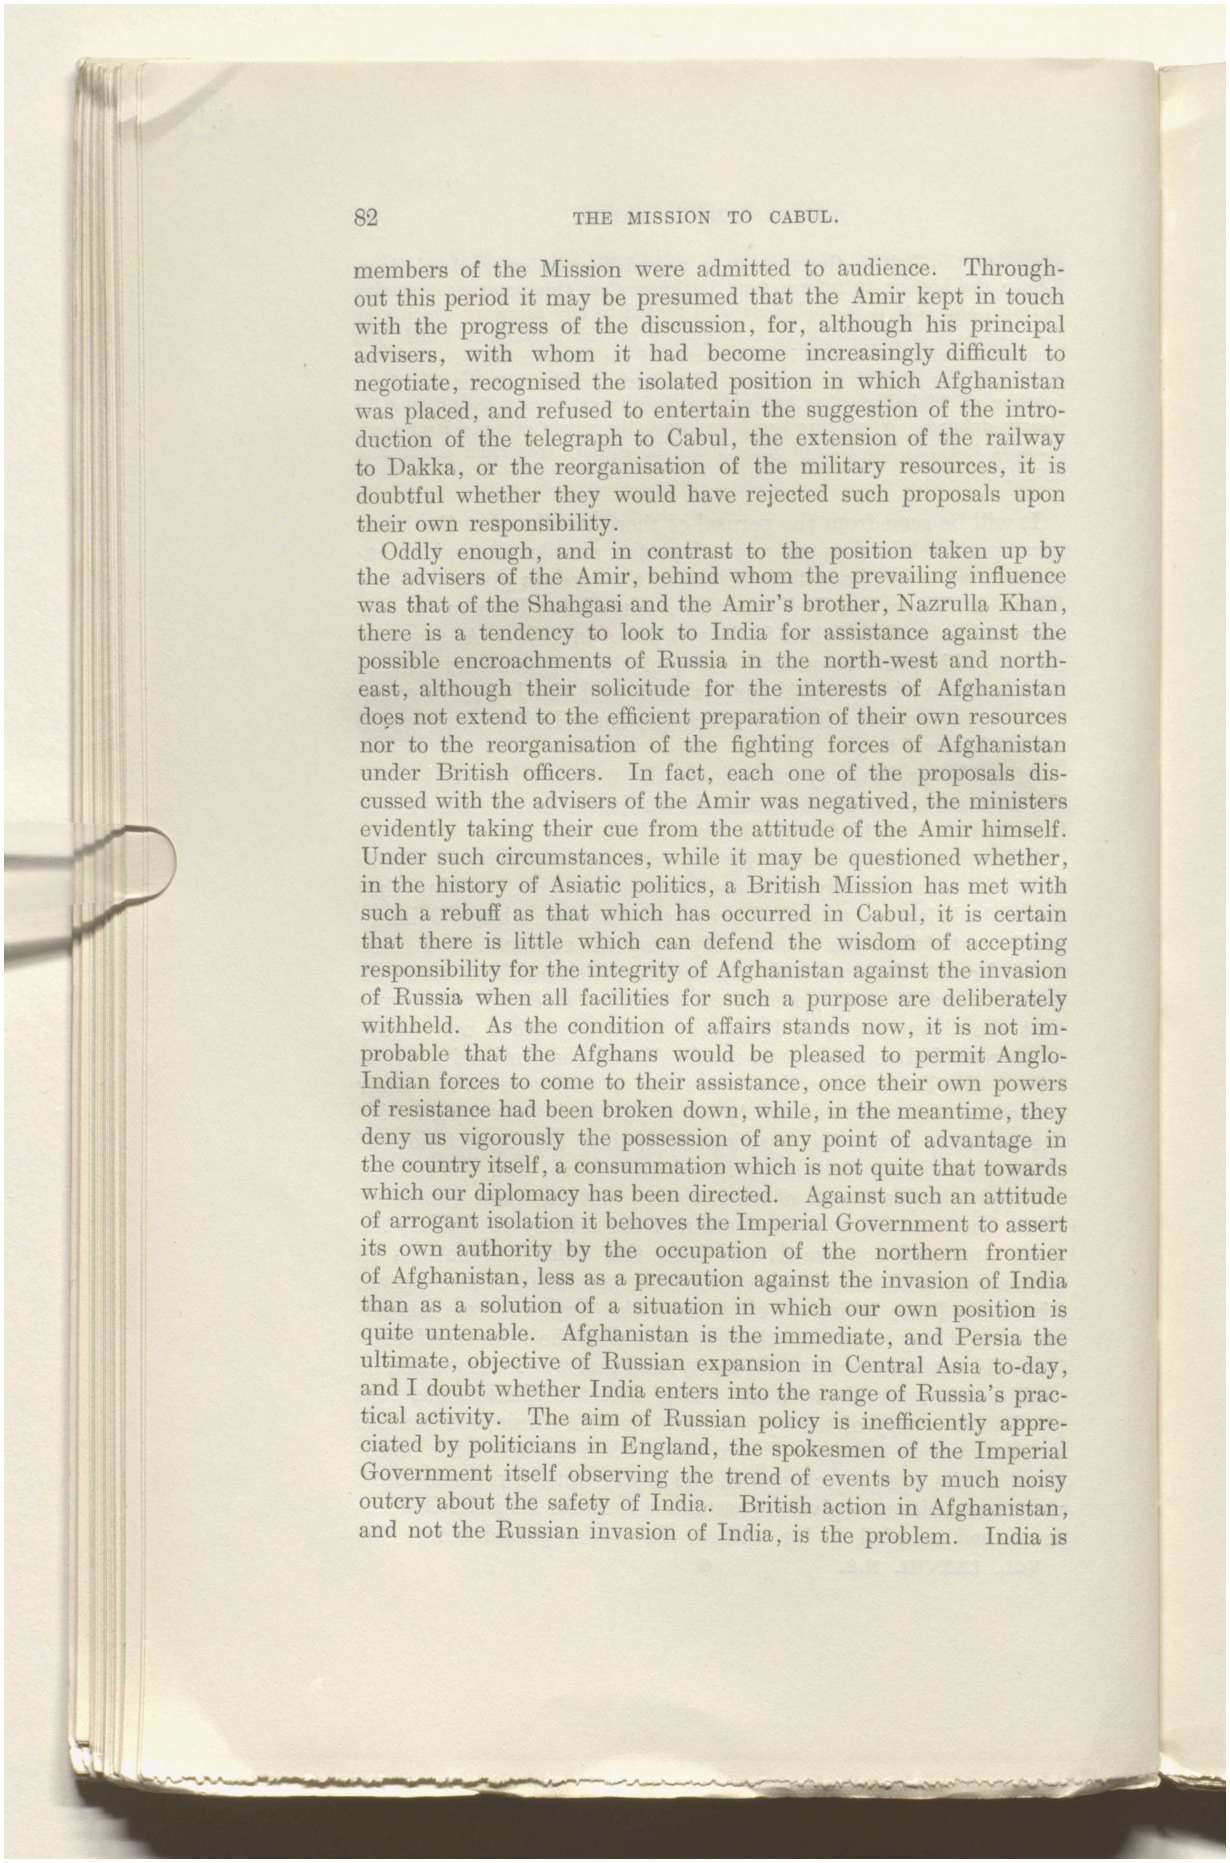
BRITISH LIBRARY

advice of the British Government in regard to your external relations. I have the honour to inform your Highness that this assurance remains in force, and that it is applicable with regard to any territory which may come into your possession in consequence of the agreement which you have made with me to-day in the matter of the Oxus frontier. It is the desire of the British Government that such portion of the Northern frontier of Afghanistan as has not yet been marked out should now be clearly defined. When this has been done, the whole of your Highness's frontier towards the side of Russia will be equally free from doubt and equally secure.

It will be seen from the perusal of these treaties that the latest agreement establishes no more than the simple renewal of engagements which have their origin in the pledges given by Lord Ripon as Viceroy of India to the Amir Abdur Rahman on his recognition by the Afghan Sirdars at Cabul in 1880. As a matter of fact, this renewal on both sides of the engagements entered into between the Amir Abdur Rahman and the Indian Government, represents the limit to which the Amir Habib Ullah would permit himself to go.



After the preliminary receptions, the moment had arrived for the first actual conference, and the subject of a new treaty was broached by the chief of the Indian Mission.

"What was good enough for my father," in effect said Habib Ullah by way of reply, "is good enough for me," adding that he wished for no treaty, the agreement with Abdur Rahman amply satisfying his views. By way of explanation it was pointed out to the Amir that the treaties which had been arranged with Abdur Rahman constituted a private *modus vivendi*, and that the Government of India was prepared with a new treaty to be regarded as made between itself and the Amir of Afghanistan. Sir Louis Dane then proceeded to read over to the Amir a copy of the suggested treaty when the Amir interrupted with the remark, anent the restrictions against the importation of arms, that Great Britain professed friendship, and yet refused to supply the just wants of Afghanistan. At this clause, together with that concerning the extension of the railway to Dakka, the Amir appeared concerned, and from this point negotiations in connection with the British proposals practically broke down, Sir Louis Dane failing to elicit from the Amir or from his advisers anything more than the assurance that the ruler of Afghanistan did not wish for a special treaty, and that what was wanted he could prepare for himself. At a later date the Mission was supplied with a copy of the agreement which the Amir was anxious to see ratified, but from the moment when he raised his objections to the opening clauses of the treaty until Sir Louis Dane was in a position to give the assurance that the Imperial Government had acceded to his wishes, six weeks passed before the

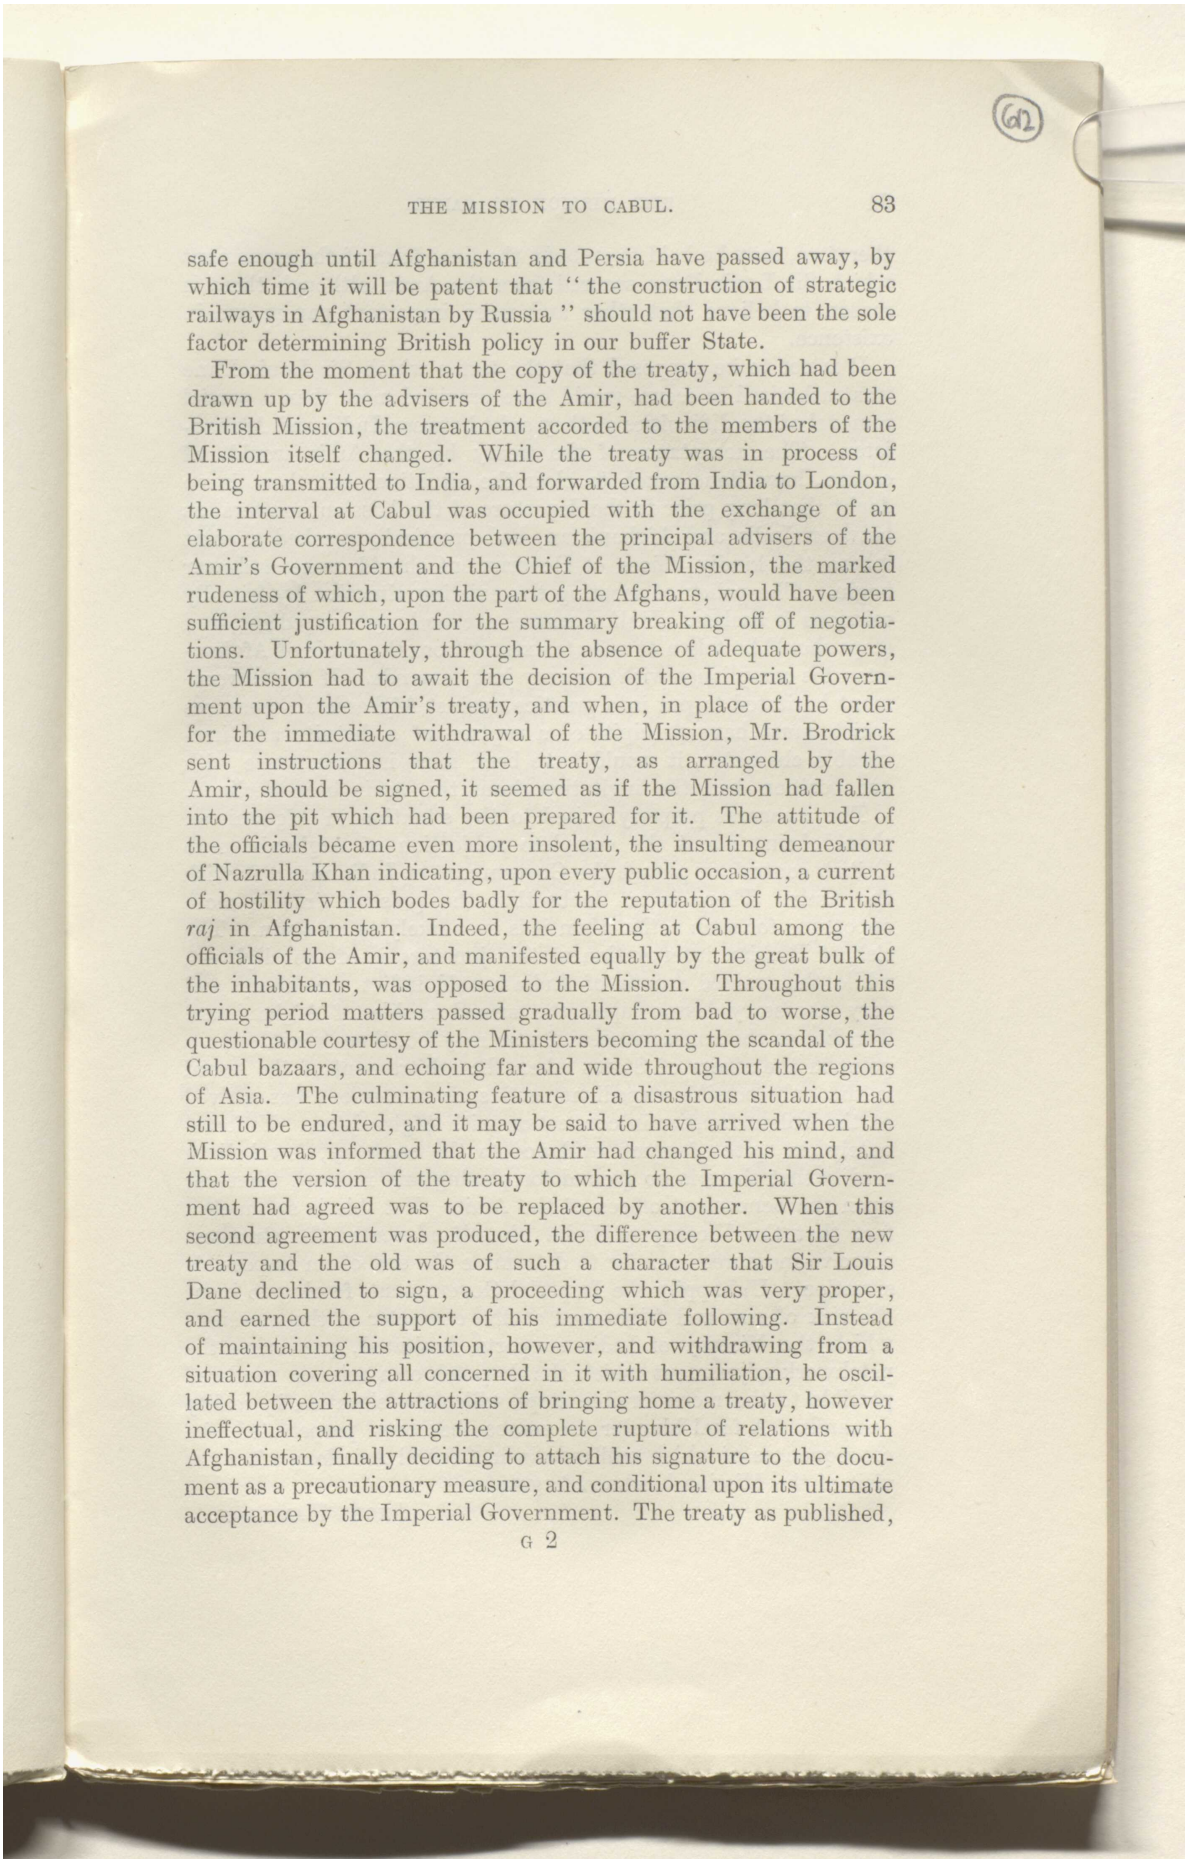
BRITISH LIBRARY



members of the Mission were admitted to audience. Throughout this period it may be presumed that the Amir kept in touch with the progress of the discussion, for, although his principal advisers, with whom it had become increasingly difficult to negotiate, recognised the isolated position in which Afghanistan was placed, and refused to entertain the suggestion of the introduction of the telegraph to Cabul, the extension of the railway to Dakka, or the reorganisation of the military resources, it is doubtful whether they would have rejected such proposals upon their own responsibility.

Oddly enough, and in contrast to the position taken up by the advisers of the Amir, behind whom the prevailing influence was that of the Shahgasi and the Amir's brother, Nazrulla Khan, there is a tendency to look to India for assistance against the possible encroachments of Russia in the north-west and north-east, although their solicitude for the interests of Afghanistan does not extend to the efficient preparation of their own resources nor to the reorganisation of the fighting forces of Afghanistan under British officers. In fact, each one of the proposals discussed with the advisers of the Amir was negatived, the ministers evidently taking their cue from the attitude of the Amir himself. Under such circumstances, while it may be questioned whether, in the history of Asiatic politics, a British Mission has met with such a rebuff as that which has occurred in Cabul, it is certain that there is little which can defend the wisdom of accepting responsibility for the integrity of Afghanistan against the invasion of Russia when all facilities for such a purpose are deliberately withheld. As the condition of affairs stands now, it is not improbable that the Afghans would be pleased to permit Anglo-Indian forces to come to their assistance, once their own powers of resistance had been broken down, while, in the meantime, they deny us vigorously the possession of any point of advantage in the country itself, a consummation which is not quite that towards which our diplomacy has been directed. Against such an attitude of arrogant isolation it behoves the Imperial Government to assert its own authority by the occupation of the northern frontier of Afghanistan, less as a precaution against the invasion of India than as a solution of a situation in which our own position is quite untenable. Afghanistan is the immediate, and Persia the ultimate, objective of Russian expansion in Central Asia to-day, and I doubt whether India enters into the range of Russia's practical activity. The aim of Russian policy is inefficiently appreciated by politicians in England, the spokesmen of the Imperial Government itself observing the trend of events by much noisy outcry about the safety of India. British action in Afghanistan, and not the Russian invasion of India, is the problem. India is

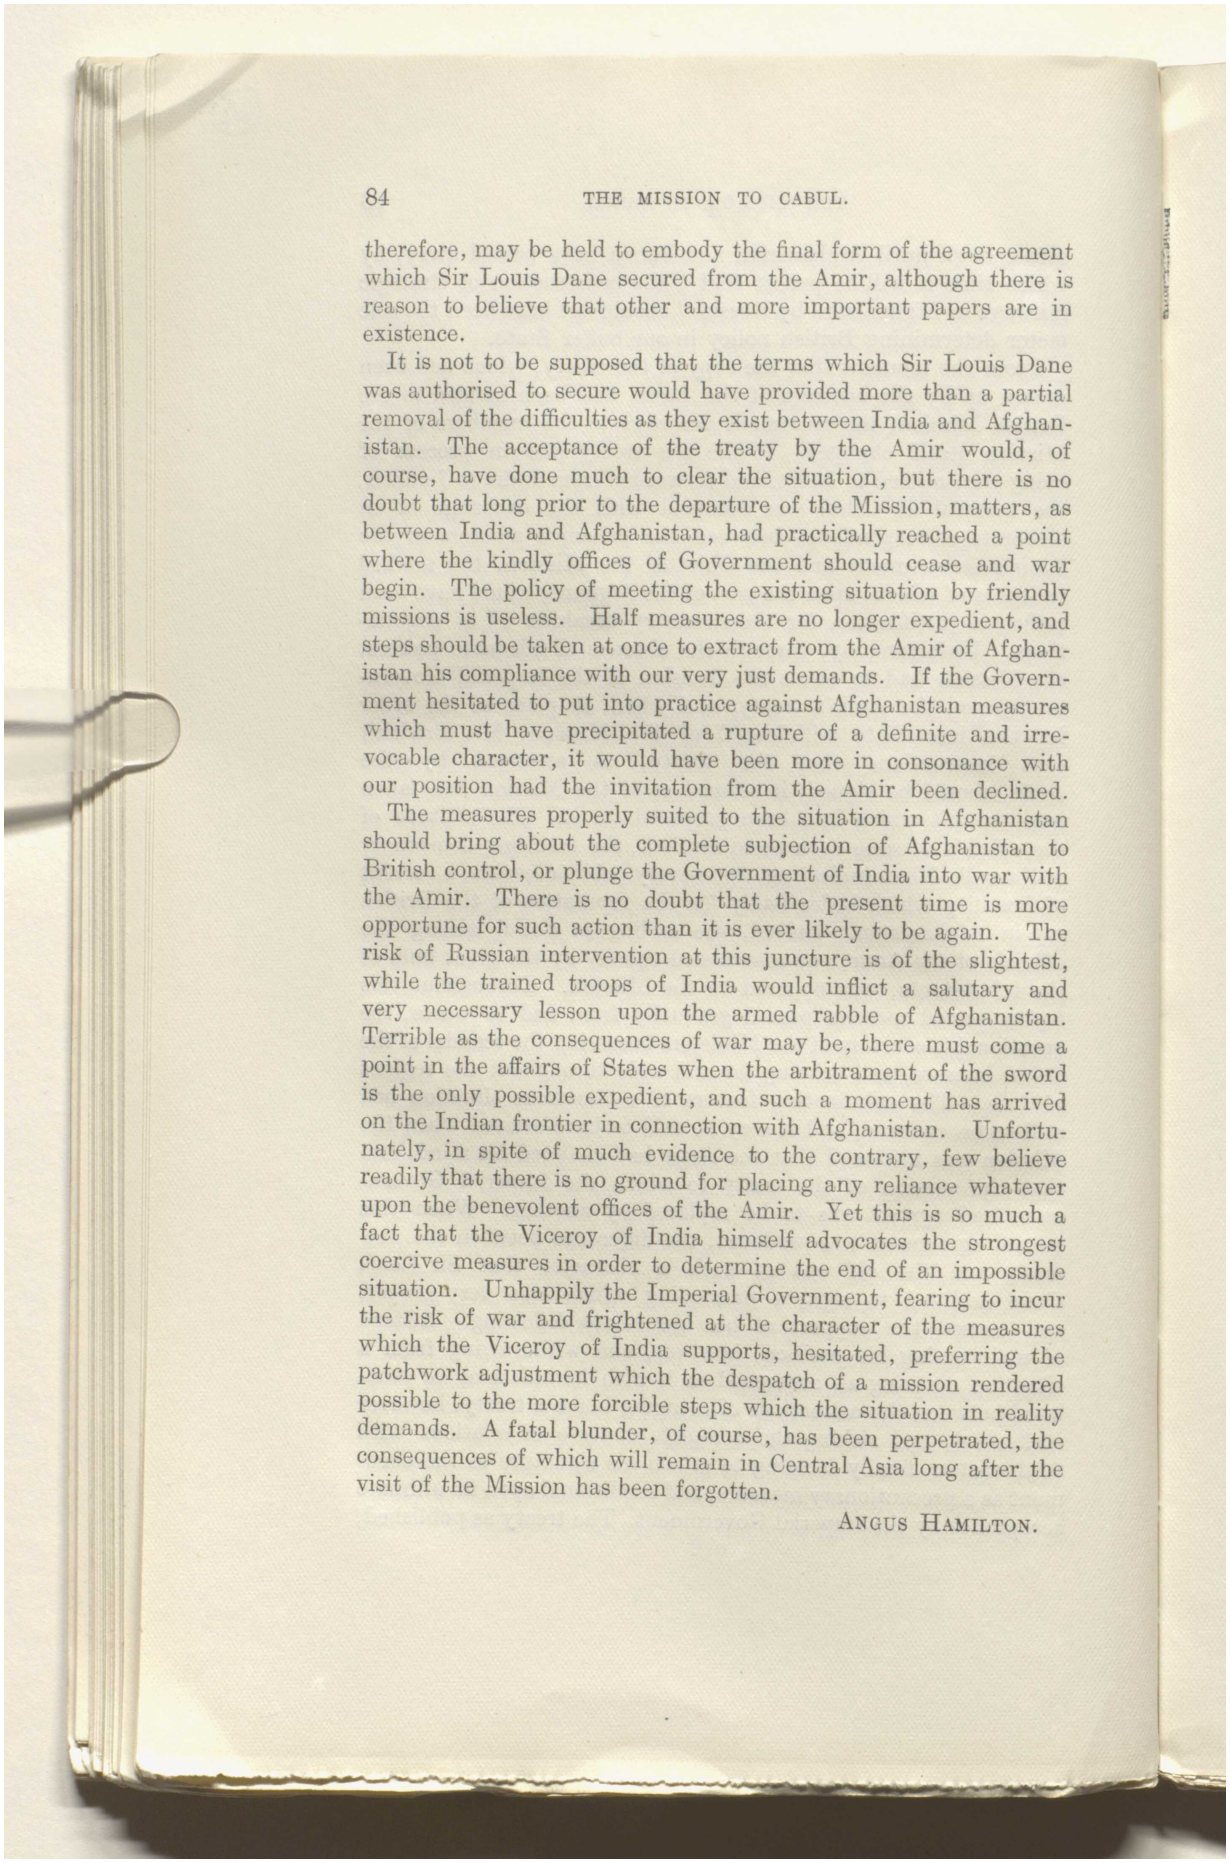
BRITISH LIBRARY



safe enough until Afghanistan and Persia have passed away, by which time it will be patent that "the construction of strategic railways in Afghanistan by Russia" should not have been the sole factor determining British policy in our buffer State.

From the moment that the copy of the treaty, which had been drawn up by the advisers of the Amir, had been handed to the British Mission, the treatment accorded to the members of the Mission itself changed. While the treaty was in process of being transmitted to India, and forwarded from India to London, the interval at Cabul was occupied with the exchange of an elaborate correspondence between the principal advisers of the Amir's Government and the Chief of the Mission, the marked rudeness of which, upon the part of the Afghans, would have been sufficient justification for the summary breaking off of negotiations. Unfortunately, through the absence of adequate powers, the Mission had to await the decision of the Imperial Government upon the Amir's treaty, and when, in place of the order for the immediate withdrawal of the Mission, Mr. Brodrick sent instructions that the treaty, as arranged by the Amir, should be signed, it seemed as if the Mission had fallen into the pit which had been prepared for it. The attitude of the officials became even more insolent, the insulting demeanour of Nazrulla Khan indicating, upon every public occasion, a current of hostility which bodes badly for the reputation of the British *raj* in Afghanistan. Indeed, the feeling at Cabul among the officials of the Amir, and manifested equally by the great bulk of the inhabitants, was opposed to the Mission. Throughout this trying period matters passed gradually from bad to worse, the questionable courtesy of the Ministers becoming the scandal of the Cabul bazaars, and echoing far and wide throughout the regions of Asia. The culminating feature of a disastrous situation had still to be endured, and it may be said to have arrived when the Mission was informed that the Amir had changed his mind, and that the version of the treaty to which the Imperial Government had agreed was to be replaced by another. When this second agreement was produced, the difference between the new treaty and the old was of such a character that Sir Louis Dane declined to sign, a proceeding which was very proper, and earned the support of his immediate following. Instead of maintaining his position, however, and withdrawing from a situation covering all concerned in it with humiliation, he oscillated between the attractions of bringing home a treaty, however ineffectual, and risking the complete rupture of relations with Afghanistan, finally deciding to attach his signature to the document as a precautionary measure, and conditional upon its ultimate acceptance by the Imperial Government. The treaty as published,

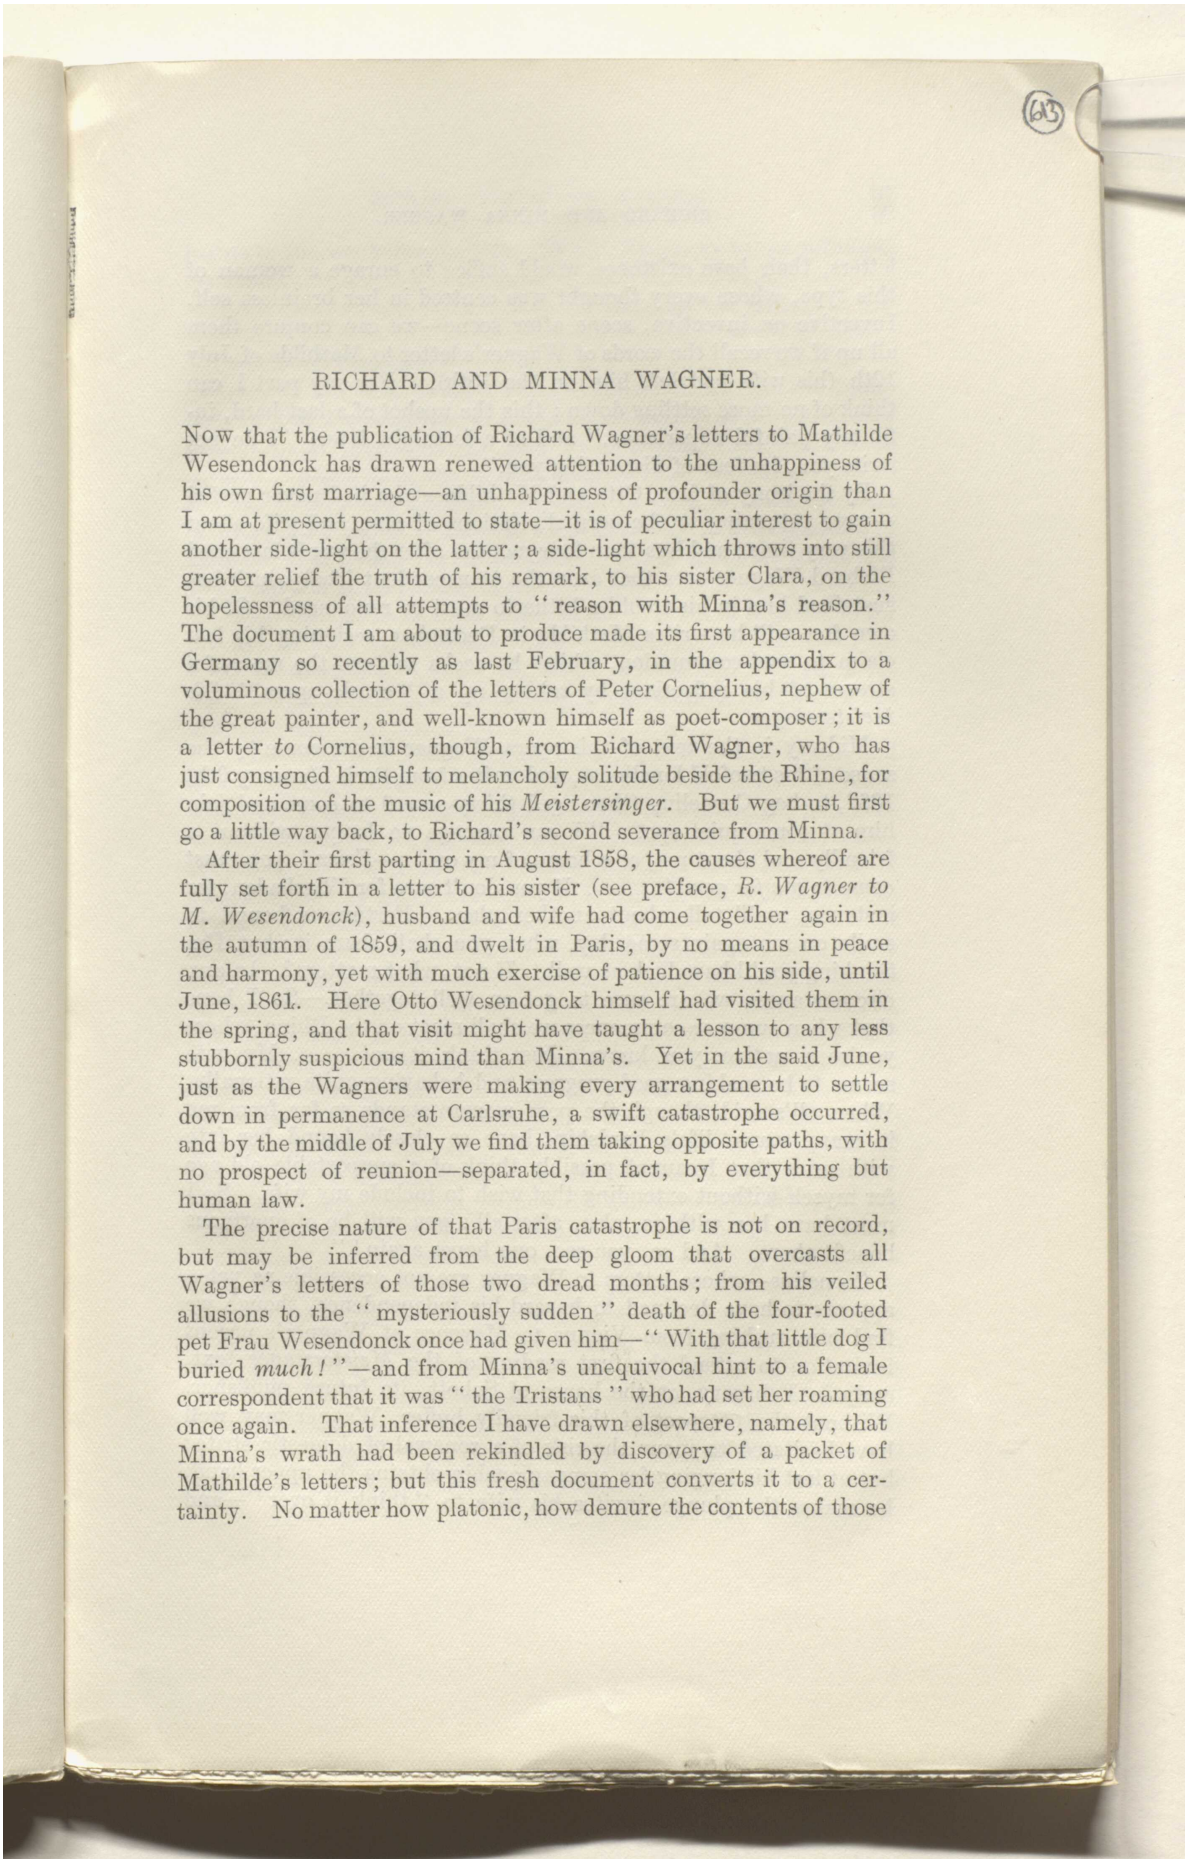
BRITISH LIBRARY

therefore, may be held to embody the final form of the agreement which Sir Louis Dane secured from the Amir, although there is reason to believe that other and more important papers are in existence.

It is not to be supposed that the terms which Sir Louis Dane was authorised to secure would have provided more than a partial removal of the difficulties as they exist between India and Afghanistan. The acceptance of the treaty by the Amir would, of course, have done much to clear the situation, but there is no doubt that long prior to the departure of the Mission, matters, as between India and Afghanistan, had practically reached a point where the kindly offices of Government should cease and war begin. The policy of meeting the existing situation by friendly missions is useless. Half measures are no longer expedient, and steps should be taken at once to extract from the Amir of Afghanistan his compliance with our very just demands. If the Government hesitated to put into practice against Afghanistan measures which must have precipitated a rupture of a definite and irrevocable character, it would have been more in consonance with our position had the invitation from the Amir been declined.



The measures properly suited to the situation in Afghanistan should bring about the complete subjection of Afghanistan to British control, or plunge the Government of India into war with the Amir. There is no doubt that the present time is more opportune for such action than it is ever likely to be again. The risk of Russian intervention at this juncture is of the slightest, while the trained troops of India would inflict a salutary and very necessary lesson upon the armed rabble of Afghanistan. Terrible as the consequences of war may be, there must come a point in the affairs of States when the arbitrament of the sword is the only possible expedient, and such a moment has arrived on the Indian frontier in connection with Afghanistan. Unfortunately, in spite of much evidence to the contrary, few believe readily that there is no ground for placing any reliance whatever upon the benevolent offices of the Amir. Yet this is so much a fact that the Viceroy of India himself advocates the strongest coercive measures in order to determine the end of an impossible situation. Unhappily the Imperial Government, fearing to incur the risk of war and frightened at the character of the measures which the Viceroy of India supports, hesitated, preferring the patchwork adjustment which the despatch of a mission rendered possible to the more forcible steps which the situation in reality demands. A fatal blunder, of course, has been perpetrated, the consequences of which will remain in Central Asia long after the visit of the Mission has been forgotten.

ANGUS HAMILTON.

RICHARD AND MINNA WAGNER.

Now that the publication of Richard Wagner's letters to Mathilde Wesendonck has drawn renewed attention to the unhappiness of his own first marriage—an unhappiness of profounder origin than I am at present permitted to state—it is of peculiar interest to gain another side-light on the latter; a side-light which throws into still greater relief the truth of his remark, to his sister Clara, on the hopelessness of all attempts to "reason with Minna's reason." The document I am about to produce made its first appearance in Germany so recently as last February, in the appendix to a voluminous collection of the letters of Peter Cornelius, nephew of the great painter, and well-known himself as poet-composer; it is a letter *to* Cornelius, though, from Richard Wagner, who has just consigned himself to melancholy solitude beside the Rhine, for composition of the music of his *Meistersinger*. But we must first go a little way back, to Richard's second severance from Minna.

After their first parting in August 1858, the causes whereof are fully set forth in a letter to his sister (see preface, *R. Wagner to M. Wesendonck*), husband and wife had come together again in the autumn of 1859, and dwelt in Paris, by no means in peace and harmony, yet with much exercise of patience on his side, until June, 1861. Here Otto Wesendonck himself had visited them in the spring, and that visit might have taught a lesson to any less stubbornly suspicious mind than Minna's. Yet in the said June, just as the Wagners were making every arrangement to settle down in permanence at Carlsruhe, a swift catastrophe occurred, and by the middle of July we find them taking opposite paths, with no prospect of reunion—separated, in fact, by everything but human law.

The precise nature of that Paris catastrophe is not on record, but may be inferred from the deep gloom that overcasts all Wagner's letters of those two dread months; from his veiled allusions to the "mysteriously sudden" death of the four-footed pet Frau Wesendonck once had given him—"With that little dog I buried *much!*"—and from Minna's unequivocal hint to a female correspondent that it was "the Tristans" who had set her roaming once again. That inference I have drawn elsewhere, namely, that Minna's wrath had been rekindled by discovery of a packet of Mathilde's letters; but this fresh document converts it to a certainty. No matter how platonic, how demure the contents of those

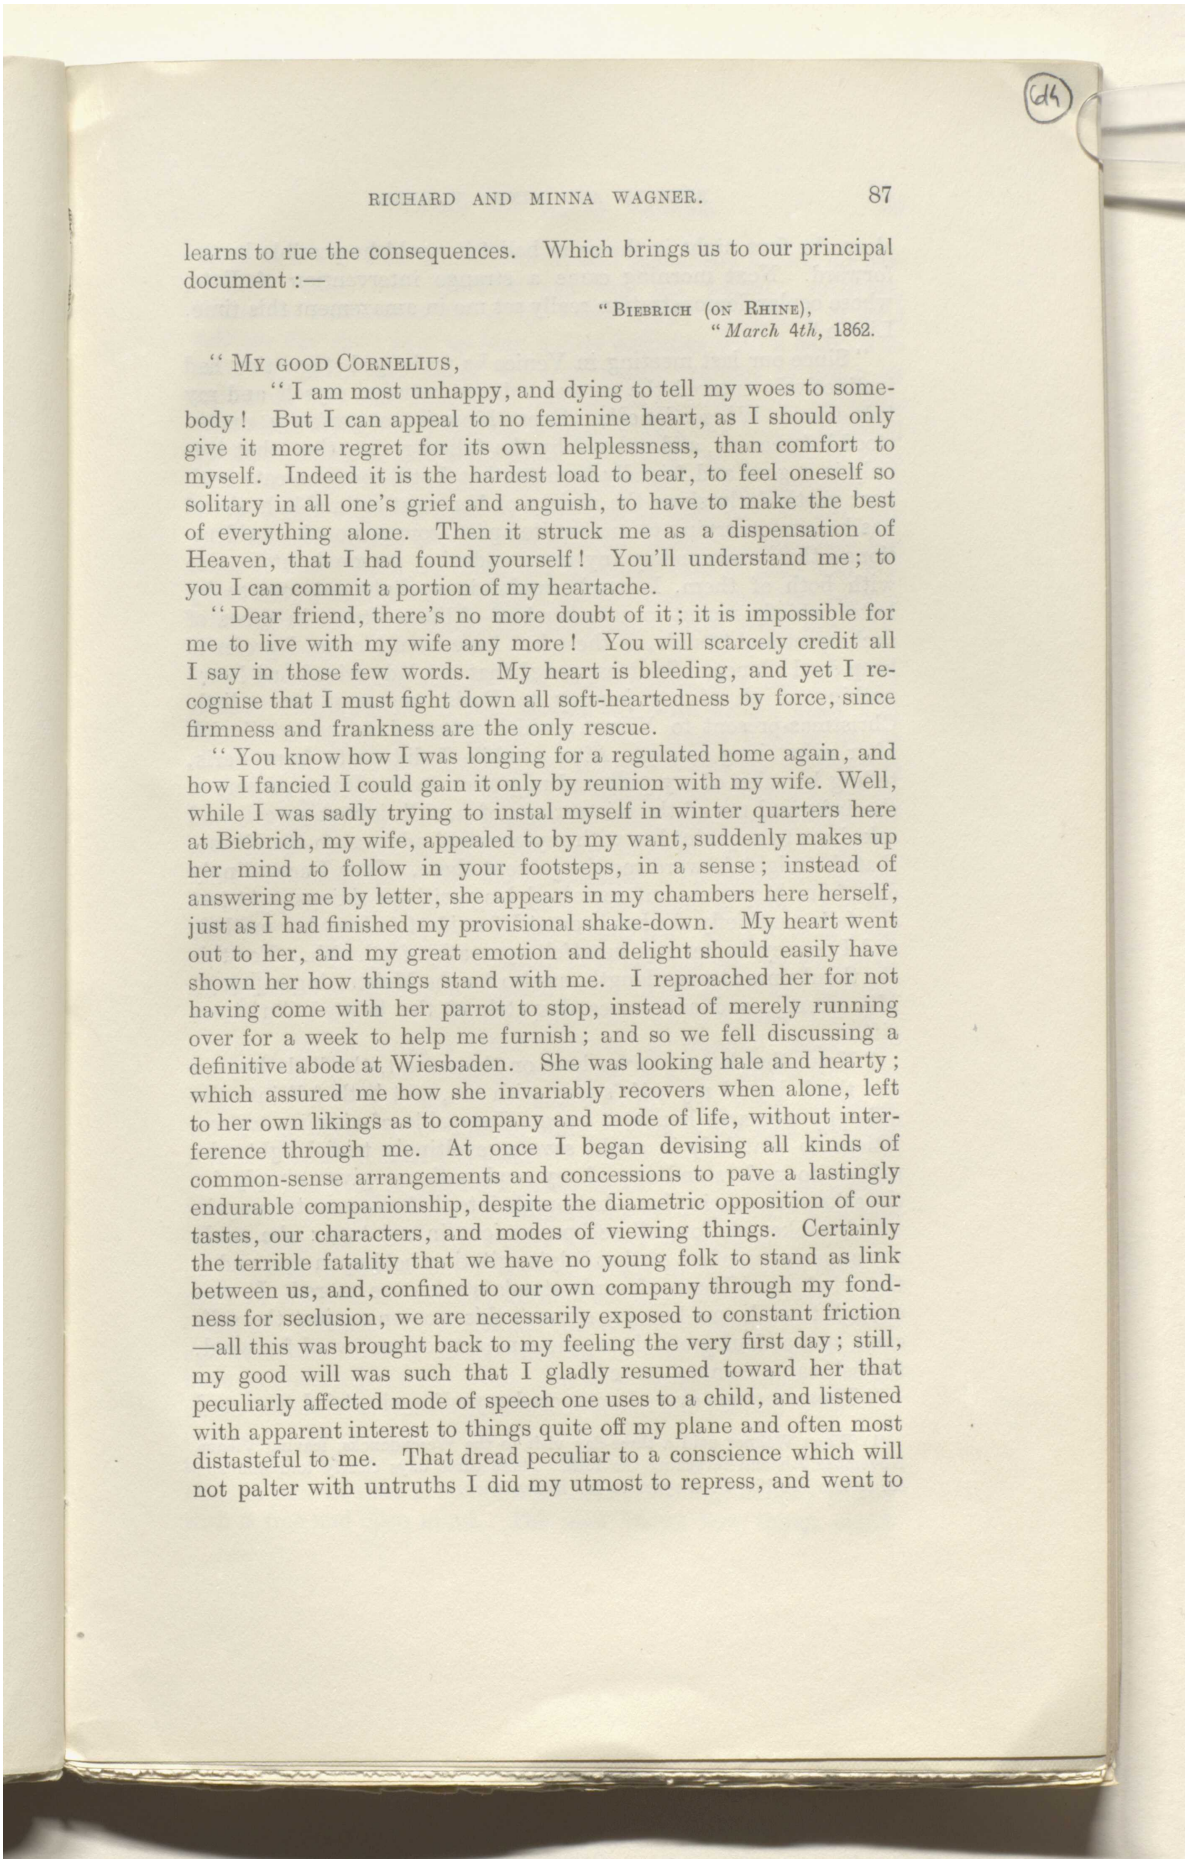
BRITISH LIBRARY

letters, their bare existence would suffice to enrage a woman of this type, whose every thought was centred in her brainless self. Invective on invective, scene after scene—we can conjure them all up if we recall the words of Wagner's letter to Mathilde of July 12th (his wife had left him on the 10th), "For my part I can think of no more settling down: this the upshot of a last hard, infinitely painful experience," and of a fortnight later, "I do not write you, for fear of distressing you."

By the irony of fate, Otto and Mathilde—who had never parted—were returning to the normal relations of man and wife about this very time; and less than four months after the words last cited Richard Wagner sees that even the transcendent ideal which has sustained him in his troubles hitherto must be renounced. Of his own free will he writes Mathilde in December, resigning his last claim to soul-communion, whilst he seeks to turn the mournful stream of his reflections by taking up a "comic opera," *Die Meistersinger*.



Midway in the text of this opera Wagner is overcome by the sense of his twofold loneliness, and writes from Paris, January 9th, 1862, to beg Cornelius (then aged thirty-seven) to come and join him at some quiet spot: "I can manage no longer without a friendly soul about me, or a home of my own:—*Friend, you must come to me for good!* . . . . If you don't care for Wiesbaden, for instance, we'll talk about another place. Fortune is bound to smile on me again some day, when you shall share it; but I'm thinking you'll have luck as well. If not, what matters? In any circumstances we are sure to get on well together.—So I hope that when summer commences we shall meet on the Rhine, where you're a native, you know. Just think it out. . . . My wife seems to be making good progress and behaving quite rationally. When all's said, though the poor woman stands so far from me in many ways, life's hardships have so closely bound her fate with mine that I cannot possibly think of a supportable old age for myself without extending that wish to include my wife. So I must have her with us, also, after all: *you* will be of enormous benefit there. And so, you see, one hopes again!"

Cornelius—whose letters to Wagner are not accessible as yet—appears to have declined to hazard his independence, though we find him rushing from Vienna to Mayence at Wagner's urgent invitation to attend the first reading of the *Meistersinger* text, early in February, at the house of Schott, its future publisher. Without the prospect of this friendly buffer, Wagner may well have hesitated to incur the risk of a renewal of domestic strife; but at last his longing for companionship obtains the upper hand, he makes the plunge, invites his wife to "think it over"—and

BRITISH LIBRARY

learns to rue the consequences. Which brings us to our principal document :—

"BIEBRICH (ON RHINE),
"*March 4th*, 1862.

"MY GOOD CORNELIUS,

"I am most unhappy, and dying to tell my woes to somebody! But I can appeal to no feminine heart, as I should only give it more regret for its own helplessness, than comfort to myself. Indeed it is the hardest load to bear, to feel oneself so solitary in all one's grief and anguish, to have to make the best of everything alone. Then it struck me as a dispensation of Heaven, that I had found yourself! You'll understand me; to you I can commit a portion of my heartache.

"Dear friend, there's no more doubt of it; it is impossible for me to live with my wife any more! You will scarcely credit all I say in those few words. My heart is bleeding, and yet I recognise that I must fight down all soft-heartedness by force, since firmness and frankness are the only rescue.

"You know how I was longing for a regulated home again, and how I fancied I could gain it only by reunion with my wife. Well, while I was sadly trying to instal myself in winter quarters here at Biebrich, my wife, appealed to by my want, suddenly makes up her mind to follow in your footsteps, in a sense; instead of answering me by letter, she appears in my chambers here herself, just as I had finished my provisional shake-down. My heart went out to her, and my great emotion and delight should easily have shown her how things stand with me. I reproached her for not having come with her parrot to stop, instead of merely running over for a week to help me furnish; and so we fell discussing a definitive abode at Wiesbaden. She was looking hale and hearty; which assured me how she invariably recovers when alone, left to her own likings as to company and mode of life, without interference through me. At once I began devising all kinds of common-sense arrangements and concessions to pave a lastingly endurable companionship, despite the diametric opposition of our tastes, our characters, and modes of viewing things. Certainly the terrible fatality that we have no young folk to stand as link between us, and, confined to our own company through my fondness for seclusion, we are necessarily exposed to constant friction —all this was brought back to my feeling the very first day; still, my good will was such that I gladly resumed toward her that peculiarly affected mode of speech one uses to a child, and listened with apparent interest to things quite off my plane and often most distasteful to me. That dread peculiar to a conscience which will not palter with untruths I did my utmost to repress, and went to

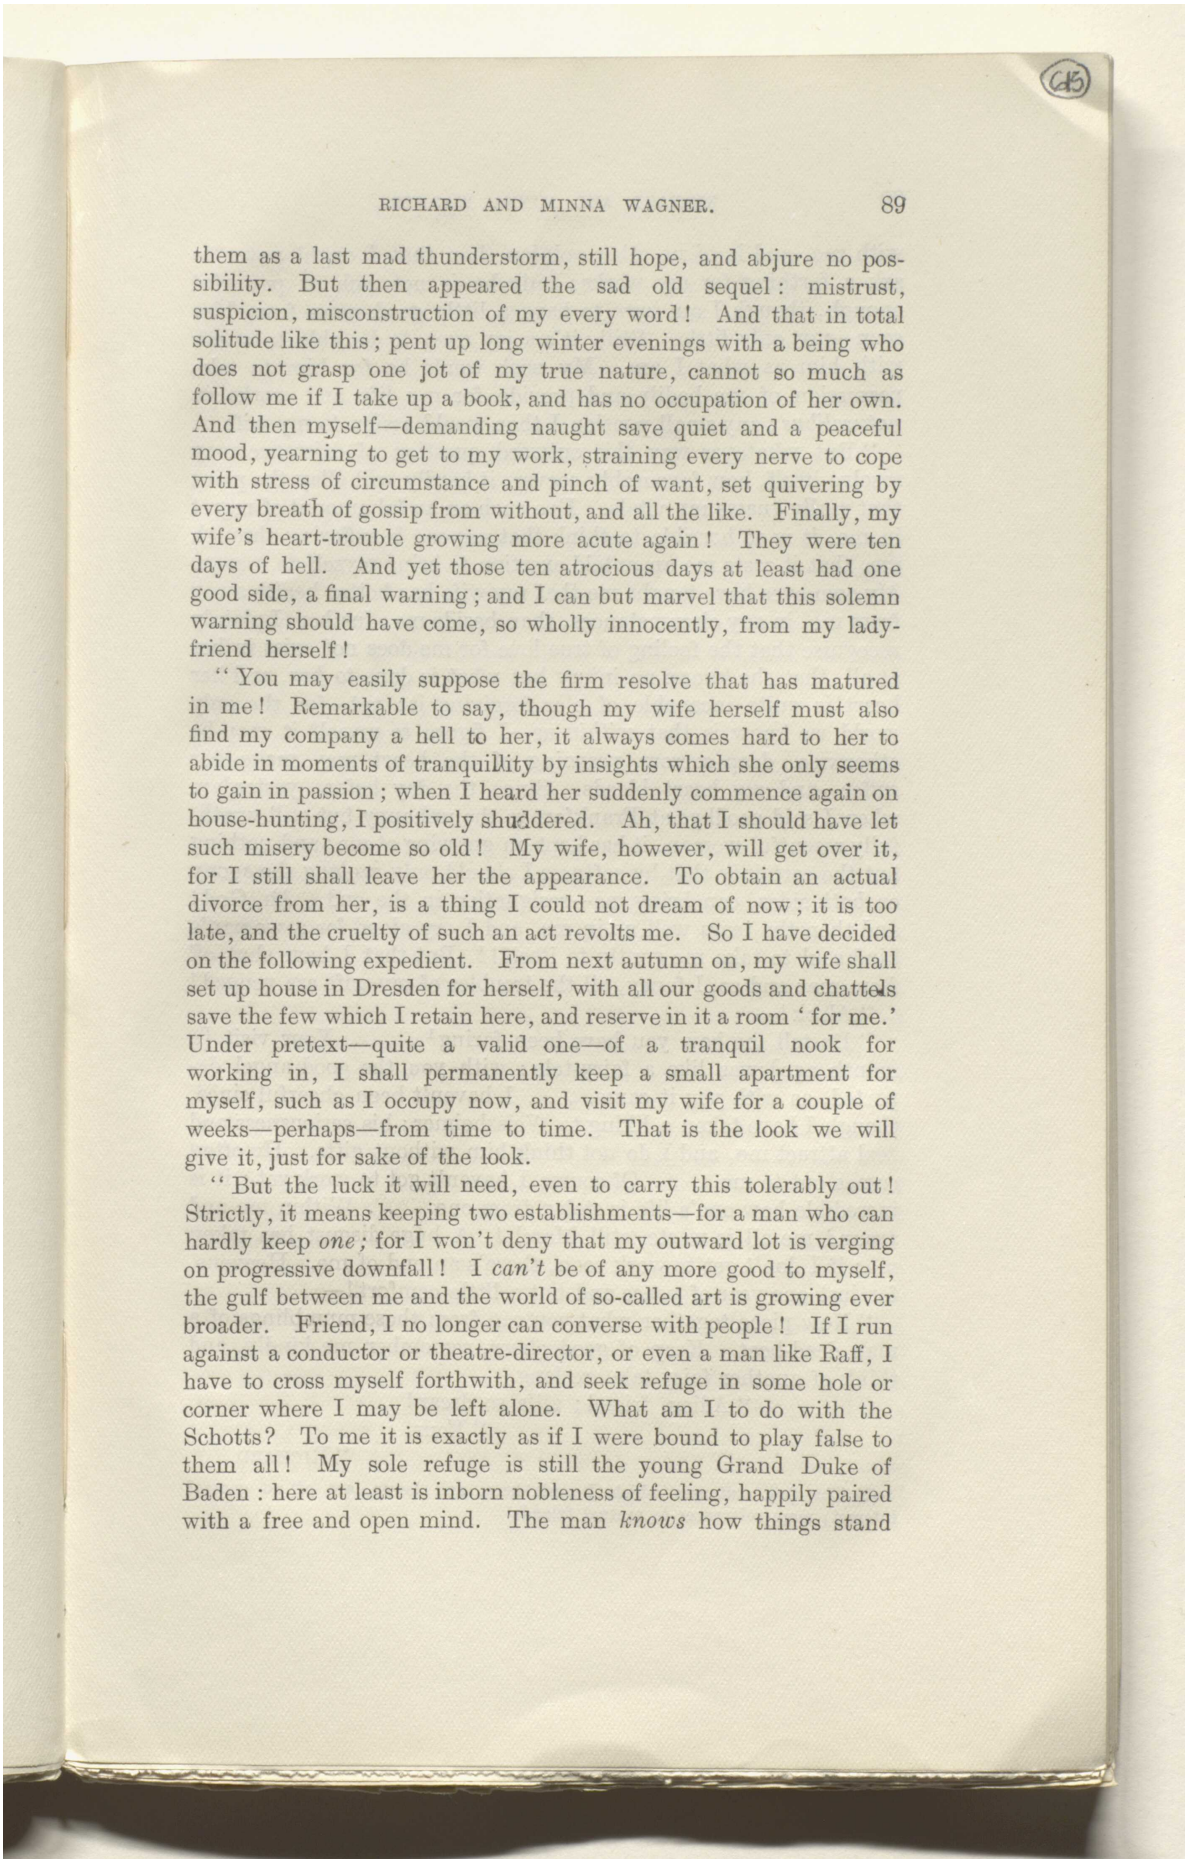
sleep the first night in the calm belief it would be possible henceforward. Next morning came a strange intervention of Fate, whose ocular demonstration really set me in amazement this time. Listen!

"Since our last meeting in Venice[1] a prolonged stagnation had instinctively entered the correspondence between myself and my lady-friend W[esendonc]k. Everything is so perfectly understood between us, and ordered by the fullest resignation, that it is only in a good and friendly humour that I still communicate with her; particularly since the society of her most estimable husband has become so trying to me—quite apart from personal considerations—that, renouncing any more enduring personal intercourse with both of them, I merely maintain a slight intercourse by letter, chiefly meant to ease her load of life a little: in times of such upset and trouble, as these last have been for me, I prefer to keep dead silence. So it happened that my lady-friend had heard nothing at all of my journey to Paris, and sent me a little Christmas-present to Vienna, which returned to her at Zurich after going long astray. After a while I did write from Paris, telling her also of my proposed migration to the Rhine; whereon she informed me of the miscarriage of her Christmas parcel, and asked me to acquaint her with my eventual address on the Rhine, that she might forward me the present there. This I accordingly did, from Mayence, but remained long without tidings. At last she tells me briefly she has been at Düsseldorf to bury her mother, and I convey to her my heartfelt sympathy forthwith. For this she thanks me at some length, as also for the Meistersinger [rough MS. poem], and announces despatch of the belated Christmas gift.

"Now, that letter arrives here on the second, the little box on the third day of my wife's stay with me, and both fall into the unhappy woman's hands at once. Incapable of viewing my relations to that lady in aught save a revoltingly trivial light, she refuses to understand any of my explanations—given simply for the sake of reassuring her—but bursts into that common tone again which makes me lose all self-possession, in my turn: she reads my anger as an effect of that lady's agitating hold upon me, and—the whole mad house of cards stands stark once more! It was enough to make me lose my senses: this woman on just the self-same spot as four years since; the same explosions, word for word, the self-same common tone!



"These ragings over, I composed myself again, tried to regard

(1) When Wagner paid a three-day visit to the Wesendoncks, leaving Vienna November 7th and returning the 13th. Those three days clearly told him all; see letters 124–125, *R. Wagner to M. Wesendonck*.

BRITISH LIBRARY

them as a last mad thunderstorm, still hope, and abjure no possibility. But then appeared the sad old sequel: mistrust, suspicion, misconstruction of my every word! And that in total solitude like this; pent up long winter evenings with a being who does not grasp one jot of my true nature, cannot so much as follow me if I take up a book, and has no occupation of her own. And then myself—demanding naught save quiet and a peaceful mood, yearning to get to my work, straining every nerve to cope with stress of circumstance and pinch of want, set quivering by every breath of gossip from without, and all the like. Finally, my wife's heart-trouble growing more acute again! They were ten days of hell. And yet those ten atrocious days at least had one good side, a final warning; and I can but marvel that this solemn warning should have come, so wholly innocently, from my lady-friend herself!

"You may easily suppose the firm resolve that has matured in me! Remarkable to say, though my wife herself must also find my company a hell to her, it always comes hard to her to abide in moments of tranquillity by insights which she only seems to gain in passion; when I heard her suddenly commence again on house-hunting, I positively shuddered. Ah, that I should have let such misery become so old! My wife, however, will get over it, for I still shall leave her the appearance. To obtain an actual divorce from her, is a thing I could not dream of now; it is too late, and the cruelty of such an act revolts me. So I have decided on the following expedient. From next autumn on, my wife shall set up house in Dresden for herself, with all our goods and chattels save the few which I retain here, and reserve in it a room 'for me.' Under pretext—quite a valid one—of a tranquil nook for working in, I shall permanently keep a small apartment for myself, such as I occupy now, and visit my wife for a couple of weeks—perhaps—from time to time. That is the look we will give it, just for sake of the look.

"But the luck it will need, even to carry this tolerably out! Strictly, it means keeping two establishments—for a man who can hardly keep *one;* for I won't deny that my outward lot is verging on progressive downfall! I *can't* be of any more good to myself, the gulf between me and the world of so-called art is growing ever broader. Friend, I no longer can converse with people! If I run against a conductor or theatre-director, or even a man like Raff, I have to cross myself forthwith, and seek refuge in some hole or corner where I may be left alone. What am I to do with the Schotts? To me it is exactly as if I were bound to play false to them all! My sole refuge is still the young Grand Duke of Baden: here at least is inborn nobleness of feeling, happily paired with a free and open mind. The man *knows* how things stand

with me, and is of no other opinion than that I ought never to ask a farthing for my works; only he is not rich or powerful enough, though I am sure to have a little good news from him soon—my only little. Still, it's a joy even to be able to speak with him as what I am. My wish would be for him to take possession of me bodily and provide for my life and works *in naturalibus*; any small pension I then would assign to my wife.

"But whatever way this outward question of existence may resolve itself, how favourably soever, it hardly will allay the point that really gnaws my vitals. I've such an awful amount of regret in me, it is so horrible to think that anyone is suffering through me, that it costs me an untold exertion to bring myself to reason. My own eyes have taught me that my wife has better health away from me, in any circumstances, than beside me; further, I plainly recognise that the feeling of true love for me does not exist in her at all, that she knows no injury but what is done *to her*, and her heart is quite incapable of e'er forgiving it; yet—for the only world we know is that *within* us—I figure to myself it *may* be otherwise, deep sorrow, yearning of the heart may make her suffer—and *my* heart bleeds. Since the day before yesterday, when I said goodbye at Frankfort to the unhappy but still wrathfully resentful woman, it has kept on gnawing at me; and nothing but the certainty that by softness I should only prolong the agony on *both* sides, can bring me—resignation in the end. Ah, God! and then the tears well up in me, and I cry aloud for a woman's kind soul to take me gently to itself!! But that I have shut off from me; and so, I fancy, all the troubles of my wife are venged!

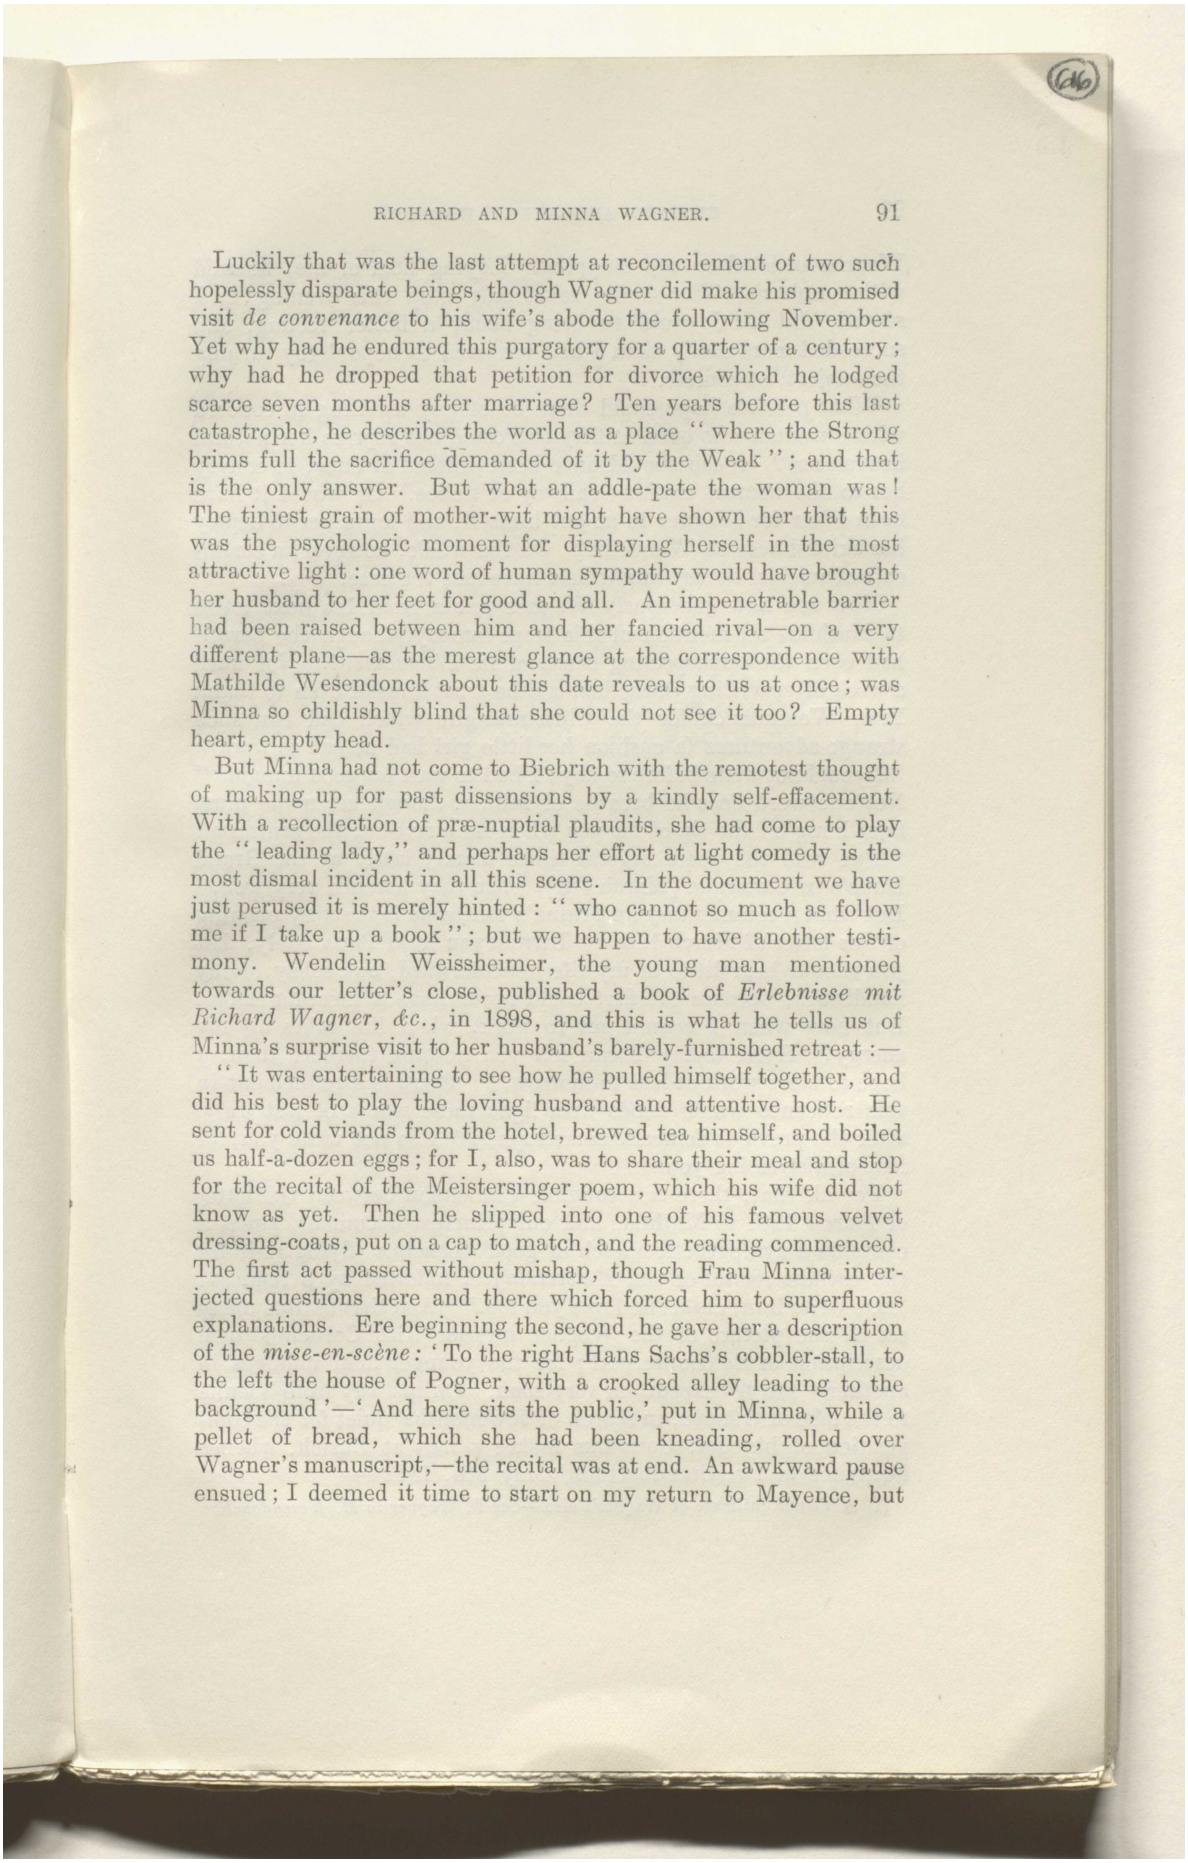
"Alack!—

"Do tell me how you have been faring[1] . . . . Your visit [a month ago] was like a fairy-tale: with you the good angel departed, as with you it came. . . . I haven't been cheerful since, though I have taken a liking to Weissheimer; his seriousness and zeal attract me, and I do not think him without gifts. He often comes out to me. . . . Of course I haven't got to work yet: it is incredible how one's life is stolen from one. . . . Within me and around me all is waste, still March! A huge disgust has taken me; if I don't get to work soon, there's an end of me. Heavens, for just one year of peace and but a little comfort!—

"Now piece together what you can from these mumblings of a man dead-beat. Keep of good cheer, remember me kindly, and think of another fairy-tale ere long.

"Adieu, friend; all's so drear!

"Your



"RICHARD."

(1) The few sentences which I omit here, and lower, are of no general interest; mere references to mutual friends.

Luckily that was the last attempt at reconcilement of two such hopelessly disparate beings, though Wagner did make his promised visit *de convenance* to his wife's abode the following November. Yet why had he endured this purgatory for a quarter of a century; why had he dropped that petition for divorce which he lodged scarce seven months after marriage? Ten years before this last catastrophe, he describes the world as a place "where the Strong brims full the sacrifice demanded of it by the Weak"; and that is the only answer. But what an addle-pate the woman was! The tiniest grain of mother-wit might have shown her that this was the psychologic moment for displaying herself in the most attractive light: one word of human sympathy would have brought her husband to her feet for good and all. An impenetrable barrier had been raised between him and her fancied rival—on a very different plane—as the merest glance at the correspondence with Mathilde Wesendonck about this date reveals to us at once; was Minna so childishly blind that she could not see it too? Empty heart, empty head.

But Minna had not come to Biebrich with the remotest thought of making up for past dissensions by a kindly self-effacement. With a recollection of præ-nuptial plaudits, she had come to play the "leading lady," and perhaps her effort at light comedy is the most dismal incident in all this scene. In the document we have just perused it is merely hinted: "who cannot so much as follow me if I take up a book"; but we happen to have another testimony. Wendelin Weissheimer, the young man mentioned towards our letter's close, published a book of *Erlebnisse mit Richard Wagner, &c.*, in 1898, and this is what he tells us of Minna's surprise visit to her husband's barely-furnished retreat:—

"It was entertaining to see how he pulled himself together, and did his best to play the loving husband and attentive host. He sent for cold viands from the hotel, brewed tea himself, and boiled us half-a-dozen eggs; for I, also, was to share their meal and stop for the recital of the Meistersinger poem, which his wife did not know as yet. Then he slipped into one of his famous velvet dressing-coats, put on a cap to match, and the reading commenced. The first act passed without mishap, though Frau Minna interjected questions here and there which forced him to superfluous explanations. Ere beginning the second, he gave her a description of the *mise-en-scène:* 'To the right Hans Sachs's cobbler-stall, to the left the house of Pogner, with a crooked alley leading to the background'—'And here sits the public,' put in Minna, while a pellet of bread, which she had been kneading, rolled over Wagner's manuscript,—the recital was at end. An awkward pause ensued; I deemed it time to start on my return to Mayence, but

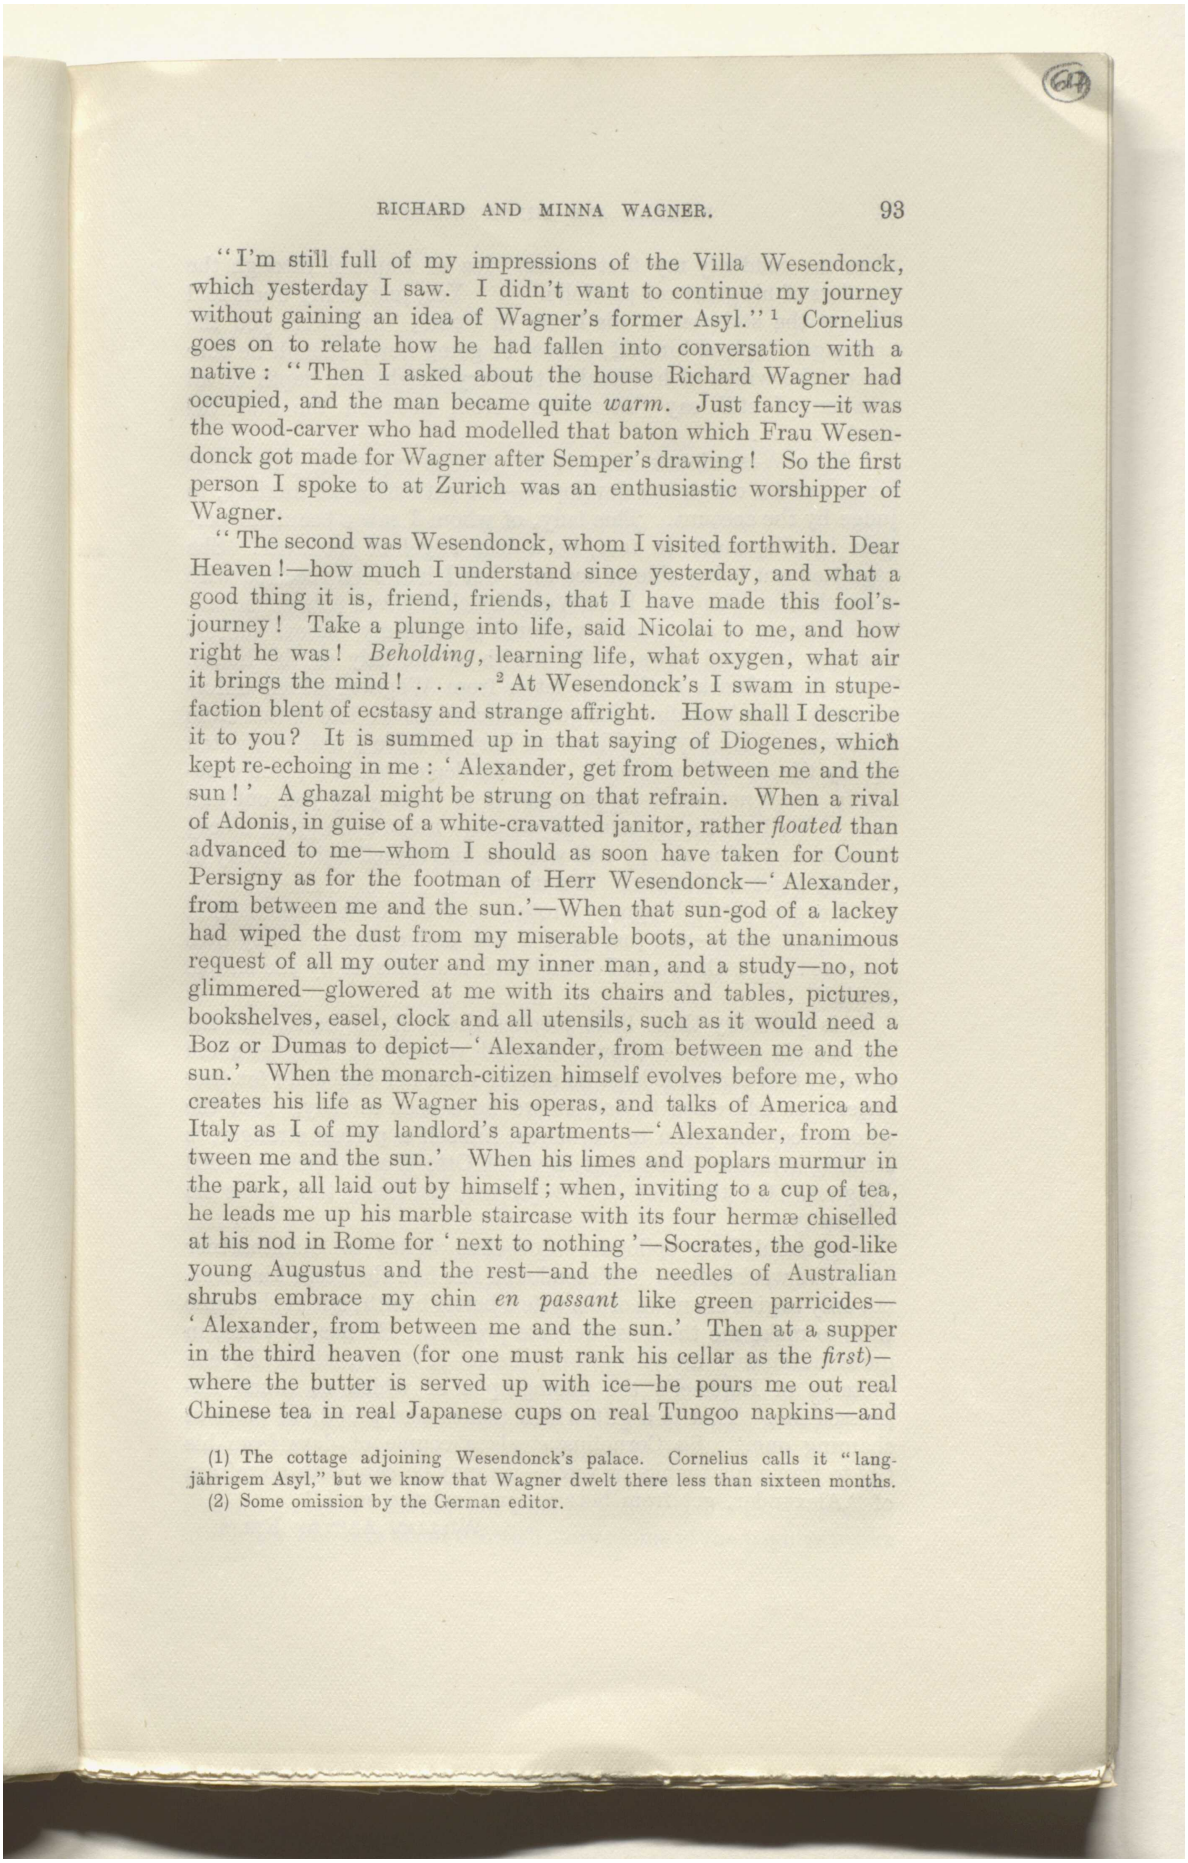
BRITISH LIBRARY

Wagner insisted on my stopping. Laying hold of me, he said with emphasis, 'For God's sake, only stop this evening!' I stayed, did all I could to bring about a better feeling, and succeeded more easily than I had ventured to hope" (by turning the subject, of course).

What possible hope could there be of any dwelling in concord with a woman who even at fifty-two could not repress her natural irreverence? A cab should have been ordered at once, to convey her to the nearest station—railway or police. Or would it have been wiser for Wagner to go out himself, and leave her to deploy her skittishness on Wendelin? On the whole, however, a certificate of suicidal lunacy might best have met the case.

Now see how generously Wagner omits from his next letter to Mathilde all mention of this tragi-comedy, though she herself had been the unsuspecting cause of its *dénouement*. Not until a week after writing Cornelius, can he trust himself even to thank Frau Wesendonck for the Christmas-gift which had run such strange adventures (a cushion her little girl had helped to work): "I could not write before to-day; I had to wait for good humour." Not one word does he breathe of Minna, though her name must have hung on the tip of his pen when he arrived at the sentence: "I've read the poem several times aloud; lastly at the Grand Duke's in Carlsruhe [March 7th], when they listened very well." But what a commentary on Minna's tantrums is the very opening of this letter of March 12th: "I wrote you from Paris lately, that you should hear little of my life henceforward, but solely of my handiwork, because the first could never have a meaning more. But how when I cannot get to work, when life takes all my energy? Even to-day I can tell you nothing further, than, I hope to start work at last to-morrow." There is a refinement in this reticence which floods with light those words of last July, after the previous domestic catastrophe: "I do not write you, for fear of distressing you."



For all that, there *is* a tangible connection between the letter of March 12th to Mathilde and our principal document, since it contains a sympathetic sketch of good Cornelius' flying visit for the earliest recital of the *Meistersinger*, followed by a request: "Do write him, child; he loves you too." And that tempts me to set off the picture of the Wagner interior with Cornelius' own description of its counterpart; for the younger man indulges in another "fairy" expedition very soon. On his way from Vienna to the lake of Geneva, in search of two months' quiet for the composition of his *Cid*, Cornelius makes a halt at Zurich, whence he writes to Dr. Standhartner,[1] May 5th, 1862:—

(1) A Vienna intimate of Wagner's also.—See *R. Wagner to M. Wesendonck.*

"I'm still full of my impressions of the Villa Wesendonck, which yesterday I saw. I didn't want to continue my journey without gaining an idea of Wagner's former Asyl."[1] Cornelius goes on to relate how he had fallen into conversation with a native: "Then I asked about the house Richard Wagner had occupied, and the man became quite *warm*. Just fancy—it was the wood-carver who had modelled that baton which Frau Wesendonck got made for Wagner after Semper's drawing! So the first person I spoke to at Zurich was an enthusiastic worshipper of Wagner.

"The second was Wesendonck, whom I visited forthwith. Dear Heaven!—how much I understand since yesterday, and what a good thing it is, friend, friends, that I have made this fool's-journey! Take a plunge into life, said Nicolai to me, and how right he was! *Beholding*, learning life, what oxygen, what air it brings the mind! . . . . [2] At Wesendonck's I swam in stupefaction blent of ecstasy and strange affright. How shall I describe it to you? It is summed up in that saying of Diogenes, which kept re-echoing in me: 'Alexander, get from between me and the sun!' A ghazal might be strung on that refrain. When a rival of Adonis, in guise of a white-cravatted janitor, rather *floated* than advanced to me—whom I should as soon have taken for Count Persigny as for the footman of Herr Wesendonck—'Alexander, from between me and the sun.'—When that sun-god of a lackey had wiped the dust from my miserable boots, at the unanimous request of all my outer and my inner man, and a study—no, not glimmered—glowered at me with its chairs and tables, pictures, bookshelves, easel, clock and all utensils, such as it would need a Boz or Dumas to depict—'Alexander, from between me and the sun.' When the monarch-citizen himself evolves before me, who creates his life as Wagner his operas, and talks of America and Italy as I of my landlord's apartments—'Alexander, from between me and the sun.' When his limes and poplars murmur in the park, all laid out by himself; when, inviting to a cup of tea, he leads me up his marble staircase with its four hermæ chiselled at his nod in Rome for 'next to nothing'—Socrates, the god-like young Augustus and the rest—and the needles of Australian shrubs embrace my chin *en passant* like green parricides—'Alexander, from between me and the sun.' Then at a supper in the third heaven (for one must rank his cellar as the *first*)—where the butter is served up with ice—he pours me out real Chinese tea in real Japanese cups on real Tungoo napkins—and

(1) The cottage adjoining Wesendonck's palace. Cornelius calls it "langjährigem Asyl," but we know that Wagner dwelt there less than sixteen months.
(2) Some omission by the German editor.

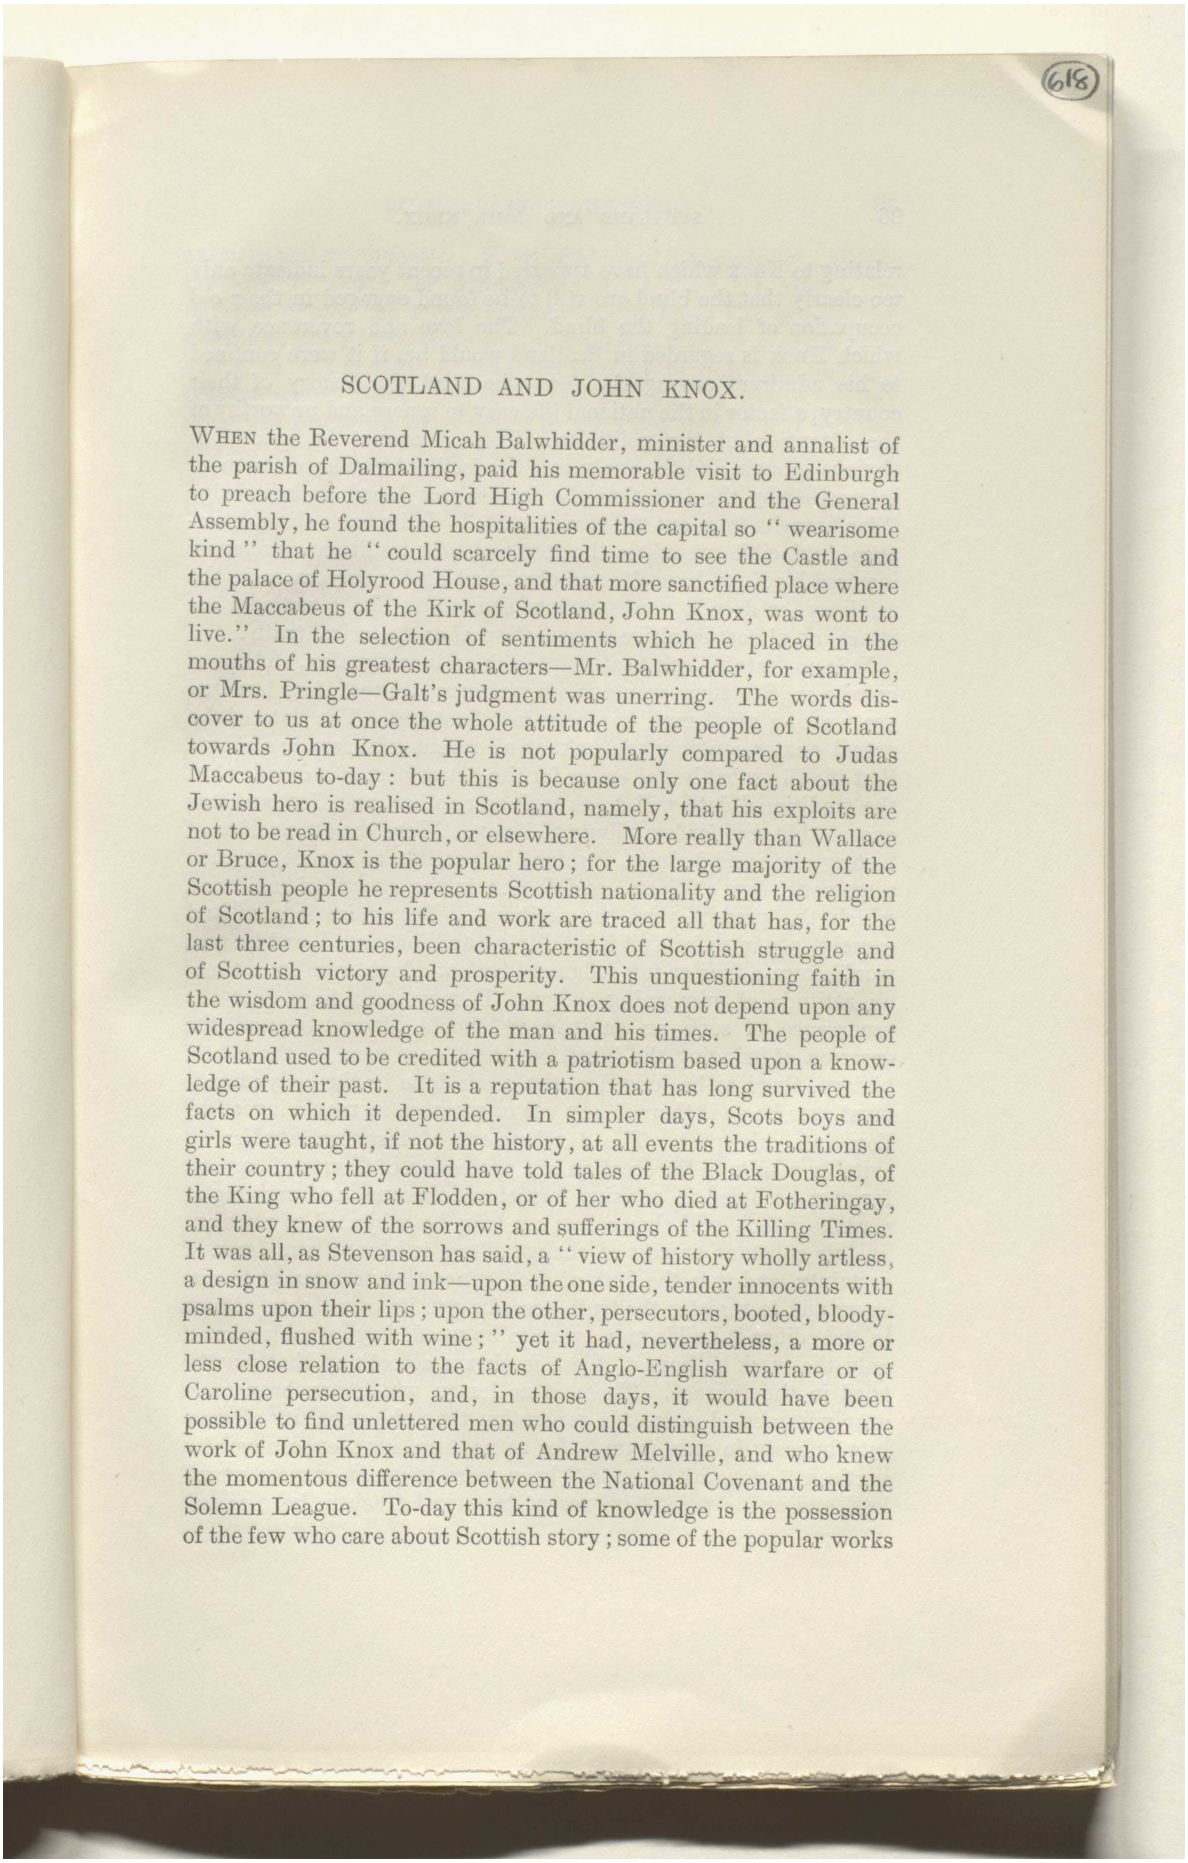
gives me suddenly my first correct idea of Raphael through the wonders of his giant red portfolio. . . . Yes, just as my uncle told him on the staircase of his house in Rome, 'And were you the archangel Raphael himself, I must be going now,' though he bore me on the wings of his wealth to every height and depth of all creation, I still say 'Alexander, from between me and the sun!' . . . .

"Frau Wesendonck, alas! is ill. She is expecting [six weeks hence] and a cough has developed—not without some anxiety, to judge by the account. This lady, of whom I saw a beautiful portrait in oils, must, in fact, be a dear angel of goodness! She regretted not being able to see me—but I had been received with so much friendship, and Herr Wesendonck behaved with such complete absence of *side*, that I ventured to leave my Geneva address and beg for kind news of the health of the lady of the house. Herr Wesendonck read me a letter from Wagner, which unfortunately doesn't confirm the good conclusions we had drawn from his silence. He says, 'Wherever I try to drive a nail to tighten up my life, it will not hold! And the doctor tells me, You *absolutely must not* work at present—it is destroying you out and out!' Write to him as often as you can—insist upon [your niece] Seraphine writing also; I will write to him myself either to-day or directly I get to Geneva! It's urgent.

"Imagine it! Wagner wrote to Wesendonck about that journey of mine—and just as if I had undertaken it at my own expense! . . . Of course I demolished that illusion by the simple truth."

It is generally these little touches that tell the most, and the last simple reference shows the full veracity of Wagner's old remark, that Mathilde kept no secrets from her husband; for that letter was addressed to *her*, as we have seen already. But the whole reception given to Cornelius, himself a perfect stranger, is striking evidence of the light in which Otto Wesendonck regarded Wagner. On this side of the picture, at least, there was no animosity.



A graceful little epilogue.—Cornelius writes to Standhartner some five weeks after: "Wesendonck has had the great kindness, not only to give me news of his wife's better health, but at the same time to make me the most delicate present. He has sent me, in quite admirable drawings, six sheets of them, those Psyche pictures of Raphael's the photographs of which so much impressed me. That is a gift which makes one proud, in place of shaming one." So Cornelius steals a couple of days from his *Cid* to frame his thanks in verse—we may be sure with no refrain of "Alexander, get from between me and the sun!"

WILLIAM ASHTON ELLIS.

SCOTLAND AND JOHN KNOX.

When the Reverend Micah Balwhidder, minister and annalist of the parish of Dalmailing, paid his memorable visit to Edinburgh to preach before the Lord High Commissioner and the General Assembly, he found the hospitalities of the capital so "wearisome kind" that he "could scarcely find time to see the Castle and the palace of Holyrood House, and that more sanctified place where the Maccabeus of the Kirk of Scotland, John Knox, was wont to live." In the selection of sentiments which he placed in the mouths of his greatest characters—Mr. Balwhidder, for example, or Mrs. Pringle—Galt's judgment was unerring. The words discover to us at once the whole attitude of the people of Scotland towards John Knox. He is not popularly compared to Judas Maccabeus to-day: but this is because only one fact about the Jewish hero is realised in Scotland, namely, that his exploits are not to be read in Church, or elsewhere. More really than Wallace or Bruce, Knox is the popular hero; for the large majority of the Scottish people he represents Scottish nationality and the religion of Scotland; to his life and work are traced all that has, for the last three centuries, been characteristic of Scottish struggle and of Scottish victory and prosperity. This unquestioning faith in the wisdom and goodness of John Knox does not depend upon any widespread knowledge of the man and his times. The people of Scotland used to be credited with a patriotism based upon a knowledge of their past. It is a reputation that has long survived the facts on which it depended. In simpler days, Scots boys and girls were taught, if not the history, at all events the traditions of their country; they could have told tales of the Black Douglas, of the King who fell at Flodden, or of her who died at Fotheringay, and they knew of the sorrows and sufferings of the Killing Times. It was all, as Stevenson has said, a "view of history wholly artless, a design in snow and ink—upon the one side, tender innocents with psalms upon their lips; upon the other, persecutors, booted, bloody-minded, flushed with wine;" yet it had, nevertheless, a more or less close relation to the facts of Anglo-English warfare or of Caroline persecution, and, in those days, it would have been possible to find unlettered men who could distinguish between the work of John Knox and that of Andrew Melville, and who knew the momentous difference between the National Covenant and the Solemn League. To-day this kind of knowledge is the possession of the few who care about Scottish story; some of the popular works

BRITISH LIBRARY

relating to Knox which have appeared in recent years indicate only too clearly that the blind are still to be found engaged in their old occupation of leading the blind. The love and reverence with which Knox is regarded in Scotland would be, if it were confined to his admirers among the few who read the history of their country, a factor in the national life easy to ignore and unworthy of the attention of the politician. That it cannot be ignored is obvious enough, and the analysis of the feeling is rendered the more interesting by the fact that the love is not based on knowledge "far brought from out the storied past." Is its basis sheer ignorance, invincible prejudice, the result of long tradition consciously inspired by Knox himself, and cherished by his successors in the ministry, or does it correspond to something like a national instinct, an almost intuitive appreciation of an historical truth?

It is no grateful task to attempt such an investigation. Those of us who are Scotsmen would much rather rejoice that, four hundred years ago, a great man was born into Scotland. The date of the actual quater-centenary is unknown; recent criticism has shown that it will probably not arrive for the better part of a decade; but the traditional date will do as well as another, and Scotland has chosen this year for her tribute to Knox. Were the conclusions of history clear and definite, it might be possible to silence, at such a moment, any criticism, and to join in the chorus of jubilation which the present year has produced. But praise is good and comely only in so far as it is intelligent and instructed, and he who would form a true or fair judgment cannot adopt, even for a time, an attitude of unmeaning eulogy. It may seem hard that the occurrence of such an anniversary should always become the occasion of bringing the illustrious dead once more to the bar of history, there to be judged of the deeds done in the body; but it must ever be so if there is any use or progress in man's investigation into his past. The development of historical studies inevitably results in the creation of a succession of Courts of Appeal, for ever occupied in revising former conclusions, and arriving at verdicts which will themselves ere long be subjected to revision. In this constant process of change, there is always some gain of certainty, and it is the duty of each generation to attempt to discover and to register the truth according to its own lights. Much in the edifice it builds may prove to be wood, hay, stubble; but if only the work be honest, there is always something that may be tried in the furnace. There is no lesson which has been more deeply impressed upon this generation than the necessity of absolute honesty in this regard, for at no time have exposures of a partisan "economy of truth" been more frequent or more merciless, and on no point have recent historical teachers been so un-

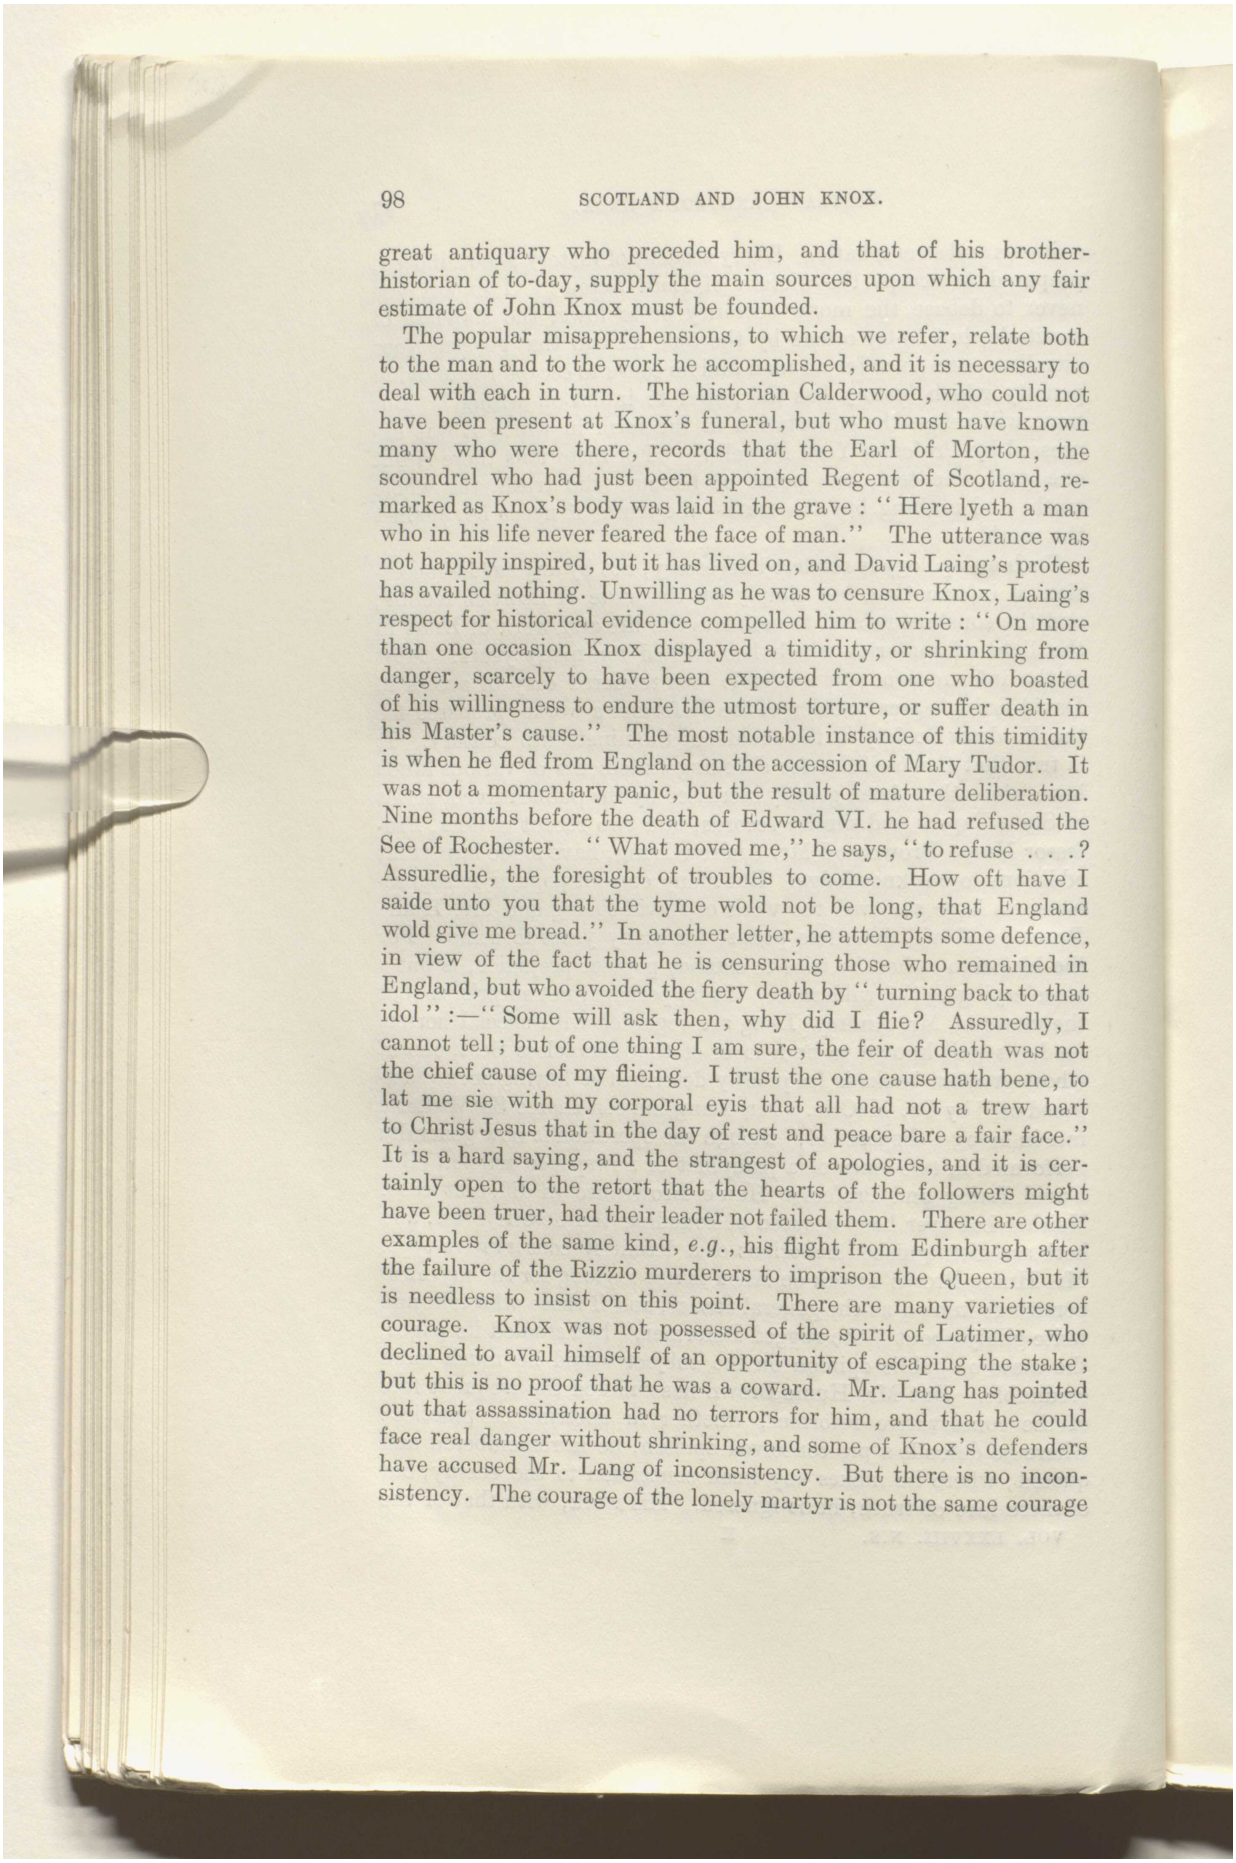
BRITISH LIBRARY



animous and so emphatic. Every student of history is not, indeed, prepared to accept the dictum of Lord Acton: "I exhort you never to debase the moral currency or to lower the standard of rectitude, but to try others by the final maxim that governs your own lives, and to suffer no man and no cause to escape the undying penalty which history has the power to inflict on wrong." But none will refuse the exhortation in the form in which it was expressed by Professor York Powell:—"For historians there is but one goal, one test, one point of honour—the truth, the whole truth, and nothing but the truth—the truth, if needs be, against the world."

Such an apology is rendered necessary, not by any sudden accession of information, but simply by the state of Scottish feeling, and the constant refusal to estimate the life and work of Knox in the light of material which has existed for many years. Most of the information now available was rendered easy of access in David Laing's great edition of the Reformer's works, prepared for the Wodrow Society in the middle of the nineteenth century. It is true that the facilities for checking statements of various kinds have, since then, been greatly increased by the publication of series of State Papers and similar records, and two recent writers, Professor Hume Brown and Mr. Andrew Lang, have made important additions to our knowledge. But many current popular misapprehensions have survived the work of David Laing and Mr. Hume Brown, and will doubtless persist for many years to come. For the historian, when he tries to combat popular prejudice, is but a voice crying in the wilderness. It is, perhaps, not surprising that the views of Mr. Andrew Lang are regarded with special horror, for he is well known to be a lover of that shameless Scot, one of whose greatest books is frequently described as having been "disposed of" by Dr. McCrie. Mr. Lang himself shares Sir Walter's fate in being "disposed of," though the operation is now generally performed in two lines of a pamphlet or newspaper article. But David Laing and Professor Hume Brown are in different case. Neither has ever been accused of sounding the heretic blast, and both are distinguished historians of a definitely conservative type. Mr. Hume Brown's work on Knox is not too long for the mythical personage known as the general reader, and if those who talk and write glibly about "the rugged Reformer," had studied its pages, the state of public opinion on the subject would be much more creditable. But Mr. Hume Brown has suffered the frequent fate of the conservative reformer, whether in doctrine or practice: where he defends a pre-conceived opinion, he is remembered and quoted; where he makes any weak concession to the enemy, out of mere love of truth, he is ignored. His work, with that of the

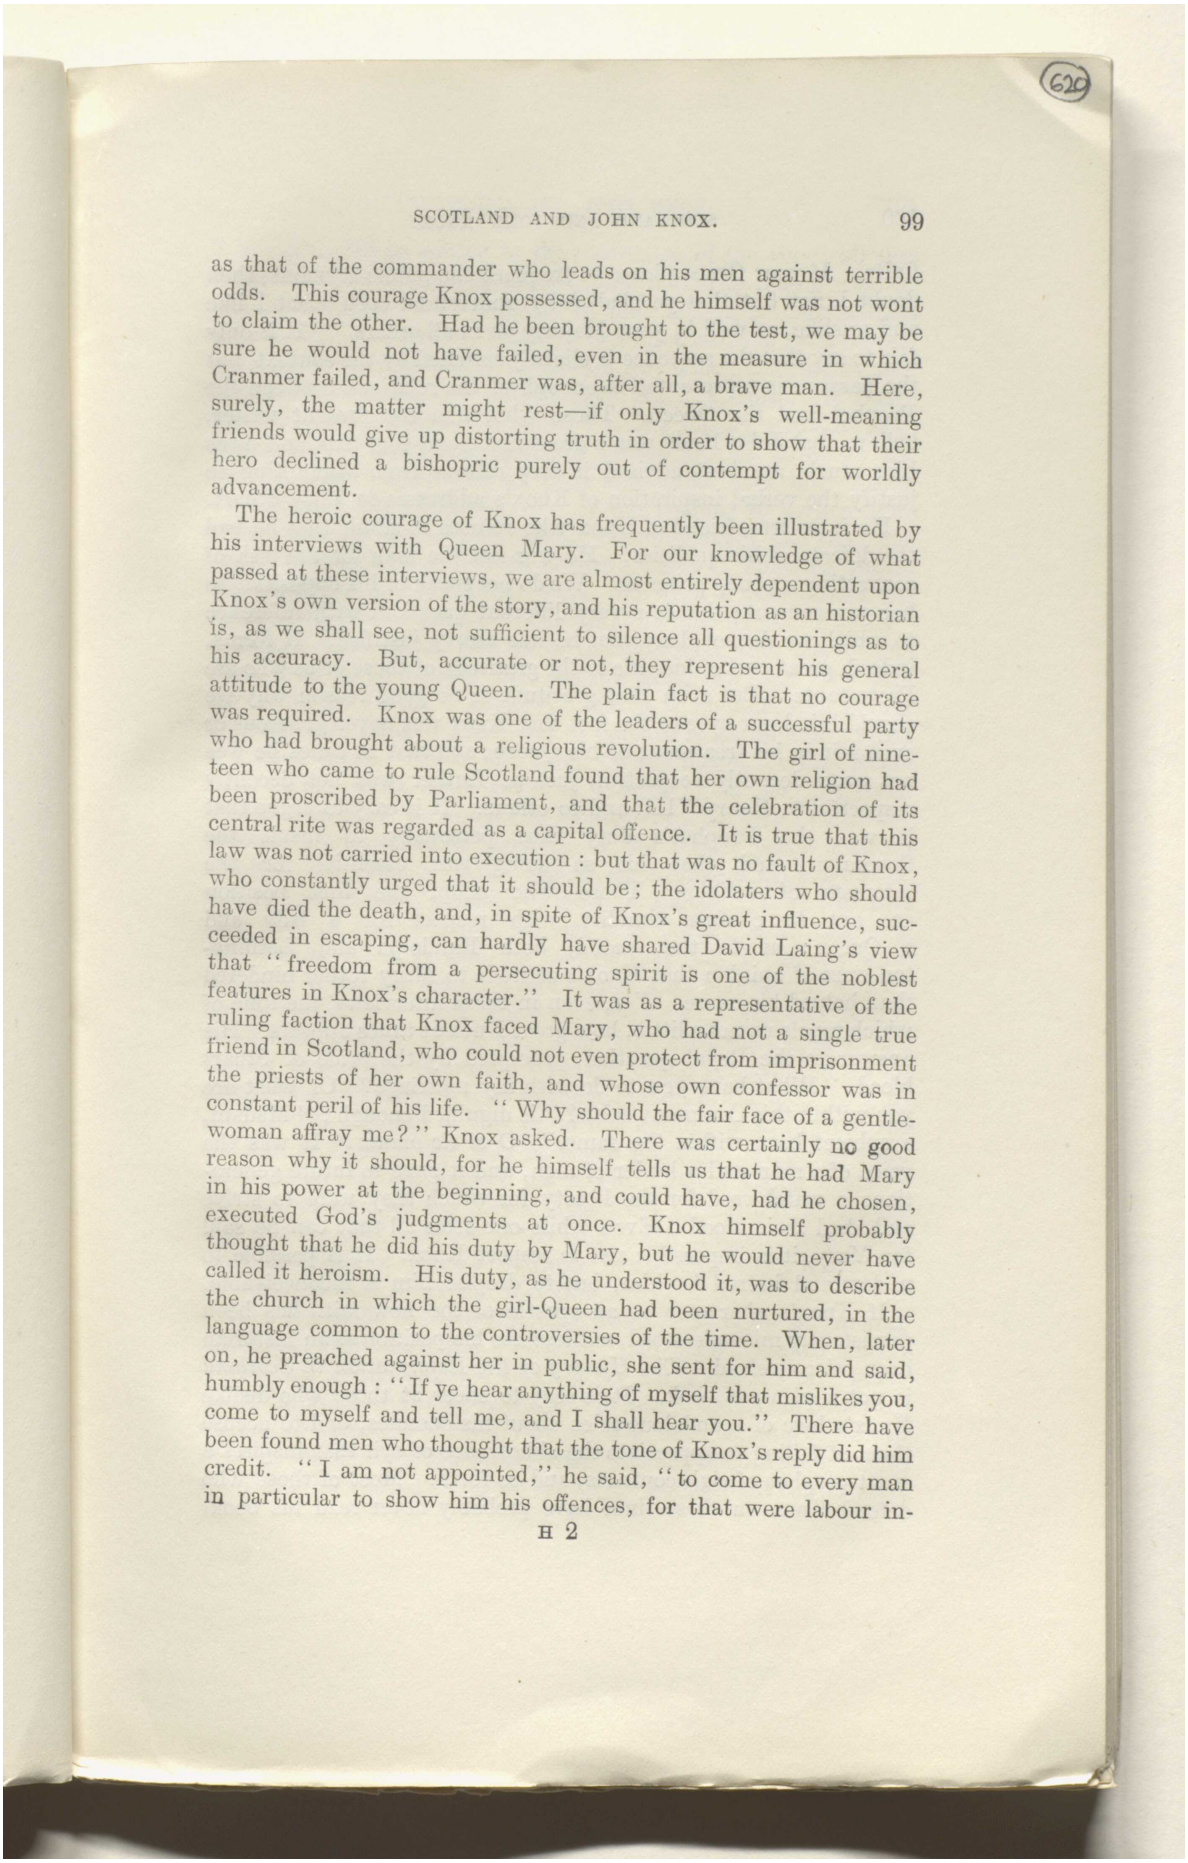
BRITISH LIBRARY



great antiquary who preceded him, and that of his brother-historian of to-day, supply the main sources upon which any fair estimate of John Knox must be founded.

The popular misapprehensions, to which we refer, relate both to the man and to the work he accomplished, and it is necessary to deal with each in turn. The historian Calderwood, who could not have been present at Knox's funeral, but who must have known many who were there, records that the Earl of Morton, the scoundrel who had just been appointed Regent of Scotland, remarked as Knox's body was laid in the grave : "Here lyeth a man who in his life never feared the face of man." The utterance was not happily inspired, but it has lived on, and David Laing's protest has availed nothing. Unwilling as he was to censure Knox, Laing's respect for historical evidence compelled him to write : "On more than one occasion Knox displayed a timidity, or shrinking from danger, scarcely to have been expected from one who boasted of his willingness to endure the utmost torture, or suffer death in his Master's cause." The most notable instance of this timidity is when he fled from England on the accession of Mary Tudor. It was not a momentary panic, but the result of mature deliberation. Nine months before the death of Edward VI. he had refused the See of Rochester. "What moved me," he says, "to refuse . . . ? Assuredlie, the foresight of troubles to come. How oft have I saide unto you that the tyme wold not be long, that England wold give me bread." In another letter, he attempts some defence, in view of the fact that he is censuring those who remained in England, but who avoided the fiery death by "turning back to that idol" :—"Some will ask then, why did I flie? Assuredly, I cannot tell; but of one thing I am sure, the feir of death was not the chief cause of my flieing. I trust the one cause hath bene, to lat me sie with my corporal eyis that all had not a trew hart to Christ Jesus that in the day of rest and peace bare a fair face." It is a hard saying, and the strangest of apologies, and it is certainly open to the retort that the hearts of the followers might have been truer, had their leader not failed them. There are other examples of the same kind, *e.g.*, his flight from Edinburgh after the failure of the Rizzio murderers to imprison the Queen, but it is needless to insist on this point. There are many varieties of courage. Knox was not possessed of the spirit of Latimer, who declined to avail himself of an opportunity of escaping the stake; but this is no proof that he was a coward. Mr. Lang has pointed out that assassination had no terrors for him, and that he could face real danger without shrinking, and some of Knox's defenders have accused Mr. Lang of inconsistency. But there is no inconsistency. The courage of the lonely martyr is not the same courage

as that of the commander who leads on his men against terrible odds. This courage Knox possessed, and he himself was not wont to claim the other. Had he been brought to the test, we may be sure he would not have failed, even in the measure in which Cranmer failed, and Cranmer was, after all, a brave man. Here, surely, the matter might rest—if only Knox's well-meaning friends would give up distorting truth in order to show that their hero declined a bishopric purely out of contempt for worldly advancement.

The heroic courage of Knox has frequently been illustrated by his interviews with Queen Mary. For our knowledge of what passed at these interviews, we are almost entirely dependent upon Knox's own version of the story, and his reputation as an historian is, as we shall see, not sufficient to silence all questionings as to his accuracy. But, accurate or not, they represent his general attitude to the young Queen. The plain fact is that no courage was required. Knox was one of the leaders of a successful party who had brought about a religious revolution. The girl of nineteen who came to rule Scotland found that her own religion had been proscribed by Parliament, and that the celebration of its central rite was regarded as a capital offence. It is true that this law was not carried into execution : but that was no fault of Knox, who constantly urged that it should be ; the idolaters who should have died the death, and, in spite of Knox's great influence, succeeded in escaping, can hardly have shared David Laing's view that "freedom from a persecuting spirit is one of the noblest features in Knox's character." It was as a representative of the ruling faction that Knox faced Mary, who had not a single true friend in Scotland, who could not even protect from imprisonment the priests of her own faith, and whose own confessor was in constant peril of his life. "Why should the fair face of a gentlewoman affray me?" Knox asked. There was certainly no good reason why it should, for he himself tells us that he had Mary in his power at the beginning, and could have, had he chosen, executed God's judgments at once. Knox himself probably thought that he did his duty by Mary, but he would never have called it heroism. His duty, as he understood it, was to describe the church in which the girl-Queen had been nurtured, in the language common to the controversies of the time. When, later on, he preached against her in public, she sent for him and said, humbly enough : "If ye hear anything of myself that mislikes you, come to myself and tell me, and I shall hear you." There have been found men who thought that the tone of Knox's reply did him credit. "I am not appointed," he said, "to come to every man in particular to show him his offences, for that were labour in-

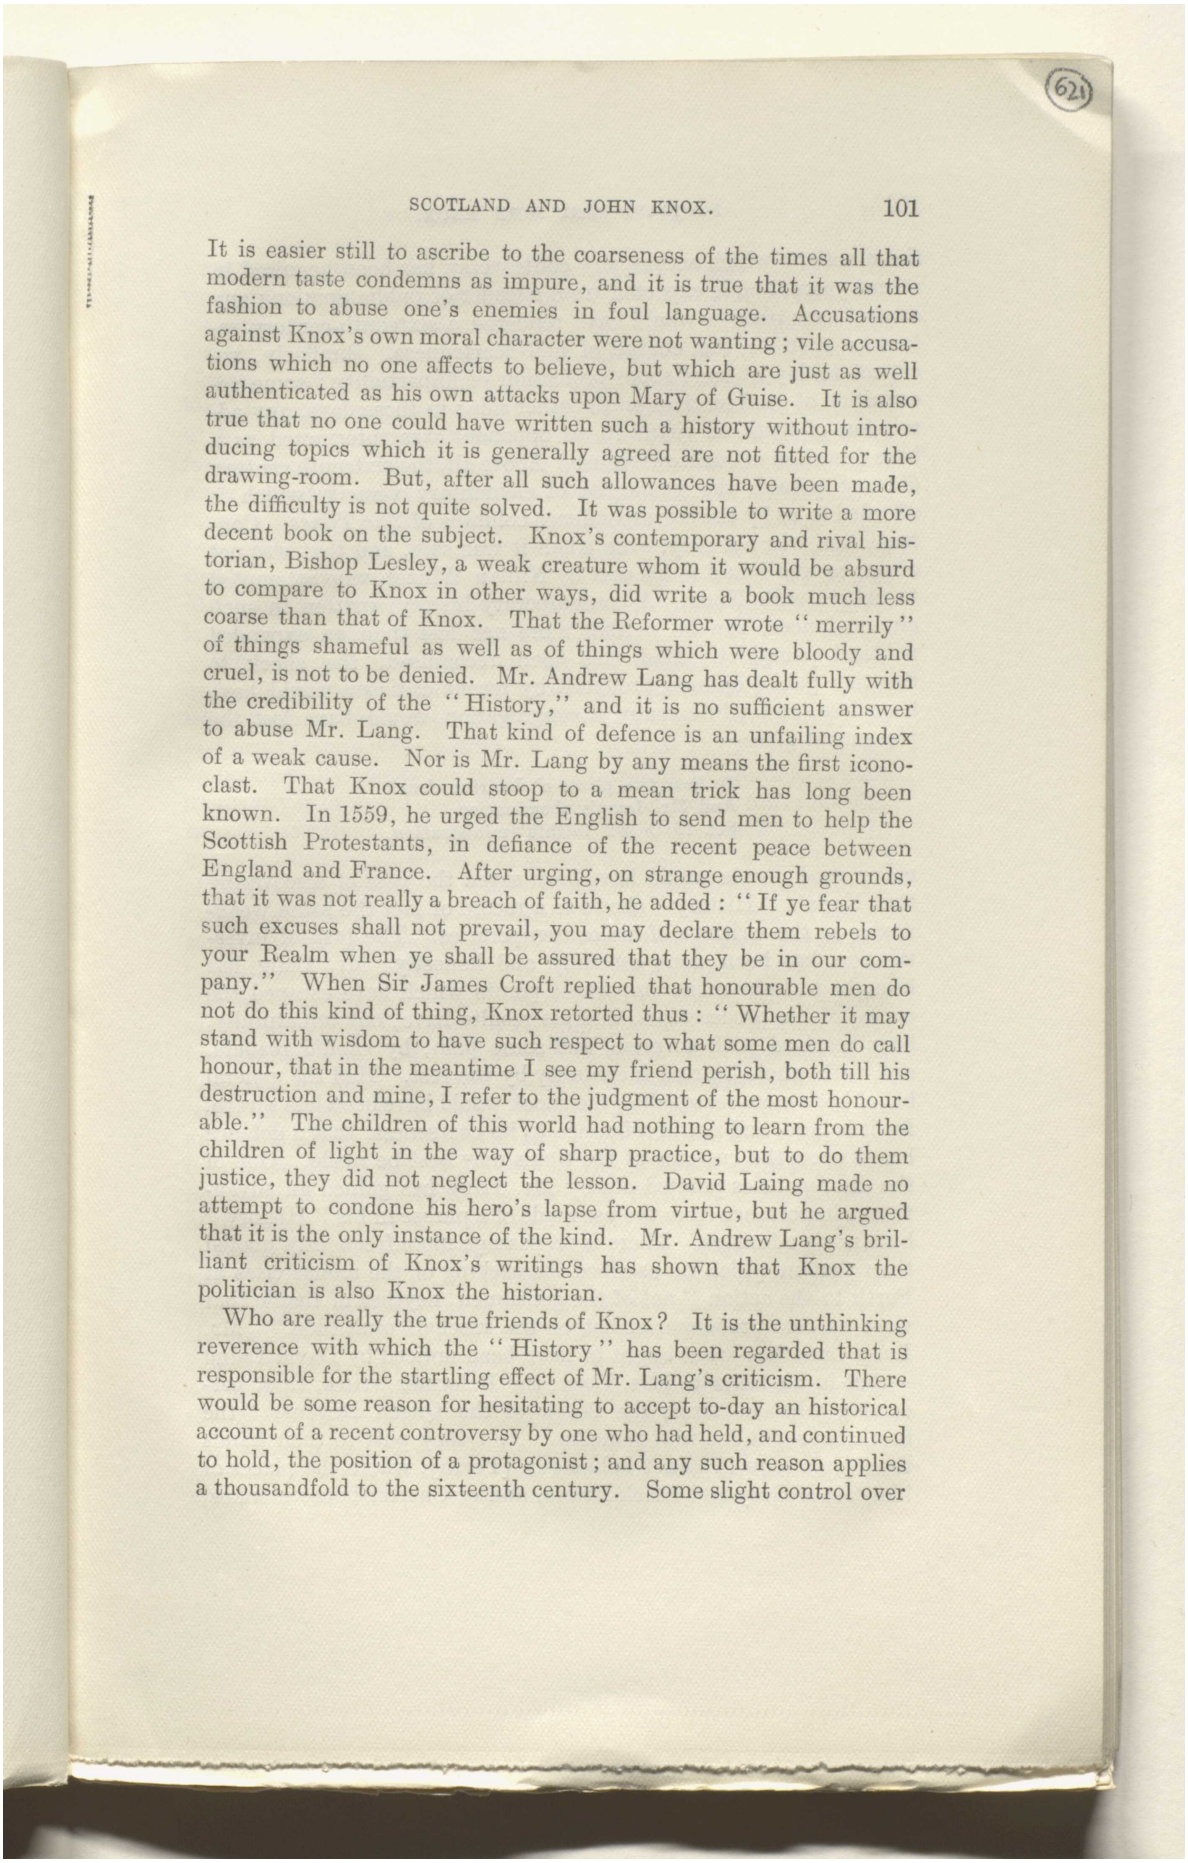
finite. If your Grace please to frequent the public sermons, then doubt I not but that ye shall fully understand both what I like and mislike, as well in your Majesty as in all others." It is only fair to say that the sentence is slightly softened by the context, but the passage is representative enough of the relations between the Prophet and the Queen. Those who, like the present writer, believe that John Knox was a great man, and that Scotland owes him much, are best advised if they refrain from attempting to justify the verbal inspiration of Knox's addresses to Mary Stuart.



He is no true friend of Knox who refuses to admit that he had the defects of his qualities. He was not the man for the task of converting a young princess. We do not speak of his opposition to her government; that is a very different question, with reference to which we do not deny that he was amply justified. It forms, indeed, great part of his title to the gratitude of those of us who are Protestants. But even that gratitude is no good reason why we should blind our eyes to the fact that Knox was never generous or even fair in his treatment of his Queen, and that at times he was not even decently respectful, just as Luther was not decently respectful to Henry VIII. and to others. It is easy to argue that it was the Prophet's duty thus personally to insult the Sovereign, and that his so doing was essential for the interests of religion. Those who adopt the first position are apt to confuse timidity with respect for a lady and a Queen; as to the second, both Randolph and Lethington were of opinion that Knox's attitude to Mary rather hindered than helped his cause. Yet, even in these interviews, the tone of which repels us not a little, how great Knox at times appears. His answer to the Royal question, prompted by the pride of Stuart blood, "What have you to do with my marriage? Or what are you within this Commonwealth?" is dignified enough: "Madam, a subject born within the same." *O si sic omnia!* It was the voice of a man and a leader of men, and it gave to future generations a watchword for the liberty for which they were to strive and shed their blood. Even while one feels all that can be said for Mary, it is impossible not to respect Knox. It is possible to understand hatred for him, but to despise him is inconceivable.

If Knox's character as an apostle of the new faith has been persistently misunderstood, not less has his position as an historian been misconceived. The *History of the Reformation in Scotland* is not a pleasant book. It is easy to sneer at those who dislike Knox's love of scandalous tales about his enemies, and to accuse them of failing to appreciate the abhorrence of evil that inspires a great prophet of righteousness, and so forth. Most of those who defend Knox on these lines have probably never read his book.

It is easier still to ascribe to the coarseness of the times all that modern taste condemns as impure, and it is true that it was the fashion to abuse one's enemies in foul language. Accusations against Knox's own moral character were not wanting; vile accusations which no one affects to believe, but which are just as well authenticated as his own attacks upon Mary of Guise. It is also true that no one could have written such a history without introducing topics which it is generally agreed are not fitted for the drawing-room. But, after all such allowances have been made, the difficulty is not quite solved. It was possible to write a more decent book on the subject. Knox's contemporary and rival historian, Bishop Lesley, a weak creature whom it would be absurd to compare to Knox in other ways, did write a book much less coarse than that of Knox. That the Reformer wrote "merrily" of things shameful as well as of things which were bloody and cruel, is not to be denied. Mr. Andrew Lang has dealt fully with the credibility of the "History," and it is no sufficient answer to abuse Mr. Lang. That kind of defence is an unfailing index of a weak cause. Nor is Mr. Lang by any means the first iconoclast. That Knox could stoop to a mean trick has long been known. In 1559, he urged the English to send men to help the Scottish Protestants, in defiance of the recent peace between England and France. After urging, on strange enough grounds, that it was not really a breach of faith, he added: "If ye fear that such excuses shall not prevail, you may declare them rebels to your Realm when ye shall be assured that they be in our company." When Sir James Croft replied that honourable men do not do this kind of thing, Knox retorted thus: "Whether it may stand with wisdom to have such respect to what some men do call honour, that in the meantime I see my friend perish, both till his destruction and mine, I refer to the judgment of the most honourable." The children of this world had nothing to learn from the children of light in the way of sharp practice, but to do them justice, they did not neglect the lesson. David Laing made no attempt to condone his hero's lapse from virtue, but he argued that it is the only instance of the kind. Mr. Andrew Lang's brilliant criticism of Knox's writings has shown that Knox the politician is also Knox the historian.

Who are really the true friends of Knox? It is the unthinking reverence with which the "History" has been regarded that is responsible for the startling effect of Mr. Lang's criticism. There would be some reason for hesitating to accept to-day an historical account of a recent controversy by one who had held, and continued to hold, the position of a protagonist; and any such reason applies a thousandfold to the sixteenth century. Some slight control over

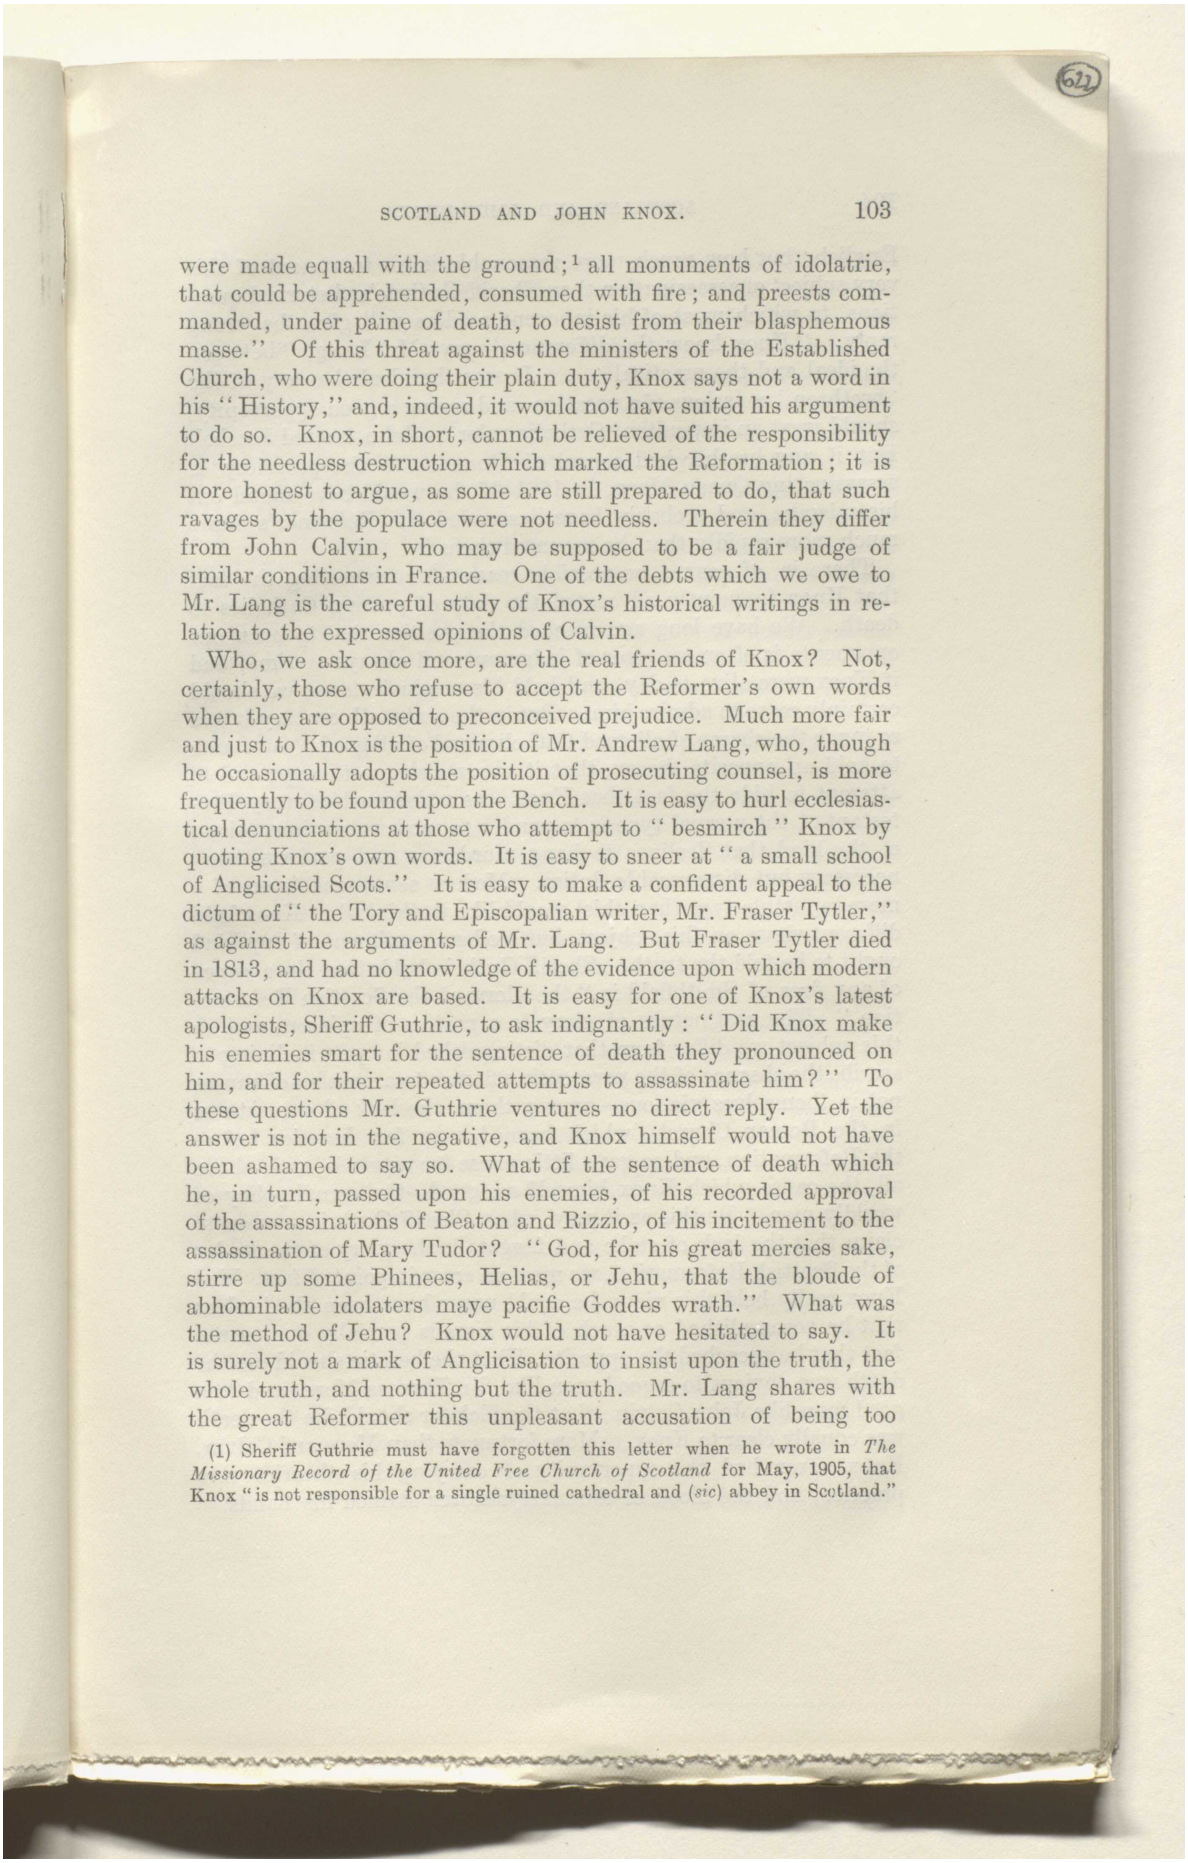
the emotions which accompany controversy has been acquired in recent years, and is expected from a leader of public opinion; any control over passion would have rendered a sixteenth-century reformer open to the charge of half-heartedness. Similarly, we expect to-day at least some profession of impartiality: some recognition of good motives on the other side; in those days, any admission of truth or virtue in an opponent was interpreted as a base desertion of one's own cause. Above all, the sixteenth century did not possess the guarantee of elementary veracity which is afforded to us by the correspondence columns of *The Times*. Contradiction was not easy, even when it was safe, and that was not often, as was found to his cost by Ninian Winzet, who attempted to debate with Knox. A contemporary history, written in such circumstances, can be neither more nor less than an expanded political pamphlet. Had this been recognised, the shock to Scottish public opinion produced by recent criticism would have been less, and while many a congregation would have lost the pleasure it gives—



> To hear two p'ints o' doctrine clearit
> And Mr. Lang's abomination
> Set fürth wi' faithfü' ministration,

many good people would have been saved the pain of discovering that Knox's "History" shows as a record of fact the same weaknesses as the writings of his contemporaries. The task of investigation has been done carefully and honestly; Mr. Lang has brought to light many important points which have escaped the notice of his predecessors, and his results have, not unnaturally, been received with surprise, and some pain, by candid readers, and with whole-hearted incredulity by the rest. Had the general belief been more reasonable, the shock would have been less severe, for it is here, and not in reference to its coarseness, that a defence based upon the customs of the times may best be made. One of the discrepancies pointed out by Mr. Lang has gained an adventitious importance from the use made of a phrase in his "History" by Knox's admirers. There is no passage more frequently quoted than that in which he ascribes the sacking of the monasteries at Perth to the action "not of the gentilmen, neyther of thame that were earnest professouris, bot of the raschall multitude." Mr. Lang remarks—what ought to have been noticed by David Laing—that in his letter to Mrs. Lock, the Reformer writes, that, perceiving what he terms the deceit of the Queen Regent, "the brethrein soght the nixt remedie . . . . they putt to their hands to reformatioun in Sanct Johnstoun [Perth], where the places of idolotrie of Gray and Black Friers, and of Charter-house monkes,

BRITISH LIBRARY

were made equall with the ground;[1] all monuments of idolatrie, that could be apprehended, consumed with fire; and preests commanded, under paine of death, to desist from their blasphemous masse." Of this threat against the ministers of the Established Church, who were doing their plain duty, Knox says not a word in his "History," and, indeed, it would not have suited his argument to do so. Knox, in short, cannot be relieved of the responsibility for the needless destruction which marked the Reformation; it is more honest to argue, as some are still prepared to do, that such ravages by the populace were not needless. Therein they differ from John Calvin, who may be supposed to be a fair judge of similar conditions in France. One of the debts which we owe to Mr. Lang is the careful study of Knox's historical writings in relation to the expressed opinions of Calvin.

Who, we ask once more, are the real friends of Knox? Not, certainly, those who refuse to accept the Reformer's own words when they are opposed to preconceived prejudice. Much more fair and just to Knox is the position of Mr. Andrew Lang, who, though he occasionally adopts the position of prosecuting counsel, is more frequently to be found upon the Bench. It is easy to hurl ecclesiastical denunciations at those who attempt to "besmirch" Knox by quoting Knox's own words. It is easy to sneer at "a small school of Anglicised Scots." It is easy to make a confident appeal to the dictum of "the Tory and Episcopalian writer, Mr. Fraser Tytler," as against the arguments of Mr. Lang. But Fraser Tytler died in 1813, and had no knowledge of the evidence upon which modern attacks on Knox are based. It is easy for one of Knox's latest apologists, Sheriff Guthrie, to ask indignantly: "Did Knox make his enemies smart for the sentence of death they pronounced on him, and for their repeated attempts to assassinate him?" To these questions Mr. Guthrie ventures no direct reply. Yet the answer is not in the negative, and Knox himself would not have been ashamed to say so. What of the sentence of death which he, in turn, passed upon his enemies, of his recorded approval of the assassinations of Beaton and Rizzio, of his incitement to the assassination of Mary Tudor? "God, for his great mercies sake, stirre up some Phinees, Helias, or Jehu, that the bloude of abhominable idolaters maye pacifie Goddes wrath." What was the method of Jehu? Knox would not have hesitated to say. It is surely not a mark of Anglicisation to insist upon the truth, the whole truth, and nothing but the truth. Mr. Lang shares with the great Reformer this unpleasant accusation of being too

(1) Sheriff Guthrie must have forgotten this letter when he wrote in *The Missionary Record of the United Free Church of Scotland* for May, 1905, that Knox "is not responsible for a single ruined cathedral and (*sic*) abbey in Scotland."

English; but how much more reasonable is his treatment of this very subject of assassination than Sheriff Guthrie's rhetorical questions, to which most of his innocent readers will give the wrong reply. "Knox knew the difference," says Mr. Lang, "between the ideal and the practical. . . . It was the ideal that any of the 'brethren,' conscious of a vocation, and seeing a good opportunity, should treat an impenitent Catholic ruler as Jehu treated Jezebel. But if any brother had consulted Knox as to the propriety of assassinating Queen Mary, in 1561–67, he would have found out his mistake, and probably have descended the Reformer's stairs much more rapidly than he mounted them."

There is, of course, no possible reason for concealing the fact that Knox frequently advocated the duty of putting Catholics to death. We have long ago reached the position that to burn our opponents is often an error of judgment and always a crime, and if Knox were alive to-day, and held his original views, we should certainly cease to admire him. But in the sixteenth century it was so much the shame of all good Catholics and of all good Protestants to hold an opposite theory, that it was no shame to any; and to attempt to hide the fact that Knox was a sixteenth-century Protestant of the normal type is to pander to modern sentimentalism of the kind that declines to hang murderers and perform other necessary but disagreeable duties. Modern sentiment (even of a more reputable type than this) would like to think that Knox held different views on this subject, but modern sentiment of any kind ought to be told the truth. Sheriff Guthrie holds that the absence of any fires of Smithfield is "the glory of the Scottish Reformation." The real nature of glory is a matter of opinion, and on this subject we differ from that distinguished lawyer, inclining to ascribe the absence of the persecuting flames to a number of causes not in themselves glorious—among them, the lack of earnestness in the Roman Church, which burned very few heretics before the Reformation, and so gave little cause for reprisals, and, above all, the cause which Knox himself assigned—the carnal policy of worldly men. Be this as it may, when Sheriff Guthrie goes on to claim that the lack of stake and faggots is the glory of the leader of the Scottish Reformation, we meet an error in point of fact. Had Knox really held this view, he could never have been the leader; that he accomplished so much of his aims is partially due to the fact that he preached the opposite. That the heretic should die the death was obvious to a good man like Sir Thomas More, and to a good man like John Calvin; that the idolater should die the death was equally clear to Knox. More fortunate than More and Calvin, Knox never had the opportunity of carrying his theories into practice, and the blood of the martyr never stained his hands.

We have no intention of palliating the more serious weaknesses of character to which we have referred. Knox is too great for an apology. His faults were the defects of his virtues; the coarseness of language is closely allied to his robust sense of humour, and is part of the vehemence of his whole character; the unfairness of word and deed, the sharp practice which we reluctantly admit, is no less part of the man than the fire and enthusiasm with which he championed his cause. It may be a contradiction of character and temperament, but if so, it is a contradiction to which there are many parallels in history. The evil is there; but it is not the main fact about the man. John Knox was not a venal liar like George Buchanan; he was not open to the charge of self-seeking like Cranmer; he was not mean like Lesley, or unscrupulous as Thomas Cromwell or Elizabeth were unscrupulous. Where shall we look for his equal among the men of his day? There was none whose hands were cleaner than those of Knox; none whose heart was so pure as his.

If Knox's character has been but imperfectly realised, the work he accomplished has also been misunderstood, though in less degree. These misapprehensions are not only widespread in England; they are also popularly current in Scotland, in spite of the teaching of generations of learned professors of Church History. It should scarcely be necessary to insist that Knox did not introduce Presbyterianism into Scotland, although that error is to be found in at least one recent book. The machinery of Scottish Presbyterianism was the work of Andrew Melville. More general is the confusion between the sacramental doctrine of Knox and that of English Puritanism, an error related to the still more common confusion between Calvinism and Zwinglianism. When Archbishop Laud made his foolish attempt to force his Liturgy upon the Scottish people, strong suspicions of Popery were produced by the language of the Communion Office—"that our sinful bodies may be made clean through His body, and our souls washed through His most precious blood." Row, who more particularly objected to these words, was not a typical Scottish Presbyterian, but his language shows that some members of the Church had even then travelled some distance from the Knoxian position. It is difficult for the lay mind to discover any real difference between the words just quoted and Knox's own statement: "that we, being fed with His flesh and refreshit with His blood, may be renewit both unto trew Godliness and to immortalitie." Once more, it is frequently said that the Scottish Reformation was a protest against the power of the priesthood. In one sense this is true, but the claims of the clergy of the Reformed Church were not less dangerous to civil liberty and freedom of conscience than

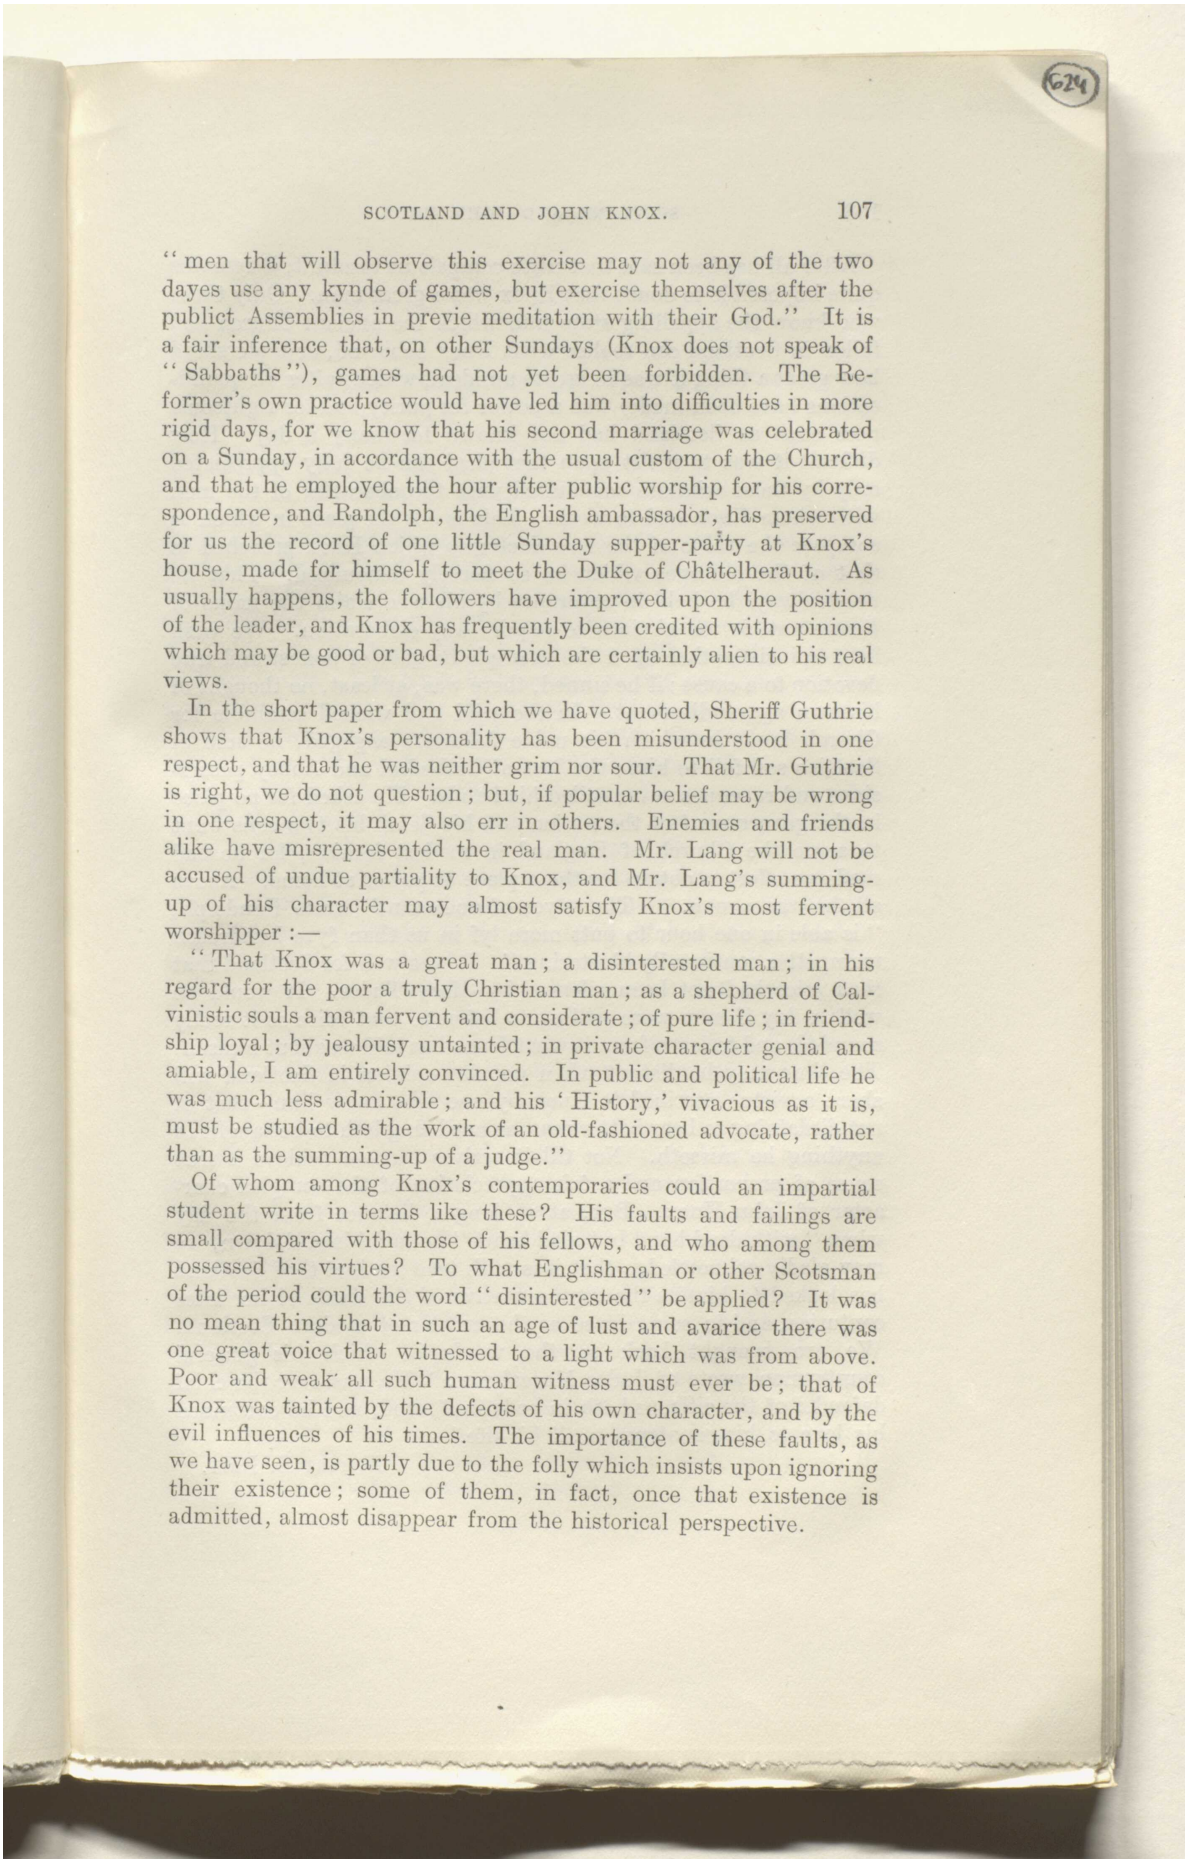
BRITISH LIBRARY



those of the priests whom they succeeded. At the time, the Reformed clergy had so much popular support, and the doctrines they preached appealed so powerfully to the people, that it would be absurd to represent Knox's followers as the victims of priestly oppression. But it must not be forgotten that Knox and his brethren claimed powers which are now commonly associated with the Roman Church, or with that party in the Church of England which is wont to arrogate to itself the title of "Catholic." The service which Knox drew up for the Public Excommunication of those who defied the Church Courts assumes the power of loosing and binding as the possession of these Courts. "I, in Thy name, and at the commandment of this Thy present congregation, cut off, seclude, and excommunicate from Thy body, and from our society, N. . . . . And this his sin (albeit with sorrow of heart) we bind, and pronounce the same to be bound in heaven and earth." In like manner, the form of absolution from spiritual censures contains the words:—"I pronounce thy sin to be loosed in heaven." Finally, the theory of spiritual independence over which men fought with sword and gun in the seventeenth century, and with other weapons since then, is not, as a cardinal point of faith, an inheritance from John Knox. That he afforded instances of the practice is quite true, but Mr. Lang has shown that he possessed no settled views on the subject, and that he on various occasions adapted his opinions to the circumstances of the time. It would be easy to quote from him passages conveying this doctrine, just as it would be easy to quote passages which express an opposite view. But the Church was not committed to the principle of "two kingdoms in Scotland" until she passed under the leadership of Andrew Melville.

In the light of all this, it is easy to understand that appeals have frequently been made to the authority of Knox on behalf of customs and doctrines of which he was wholly innocent. It is not even yet fully understood in Scotland that Knox was the author of a Service-Book, and that until the time of the Solemn League, Scottish Presbyterians had no objection to read prayers, or to the use of the Gloria or of the Creed. The time was to come when neither the Lord's Prayer nor the simple reading of any passage of Scripture formed part of the ordinary Public Worship in a parish church in Scotland, and those who advocated such "innovations," a century and less ago, were opposed in the name of the Knoxian tradition. Nor had Knox any share in the introduction of what is generally known as the "Scottish Sabbath"—really an institution borrowed from English Puritanism. There is no authority for the story that he played golf on Sunday, but it may well have been so, for in an order for a General Fast, published in 1566, he directs that on the two Sundays of Abstinence,

BRITISH LIBRARY

"men that will observe this exercise may not any of the two dayes use any kynde of games, but exercise themselves after the publict Assemblies in previe meditation with their God." It is a fair inference that, on other Sundays (Knox does not speak of "Sabbaths"), games had not yet been forbidden. The Reformer's own practice would have led him into difficulties in more rigid days, for we know that his second marriage was celebrated on a Sunday, in accordance with the usual custom of the Church, and that he employed the hour after public worship for his correspondence, and Randolph, the English ambassador, has preserved for us the record of one little Sunday supper-party at Knox's house, made for himself to meet the Duke of Châtelheraut. As usually happens, the followers have improved upon the position of the leader, and Knox has frequently been credited with opinions which may be good or bad, but which are certainly alien to his real views.

In the short paper from which we have quoted, Sheriff Guthrie shows that Knox's personality has been misunderstood in one respect, and that he was neither grim nor sour. That Mr. Guthrie is right, we do not question; but, if popular belief may be wrong in one respect, it may also err in others. Enemies and friends alike have misrepresented the real man. Mr. Lang will not be accused of undue partiality to Knox, and Mr. Lang's summing-up of his character may almost satisfy Knox's most fervent worshipper:—

"That Knox was a great man; a disinterested man; in his regard for the poor a truly Christian man; as a shepherd of Calvinistic souls a man fervent and considerate; of pure life; in friendship loyal; by jealousy untainted; in private character genial and amiable, I am entirely convinced. In public and political life he was much less admirable; and his 'History,' vivacious as it is, must be studied as the work of an old-fashioned advocate, rather than as the summing-up of a judge."

Of whom among Knox's contemporaries could an impartial student write in terms like these? His faults and failings are small compared with those of his fellows, and who among them possessed his virtues? To what Englishman or other Scotsman of the period could the word "disinterested" be applied? It was no mean thing that in such an age of lust and avarice there was one great voice that witnessed to a light which was from above. Poor and weak all such human witness must ever be; that of Knox was tainted by the defects of his own character, and by the evil influences of his times. The importance of these faults, as we have seen, is partly due to the folly which insists upon ignoring their existence; some of them, in fact, once that existence is admitted, almost disappear from the historical perspective.

After all has been said that truth compels us to admit, it remains quite impossible to doubt that Knox was a great man. Only those who know the appalling state into which the ancient Church had fallen in Scotland can realise what Knox achieved, or understand how great a thing it was to create an ideal, which (after all qualifications have been made) was a power for purity and for righteousness such as Scotland had not known for many a day. How difficult it was to insist upon that ideal can be fully appreciated only by those who are acquainted with the character of the men with whom Knox had to work. This is not the place in which to compare the value of the new doctrines which Knox preached to that of the old ones which he so fiercely denounced. That he must always be held in reverence by all who claim the name of Protestant, is too obvious to require any elaboration. We wish here to insist rather upon the example he gave of honest and true devotion to a cause; if he sinned, there was, at least, no thought of his own aggrandisement. In the wild and wicked scramble for Church lands in which his noble followers engaged, no acre of Scottish soil fell to him; the loot of Cathedral and Abbey possessions and revenues never soiled his hands. He asked for no place in the government of the nation; on his death his two sons went to serve the Church of England in modest fashion, for he had made no effort to obtain for them place or power at home. Above all, he was a man. "The voyce of one man," wrote Randolph, "is able in one hour to putt more lyf in us than fyve hundredth trumpettes continually blustering." It was well for Scotland that that voice had not been silenced by Mary Tudor. It would be well to-day if men were willing to listen to that voice as it really sounded, and to learn from it what Knox has told us about himself. The time may be distant when popular opinion in Scotland will share a virtue ascribed to Knox by one who knew him—that of not disdaining to hear better reasons nor being loth to be taught in anything he misseth. Not till it arrives can we achieve a true sense of proportion and a fair appreciation of the complex character of John Knox. But, at so long a distance from the day when "with dead hand but glad heart" he laid himself down, we may gladly acknowledge that it is with true instinct that Scotland has looked to him as the representative of the ideals of her later centuries, and in some sense as the creator of modern Scotland. We are brought back to the words in which his grateful countrymen wrote of Judas Maccabeus: "He was ever the chief defender of the citizens both in body and mind, and he continued his love to his countrymen all his life."

ROBERT S. RAIT.

THE POSITION OF WOMEN.

I.

The Duel of the Sexes.—A Comment.

It is a curious and discouraging fact that the women who have profited most by the "woman's movement," those whose genius has enabled them to avail themselves to the full of the increased opportunities it would fain offer to all, have nearly without exception risen up to decry it and their sex with singular rancour and contempt. We have had several recent examples of this fact; Mrs. Craigie, Miss Elizabeth Robins, and now Lucas Malet, to crown the distinguished list. Mrs. Craigie accuses her sex of every frailty and meanness, while Elizabeth Robins depicts a heroine, a poetess of sensitive and romantic temperament who rejects the love of dozens of men, more or less true and chivalrous, to lavish hers upon a man who gratuitously insults her every time he opens his mouth; a man whose brutalities are not even balanced by the rough honesty and honour that are generally supposed to accompany a chronic habit of lacerating people's feelings, for he has the amazing meanness to break open the locked volume in which his wife has written her poems; and finally he tears down the door of the room in which she has taken refuge in sheer terror of her lfie. Katharine thinks nothing of the dishonourable violation of her locked volume; a wife, it seems, has no personal rights where her husband is concerned; it does not lower him in her eyes to find him guilty of an action which might be expected from a housemaid who would not hesitate to read other people's letters or to listen at keyholes. Nor does this proud and romantic heroine appear to be moved (except to fear) by her husband's violent entry into her room, for it is immediately after he has torn down the door and burst upon her with the face of a maniac that a *rapprochement* takes place between the pair (for there *had* been some slight strain in their relations in spite of the wife's meekness). Touched, apparently, with gratitude that, after all, he has not strangled her as she anticipated, she promises that she will never again lock him out since it seems to discompose him so seriously. She will take the risk of sudden death, as, in fact, she *must*, if she is to stay with her pleasant companion.

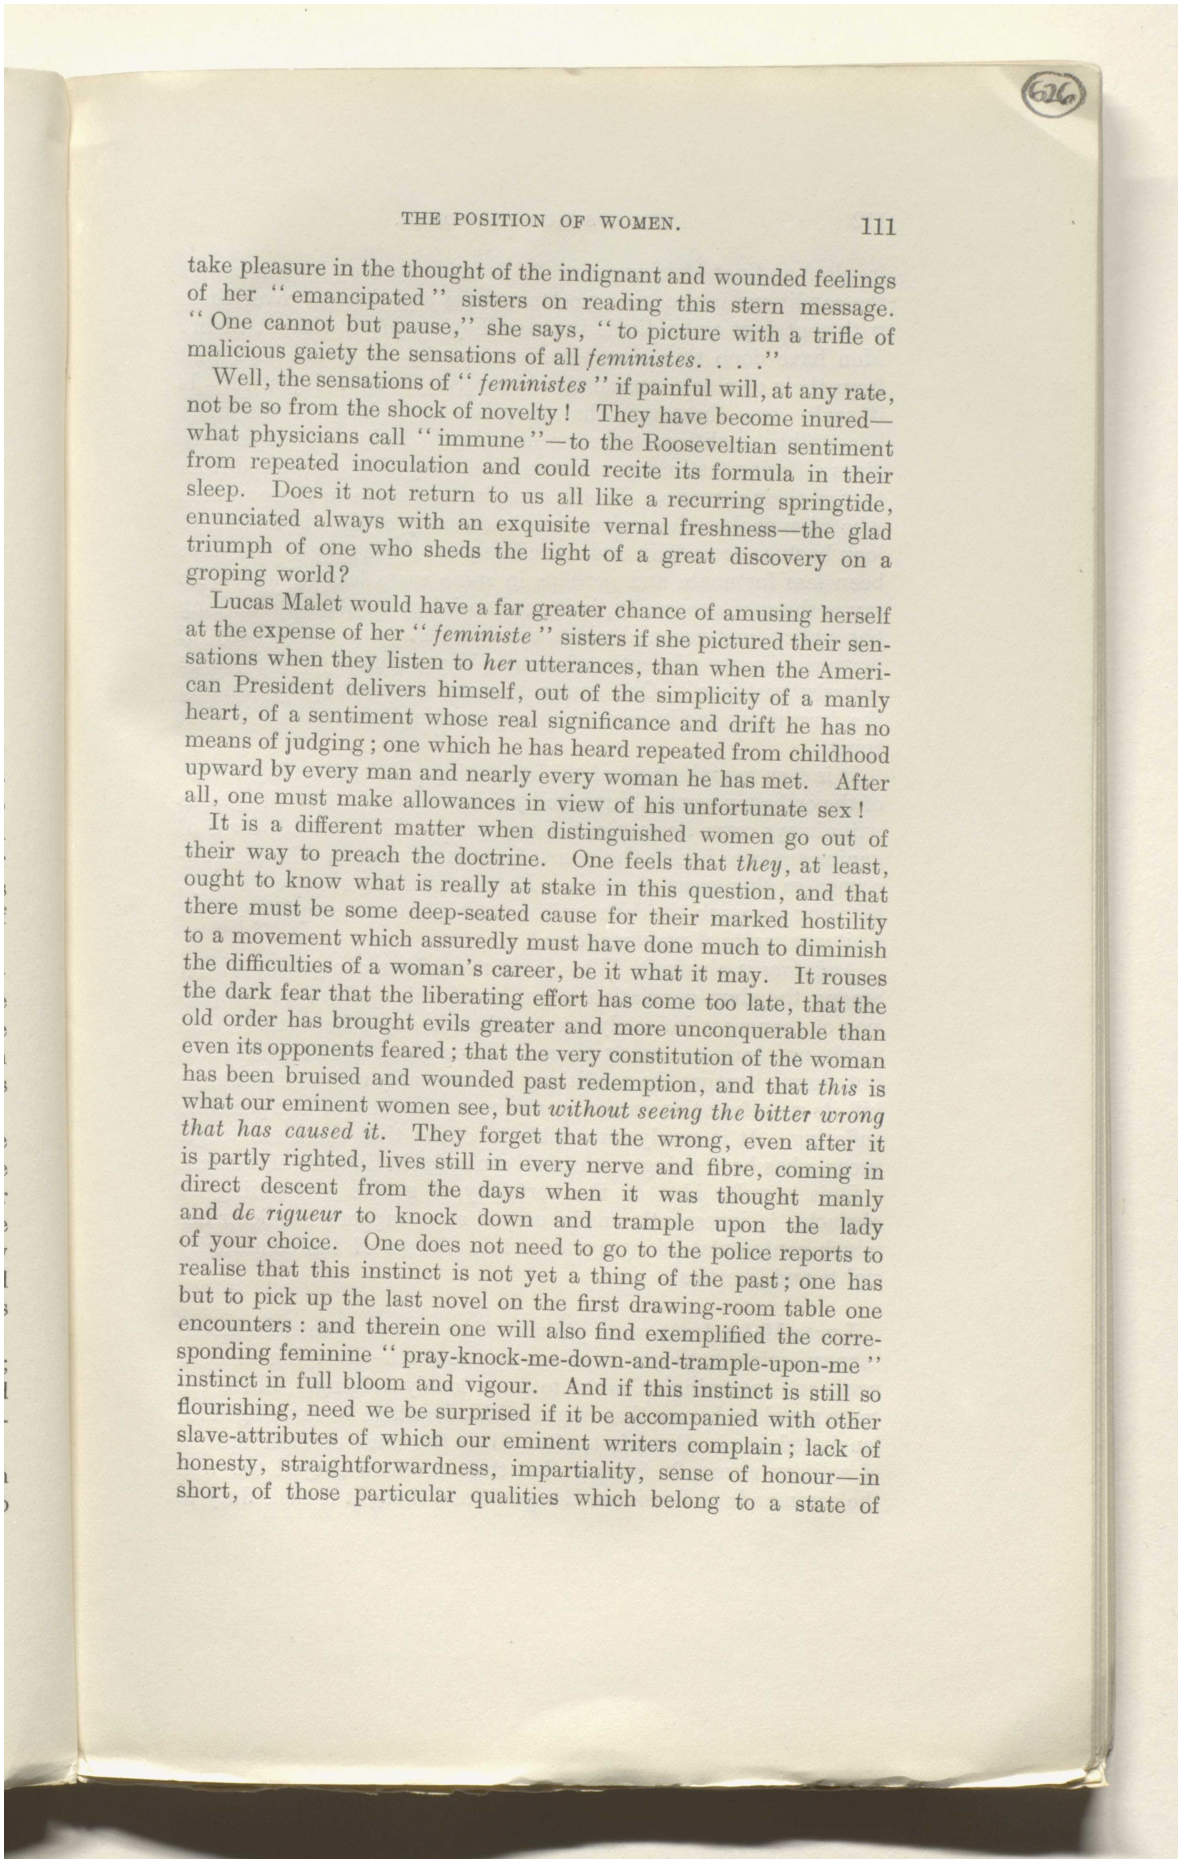
BRITISH LIBRARY

And so ends *The Dark Lantern*, a powerfully written modern version of the repellent old story of Patient Griselda, with the difference that the mediæval ruffian is by many degrees less of a bully and a coward than his almost inconceivable twentieth century prototype. Our old friend Rochester is a polished, delicately refined person beside him!

What has become of the noble ideal of the knight and the gentleman bequeathed to us from the days of chivalry? Is the book a simple study of that magnetic type of character which attracts in spite of every odious attribute? But one is driven from the supposition at every sentence, for the writer betrays sympathy with the submission of the heroine, not only to cruelty but to unremitting and apparently purposeless insult of the coarsest kind. The drift of the book is set—as violently as the current of a great river—towards the old order of sex-relationship in its most brutal, least decorative form. The wife is to be subject to the rule of the husband, and she is to rejoice in her submergence in him and in his children, for it is *his* children not *hers* that she is to spend herself for, body and soul. Katharine's child is only hers as far as suffering and service are concerned; when it comes to matters of direction she has no further part to play. Her husband calmly orders the child to be sent to the country without her consent or even knowledge, and when she follows it he telegraphs to the nurse to bring it back to town again—for its "good," of course, as all such deeds are done.

And now Lucas Malet comes forward, not to defend her sex—and, be it added, humanity—from the primitive barbarism here threatened, but to fasten yet another stone round the neck of the drowning—if, in fact, those who have toiled for what they claim to be a more human relation of the sexes, have toiled in vain, as the authoress seems to believe.

Her only doubt is of the possibility of persuading those women who have escaped from their prison to return to it. We have the advantage of seeing that prison-"home" pictured for us in *The Dark Lantern* (no "emancipated" writer would have dared to paint it in such colours!) and a "dark lantern" in very truth that "proper sphere" must be if the authoress has painted it aright. For once, we view it without the usual decorations that sentimentality loves to hang upon its grim walls.



Miss Robins does not pretend that it is garlanded with roses; she seems to say: "Here women must seek their career, and what little of happiness they can hope for in absolute subservience, for so nature has fashioned their souls."

Lucas Malet, applauding President Roosevelt's proclamation that woman's mission is that of unlimited maternity, seems to

BRITISH LIBRARY

take pleasure in the thought of the indignant and wounded feelings of her "emancipated" sisters on reading this stern message. "One cannot but pause," she says, "to picture with a trifle of malicious gaiety the sensations of all *feministes*. . . ."

Well, the sensations of "*feministes*" if painful will, at any rate, not be so from the shock of novelty! They have become inured—what physicians call "immune"—to the Rooseveltian sentiment from repeated inoculation and could recite its formula in their sleep. Does it not return to us all like a recurring springtide, enunciated always with an exquisite vernal freshness—the glad triumph of one who sheds the light of a great discovery on a groping world?

Lucas Malet would have a far greater chance of amusing herself at the expense of her "*feministe*" sisters if she pictured their sensations when they listen to *her* utterances, than when the American President delivers himself, out of the simplicity of a manly heart, of a sentiment whose real significance and drift he has no means of judging; one which he has heard repeated from childhood upward by every man and nearly every woman he has met. After all, one must make allowances in view of his unfortunate sex!

It is a different matter when distinguished women go out of their way to preach the doctrine. One feels that *they*, at least, ought to know what is really at stake in this question, and that there must be some deep-seated cause for their marked hostility to a movement which assuredly must have done much to diminish the difficulties of a woman's career, be it what it may. It rouses the dark fear that the liberating effort has come too late, that the old order has brought evils greater and more unconquerable than even its opponents feared; that the very constitution of the woman has been bruised and wounded past redemption, and that *this* is what our eminent women see, but *without seeing the bitter wrong that has caused it*. They forget that the wrong, even after it is partly righted, lives still in every nerve and fibre, coming in direct descent from the days when it was thought manly and *de rigueur* to knock down and trample upon the lady of your choice. One does not need to go to the police reports to realise that this instinct is not yet a thing of the past; one has but to pick up the last novel on the first drawing-room table one encounters: and therein one will also find exemplified the corresponding feminine "pray-knock-me-down-and-trample-upon-me" instinct in full bloom and vigour. And if this instinct is still so flourishing, need we be surprised if it be accompanied with other slave-attributes of which our eminent writers complain; lack of honesty, straightforwardness, impartiality, sense of honour—in short, of those particular qualities which belong to a state of

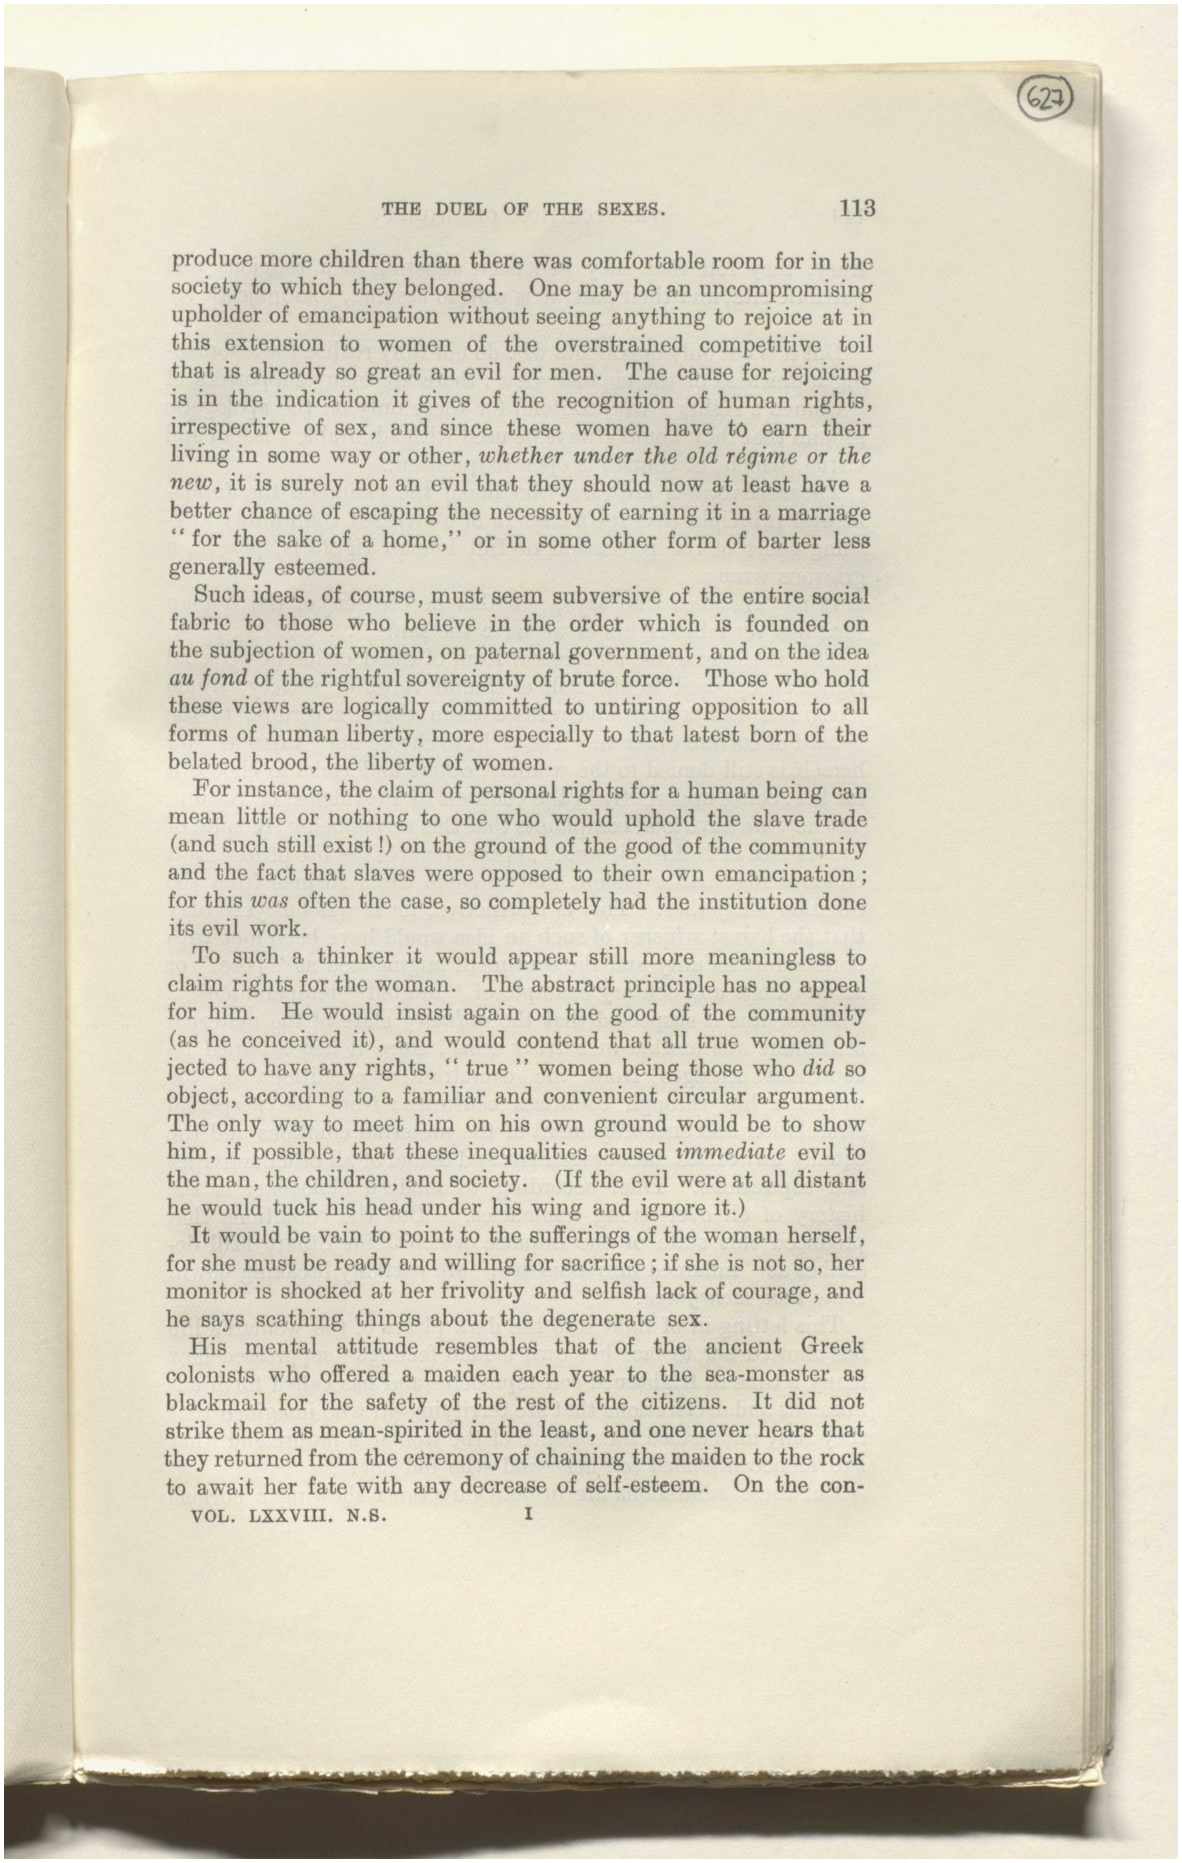
freedom and not of subservience? Is it fair to deny human beings the conditions for acquiring certain traits and then to cover them with contempt and ridicule because they are often without them? Men have done this from time immemorial; it seems hard that from their own sex women should receive the same injustice. Is it really true, however, that they are so lacking in the more honourable qualities at the present day? Individual experience gives differing testimony, in some cases very different indeed from that of their accusers. In any case, is it generous in those women who have shaken themselves free from many of the old fetters, to look back so scornfully and mercilessly on those others who have been less fortunate and perhaps in some cases less valiant? To say nothing of generosity, is it good sociology to attribute nothing but paltry motives and ridiculous conduct to a whole body of persons who are advocates of certain ideas, even if these ideas be entirely mistaken? One surely does not arrive at understanding the forces at work in society by approaching its members in that spirit.

It is easy to make light of the hampering and imprisoning nature of the orthodox woman's sphere by asserting that, after all, genius will always carve its way out of any prison. First of all, cases of genius are here beside the point, for it is *all* women who are concerned in this great question. But if genius does carve its way, bleeding, through the dense prison walls of human stupidity, what a piteous waste of precious force!

And *does* it always? Why do we never hear of a genius arising among the slum-population of our great cities, where the proportion of chances is infinitely greater than in any other class? Certainly not because among those millions no genius is ever born, but simply because the conditions are so cruelly unfavourable as to kill its manifestation except, perhaps, in the form of inexpressible suffering. It is surely impossible to doubt that the same tragic process has been going on through centuries in the case of women.



This popular idea of the certainty of genius overcoming all obstacles is incessantly made use of as a support for doctrines which contemplate denying to certain classes of the community rights and liberties.

Lucas Malet draws a sad picture of the crowds of modern bread-earners—girls employed in offices and so forth—hurrying to their work and returning at night to some lonely lodging. There are some populous homes that might with advantage be exchanged for lonely lodgings. But what, after all, is the cause of these crowds of solitary women? Simply that their mothers obeyed too well the commands of President Roosevelt and thought it their duty to

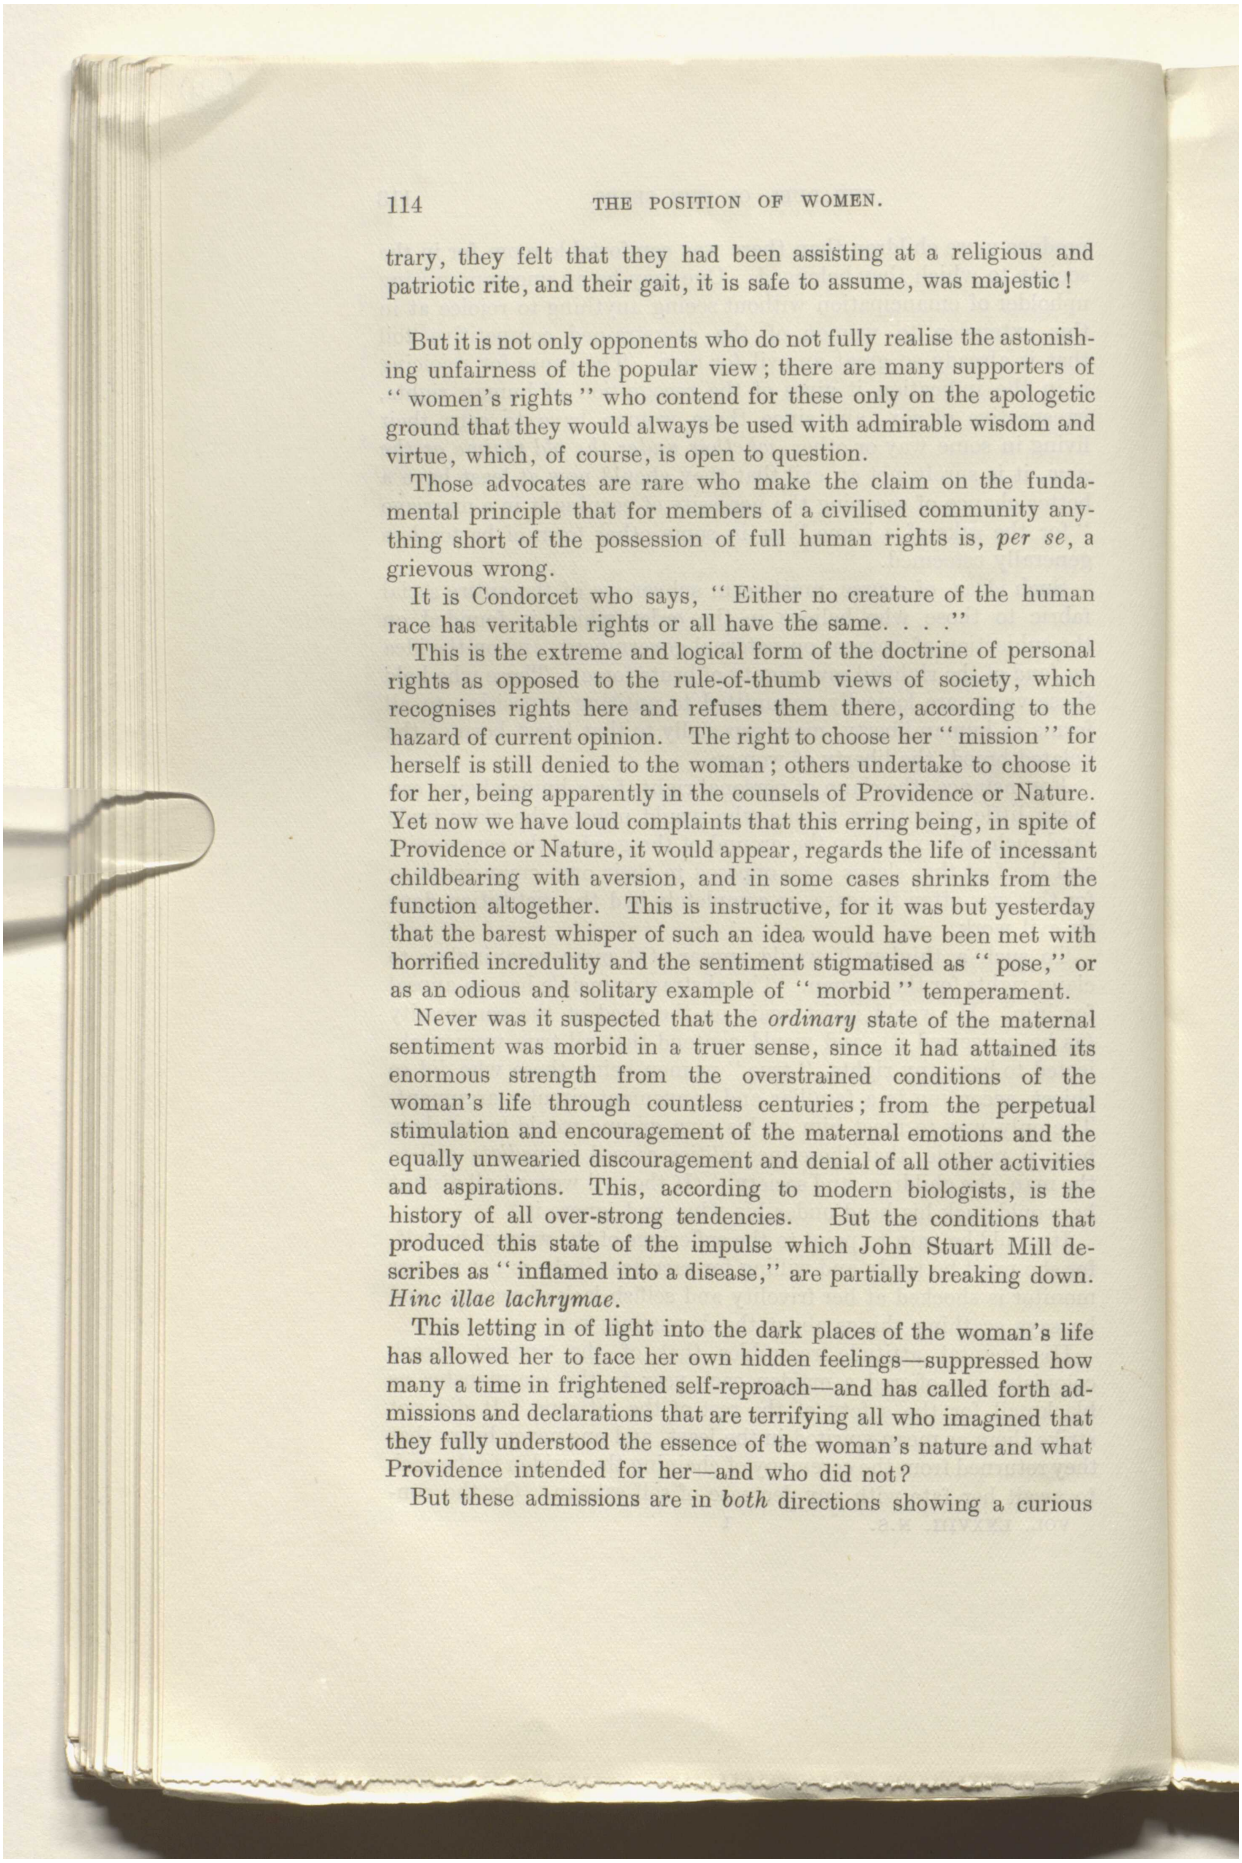
produce more children than there was comfortable room for in the society to which they belonged. One may be an uncompromising upholder of emancipation without seeing anything to rejoice at in this extension to women of the overstrained competitive toil that is already so great an evil for men. The cause for rejoicing is in the indication it gives of the recognition of human rights, irrespective of sex, and since these women have to earn their living in some way or other, *whether under the old régime or the new*, it is surely not an evil that they should now at least have a better chance of escaping the necessity of earning it in a marriage "for the sake of a home," or in some other form of barter less generally esteemed.

Such ideas, of course, must seem subversive of the entire social fabric to those who believe in the order which is founded on the subjection of women, on paternal government, and on the idea *au fond* of the rightful sovereignty of brute force. Those who hold these views are logically committed to untiring opposition to all forms of human liberty, more especially to that latest born of the belated brood, the liberty of women.

For instance, the claim of personal rights for a human being can mean little or nothing to one who would uphold the slave trade (and such still exist!) on the ground of the good of the community and the fact that slaves were opposed to their own emancipation; for this *was* often the case, so completely had the institution done its evil work.

To such a thinker it would appear still more meaningless to claim rights for the woman. The abstract principle has no appeal for him. He would insist again on the good of the community (as he conceived it), and would contend that all true women objected to have any rights, "true" women being those who *did* so object, according to a familiar and convenient circular argument. The only way to meet him on his own ground would be to show him, if possible, that these inequalities caused *immediate* evil to the man, the children, and society. (If the evil were at all distant he would tuck his head under his wing and ignore it.)



It would be vain to point to the sufferings of the woman herself, for she must be ready and willing for sacrifice; if she is not so, her monitor is shocked at her frivolity and selfish lack of courage, and he says scathing things about the degenerate sex.

His mental attitude resembles that of the ancient Greek colonists who offered a maiden each year to the sea-monster as blackmail for the safety of the rest of the citizens. It did not strike them as mean-spirited in the least, and one never hears that they returned from the ceremony of chaining the maiden to the rock to await her fate with any decrease of self-esteem. On the con-

trary, they felt that they had been assisting at a religious and patriotic rite, and their gait, it is safe to assume, was majestic!

But it is not only opponents who do not fully realise the astonishing unfairness of the popular view; there are many supporters of "women's rights" who contend for these only on the apologetic ground that they would always be used with admirable wisdom and virtue, which, of course, is open to question.

Those advocates are rare who make the claim on the fundamental principle that for members of a civilised community anything short of the possession of full human rights is, *per se*, a grievous wrong.

It is Condorcet who says, "Either no creature of the human race has veritable rights or all have the same. . . ."

This is the extreme and logical form of the doctrine of personal rights as opposed to the rule-of-thumb views of society, which recognises rights here and refuses them there, according to the hazard of current opinion. The right to choose her "mission" for herself is still denied to the woman; others undertake to choose it for her, being apparently in the counsels of Providence or Nature. Yet now we have loud complaints that this erring being, in spite of Providence or Nature, it would appear, regards the life of incessant childbearing with aversion, and in some cases shrinks from the function altogether. This is instructive, for it was but yesterday that the barest whisper of such an idea would have been met with horrified incredulity and the sentiment stigmatised as "pose," or as an odious and solitary example of "morbid" temperament.

Never was it suspected that the *ordinary* state of the maternal sentiment was morbid in a truer sense, since it had attained its enormous strength from the overstrained conditions of the woman's life through countless centuries; from the perpetual stimulation and encouragement of the maternal emotions and the equally unwearied discouragement and denial of all other activities and aspirations. This, according to modern biologists, is the history of all over-strong tendencies. But the conditions that produced this state of the impulse which John Stuart Mill describes as "inflamed into a disease," are partially breaking down. *Hinc illae lachrymae.*

This letting in of light into the dark places of the woman's life has allowed her to face her own hidden feelings—suppressed how many a time in frightened self-reproach—and has called forth admissions and declarations that are terrifying all who imagined that they fully understood the essence of the woman's nature and what Providence intended for her—and who did not?

But these admissions are in *both* directions showing a curious

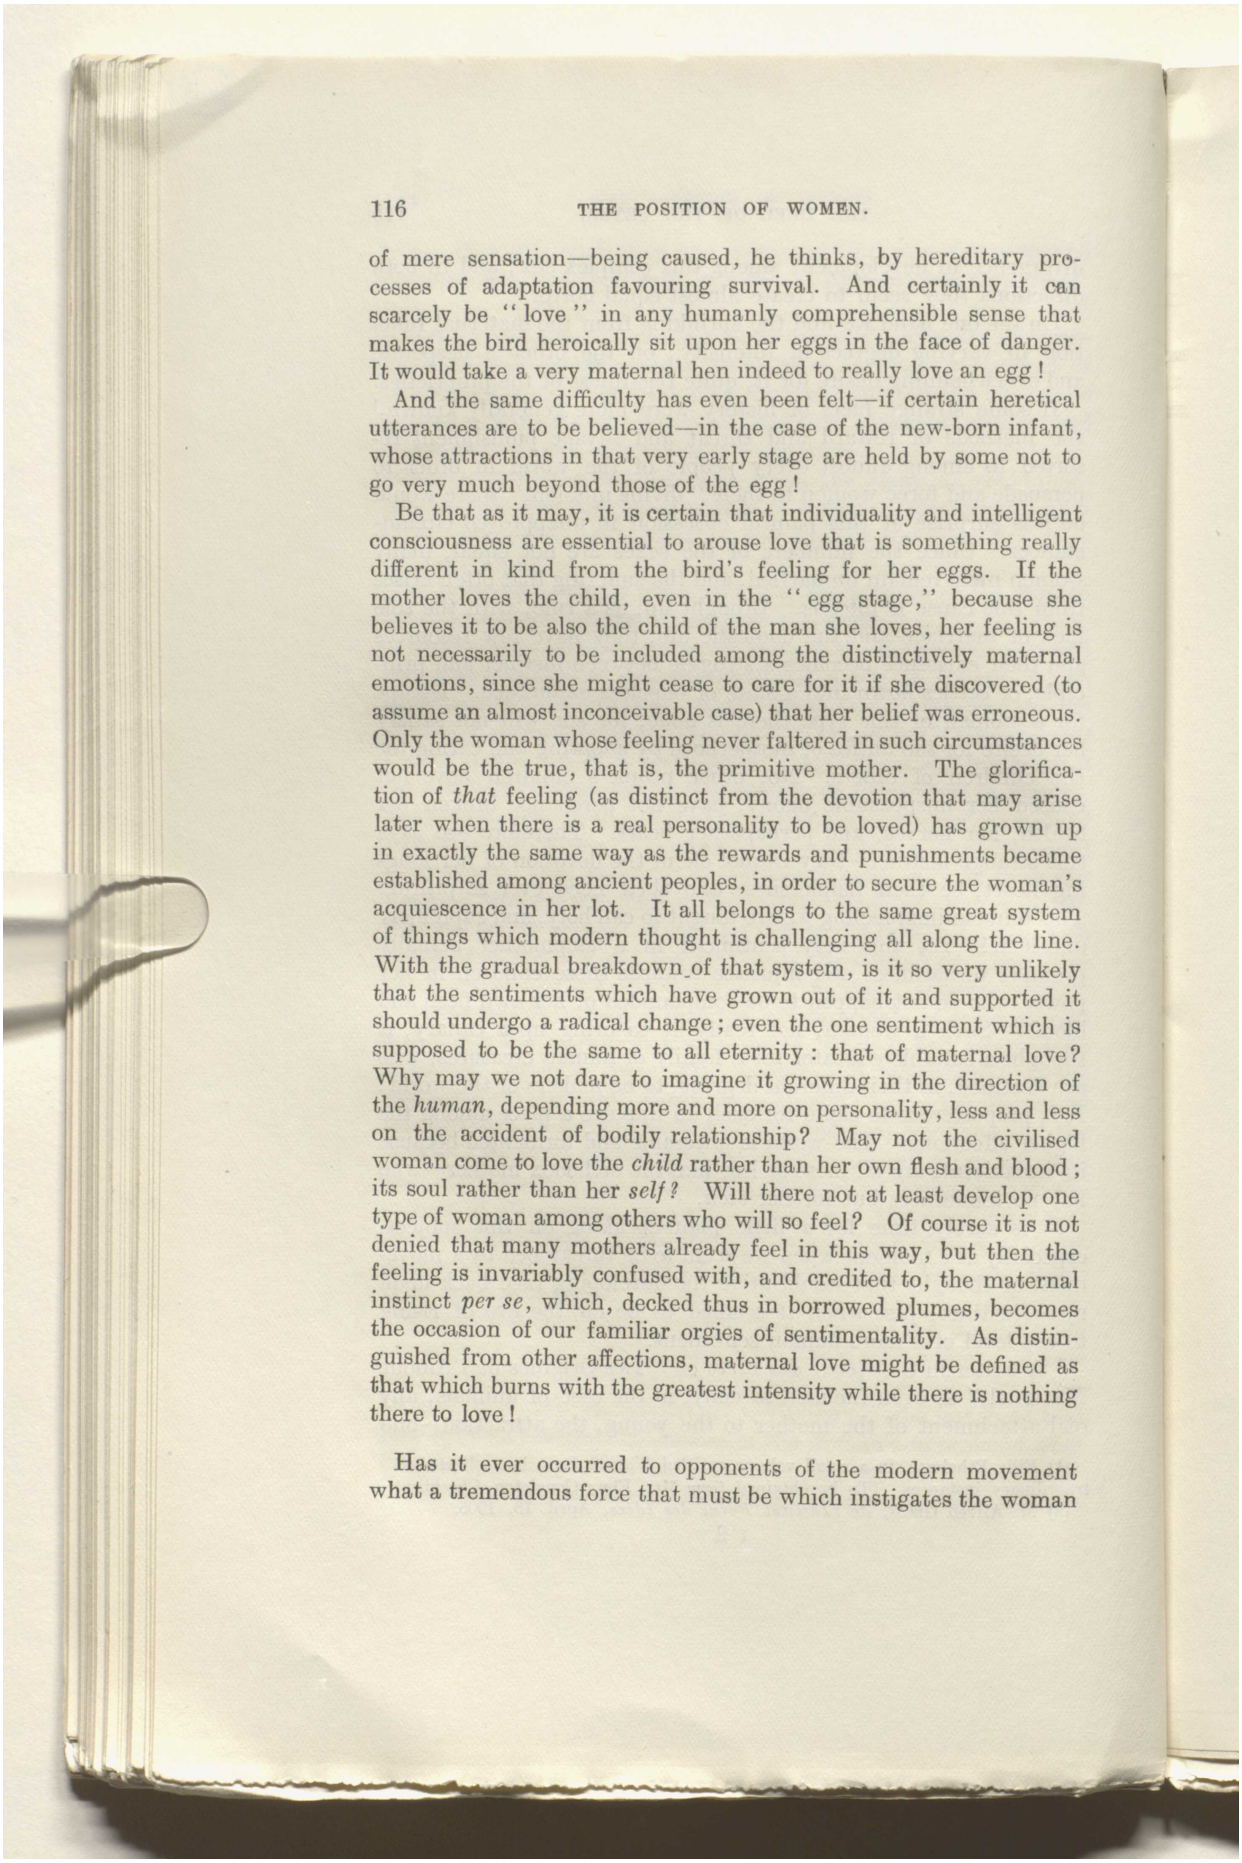
BRITISH LIBRARY

divergence in development among this complex sex; and in both directions they seem to create almost equal horror!

On the one hand we find the shrinking from the maternal function in varying degrees of intensity; on the other a desperate and overwhelming desire for it, quite regardless of the proprieties.

If some strange facts of history were more generally known,[1] the methods of reward and threat and savage punishment resorted to among almost every people of the world in order to persuade and force women to their "divine mission," there would be less surprise at this painful obsession in unapproved circumstances. Since the numbers of the sexes are not equal, many women must remain unmarried, and the suffering that often arises from this cause is piteous. Brought up, as a rule, with the sole idea of marriage and the domestic life, they have few resources and their existence becomes a struggle between instinct and principle, or settles down into a state of hopeless endurance. Escape for a woman of this type there is none, for she will not satisfy her desire for the duties of motherhood by adopting and caring for the children of others. No, other people's children have not caused her unspeakable agony, have not perchance broken her health, her nerves, and perhaps her heart. Therefore—so says this strange instinct—they cannot claim the devotion of her longing heart, be their helplessness and their need ever so pitiful! This blind animal feeling we are taught to call holy, and supremely unselfish! Yet this very sentiment in a stepmother actually prompts to hardness and injustice towards those children in her power who do not happen to be compounded of her own flesh and blood! Such a woman, not really fit to bring up a canary, is thought a suitable educator for a family of human creatures, who are destined, in their different degrees, to be makers of the world! It is preposterous to claim for such an impulse a place among the higher affections. The world is miserable and tormented because its inhabitants are all more or less like the orthodox mother—who has no tenderness but for her *own*.

It is surely time for a little plain-speaking on this subject, especially at a moment when we seem to be threatened by a movement of thought that would drive the developing race back upon mere instinct, just when it seemed to be on the eve of rising to the level of a more human sentiment.



[2] A writer in the *Revue des Idées* on "Les Origines de l'Amour Maternel," is even inclined to deny, in the case of animals, any real attachment of the mother to the young, the attraction—one

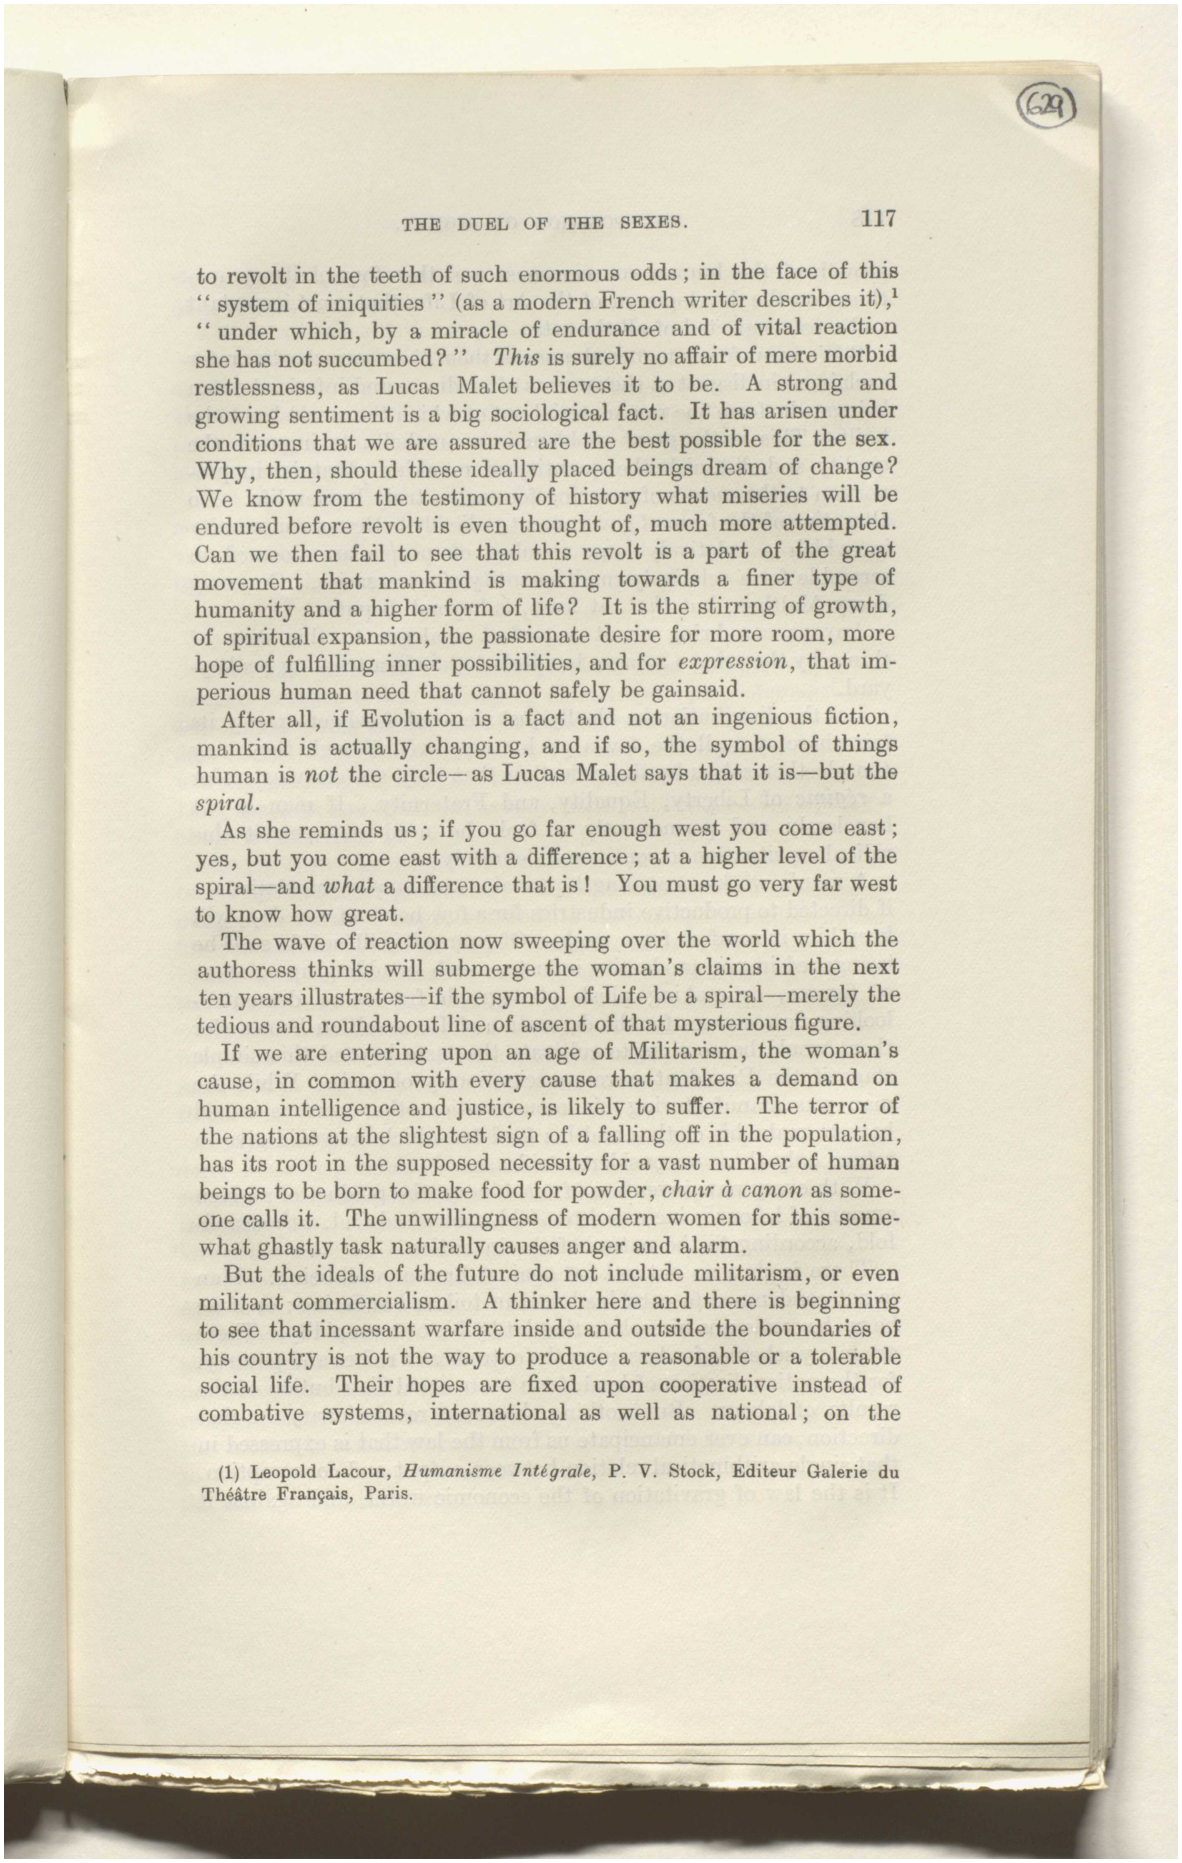
of mere sensation—being caused, he thinks, by hereditary processes of adaptation favouring survival. And certainly it can scarcely be "love" in any humanly comprehensible sense that makes the bird heroically sit upon her eggs in the face of danger. It would take a very maternal hen indeed to really love an egg!

And the same difficulty has even been felt—if certain heretical utterances are to be believed—in the case of the new-born infant, whose attractions in that very early stage are held by some not to go very much beyond those of the egg!



Be that as it may, it is certain that individuality and intelligent consciousness are essential to arouse love that is something really different in kind from the bird's feeling for her eggs. If the mother loves the child, even in the "egg stage," because she believes it to be also the child of the man she loves, her feeling is not necessarily to be included among the distinctively maternal emotions, since she might cease to care for it if she discovered (to assume an almost inconceivable case) that her belief was erroneous. Only the woman whose feeling never faltered in such circumstances would be the true, that is, the primitive mother. The glorification of *that* feeling (as distinct from the devotion that may arise later when there is a real personality to be loved) has grown up in exactly the same way as the rewards and punishments became established among ancient peoples, in order to secure the woman's acquiescence in her lot. It all belongs to the same great system of things which modern thought is challenging all along the line. With the gradual breakdown of that system, is it so very unlikely that the sentiments which have grown out of it and supported it should undergo a radical change; even the one sentiment which is supposed to be the same to all eternity: that of maternal love? Why may we not dare to imagine it growing in the direction of the *human*, depending more and more on personality, less and less on the accident of bodily relationship? May not the civilised woman come to love the *child* rather than her own flesh and blood; its soul rather than her *self*? Will there not at least develop one type of woman among others who will so feel? Of course it is not denied that many mothers already feel in this way, but then the feeling is invariably confused with, and credited to, the maternal instinct *per se*, which, decked thus in borrowed plumes, becomes the occasion of our familiar orgies of sentimentality. As distinguished from other affections, maternal love might be defined as that which burns with the greatest intensity while there is nothing there to love!

Has it ever occurred to opponents of the modern movement what a tremendous force that must be which instigates the woman

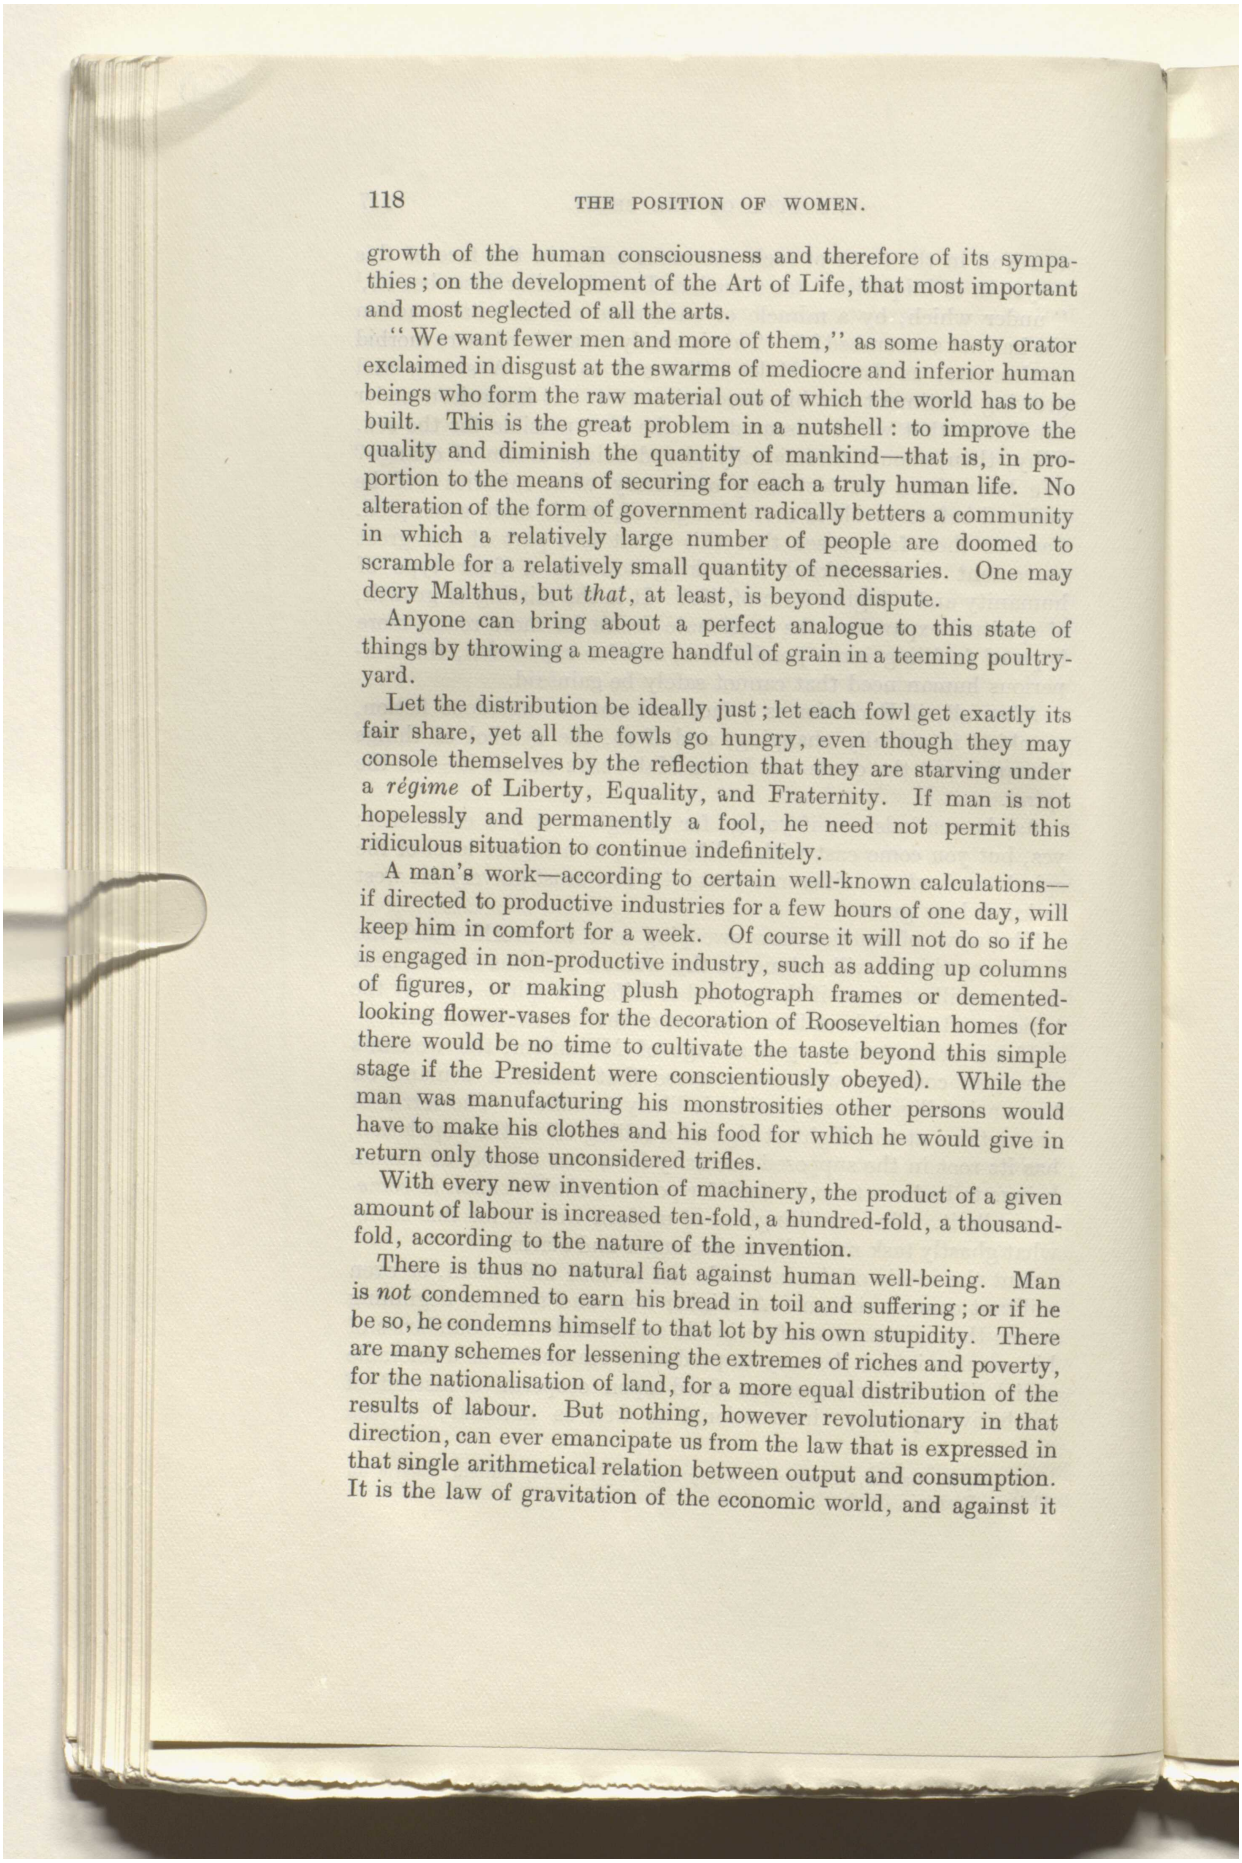
to revolt in the teeth of such enormous odds; in the face of this "system of iniquities" (as a modern French writer describes it),[1] "under which, by a miracle of endurance and of vital reaction she has not succumbed?" *This* is surely no affair of mere morbid restlessness, as Lucas Malet believes it to be. A strong and growing sentiment is a big sociological fact. It has arisen under conditions that we are assured are the best possible for the sex. Why, then, should these ideally placed beings dream of change? We know from the testimony of history what miseries will be endured before revolt is even thought of, much more attempted. Can we then fail to see that this revolt is a part of the great movement that mankind is making towards a finer type of humanity and a higher form of life? It is the stirring of growth, of spiritual expansion, the passionate desire for more room, more hope of fulfilling inner possibilities, and for *expression*, that imperious human need that cannot safely be gainsaid.

After all, if Evolution is a fact and not an ingenious fiction, mankind is actually changing, and if so, the symbol of things human is *not* the circle—as Lucas Malet says that it is—but the *spiral*.

As she reminds us; if you go far enough west you come east; yes, but you come east with a difference; at a higher level of the spiral—and *what* a difference that is! You must go very far west to know how great.

The wave of reaction now sweeping over the world which the authoress thinks will submerge the woman's claims in the next ten years illustrates—if the symbol of Life be a spiral—merely the tedious and roundabout line of ascent of that mysterious figure.

If we are entering upon an age of Militarism, the woman's cause, in common with every cause that makes a demand on human intelligence and justice, is likely to suffer. The terror of the nations at the slightest sign of a falling off in the population, has its root in the supposed necessity for a vast number of human beings to be born to make food for powder, *chair à canon* as someone calls it. The unwillingness of modern women for this somewhat ghastly task naturally causes anger and alarm.



But the ideals of the future do not include militarism, or even militant commercialism. A thinker here and there is beginning to see that incessant warfare inside and outside the boundaries of his country is not the way to produce a reasonable or a tolerable social life. Their hopes are fixed upon cooperative instead of combative systems, international as well as national; on the

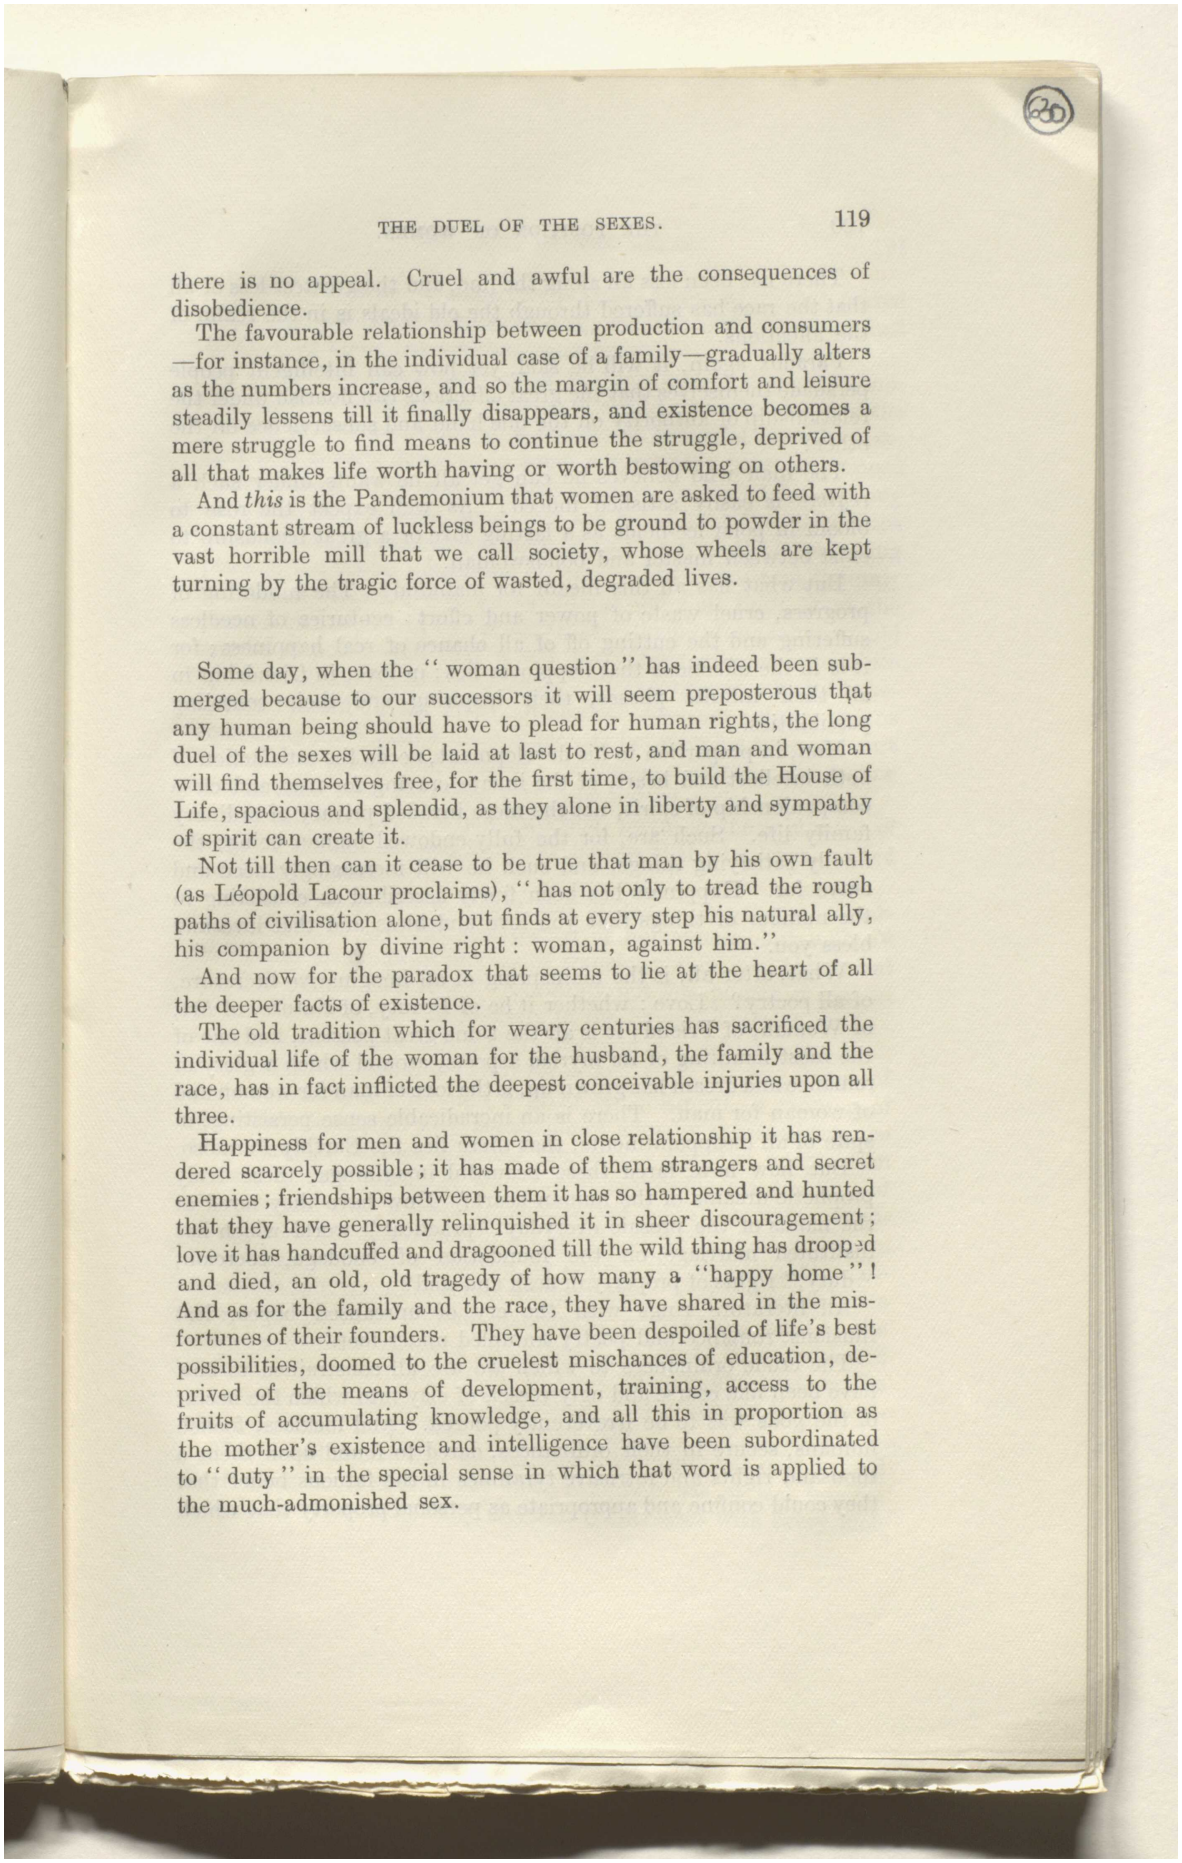
growth of the human consciousness and therefore of its sympathies; on the development of the Art of Life, that most important and most neglected of all the arts.

"We want fewer men and more of them," as some hasty orator exclaimed in disgust at the swarms of mediocre and inferior human beings who form the raw material out of which the world has to be built. This is the great problem in a nutshell: to improve the quality and diminish the quantity of mankind—that is, in proportion to the means of securing for each a truly human life. No alteration of the form of government radically betters a community in which a relatively large number of people are doomed to scramble for a relatively small quantity of necessaries. One may decry Malthus, but *that*, at least, is beyond dispute.

Anyone can bring about a perfect analogue to this state of things by throwing a meagre handful of grain in a teeming poultry-yard.

Let the distribution be ideally just; let each fowl get exactly its fair share, yet all the fowls go hungry, even though they may console themselves by the reflection that they are starving under a *régime* of Liberty, Equality, and Fraternity. If man is not hopelessly and permanently a fool, he need not permit this ridiculous situation to continue indefinitely.

A man's work—according to certain well-known calculations—if directed to productive industries for a few hours of one day, will keep him in comfort for a week. Of course it will not do so if he is engaged in non-productive industry, such as adding up columns of figures, or making plush photograph frames or demented-looking flower-vases for the decoration of Rooseveltian homes (for there would be no time to cultivate the taste beyond this simple stage if the President were conscientiously obeyed). While the man was manufacturing his monstrosities other persons would have to make his clothes and his food for which he would give in return only those unconsidered trifles.



With every new invention of machinery, the product of a given amount of labour is increased ten-fold, a hundred-fold, a thousand-fold, according to the nature of the invention.

There is thus no natural fiat against human well-being. Man is *not* condemned to earn his bread in toil and suffering; or if he be so, he condemns himself to that lot by his own stupidity. There are many schemes for lessening the extremes of riches and poverty, for the nationalisation of land, for a more equal distribution of the results of labour. But nothing, however revolutionary in that direction, can ever emancipate us from the law that is expressed in that single arithmetical relation between output and consumption. It is the law of gravitation of the economic world, and against it

BRITISH LIBRARY

there is no appeal. Cruel and awful are the consequences of disobedience.

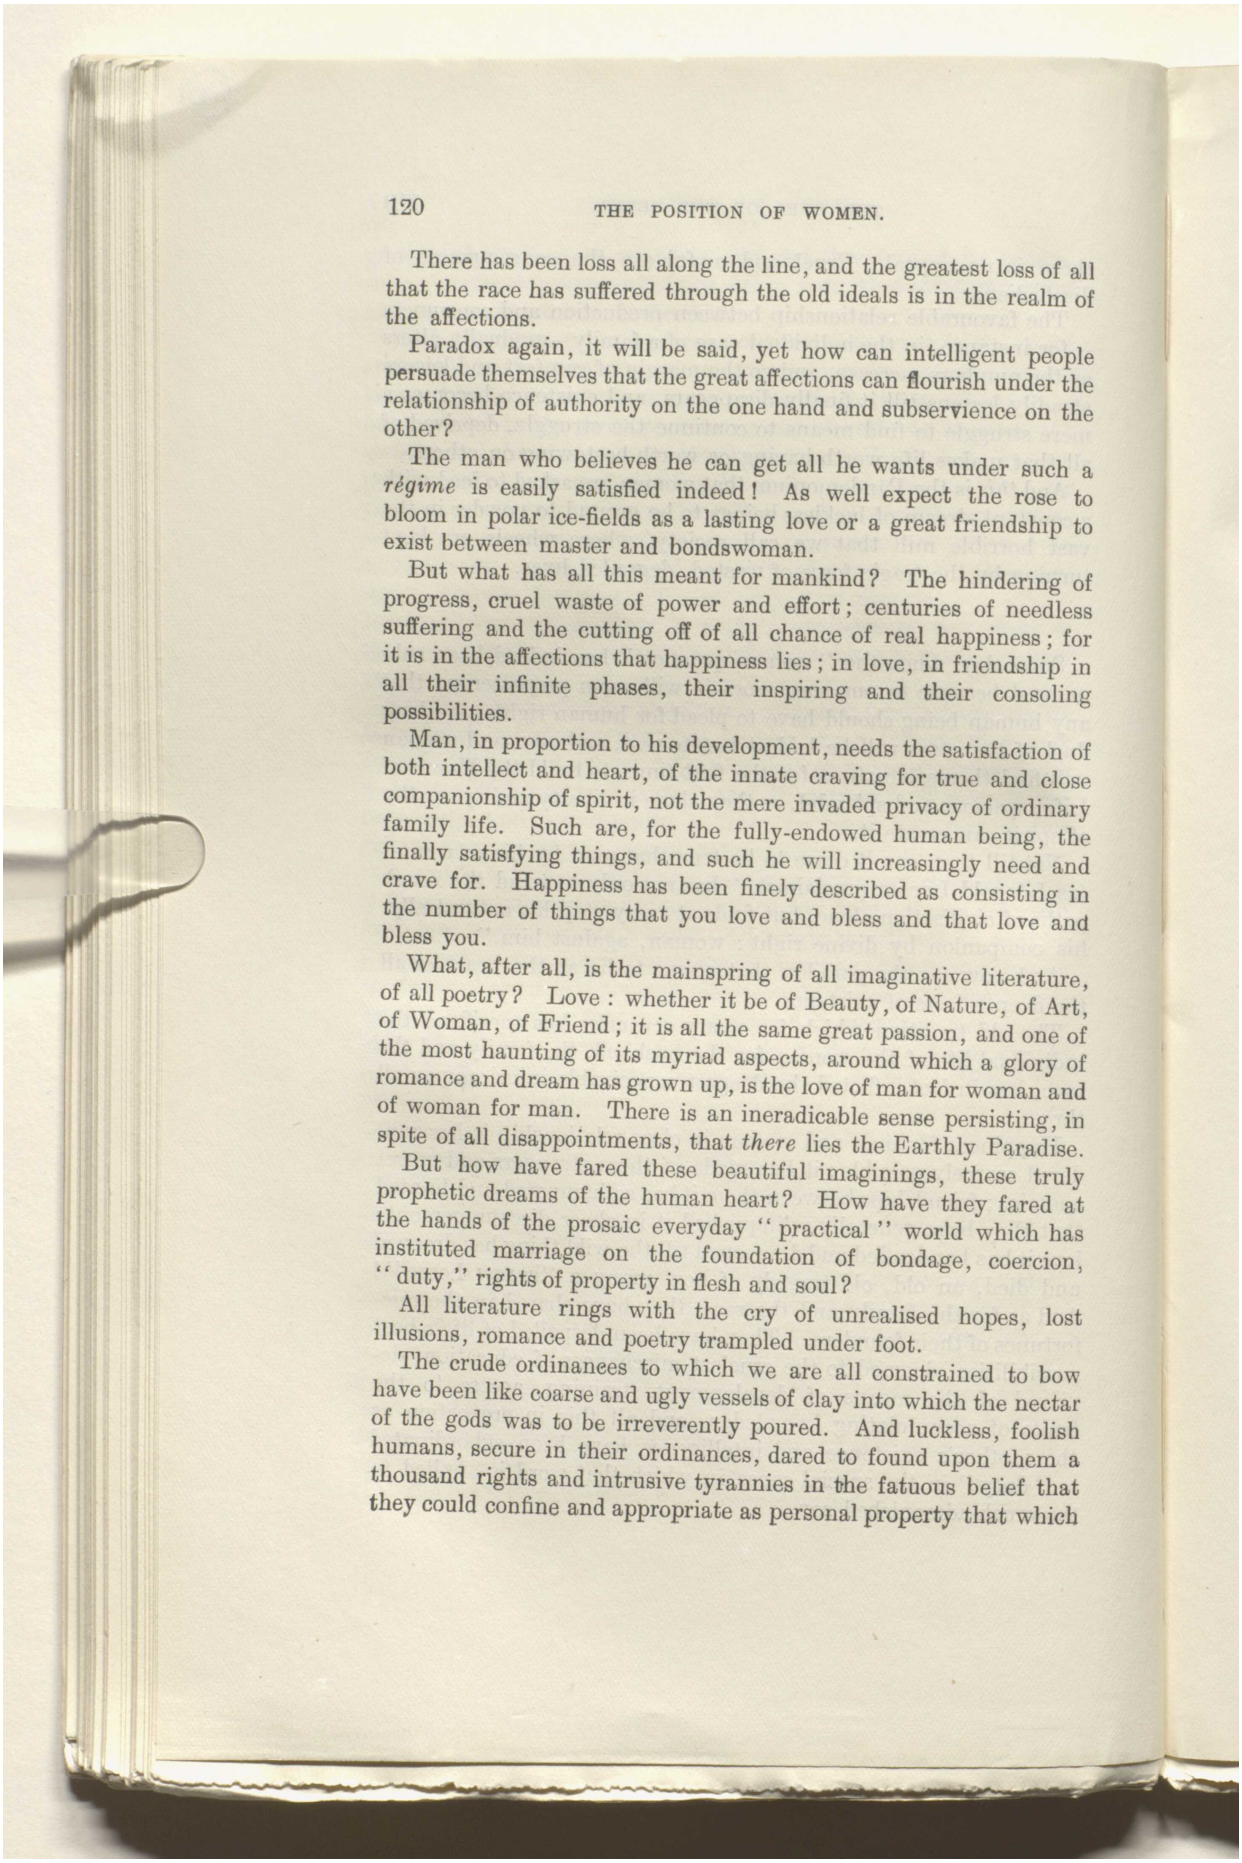
The favourable relationship between production and consumers —for instance, in the individual case of a family—gradually alters as the numbers increase, and so the margin of comfort and leisure steadily lessens till it finally disappears, and existence becomes a mere struggle to find means to continue the struggle, deprived of all that makes life worth having or worth bestowing on others.

And *this* is the Pandemonium that women are asked to feed with a constant stream of luckless beings to be ground to powder in the vast horrible mill that we call society, whose wheels are kept turning by the tragic force of wasted, degraded lives.

Some day, when the "woman question" has indeed been submerged because to our successors it will seem preposterous that any human being should have to plead for human rights, the long duel of the sexes will be laid at last to rest, and man and woman will find themselves free, for the first time, to build the House of Life, spacious and splendid, as they alone in liberty and sympathy of spirit can create it.

Not till then can it cease to be true that man by his own fault (as Léopold Lacour proclaims), "has not only to tread the rough paths of civilisation alone, but finds at every step his natural ally, his companion by divine right: woman, against him."

And now for the paradox that seems to lie at the heart of all the deeper facts of existence.



The old tradition which for weary centuries has sacrificed the individual life of the woman for the husband, the family and the race, has in fact inflicted the deepest conceivable injuries upon all three.

Happiness for men and women in close relationship it has rendered scarcely possible; it has made of them strangers and secret enemies; friendships between them it has so hampered and hunted that they have generally relinquished it in sheer discouragement; love it has handcuffed and dragooned till the wild thing has drooped and died, an old, old tragedy of how many a "happy home"! And as for the family and the race, they have shared in the misfortunes of their founders. They have been despoiled of life's best possibilities, doomed to the cruelest mischances of education, deprived of the means of development, training, access to the fruits of accumulating knowledge, and all this in proportion as the mother's existence and intelligence have been subordinated to "duty" in the special sense in which that word is applied to the much-admonished sex.

BRITISH LIBRARY

There has been loss all along the line, and the greatest loss of all that the race has suffered through the old ideals is in the realm of the affections.

Paradox again, it will be said, yet how can intelligent people persuade themselves that the great affections can flourish under the relationship of authority on the one hand and subservience on the other?

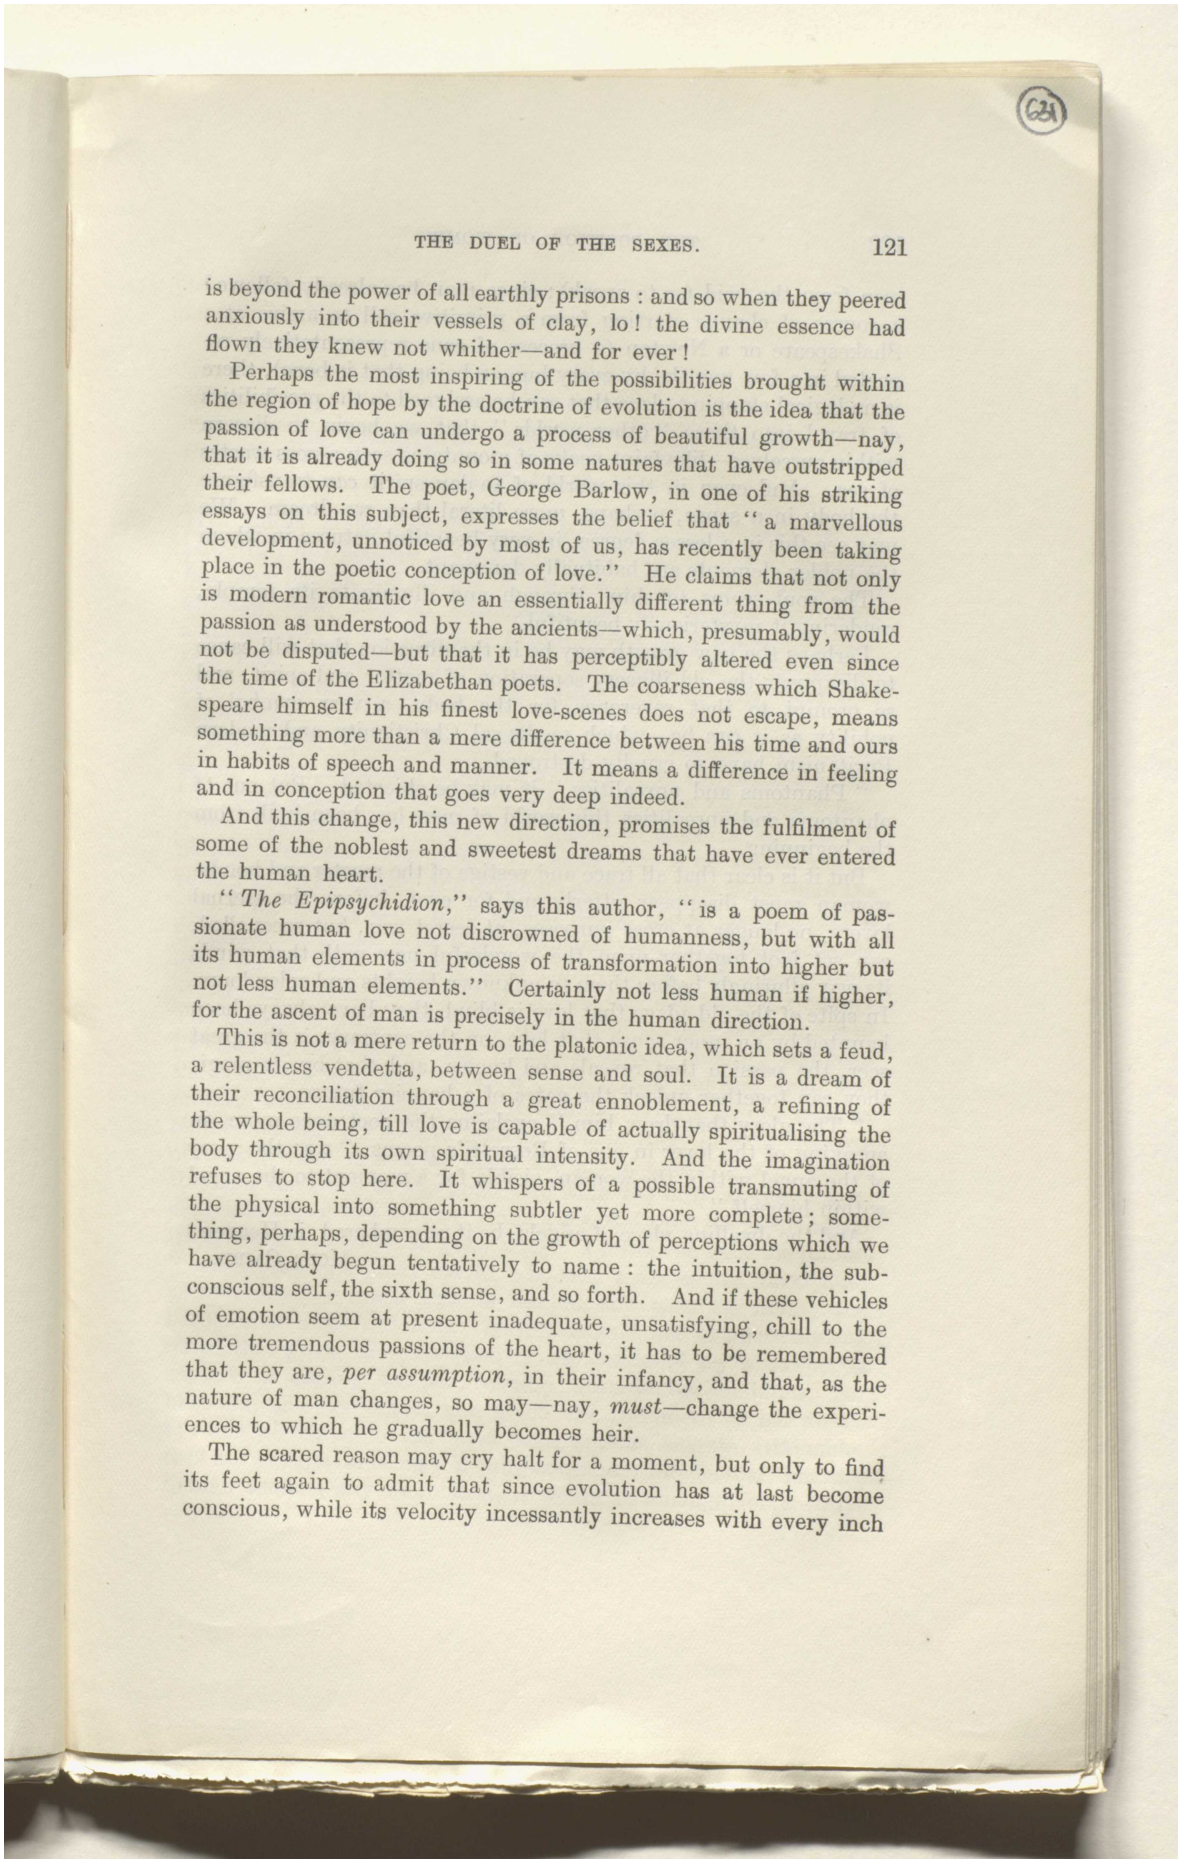
The man who believes he can get all he wants under such a *régime* is easily satisfied indeed! As well expect the rose to bloom in polar ice-fields as a lasting love or a great friendship to exist between master and bondswoman.

But what has all this meant for mankind? The hindering of progress, cruel waste of power and effort; centuries of needless suffering and the cutting off of all chance of real happiness; for it is in the affections that happiness lies; in love, in friendship in all their infinite phases, their inspiring and their consoling possibilities.

Man, in proportion to his development, needs the satisfaction of both intellect and heart, of the innate craving for true and close companionship of spirit, not the mere invaded privacy of ordinary family life. Such are, for the fully-endowed human being, the finally satisfying things, and such he will increasingly need and crave for. Happiness has been finely described as consisting in the number of things that you love and bless and that love and bless you.

What, after all, is the mainspring of all imaginative literature, of all poetry? Love: whether it be of Beauty, of Nature, of Art, of Woman, of Friend; it is all the same great passion, and one of the most haunting of its myriad aspects, around which a glory of romance and dream has grown up, is the love of man for woman and of woman for man. There is an ineradicable sense persisting, in spite of all disappointments, that *there* lies the Earthly Paradise.

But how have fared these beautiful imaginings, these truly prophetic dreams of the human heart? How have they fared at the hands of the prosaic everyday "practical" world which has instituted marriage on the foundation of bondage, coercion, "duty," rights of property in flesh and soul?



All literature rings with the cry of unrealised hopes, lost illusions, romance and poetry trampled under foot.

The crude ordinances to which we are all constrained to bow have been like coarse and ugly vessels of clay into which the nectar of the gods was to be irreverently poured. And luckless, foolish humans, secure in their ordinances, dared to found upon them a thousand rights and intrusive tyrannies in the fatuous belief that they could confine and appropriate as personal property that which

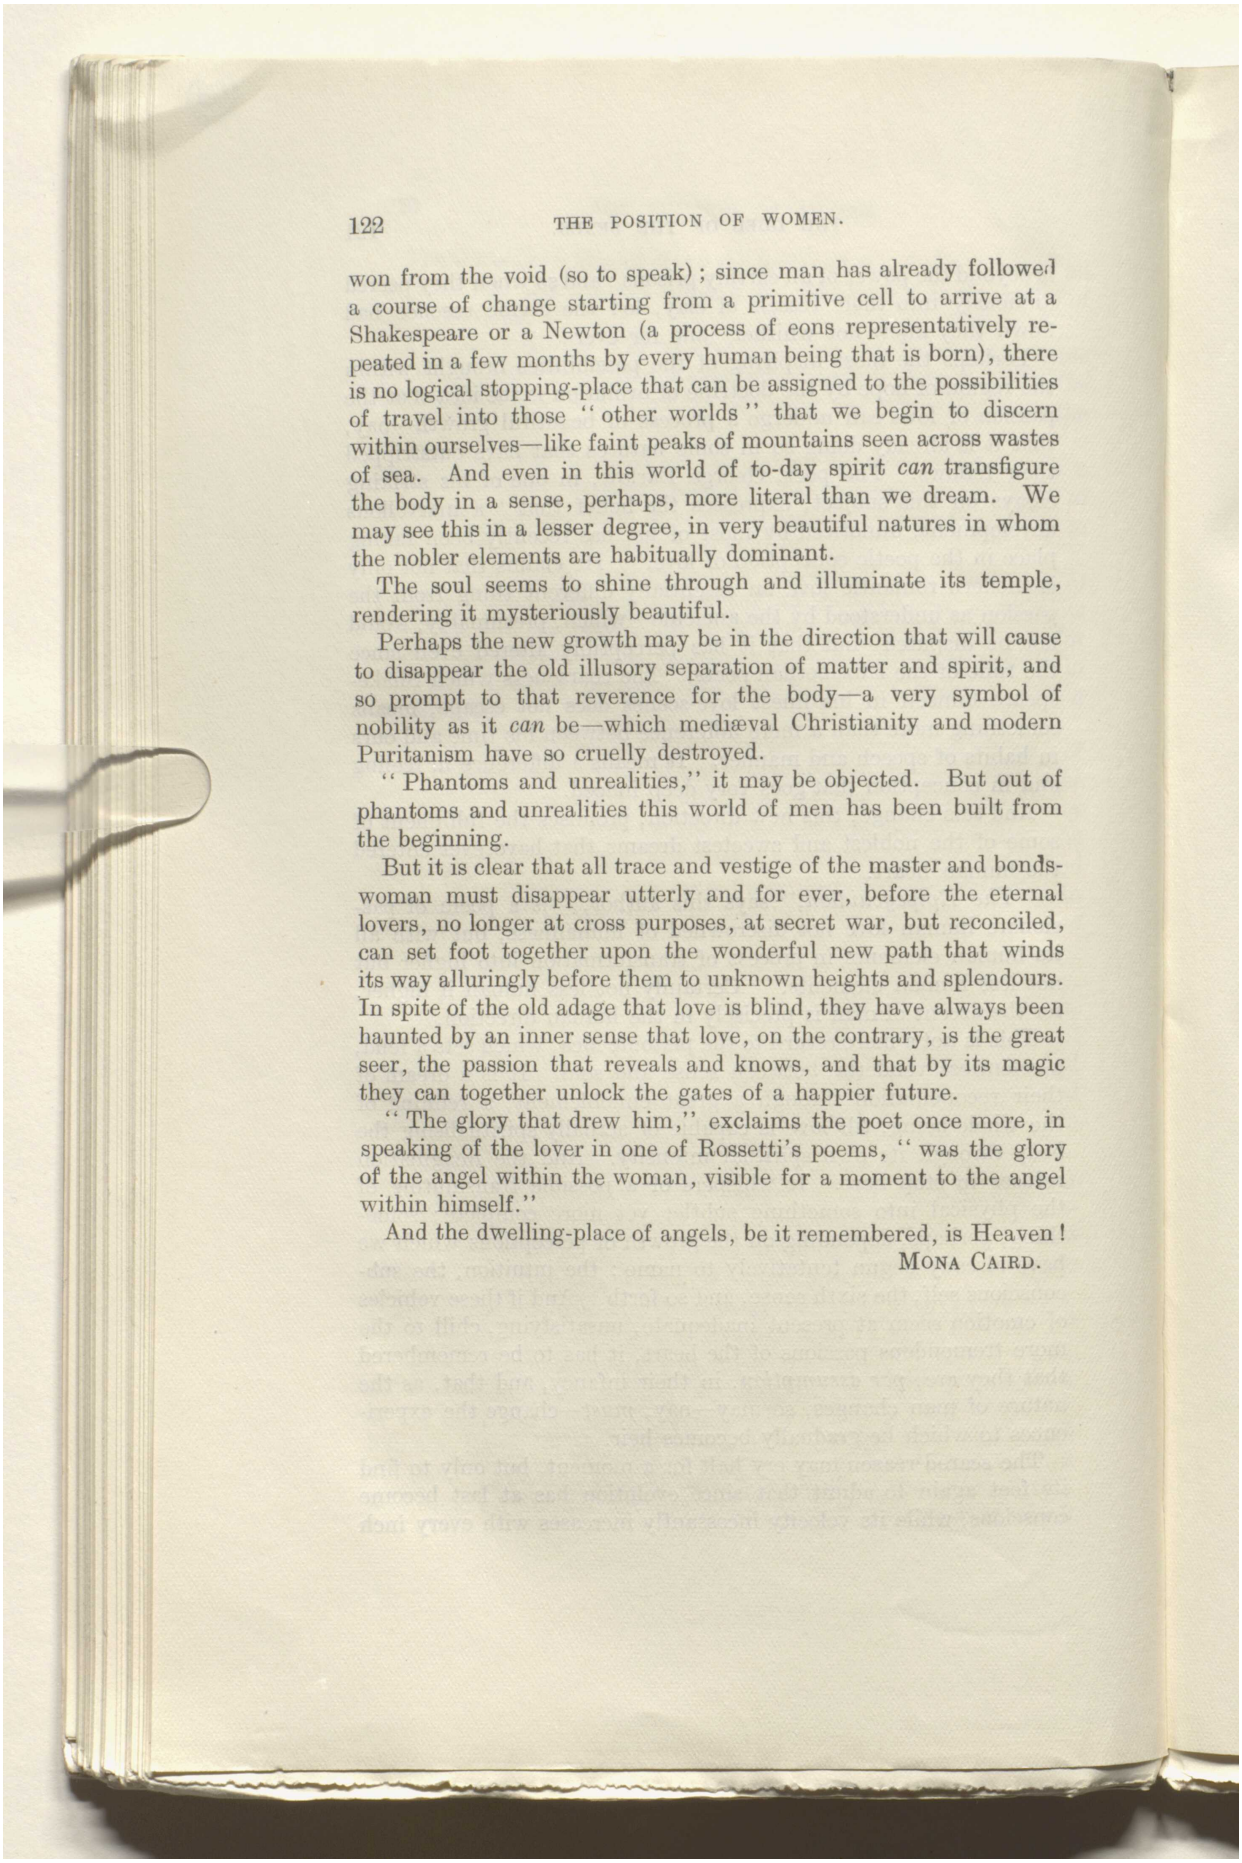
BRITISH LIBRARY

is beyond the power of all earthly prisons : and so when they peered anxiously into their vessels of clay, lo ! the divine essence had flown they knew not whither—and for ever !

Perhaps the most inspiring of the possibilities brought within the region of hope by the doctrine of evolution is the idea that the passion of love can undergo a process of beautiful growth—nay, that it is already doing so in some natures that have outstripped their fellows. The poet, George Barlow, in one of his striking essays on this subject, expresses the belief that "a marvellous development, unnoticed by most of us, has recently been taking place in the poetic conception of love." He claims that not only is modern romantic love an essentially different thing from the passion as understood by the ancients—which, presumably, would not be disputed—but that it has perceptibly altered even since the time of the Elizabethan poets. The coarseness which Shakespeare himself in his finest love-scenes does not escape, means something more than a mere difference between his time and ours in habits of speech and manner. It means a difference in feeling and in conception that goes very deep indeed.

And this change, this new direction, promises the fulfilment of some of the noblest and sweetest dreams that have ever entered the human heart.

"*The Epipsychidion*," says this author, "is a poem of passionate human love not discrowned of humanness, but with all its human elements in process of transformation into higher but not less human elements." Certainly not less human if higher, for the ascent of man is precisely in the human direction.



This is not a mere return to the platonic idea, which sets a feud, a relentless vendetta, between sense and soul. It is a dream of their reconciliation through a great ennoblement, a refining of the whole being, till love is capable of actually spiritualising the body through its own spiritual intensity. And the imagination refuses to stop here. It whispers of a possible transmuting of the physical into something subtler yet more complete ; something, perhaps, depending on the growth of perceptions which we have already begun tentatively to name : the intuition, the subconscious self, the sixth sense, and so forth. And if these vehicles of emotion seem at present inadequate, unsatisfying, chill to the more tremendous passions of the heart, it has to be remembered that they are, *per assumption*, in their infancy, and that, as the nature of man changes, so may—nay, *must*—change the experiences to which he gradually becomes heir.

The scared reason may cry halt for a moment, but only to find its feet again to admit that since evolution has at last become conscious, while its velocity incessantly increases with every inch

won from the void (so to speak); since man has already followed a course of change starting from a primitive cell to arrive at a Shakespeare or a Newton (a process of eons representatively repeated in a few months by every human being that is born), there is no logical stopping-place that can be assigned to the possibilities of travel into those "other worlds" that we begin to discern within ourselves—like faint peaks of mountains seen across wastes of sea. And even in this world of to-day spirit *can* transfigure the body in a sense, perhaps, more literal than we dream. We may see this in a lesser degree, in very beautiful natures in whom the nobler elements are habitually dominant.

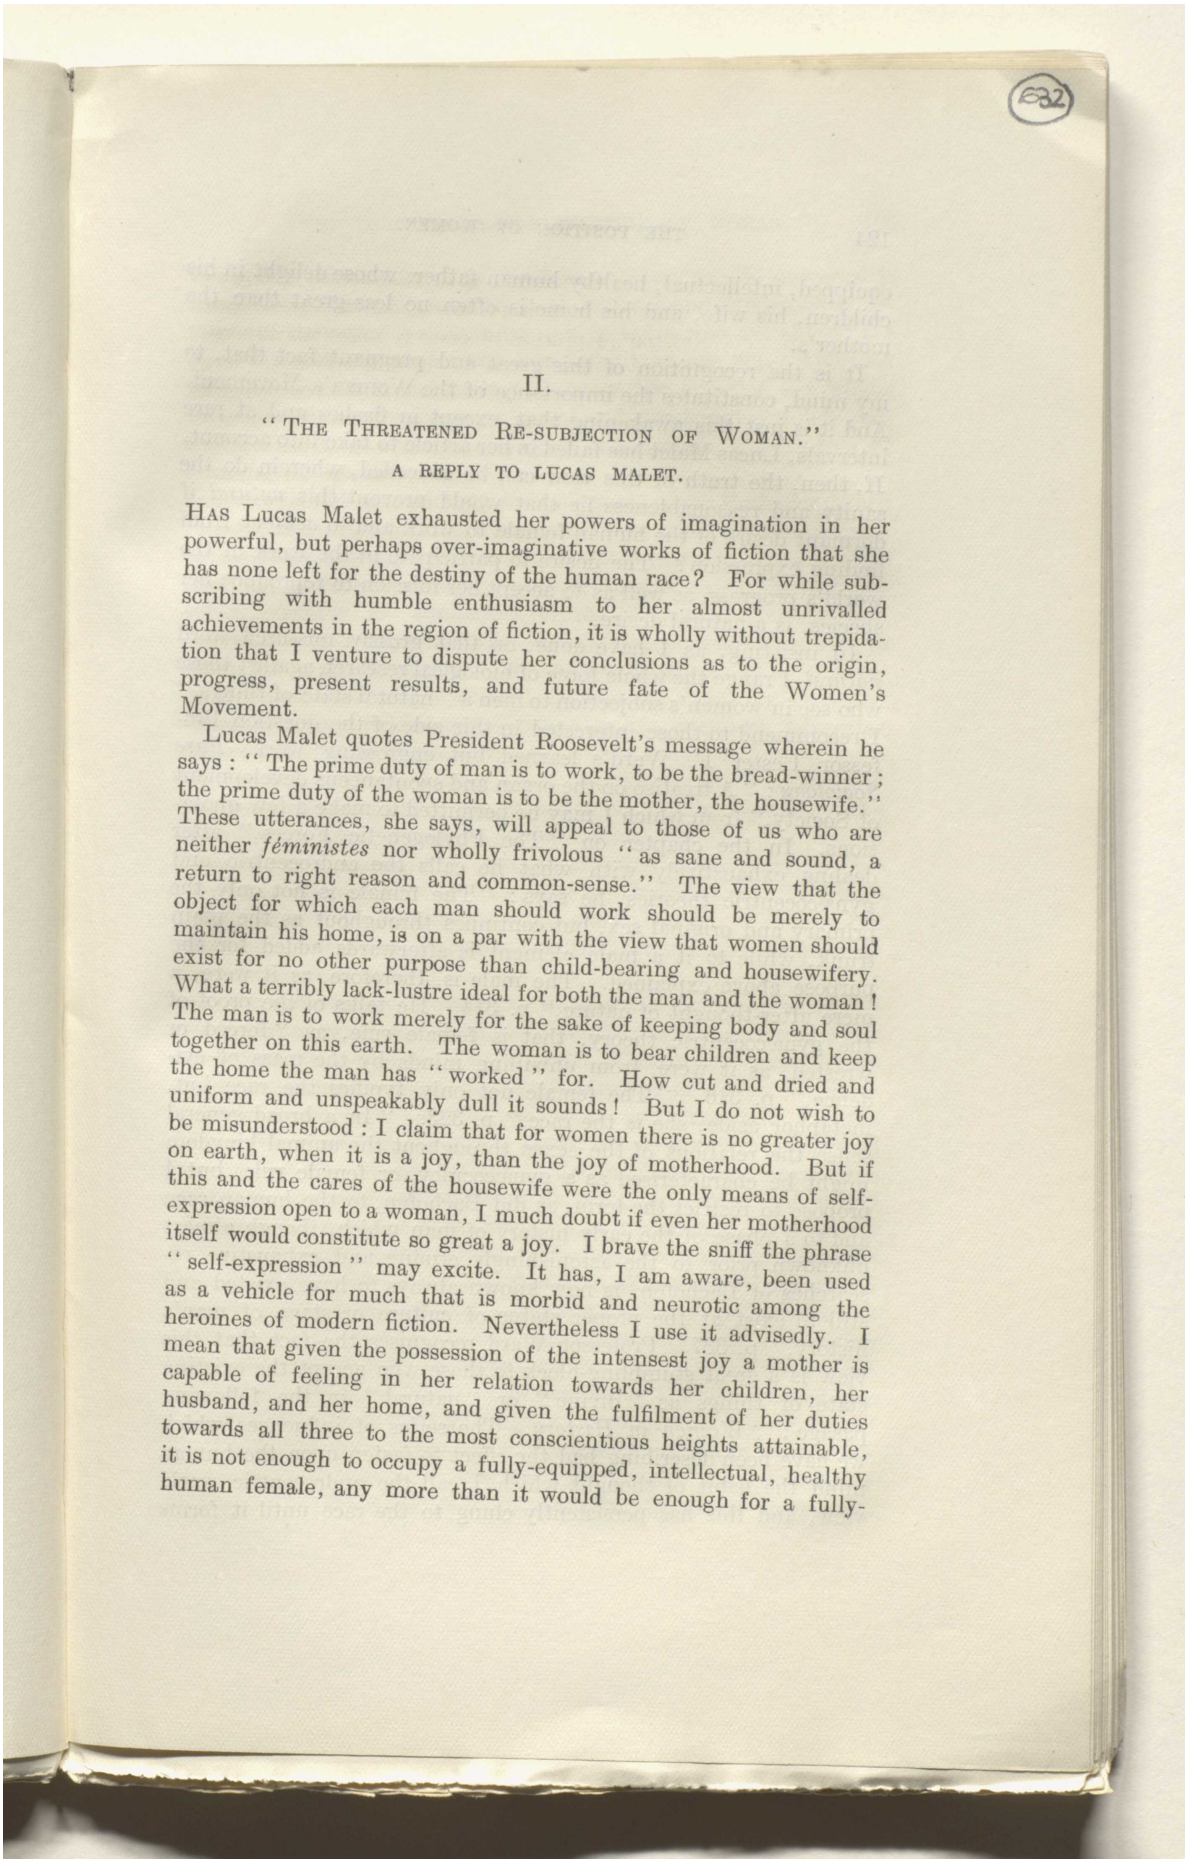
The soul seems to shine through and illuminate its temple, rendering it mysteriously beautiful.

Perhaps the new growth may be in the direction that will cause to disappear the old illusory separation of matter and spirit, and so prompt to that reverence for the body—a very symbol of nobility as it *can* be—which mediæval Christianity and modern Puritanism have so cruelly destroyed.

"Phantoms and unrealities," it may be objected. But out of phantoms and unrealities this world of men has been built from the beginning.

But it is clear that all trace and vestige of the master and bondswoman must disappear utterly and for ever, before the eternal lovers, no longer at cross purposes, at secret war, but reconciled, can set foot together upon the wonderful new path that winds its way alluringly before them to unknown heights and splendours. In spite of the old adage that love is blind, they have always been haunted by an inner sense that love, on the contrary, is the great seer, the passion that reveals and knows, and that by its magic they can together unlock the gates of a happier future.

"The glory that drew him," exclaims the poet once more, in speaking of the lover in one of Rossetti's poems, "was the glory of the angel within the woman, visible for a moment to the angel within himself."



And the dwelling-place of angels, be it remembered, is Heaven!

MONA CAIRD.

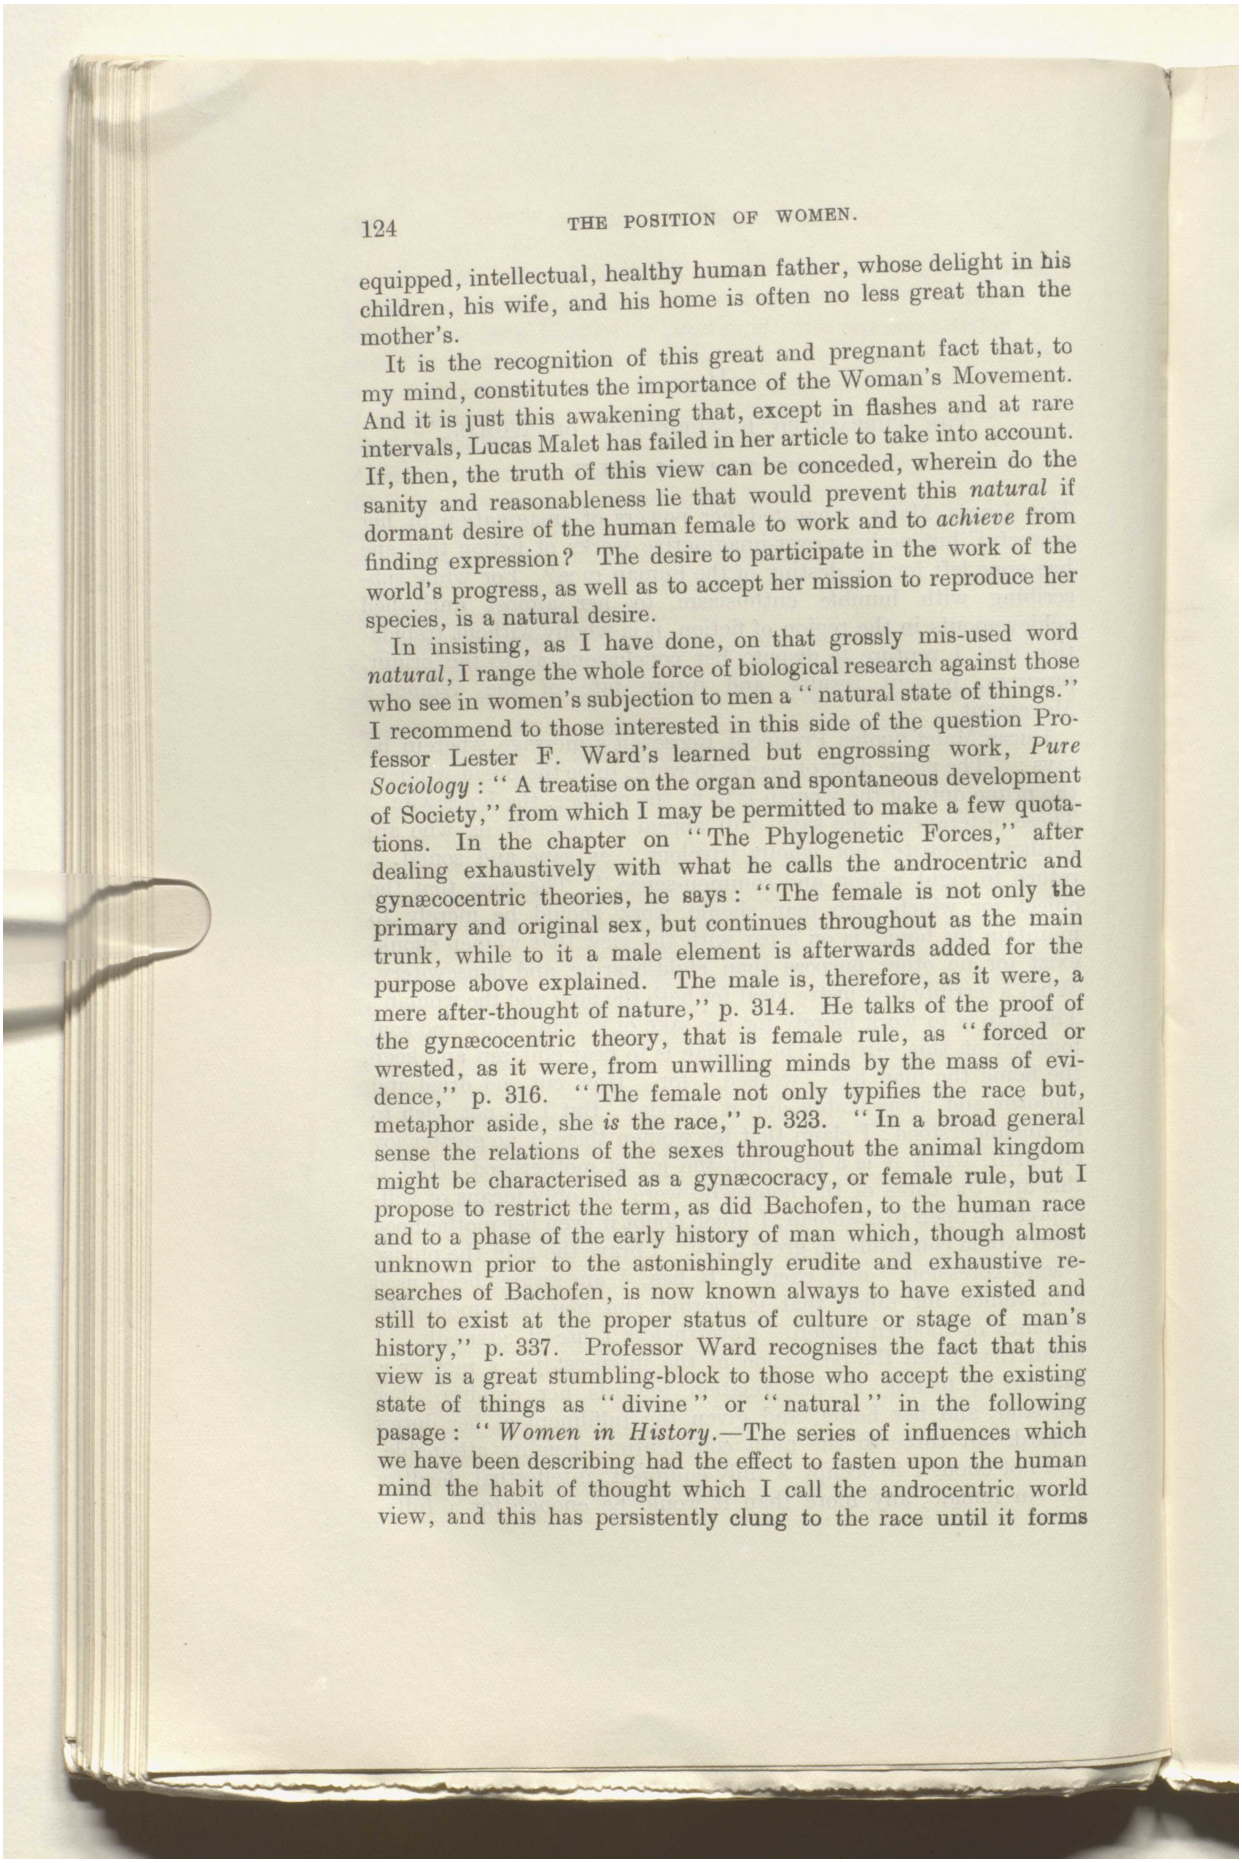
II.

"The Threatened Re-subjection of Woman."

A reply to Lucas Malet.



Has Lucas Malet exhausted her powers of imagination in her powerful, but perhaps over-imaginative works of fiction that she has none left for the destiny of the human race? For while subscribing with humble enthusiasm to her almost unrivalled achievements in the region of fiction, it is wholly without trepidation that I venture to dispute her conclusions as to the origin, progress, present results, and future fate of the Women's Movement.

Lucas Malet quotes President Roosevelt's message wherein he says: "The prime duty of man is to work, to be the bread-winner; the prime duty of the woman is to be the mother, the housewife." These utterances, she says, will appeal to those of us who are neither *féministes* nor wholly frivolous "as sane and sound, a return to right reason and common-sense." The view that the object for which each man should work should be merely to maintain his home, is on a par with the view that women should exist for no other purpose than child-bearing and housewifery. What a terribly lack-lustre ideal for both the man and the woman! The man is to work merely for the sake of keeping body and soul together on this earth. The woman is to bear children and keep the home the man has "worked" for. How cut and dried and uniform and unspeakably dull it sounds! But I do not wish to be misunderstood: I claim that for women there is no greater joy on earth, when it is a joy, than the joy of motherhood. But if this and the cares of the housewife were the only means of self-expression open to a woman, I much doubt if even her motherhood itself would constitute so great a joy. I brave the sniff the phrase "self-expression" may excite. It has, I am aware, been used as a vehicle for much that is morbid and neurotic among the heroines of modern fiction. Nevertheless I use it advisedly. I mean that given the possession of the intensest joy a mother is capable of feeling in her relation towards her children, her husband, and her home, and given the fulfilment of her duties towards all three to the most conscientious heights attainable, it is not enough to occupy a fully-equipped, intellectual, healthy human female, any more than it would be enough for a fully-

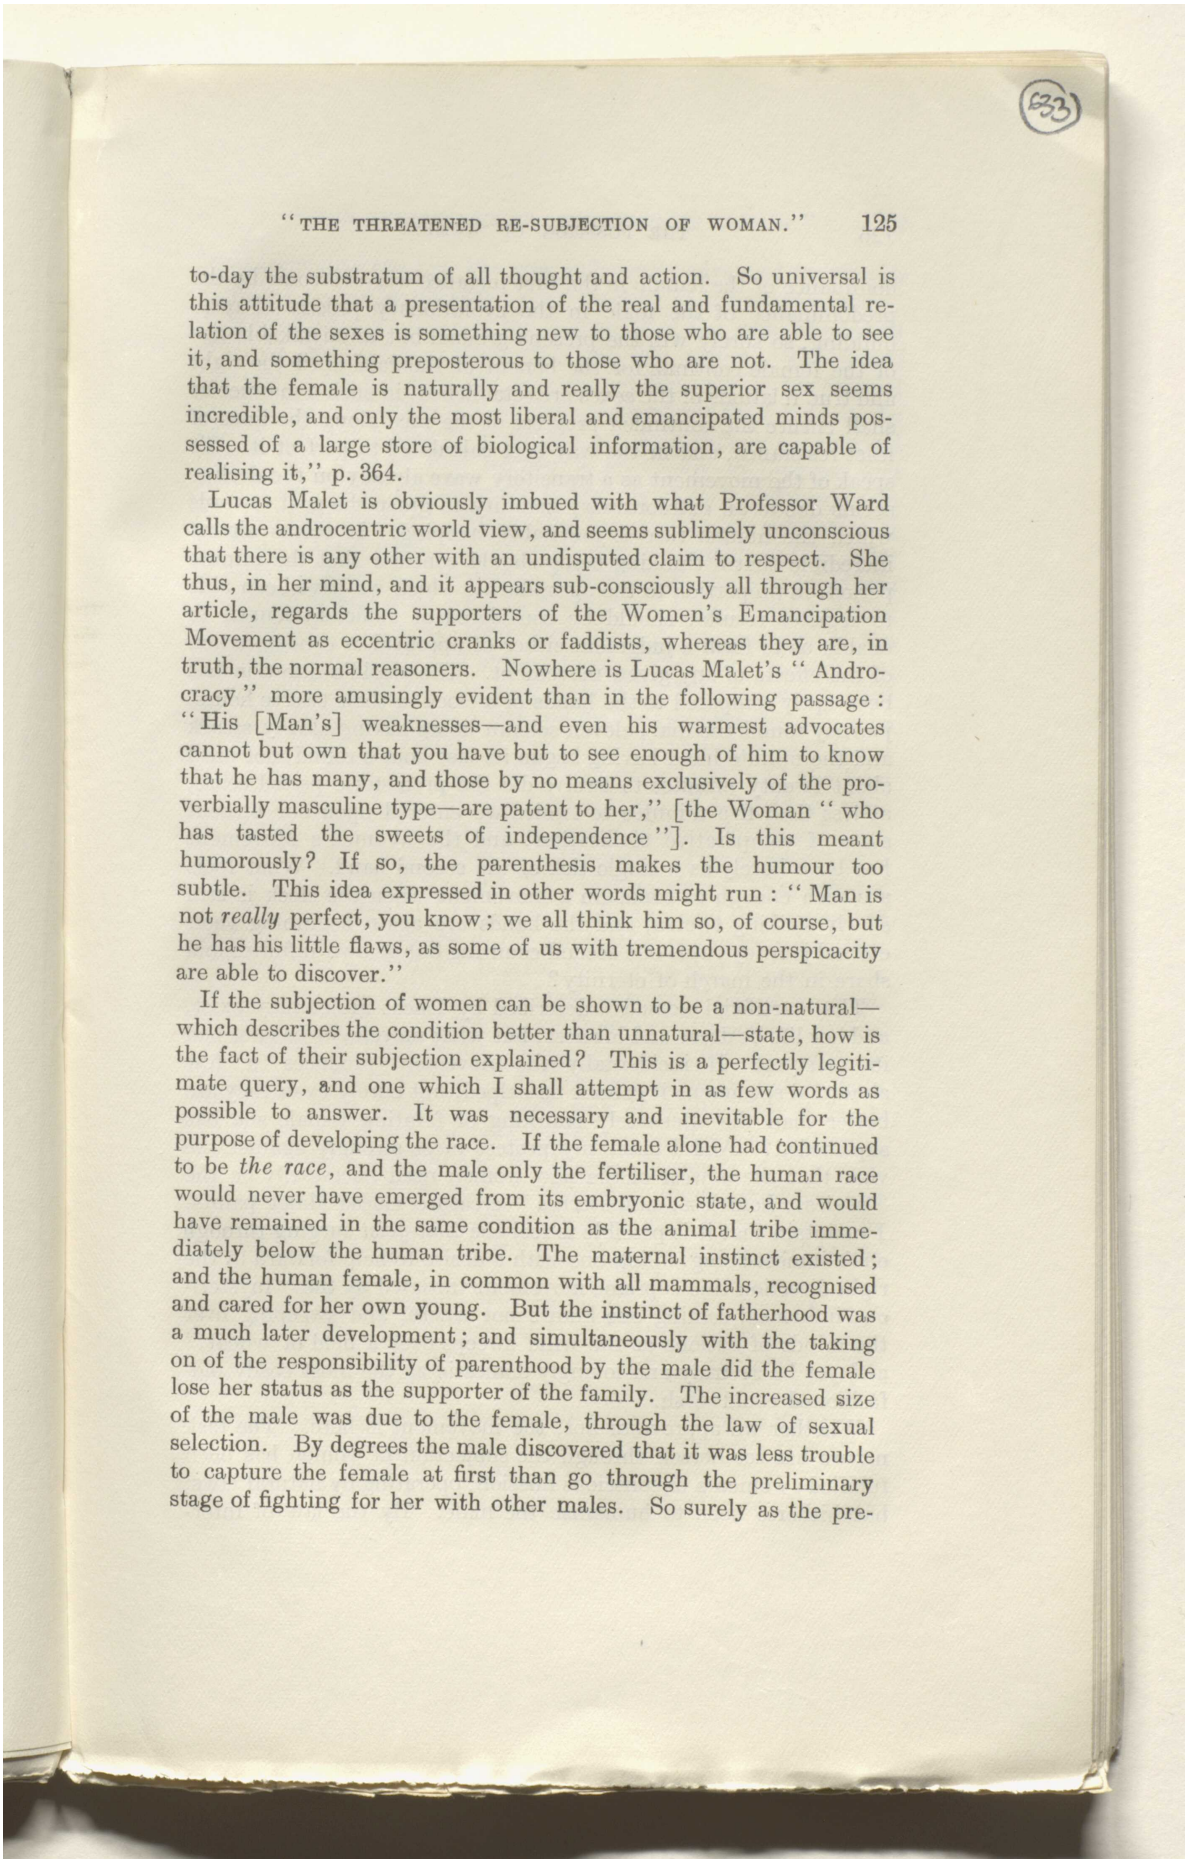
BRITISH LIBRARY

equipped, intellectual, healthy human father, whose delight in his children, his wife, and his home is often no less great than the mother's.



It is the recognition of this great and pregnant fact that, to my mind, constitutes the importance of the Woman's Movement. And it is just this awakening that, except in flashes and at rare intervals, Lucas Malet has failed in her article to take into account. If, then, the truth of this view can be conceded, wherein do the sanity and reasonableness lie that would prevent this *natural* if dormant desire of the human female to work and to *achieve* from finding expression? The desire to participate in the work of the world's progress, as well as to accept her mission to reproduce her species, is a natural desire.

In insisting, as I have done, on that grossly mis-used word *natural*, I range the whole force of biological research against those who see in women's subjection to men a "natural state of things." I recommend to those interested in this side of the question Professor Lester F. Ward's learned but engrossing work, *Pure Sociology*: "A treatise on the organ and spontaneous development of Society," from which I may be permitted to make a few quotations. In the chapter on "The Phylogenetic Forces," after dealing exhaustively with what he calls the androcentric and gynæcocentric theories, he says: "The female is not only the primary and original sex, but continues throughout as the main trunk, while to it a male element is afterwards added for the purpose above explained. The male is, therefore, as it were, a mere after-thought of nature," p. 314. He talks of the proof of the gynæcocentric theory, that is female rule, as "forced or wrested, as it were, from unwilling minds by the mass of evidence," p. 316. "The female not only typifies the race but, metaphor aside, she *is* the race," p. 323. "In a broad general sense the relations of the sexes throughout the animal kingdom might be characterised as a gynæcocracy, or female rule, but I propose to restrict the term, as did Bachofen, to the human race and to a phase of the early history of man which, though almost unknown prior to the astonishingly erudite and exhaustive researches of Bachofen, is now known always to have existed and still to exist at the proper status of culture or stage of man's history," p. 337. Professor Ward recognises the fact that this view is a great stumbling-block to those who accept the existing state of things as "divine" or "natural" in the following pasage: "*Women in History*.—The series of influences which we have been describing had the effect to fasten upon the human mind the habit of thought which I call the androcentric world view, and this has persistently clung to the race until it forms

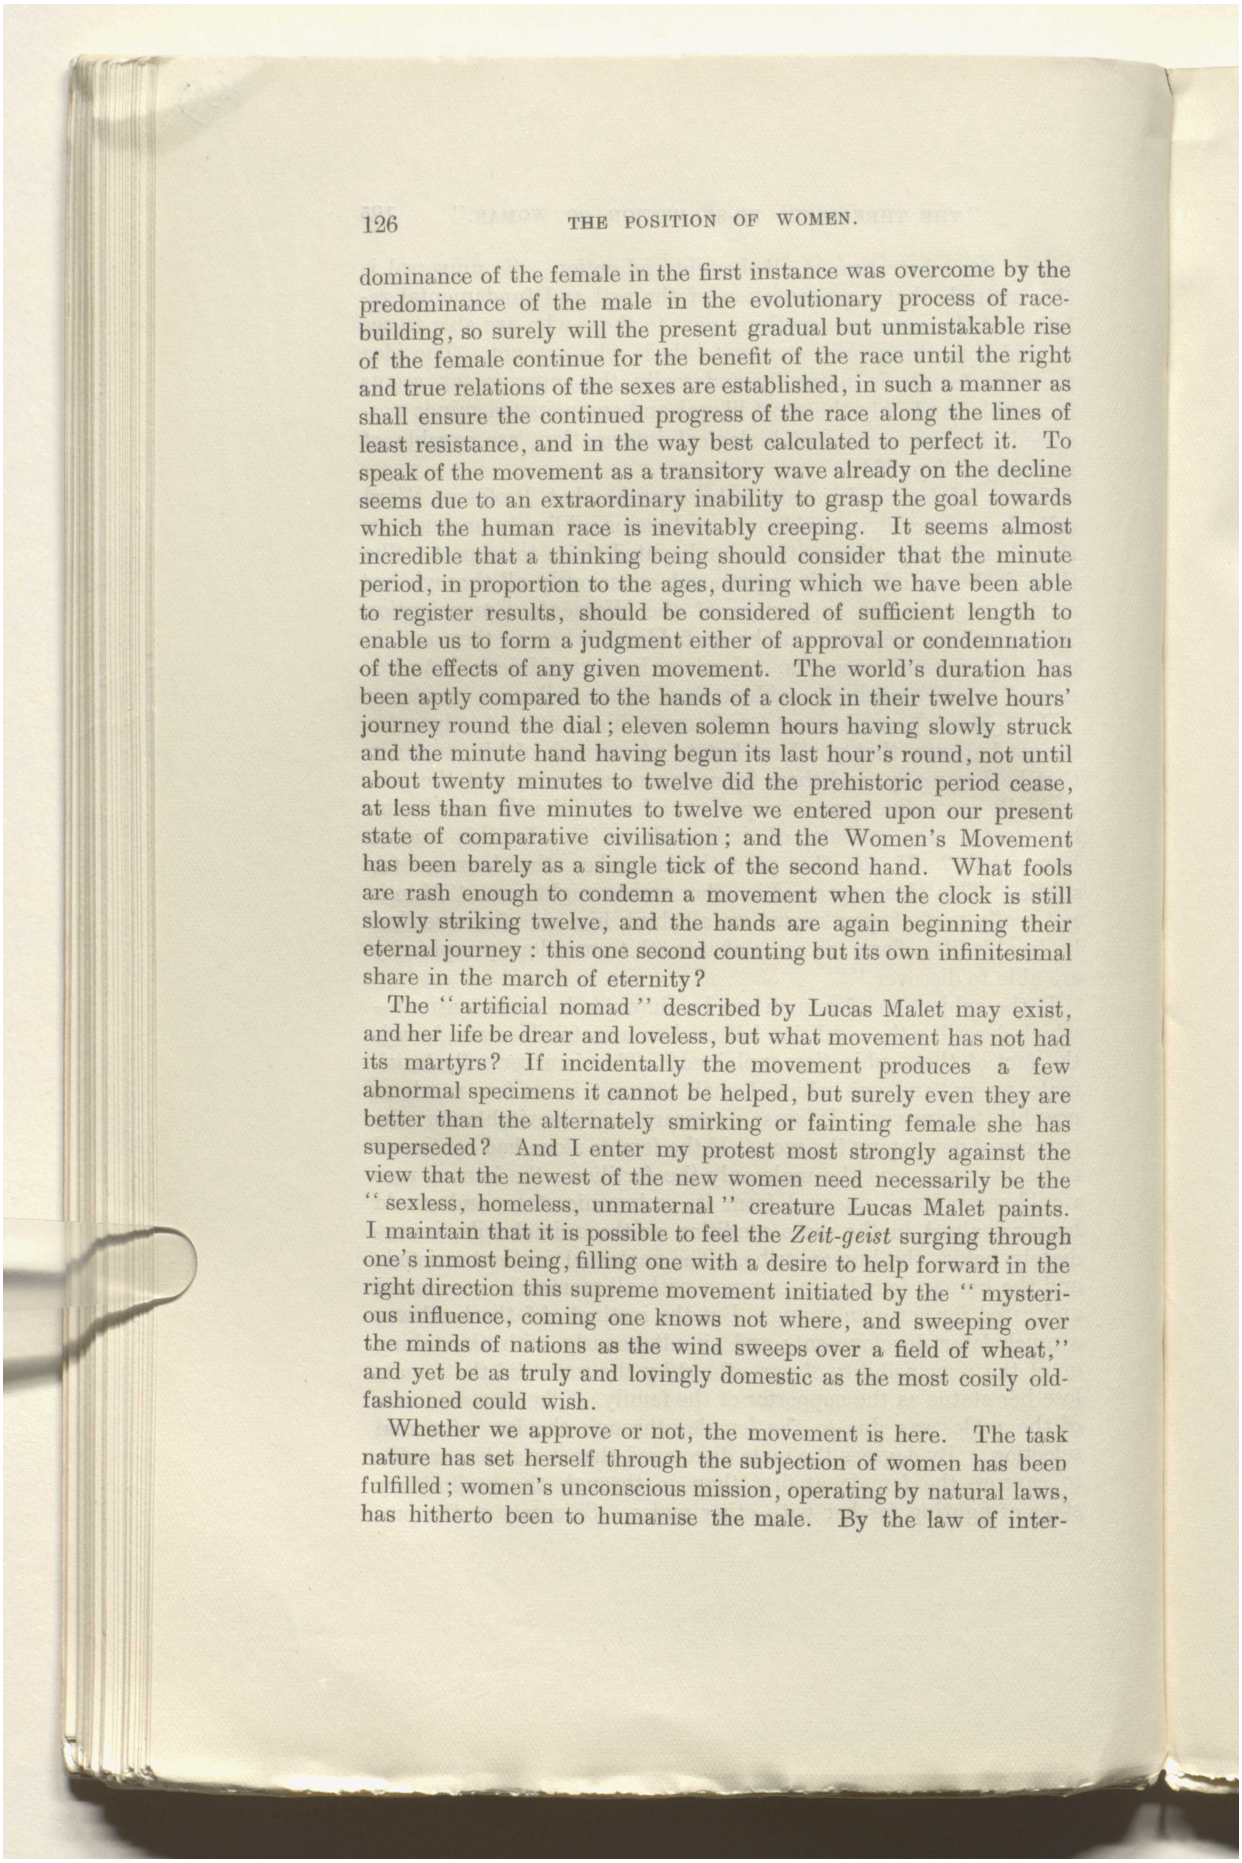
to-day the substratum of all thought and action. So universal is this attitude that a presentation of the real and fundamental relation of the sexes is something new to those who are able to see it, and something preposterous to those who are not. The idea that the female is naturally and really the superior sex seems incredible, and only the most liberal and emancipated minds possessed of a large store of biological information, are capable of realising it," p. 364.



Lucas Malet is obviously imbued with what Professor Ward calls the androcentric world view, and seems sublimely unconscious that there is any other with an undisputed claim to respect. She thus, in her mind, and it appears sub-consciously all through her article, regards the supporters of the Women's Emancipation Movement as eccentric cranks or faddists, whereas they are, in truth, the normal reasoners. Nowhere is Lucas Malet's "Androcracy" more amusingly evident than in the following passage: "His [Man's] weaknesses—and even his warmest advocates cannot but own that you have but to see enough of him to know that he has many, and those by no means exclusively of the proverbially masculine type—are patent to her," [the Woman "who has tasted the sweets of independence"]. Is this meant humorously? If so, the parenthesis makes the humour too subtle. This idea expressed in other words might run: "Man is not *really* perfect, you know; we all think him so, of course, but he has his little flaws, as some of us with tremendous perspicacity are able to discover."

If the subjection of women can be shown to be a non-natural—which describes the condition better than unnatural—state, how is the fact of their subjection explained? This is a perfectly legitimate query, and one which I shall attempt in as few words as possible to answer. It was necessary and inevitable for the purpose of developing the race. If the female alone had continued to be *the race*, and the male only the fertiliser, the human race would never have emerged from its embryonic state, and would have remained in the same condition as the animal tribe immediately below the human tribe. The maternal instinct existed; and the human female, in common with all mammals, recognised and cared for her own young. But the instinct of fatherhood was a much later development; and simultaneously with the taking on of the responsibility of parenthood by the male did the female lose her status as the supporter of the family. The increased size of the male was due to the female, through the law of sexual selection. By degrees the male discovered that it was less trouble to capture the female at first than go through the preliminary stage of fighting for her with other males. So surely as the pre-

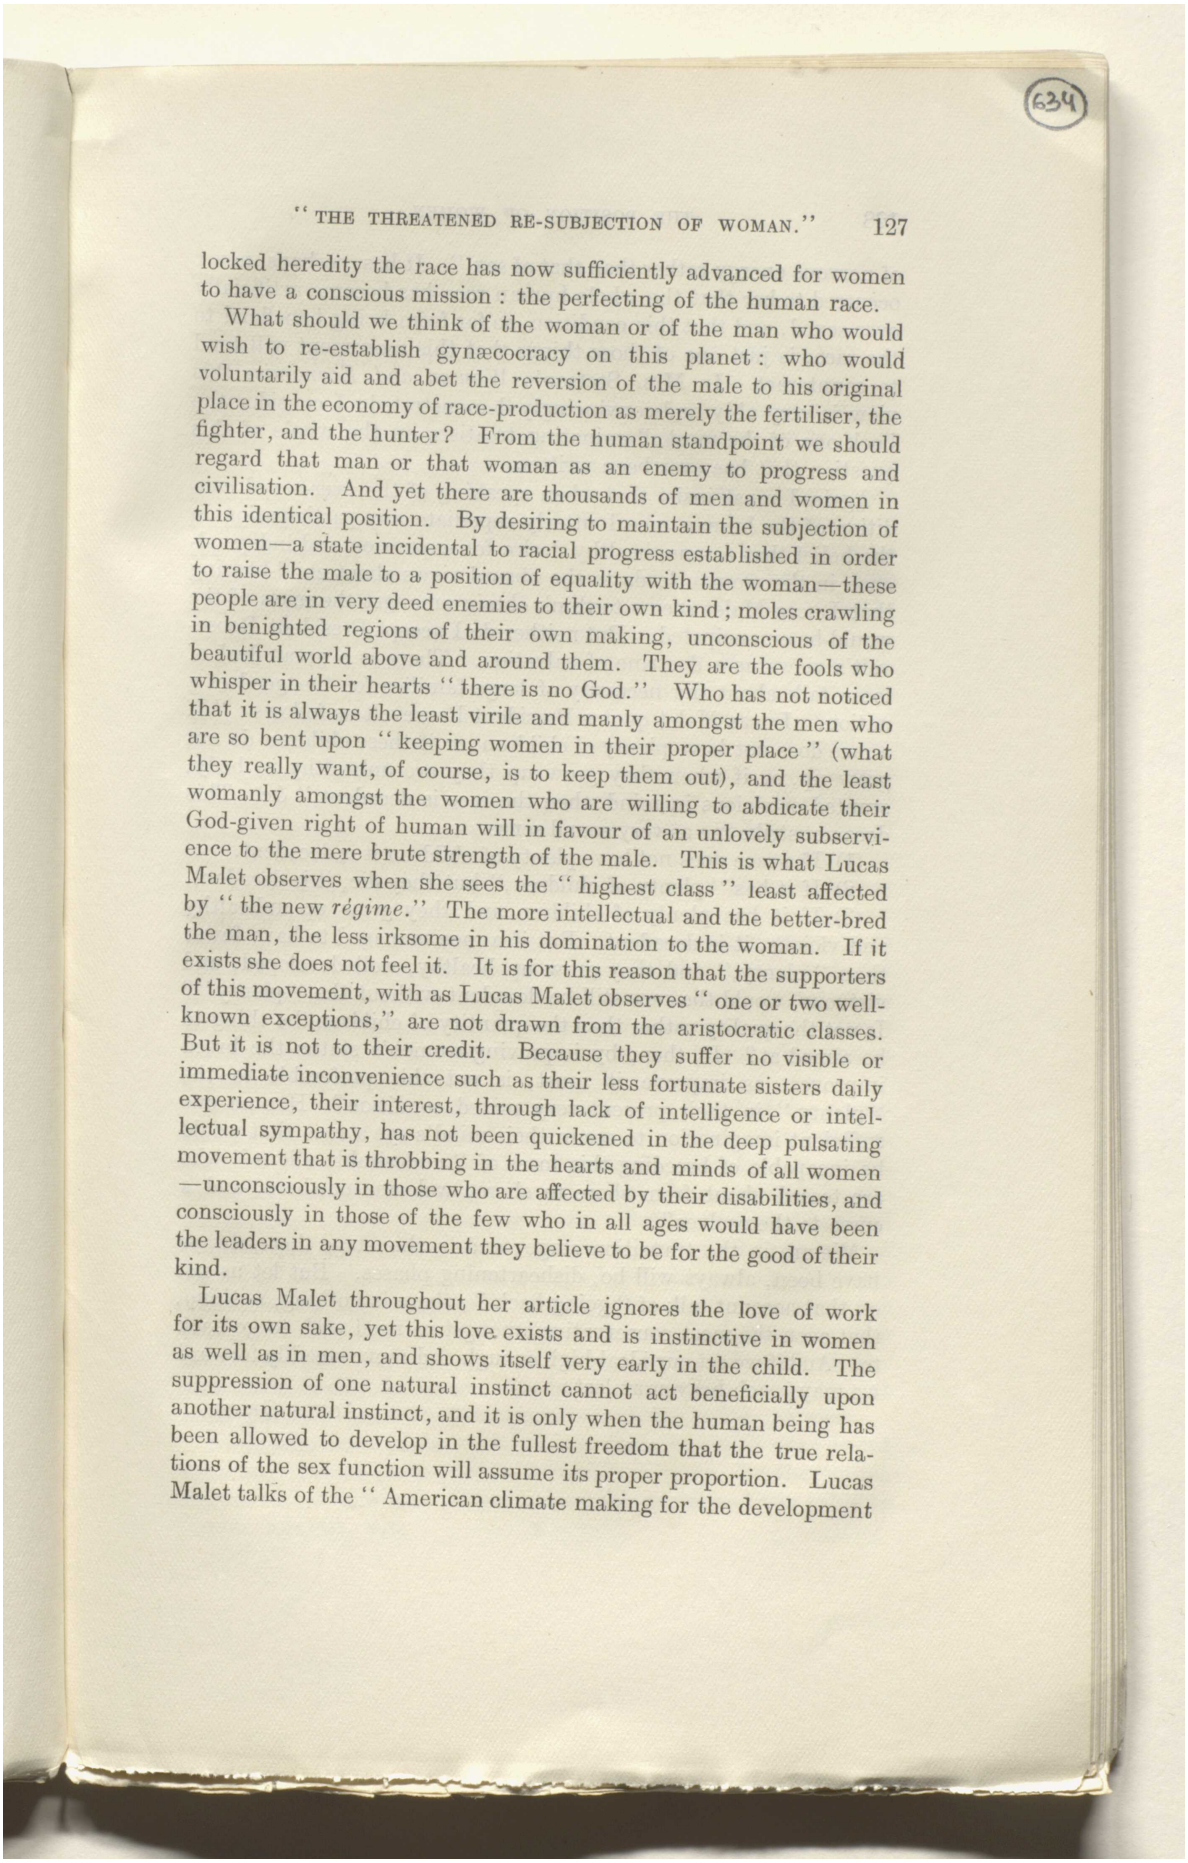
dominance of the female in the first instance was overcome by the predominance of the male in the evolutionary process of race-building, so surely will the present gradual but unmistakable rise of the female continue for the benefit of the race until the right and true relations of the sexes are established, in such a manner as shall ensure the continued progress of the race along the lines of least resistance, and in the way best calculated to perfect it. To speak of the movement as a transitory wave already on the decline seems due to an extraordinary inability to grasp the goal towards which the human race is inevitably creeping. It seems almost incredible that a thinking being should consider that the minute period, in proportion to the ages, during which we have been able to register results, should be considered of sufficient length to enable us to form a judgment either of approval or condemnation of the effects of any given movement. The world's duration has been aptly compared to the hands of a clock in their twelve hours' journey round the dial; eleven solemn hours having slowly struck and the minute hand having begun its last hour's round, not until about twenty minutes to twelve did the prehistoric period cease, at less than five minutes to twelve we entered upon our present state of comparative civilisation; and the Women's Movement has been barely as a single tick of the second hand. What fools are rash enough to condemn a movement when the clock is still slowly striking twelve, and the hands are again beginning their eternal journey: this one second counting but its own infinitesimal share in the march of eternity?



The "artificial nomad" described by Lucas Malet may exist, and her life be drear and loveless, but what movement has not had its martyrs? If incidentally the movement produces a few abnormal specimens it cannot be helped, but surely even they are better than the alternately smirking or fainting female she has superseded? And I enter my protest most strongly against the view that the newest of the new women need necessarily be the "sexless, homeless, unmaternal" creature Lucas Malet paints. I maintain that it is possible to feel the *Zeit-geist* surging through one's inmost being, filling one with a desire to help forward in the right direction this supreme movement initiated by the "mysterious influence, coming one knows not where, and sweeping over the minds of nations as the wind sweeps over a field of wheat," and yet be as truly and lovingly domestic as the most cosily old-fashioned could wish.

Whether we approve or not, the movement is here. The task nature has set herself through the subjection of women has been fulfilled; women's unconscious mission, operating by natural laws, has hitherto been to humanise the male. By the law of inter-

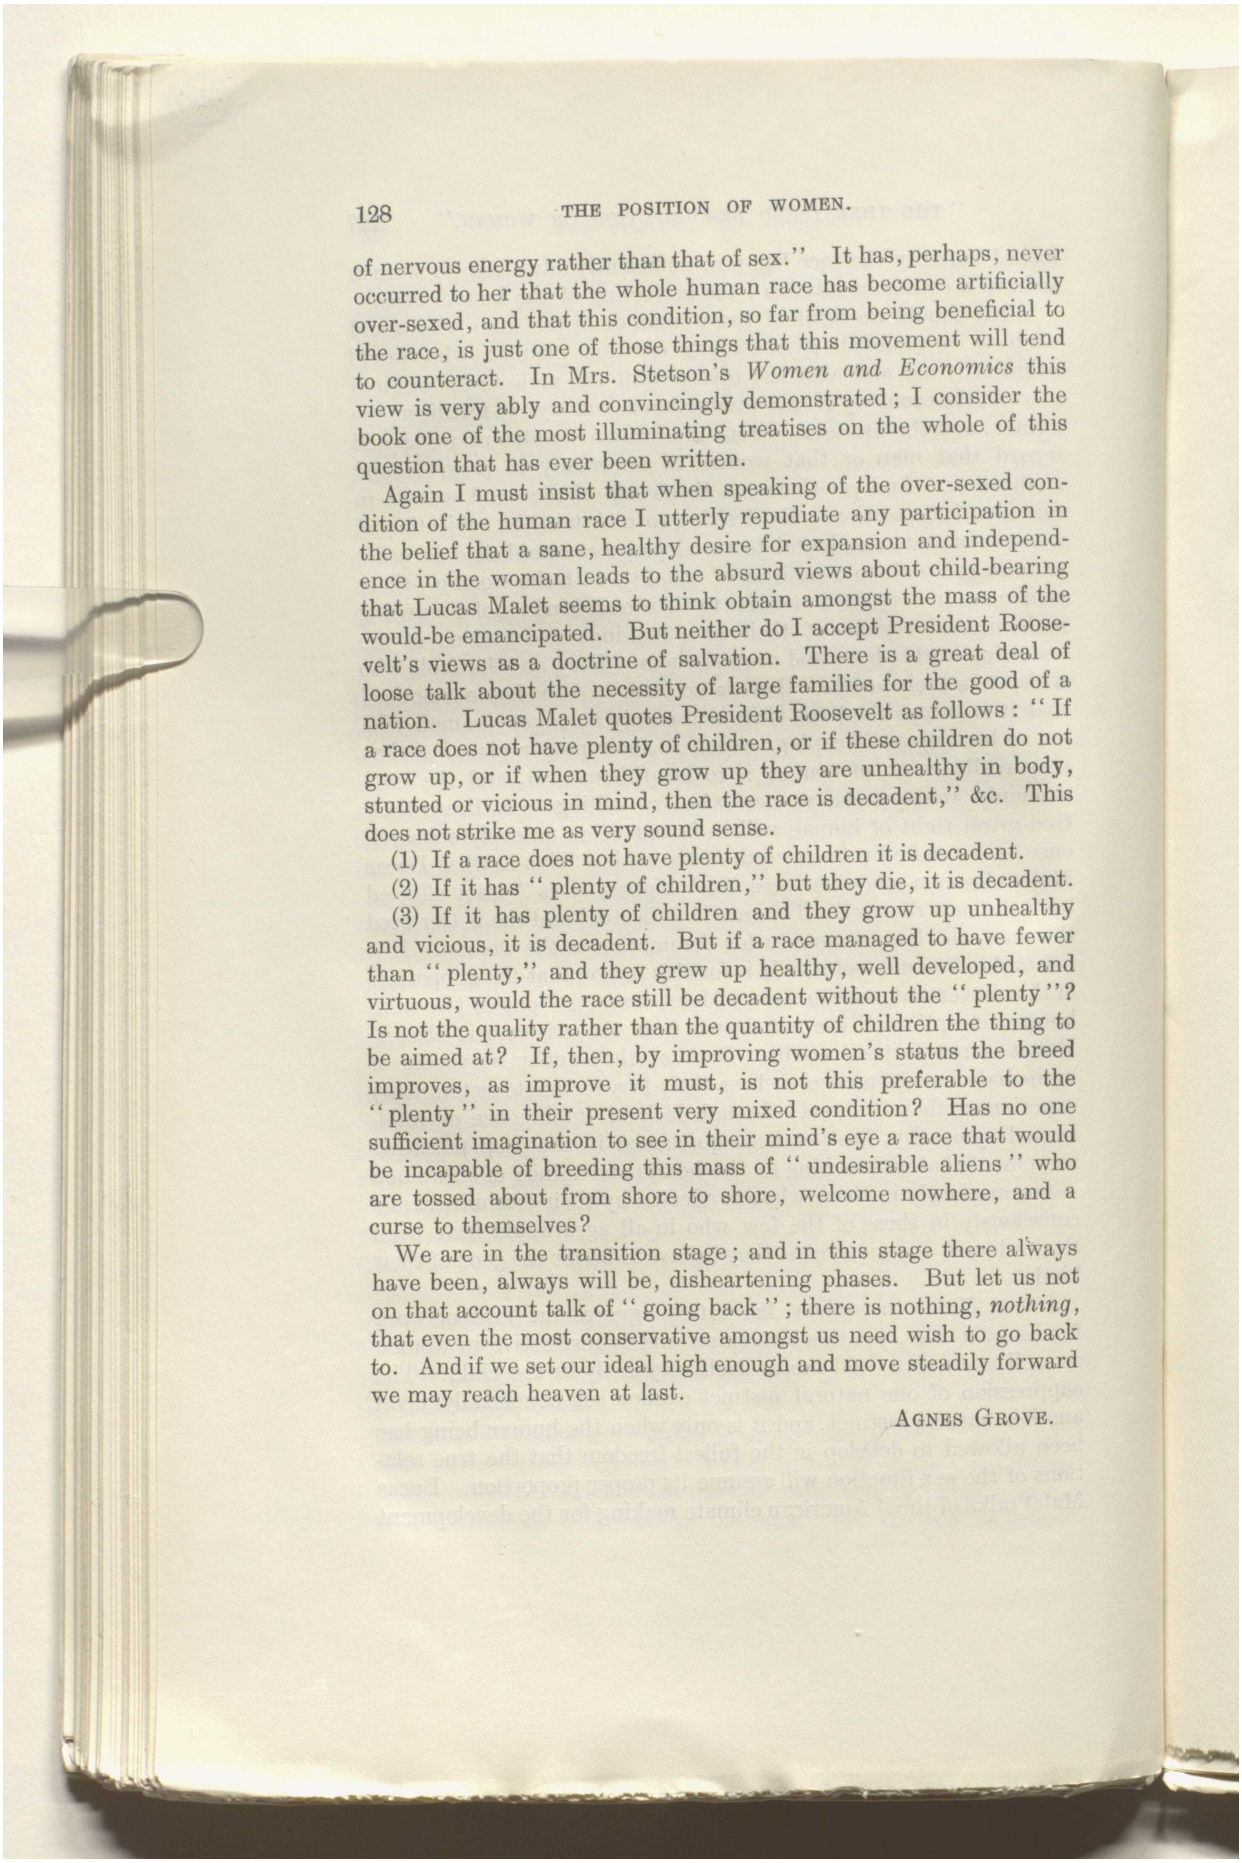
locked heredity the race has now sufficiently advanced for women to have a conscious mission: the perfecting of the human race.



What should we think of the woman or of the man who would wish to re-establish gynæcocracy on this planet: who would voluntarily aid and abet the reversion of the male to his original place in the economy of race-production as merely the fertiliser, the fighter, and the hunter? From the human standpoint we should regard that man or that woman as an enemy to progress and civilisation. And yet there are thousands of men and women in this identical position. By desiring to maintain the subjection of women—a state incidental to racial progress established in order to raise the male to a position of equality with the woman—these people are in very deed enemies to their own kind; moles crawling in benighted regions of their own making, unconscious of the beautiful world above and around them. They are the fools who whisper in their hearts "there is no God." Who has not noticed that it is always the least virile and manly amongst the men who are so bent upon "keeping women in their proper place" (what they really want, of course, is to keep them out), and the least womanly amongst the women who are willing to abdicate their God-given right of human will in favour of an unlovely subservience to the mere brute strength of the male. This is what Lucas Malet observes when she sees the "highest class" least affected by "the new *régime*." The more intellectual and the better-bred the man, the less irksome in his domination to the woman. If it exists she does not feel it. It is for this reason that the supporters of this movement, with as Lucas Malet observes "one or two well-known exceptions," are not drawn from the aristocratic classes. But it is not to their credit. Because they suffer no visible or immediate inconvenience such as their less fortunate sisters daily experience, their interest, through lack of intelligence or intellectual sympathy, has not been quickened in the deep pulsating movement that is throbbing in the hearts and minds of all women—unconsciously in those who are affected by their disabilities, and consciously in those of the few who in all ages would have been the leaders in any movement they believe to be for the good of their kind.

Lucas Malet throughout her article ignores the love of work for its own sake, yet this love exists and is instinctive in women as well as in men, and shows itself very early in the child. The suppression of one natural instinct cannot act beneficially upon another natural instinct, and it is only when the human being has been allowed to develop in the fullest freedom that the true relations of the sex function will assume its proper proportion. Lucas Malet talks of the "American climate making for the development

BRITISH LIBRARY

of nervous energy rather than that of sex." It has, perhaps, never occurred to her that the whole human race has become artificially over-sexed, and that this condition, so far from being beneficial to the race, is just one of those things that this movement will tend to counteract. In Mrs. Stetson's *Women and Economics* this view is very ably and convincingly demonstrated; I consider the book one of the most illuminating treatises on the whole of this question that has ever been written.

Again I must insist that when speaking of the over-sexed condition of the human race I utterly repudiate any participation in the belief that a sane, healthy desire for expansion and independence in the woman leads to the absurd views about child-bearing that Lucas Malet seems to think obtain amongst the mass of the would-be emancipated. But neither do I accept President Roosevelt's views as a doctrine of salvation. There is a great deal of loose talk about the necessity of large families for the good of a nation. Lucas Malet quotes President Roosevelt as follows: "If a race does not have plenty of children, or if these children do not grow up, or if when they grow up they are unhealthy in body, stunted or vicious in mind, then the race is decadent," &c. This does not strike me as very sound sense.

(1) If a race does not have plenty of children it is decadent.

(2) If it has "plenty of children," but they die, it is decadent.

(3) If it has plenty of children and they grow up unhealthy and vicious, it is decadent. But if a race managed to have fewer than "plenty," and they grew up healthy, well developed, and virtuous, would the race still be decadent without the "plenty"? Is not the quality rather than the quantity of children the thing to be aimed at? If, then, by improving women's status the breed improves, as improve it must, is not this preferable to the "plenty" in their present very mixed condition? Has no one sufficient imagination to see in their mind's eye a race that would be incapable of breeding this mass of "undesirable aliens" who are tossed about from shore to shore, welcome nowhere, and a curse to themselves?

We are in the transition stage; and in this stage there always have been, always will be, disheartening phases. But let us not on that account talk of "going back"; there is nothing, *nothing*, that even the most conservative amongst us need wish to go back to. And if we set our ideal high enough and move steadily forward we may reach heaven at last.

AGNES GROVE.

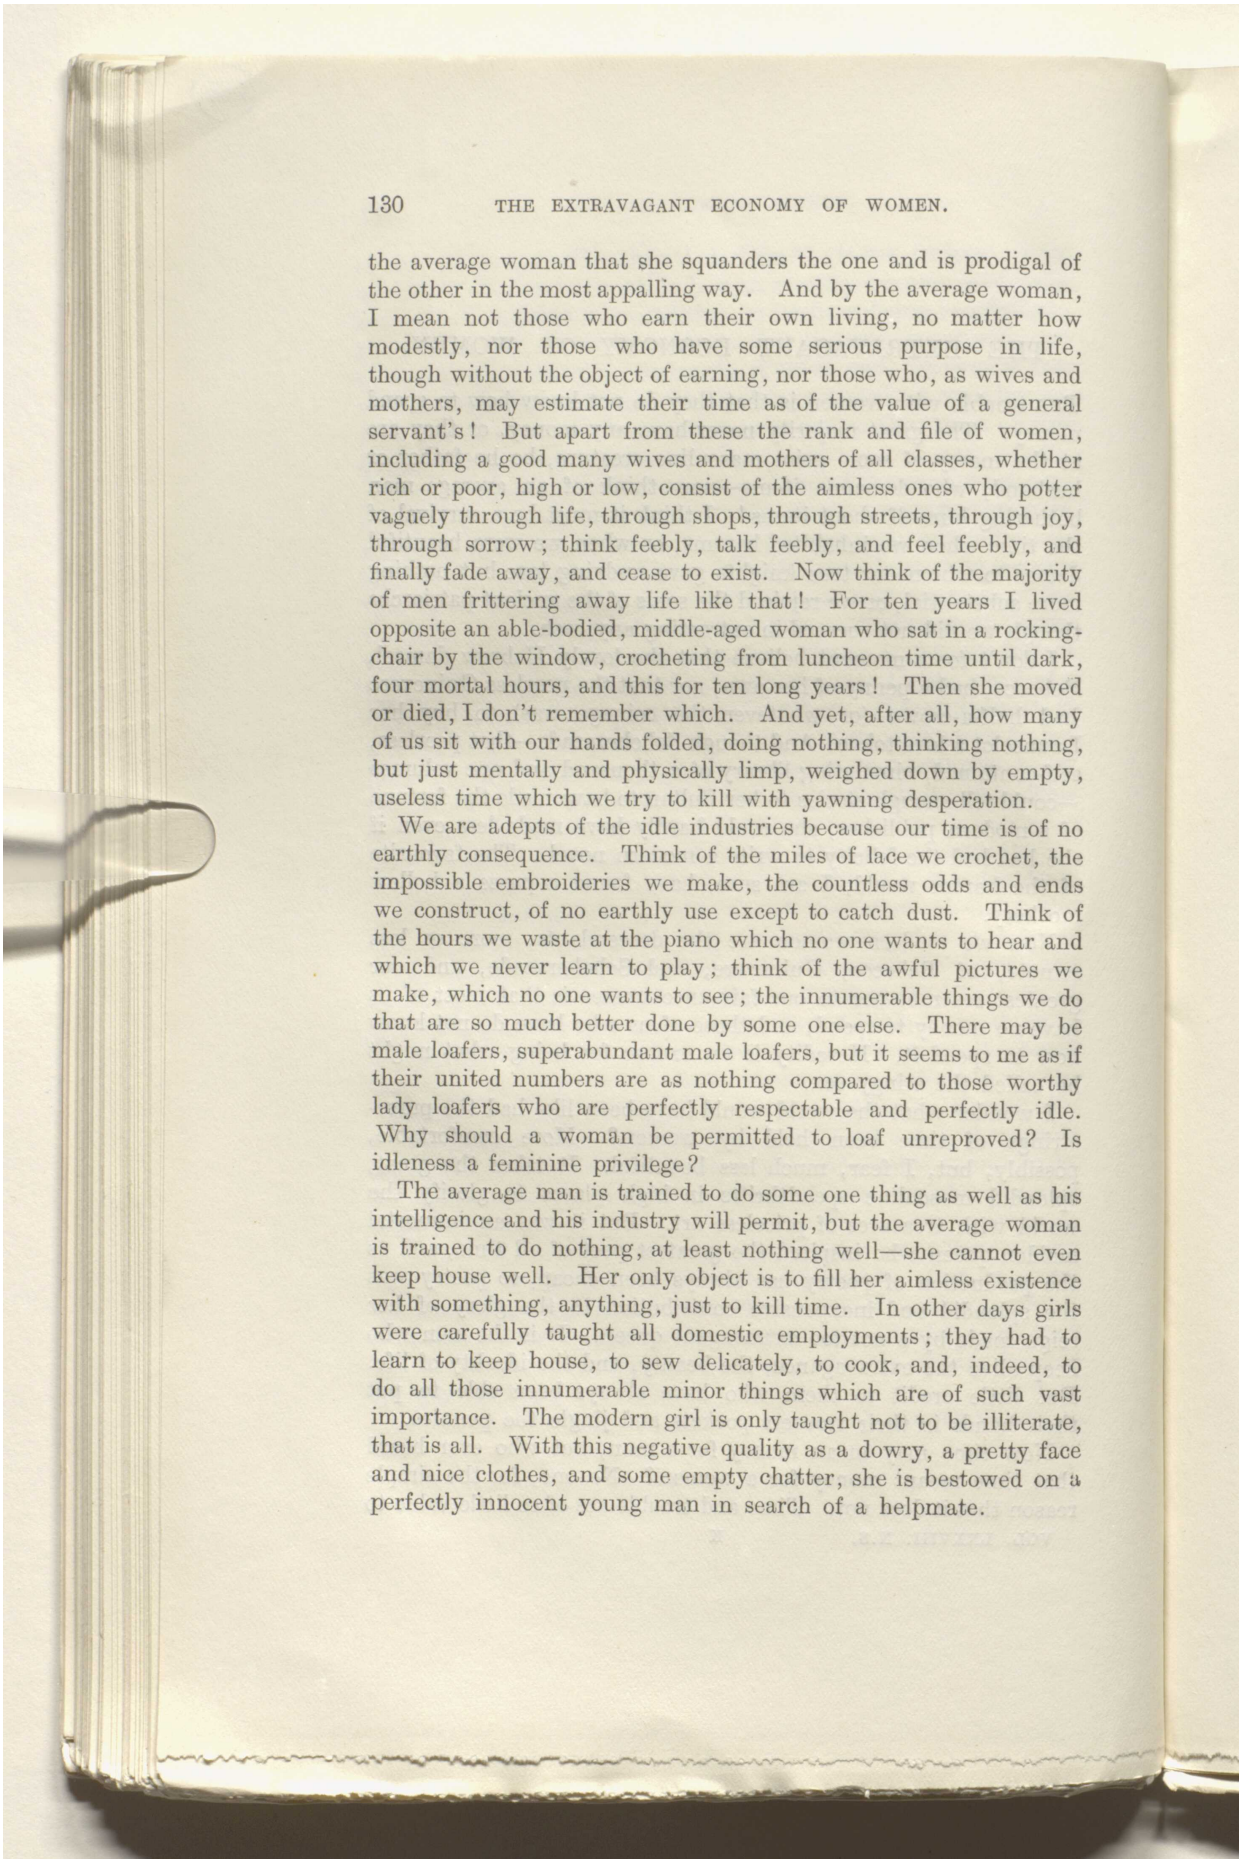
THE EXTRAVAGANT ECONOMY OF WOMEN.

THE trouble with women is that they do not know how to spend money. The great majority never have any money, or they are at the mercy of some grim masculine creature, be he father or husband, who demands items—now think of an average man bothering himself about items! I think it must be a survival of the time when we inhabited harems, or when we were beautiful dames to whom our true knights gave undying love but nothing more substantial, or we rejoiced the souls of the ancient patriarchs though we did not succeed in extracting any cash.

I don't for a moment believe that the lovely Hebrew damsel, Rebecca, had a penny of her own, nor that the peerless Guinevere had half-a-crown (or whatever the coinage was) to buy her Launcelot a love token. And though Scheherazade—that peerless, self-contained, circulating library of a thousand and one volumes—could tell enough stories to her Sultan to have made the fortune of a modern publisher, she could hardly have made less even if she had had the felicity to write a modern novel. The favourite of the harem would, I am sure, have found a purse a hollow mockery.

Now we modern women are the descendants, more or less remote, of Rebecca, Guinevere, and Scheherazade, and our greatest resemblance to our fair ancestresses is that most of us have no money to spend, and those of us who have do not know how to spend it. Heredity is an excuse for being what might be called the stingy sex.



I wonder what the world would have been like had the purse-strings of time been held by women? More comfortable, possibly, but, I fear, much less beautiful. It takes the great, splendid masculine spendthrifts in high places to glorify the world with treasures of priceless art. But it was an immortal maiden queen who inspired the greatest poet of all time, and as the production of poetry has always been cheap, so poetry was the splendid and inexpensive contribution to the glory of her reign made by a not too extravagant queen. It is the men who keep alive the extravagance, the beauty, and the ideality of life. But little credit to them who have always been able to put their hands in their trousers pockets and jingle the pennies.

Now time may mean money for a man, but who ever heard that time meant money for a woman? No one, for the simple reason that it does not. Time and trouble are of so little value to

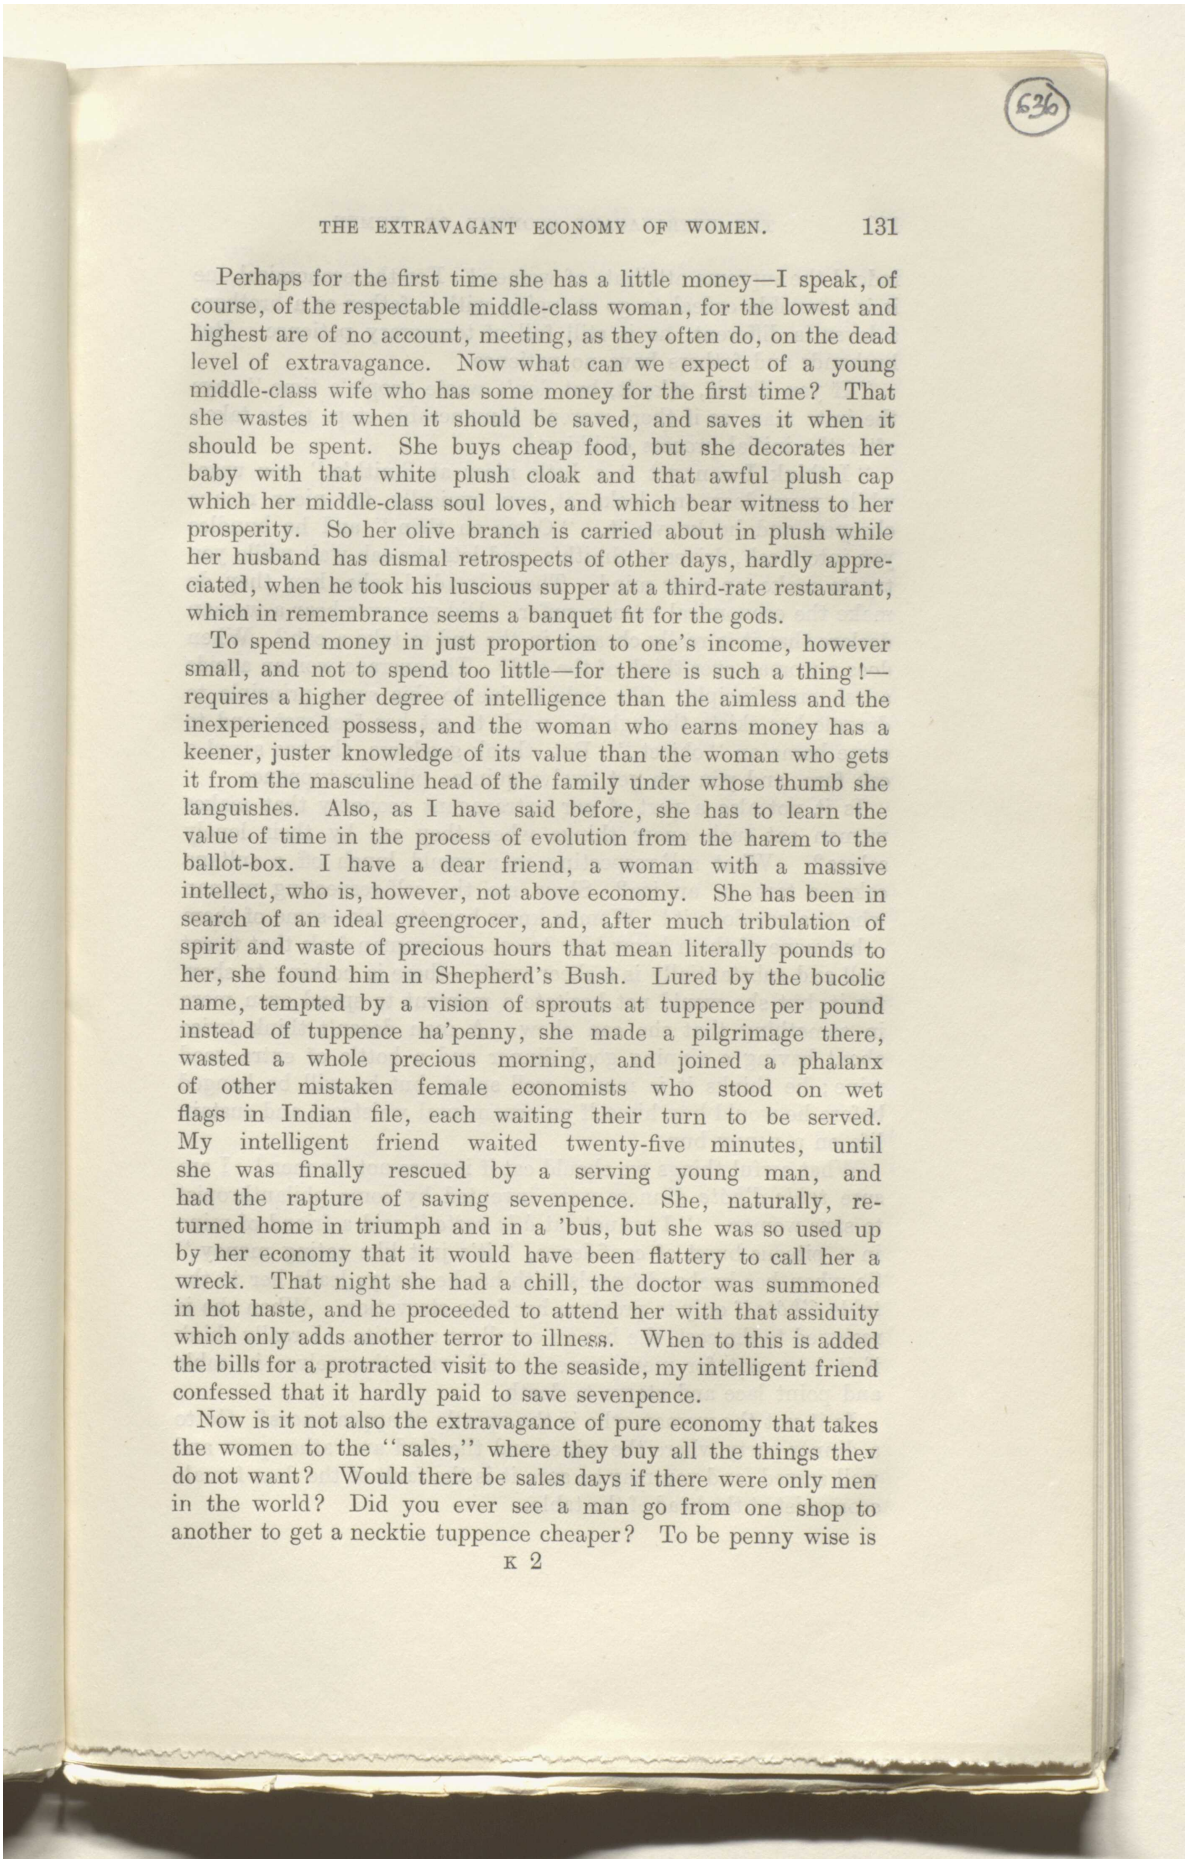
the average woman that she squanders the one and is prodigal of the other in the most appalling way. And by the average woman, I mean not those who earn their own living, no matter how modestly, nor those who have some serious purpose in life, though without the object of earning, nor those who, as wives and mothers, may estimate their time as of the value of a general servant's! But apart from these the rank and file of women, including a good many wives and mothers of all classes, whether rich or poor, high or low, consist of the aimless ones who potter vaguely through life, through shops, through streets, through joy, through sorrow; think feebly, talk feebly, and feel feebly, and finally fade away, and cease to exist. Now think of the majority of men frittering away life like that! For ten years I lived opposite an able-bodied, middle-aged woman who sat in a rocking-chair by the window, crocheting from luncheon time until dark, four mortal hours, and this for ten long years! Then she moved or died, I don't remember which. And yet, after all, how many of us sit with our hands folded, doing nothing, thinking nothing, but just mentally and physically limp, weighed down by empty, useless time which we try to kill with yawning desperation.



We are adepts of the idle industries because our time is of no earthly consequence. Think of the miles of lace we crochet, the impossible embroideries we make, the countless odds and ends we construct, of no earthly use except to catch dust. Think of the hours we waste at the piano which no one wants to hear and which we never learn to play; think of the awful pictures we make, which no one wants to see; the innumerable things we do that are so much better done by some one else. There may be male loafers, superabundant male loafers, but it seems to me as if their united numbers are as nothing compared to those worthy lady loafers who are perfectly respectable and perfectly idle. Why should a woman be permitted to loaf unreproved? Is idleness a feminine privilege?

The average man is trained to do some one thing as well as his intelligence and his industry will permit, but the average woman is trained to do nothing, at least nothing well—she cannot even keep house well. Her only object is to fill her aimless existence with something, anything, just to kill time. In other days girls were carefully taught all domestic employments; they had to learn to keep house, to sew delicately, to cook, and, indeed, to do all those innumerable minor things which are of such vast importance. The modern girl is only taught not to be illiterate, that is all. With this negative quality as a dowry, a pretty face and nice clothes, and some empty chatter, she is bestowed on a perfectly innocent young man in search of a helpmate.

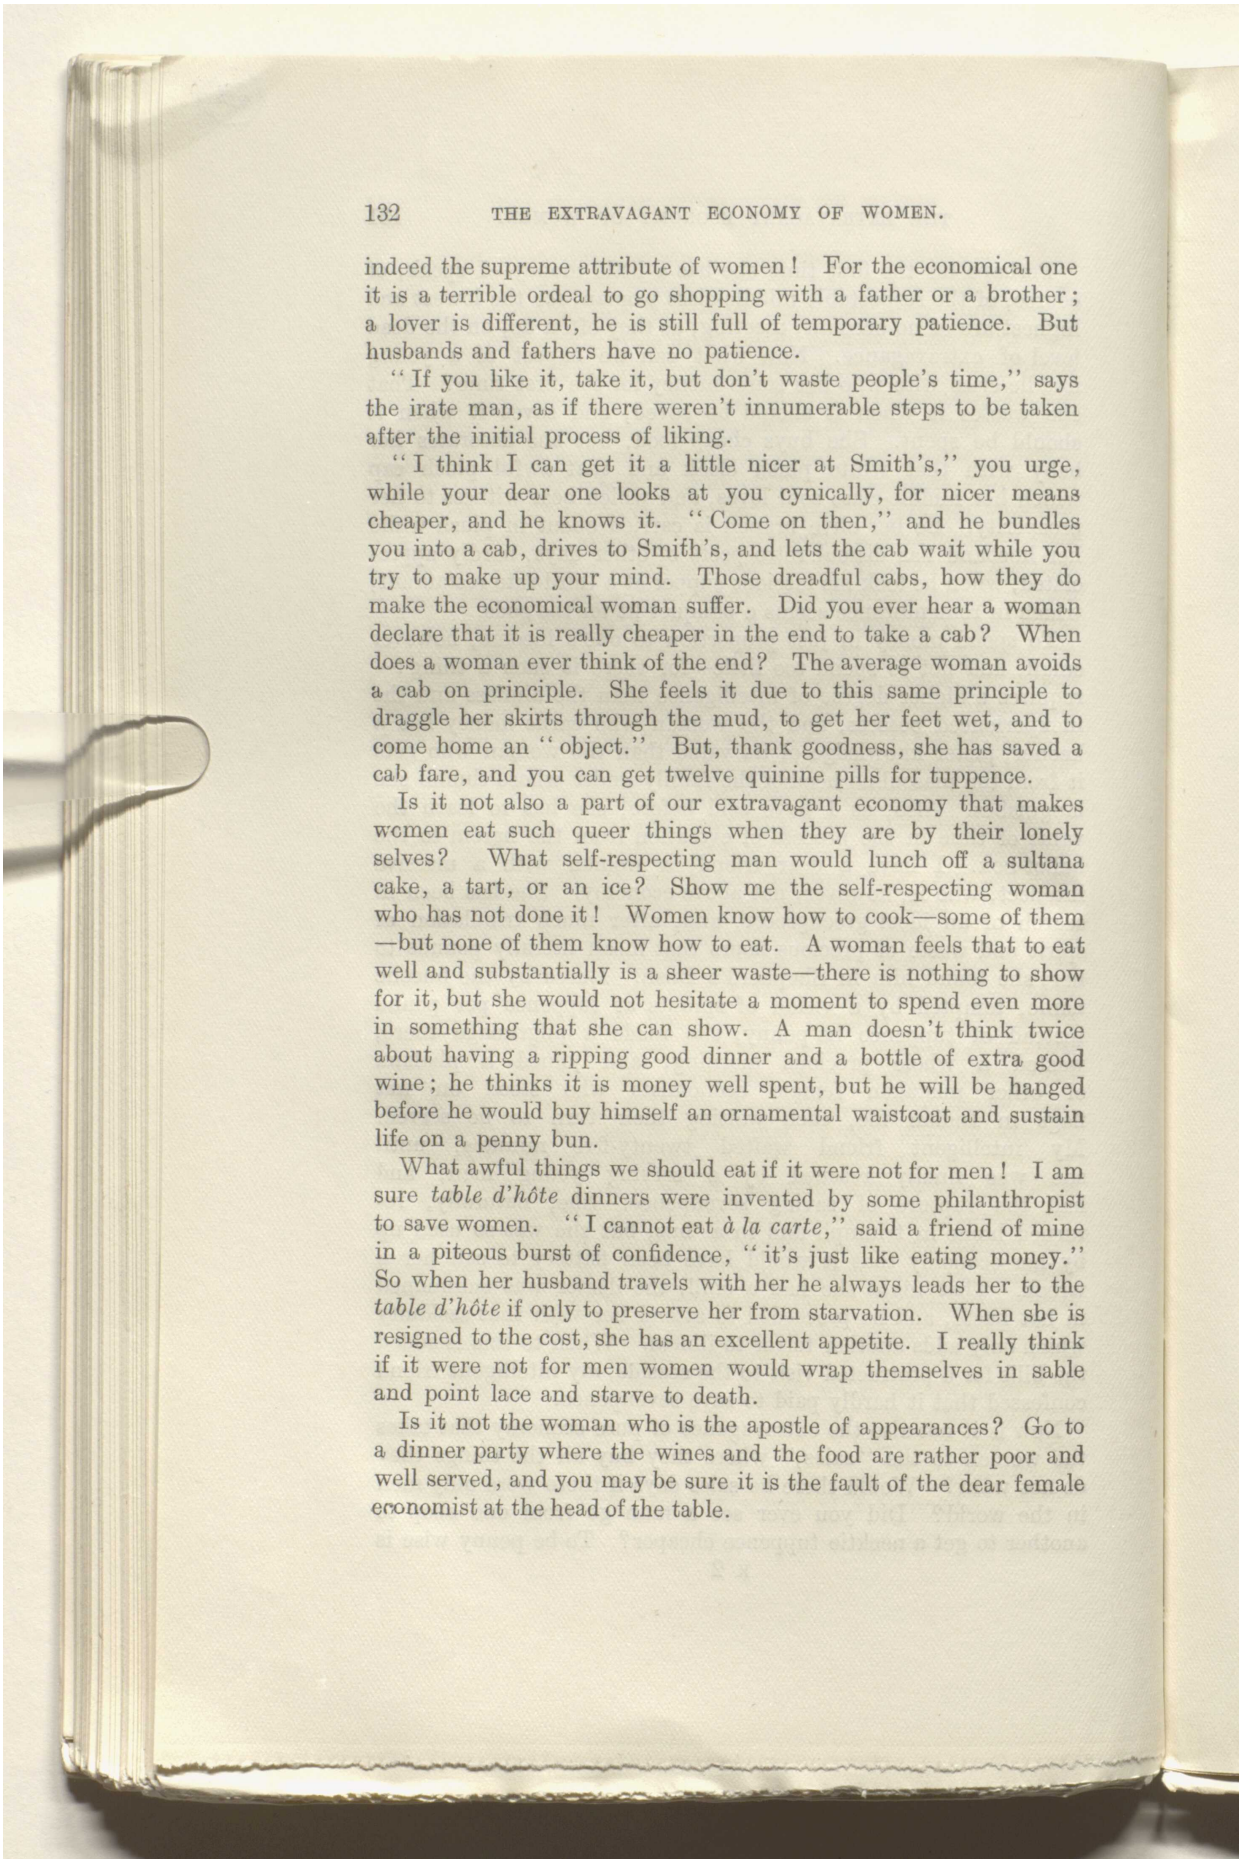
BRITISH LIBRARY

Perhaps for the first time she has a little money—I speak, of course, of the respectable middle-class woman, for the lowest and highest are of no account, meeting, as they often do, on the dead level of extravagance. Now what can we expect of a young middle-class wife who has some money for the first time? That she wastes it when it should be saved, and saves it when it should be spent. She buys cheap food, but she decorates her baby with that white plush cloak and that awful plush cap which her middle-class soul loves, and which bear witness to her prosperity. So her olive branch is carried about in plush while her husband has dismal retrospects of other days, hardly appreciated, when he took his luscious supper at a third-rate restaurant, which in remembrance seems a banquet fit for the gods.



To spend money in just proportion to one's income, however small, and not to spend too little—for there is such a thing!—requires a higher degree of intelligence than the aimless and the inexperienced possess, and the woman who earns money has a keener, juster knowledge of its value than the woman who gets it from the masculine head of the family under whose thumb she languishes. Also, as I have said before, she has to learn the value of time in the process of evolution from the harem to the ballot-box. I have a dear friend, a woman with a massive intellect, who is, however, not above economy. She has been in search of an ideal greengrocer, and, after much tribulation of spirit and waste of precious hours that mean literally pounds to her, she found him in Shepherd's Bush. Lured by the bucolic name, tempted by a vision of sprouts at tuppence per pound instead of tuppence ha'penny, she made a pilgrimage there, wasted a whole precious morning, and joined a phalanx of other mistaken female economists who stood on wet flags in Indian file, each waiting their turn to be served. My intelligent friend waited twenty-five minutes, until she was finally rescued by a serving young man, and had the rapture of saving sevenpence. She, naturally, returned home in triumph and in a 'bus, but she was so used up by her economy that it would have been flattery to call her a wreck. That night she had a chill, the doctor was summoned in hot haste, and he proceeded to attend her with that assiduity which only adds another terror to illness. When to this is added the bills for a protracted visit to the seaside, my intelligent friend confessed that it hardly paid to save sevenpence.

Now is it not also the extravagance of pure economy that takes the women to the "sales," where they buy all the things they do not want? Would there be sales days if there were only men in the world? Did you ever see a man go from one shop to another to get a necktie tuppence cheaper? To be penny wise is

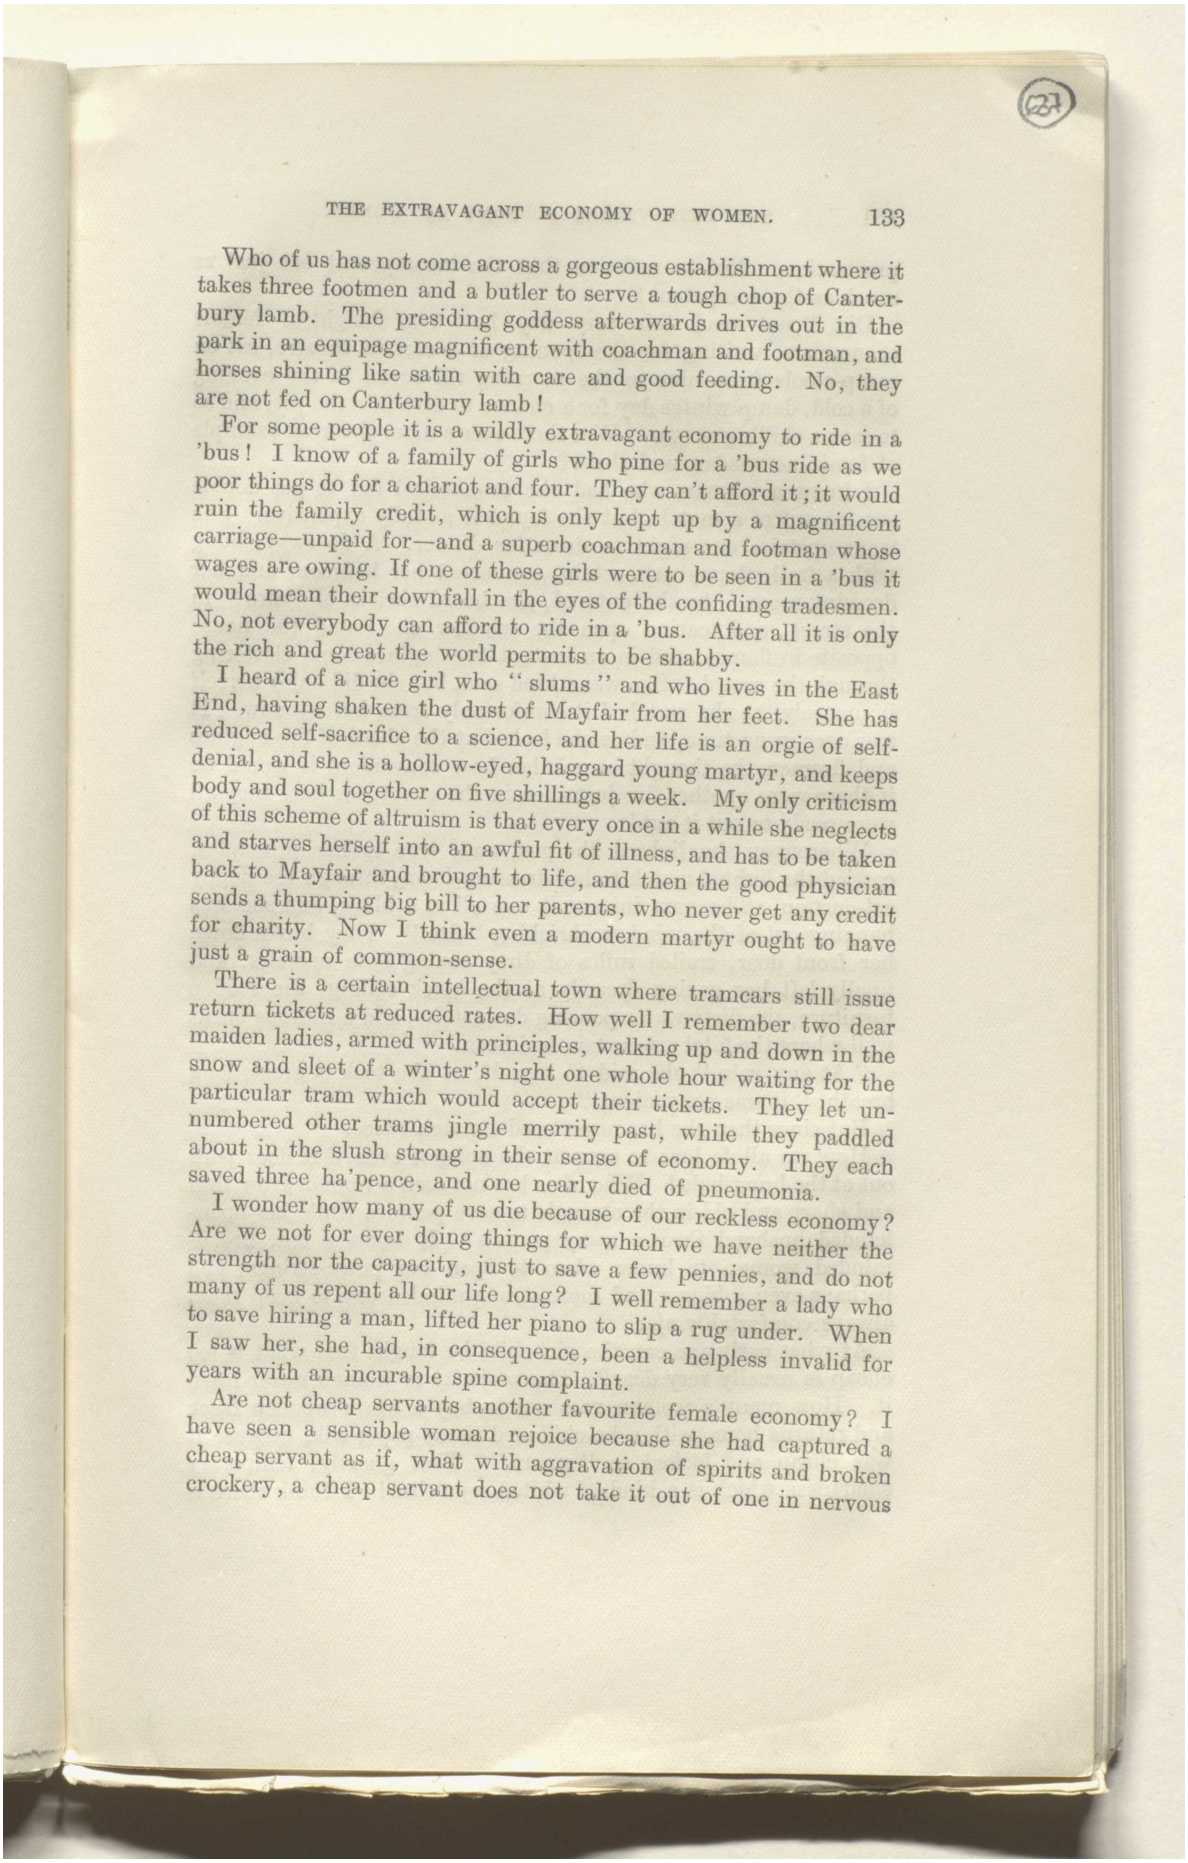
BRITISH LIBRARY

indeed the supreme attribute of women! For the economical one it is a terrible ordeal to go shopping with a father or a brother; a lover is different, he is still full of temporary patience. But husbands and fathers have no patience.

"If you like it, take it, but don't waste people's time," says the irate man, as if there weren't innumerable steps to be taken after the initial process of liking.

"I think I can get it a little nicer at Smith's," you urge, while your dear one looks at you cynically, for nicer means cheaper, and he knows it. "Come on then," and he bundles you into a cab, drives to Smith's, and lets the cab wait while you try to make up your mind. Those dreadful cabs, how they do make the economical woman suffer. Did you ever hear a woman declare that it is really cheaper in the end to take a cab? When does a woman ever think of the end? The average woman avoids a cab on principle. She feels it due to this same principle to draggle her skirts through the mud, to get her feet wet, and to come home an "object." But, thank goodness, she has saved a cab fare, and you can get twelve quinine pills for tuppence.

Is it not also a part of our extravagant economy that makes women eat such queer things when they are by their lonely selves? What self-respecting man would lunch off a sultana cake, a tart, or an ice? Show me the self-respecting woman who has not done it! Women know how to cook—some of them—but none of them know how to eat. A woman feels that to eat well and substantially is a sheer waste—there is nothing to show for it, but she would not hesitate a moment to spend even more in something that she can show. A man doesn't think twice about having a ripping good dinner and a bottle of extra good wine; he thinks it is money well spent, but he will be hanged before he would buy himself an ornamental waistcoat and sustain life on a penny bun.



What awful things we should eat if it were not for men! I am sure *table d'hôte* dinners were invented by some philanthropist to save women. "I cannot eat *à la carte*," said a friend of mine in a piteous burst of confidence, "it's just like eating money." So when her husband travels with her he always leads her to the *table d'hôte* if only to preserve her from starvation. When she is resigned to the cost, she has an excellent appetite. I really think if it were not for men women would wrap themselves in sable and point lace and starve to death.

Is it not the woman who is the apostle of appearances? Go to a dinner party where the wines and the food are rather poor and well served, and you may be sure it is the fault of the dear female economist at the head of the table.

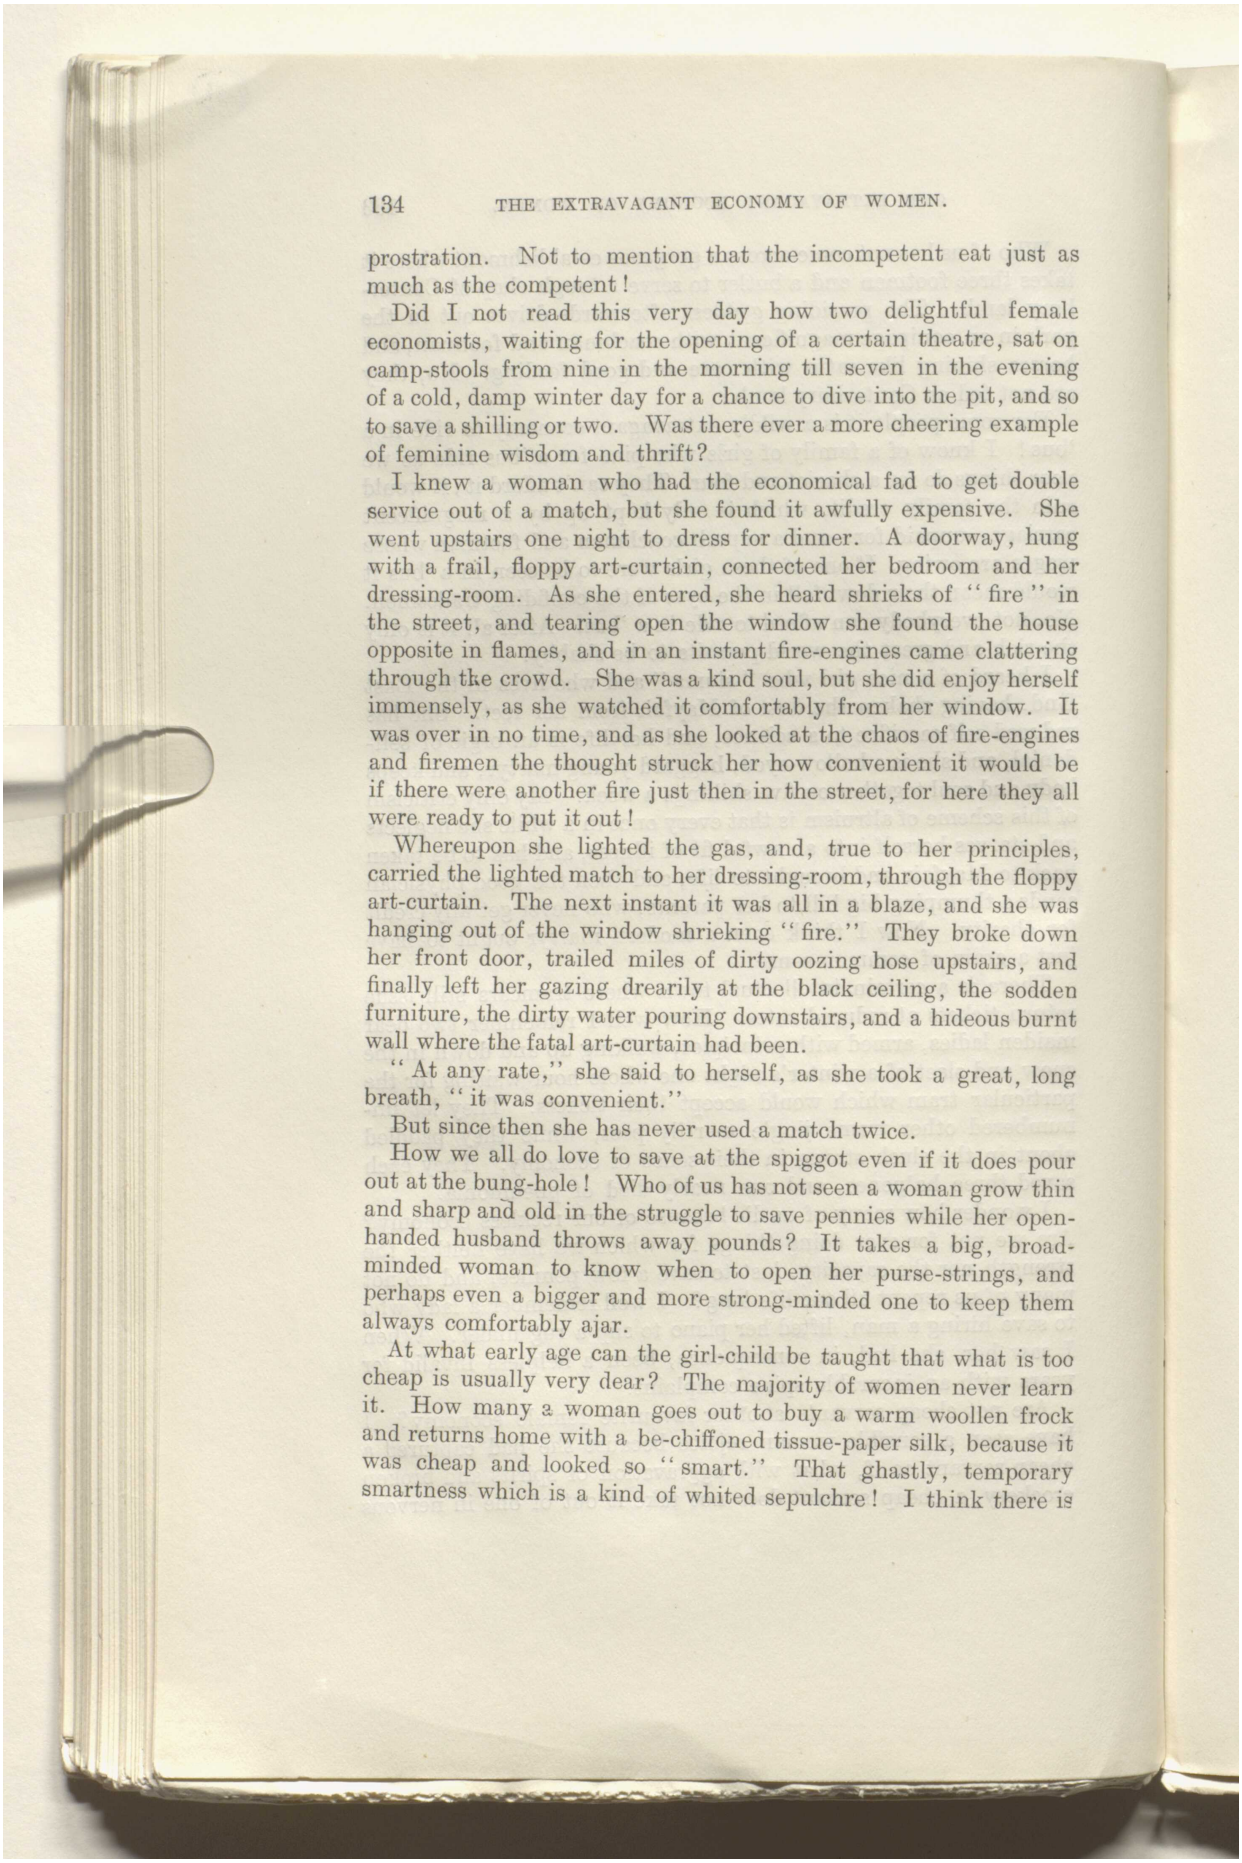
Who of us has not come across a gorgeous establishment where it takes three footmen and a butler to serve a tough chop of Canterbury lamb. The presiding goddess afterwards drives out in the park in an equipage magnificent with coachman and footman, and horses shining like satin with care and good feeding. No, they are not fed on Canterbury lamb!

For some people it is a wildly extravagant economy to ride in a 'bus! I know of a family of girls who pine for a 'bus ride as we poor things do for a chariot and four. They can't afford it; it would ruin the family credit, which is only kept up by a magnificent carriage—unpaid for—and a superb coachman and footman whose wages are owing. If one of these girls were to be seen in a 'bus it would mean their downfall in the eyes of the confiding tradesmen. No, not everybody can afford to ride in a 'bus. After all it is only the rich and great the world permits to be shabby.

I heard of a nice girl who "slums" and who lives in the East End, having shaken the dust of Mayfair from her feet. She has reduced self-sacrifice to a science, and her life is an orgie of self-denial, and she is a hollow-eyed, haggard young martyr, and keeps body and soul together on five shillings a week. My only criticism of this scheme of altruism is that every once in a while she neglects and starves herself into an awful fit of illness, and has to be taken back to Mayfair and brought to life, and then the good physician sends a thumping big bill to her parents, who never get any credit for charity. Now I think even a modern martyr ought to have just a grain of common-sense.

There is a certain intellectual town where tramcars still issue return tickets at reduced rates. How well I remember two dear maiden ladies, armed with principles, walking up and down in the snow and sleet of a winter's night one whole hour waiting for the particular tram which would accept their tickets. They let unnumbered other trams jingle merrily past, while they paddled about in the slush strong in their sense of economy. They each saved three ha'pence, and one nearly died of pneumonia.



I wonder how many of us die because of our reckless economy? Are we not for ever doing things for which we have neither the strength nor the capacity, just to save a few pennies, and do not many of us repent all our life long? I well remember a lady who to save hiring a man, lifted her piano to slip a rug under. When I saw her, she had, in consequence, been a helpless invalid for years with an incurable spine complaint.

Are not cheap servants another favourite female economy? I have seen a sensible woman rejoice because she had captured a cheap servant as if, what with aggravation of spirits and broken crockery, a cheap servant does not take it out of one in nervous

BRITISH LIBRARY

prostration. Not to mention that the incompetent eat just as much as the competent!

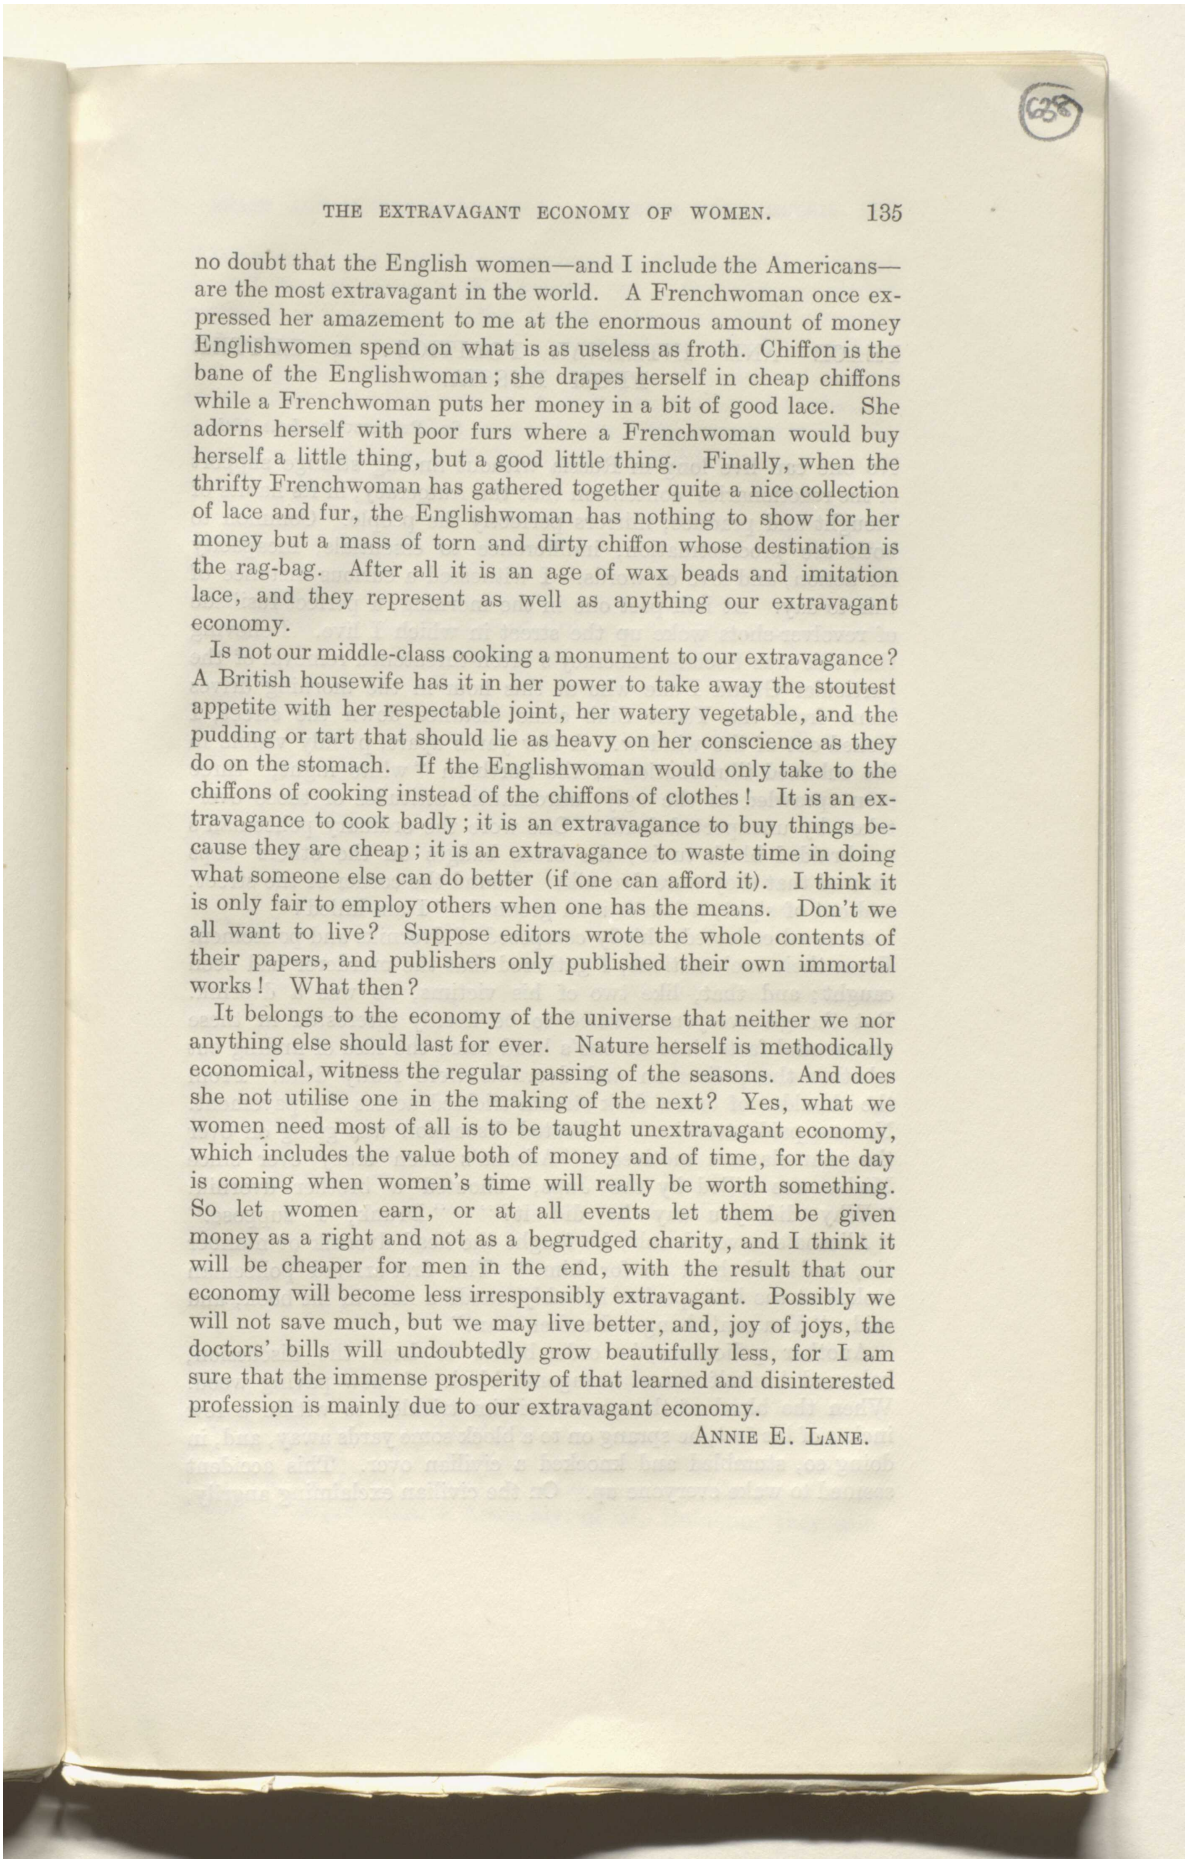
Did I not read this very day how two delightful female economists, waiting for the opening of a certain theatre, sat on camp-stools from nine in the morning till seven in the evening of a cold, damp winter day for a chance to dive into the pit, and so to save a shilling or two. Was there ever a more cheering example of feminine wisdom and thrift?

I knew a woman who had the economical fad to get double service out of a match, but she found it awfully expensive. She went upstairs one night to dress for dinner. A doorway, hung with a frail, floppy art-curtain, connected her bedroom and her dressing-room. As she entered, she heard shrieks of "fire" in the street, and tearing open the window she found the house opposite in flames, and in an instant fire-engines came clattering through the crowd. She was a kind soul, but she did enjoy herself immensely, as she watched it comfortably from her window. It was over in no time, and as she looked at the chaos of fire-engines and firemen the thought struck her how convenient it would be if there were another fire just then in the street, for here they all were ready to put it out!

Whereupon she lighted the gas, and, true to her principles, carried the lighted match to her dressing-room, through the floppy art-curtain. The next instant it was all in a blaze, and she was hanging out of the window shrieking "fire." They broke down her front door, trailed miles of dirty oozing hose upstairs, and finally left her gazing drearily at the black ceiling, the sodden furniture, the dirty water pouring downstairs, and a hideous burnt wall where the fatal art-curtain had been.

"At any rate," she said to herself, as she took a great, long breath, "it was convenient."

But since then she has never used a match twice.



How we all do love to save at the spiggot even if it does pour out at the bung-hole! Who of us has not seen a woman grow thin and sharp and old in the struggle to save pennies while her open-handed husband throws away pounds? It takes a big, broad-minded woman to know when to open her purse-strings, and perhaps even a bigger and more strong-minded one to keep them always comfortably ajar.

At what early age can the girl-child be taught that what is too cheap is usually very dear? The majority of women never learn it. How many a woman goes out to buy a warm woollen frock and returns home with a be-chiffoned tissue-paper silk, because it was cheap and looked so "smart." That ghastly, temporary smartness which is a kind of whited sepulchre! I think there is

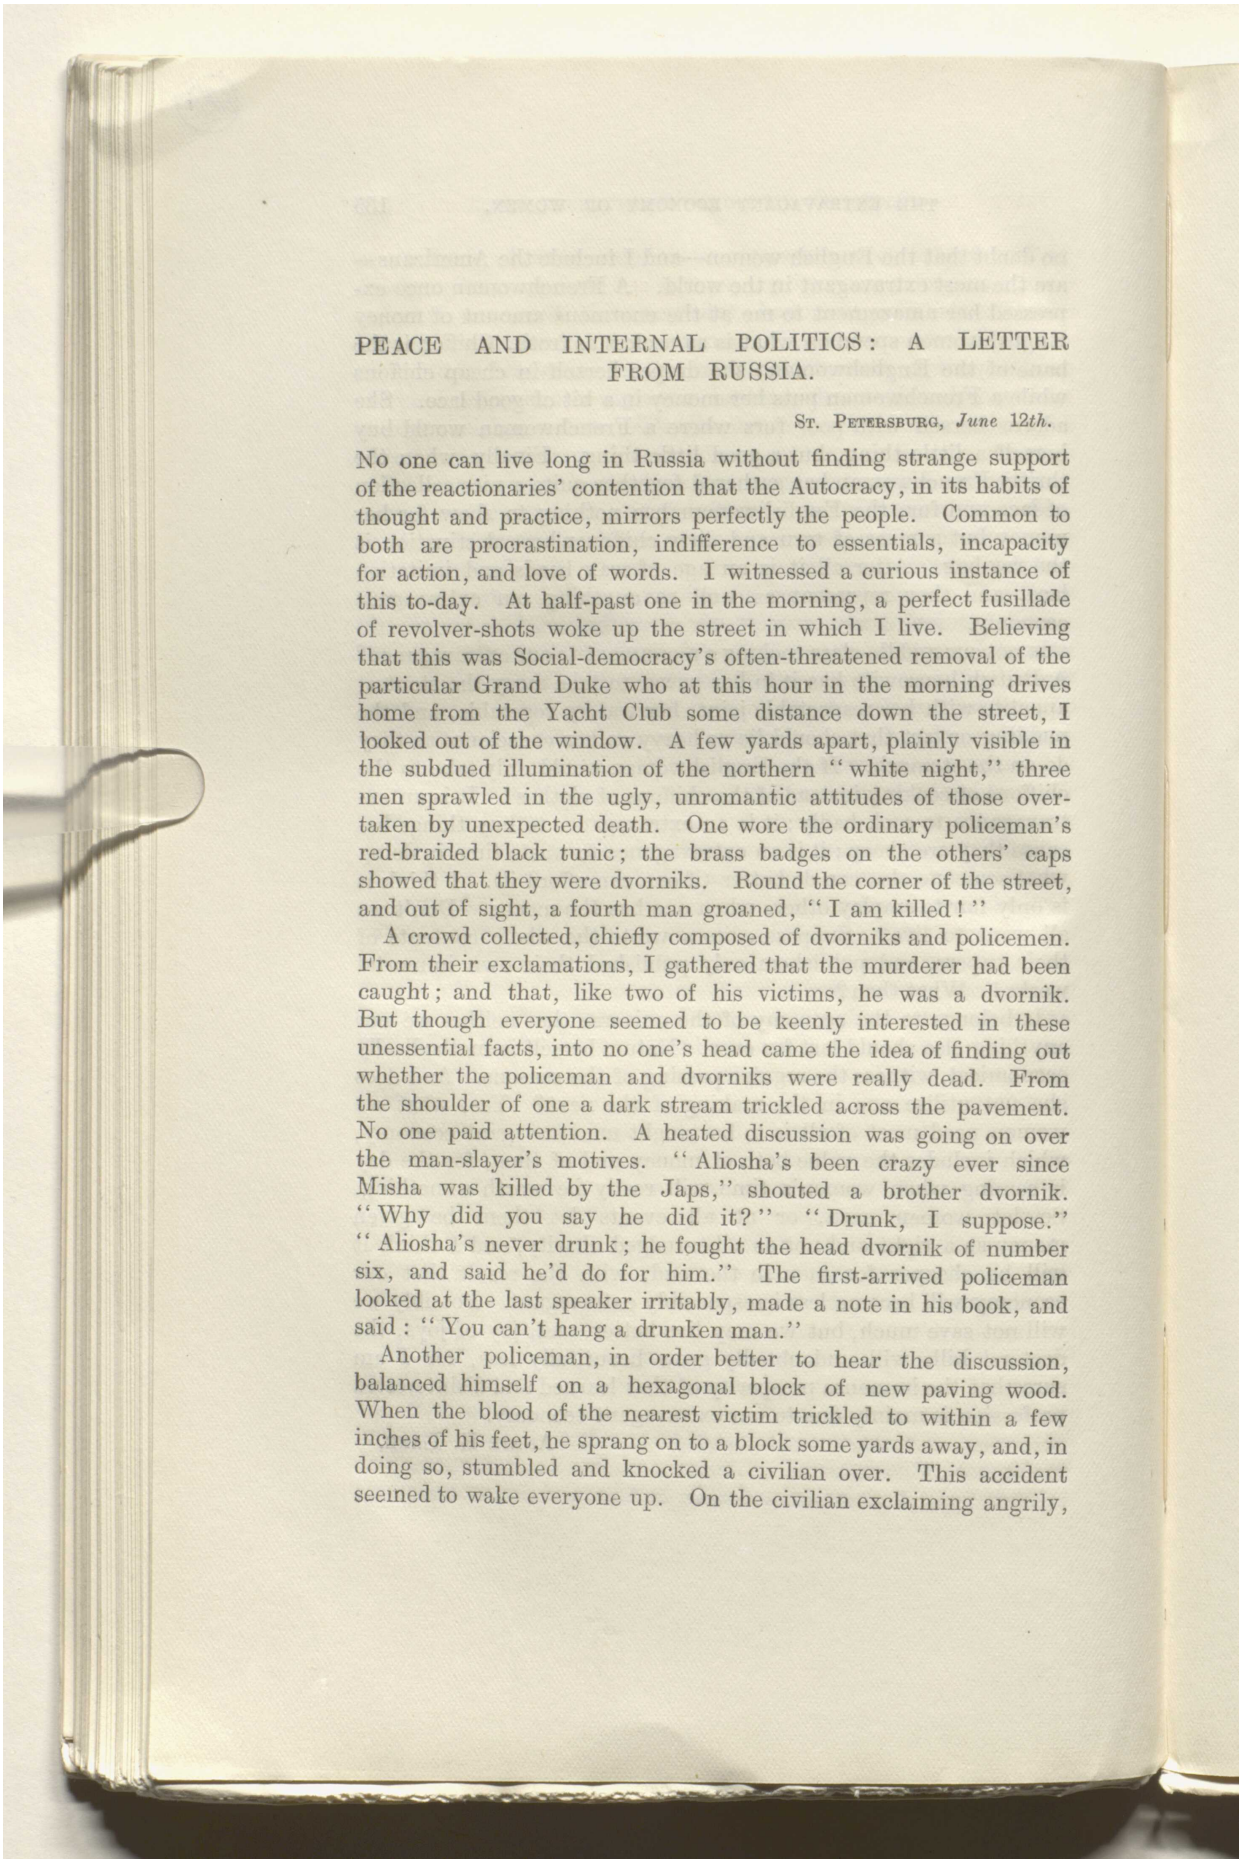
BRITISH LIBRARY

no doubt that the English women—and I include the Americans—are the most extravagant in the world. A Frenchwoman once expressed her amazement to me at the enormous amount of money Englishwomen spend on what is as useless as froth. Chiffon is the bane of the Englishwoman; she drapes herself in cheap chiffons while a Frenchwoman puts her money in a bit of good lace. She adorns herself with poor furs where a Frenchwoman would buy herself a little thing, but a good little thing. Finally, when the thrifty Frenchwoman has gathered together quite a nice collection of lace and fur, the Englishwoman has nothing to show for her money but a mass of torn and dirty chiffon whose destination is the rag-bag. After all it is an age of wax beads and imitation lace, and they represent as well as anything our extravagant economy.

Is not our middle-class cooking a monument to our extravagance? A British housewife has it in her power to take away the stoutest appetite with her respectable joint, her watery vegetable, and the pudding or tart that should lie as heavy on her conscience as they do on the stomach. If the Englishwoman would only take to the chiffons of cooking instead of the chiffons of clothes! It is an extravagance to cook badly; it is an extravagance to buy things because they are cheap; it is an extravagance to waste time in doing what someone else can do better (if one can afford it). I think it is only fair to employ others when one has the means. Don't we all want to live? Suppose editors wrote the whole contents of their papers, and publishers only published their own immortal works! What then?



It belongs to the economy of the universe that neither we nor anything else should last for ever. Nature herself is methodically economical, witness the regular passing of the seasons. And does she not utilise one in the making of the next? Yes, what we women need most of all is to be taught unextravagant economy, which includes the value both of money and of time, for the day is coming when women's time will really be worth something. So let women earn, or at all events let them be given money as a right and not as a begrudged charity, and I think it will be cheaper for men in the end, with the result that our economy will become less irresponsibly extravagant. Possibly we will not save much, but we may live better, and, joy of joys, the doctors' bills will undoubtedly grow beautifully less, for I am sure that the immense prosperity of that learned and disinterested profession is mainly due to our extravagant economy.

ANNIE E. LANE.

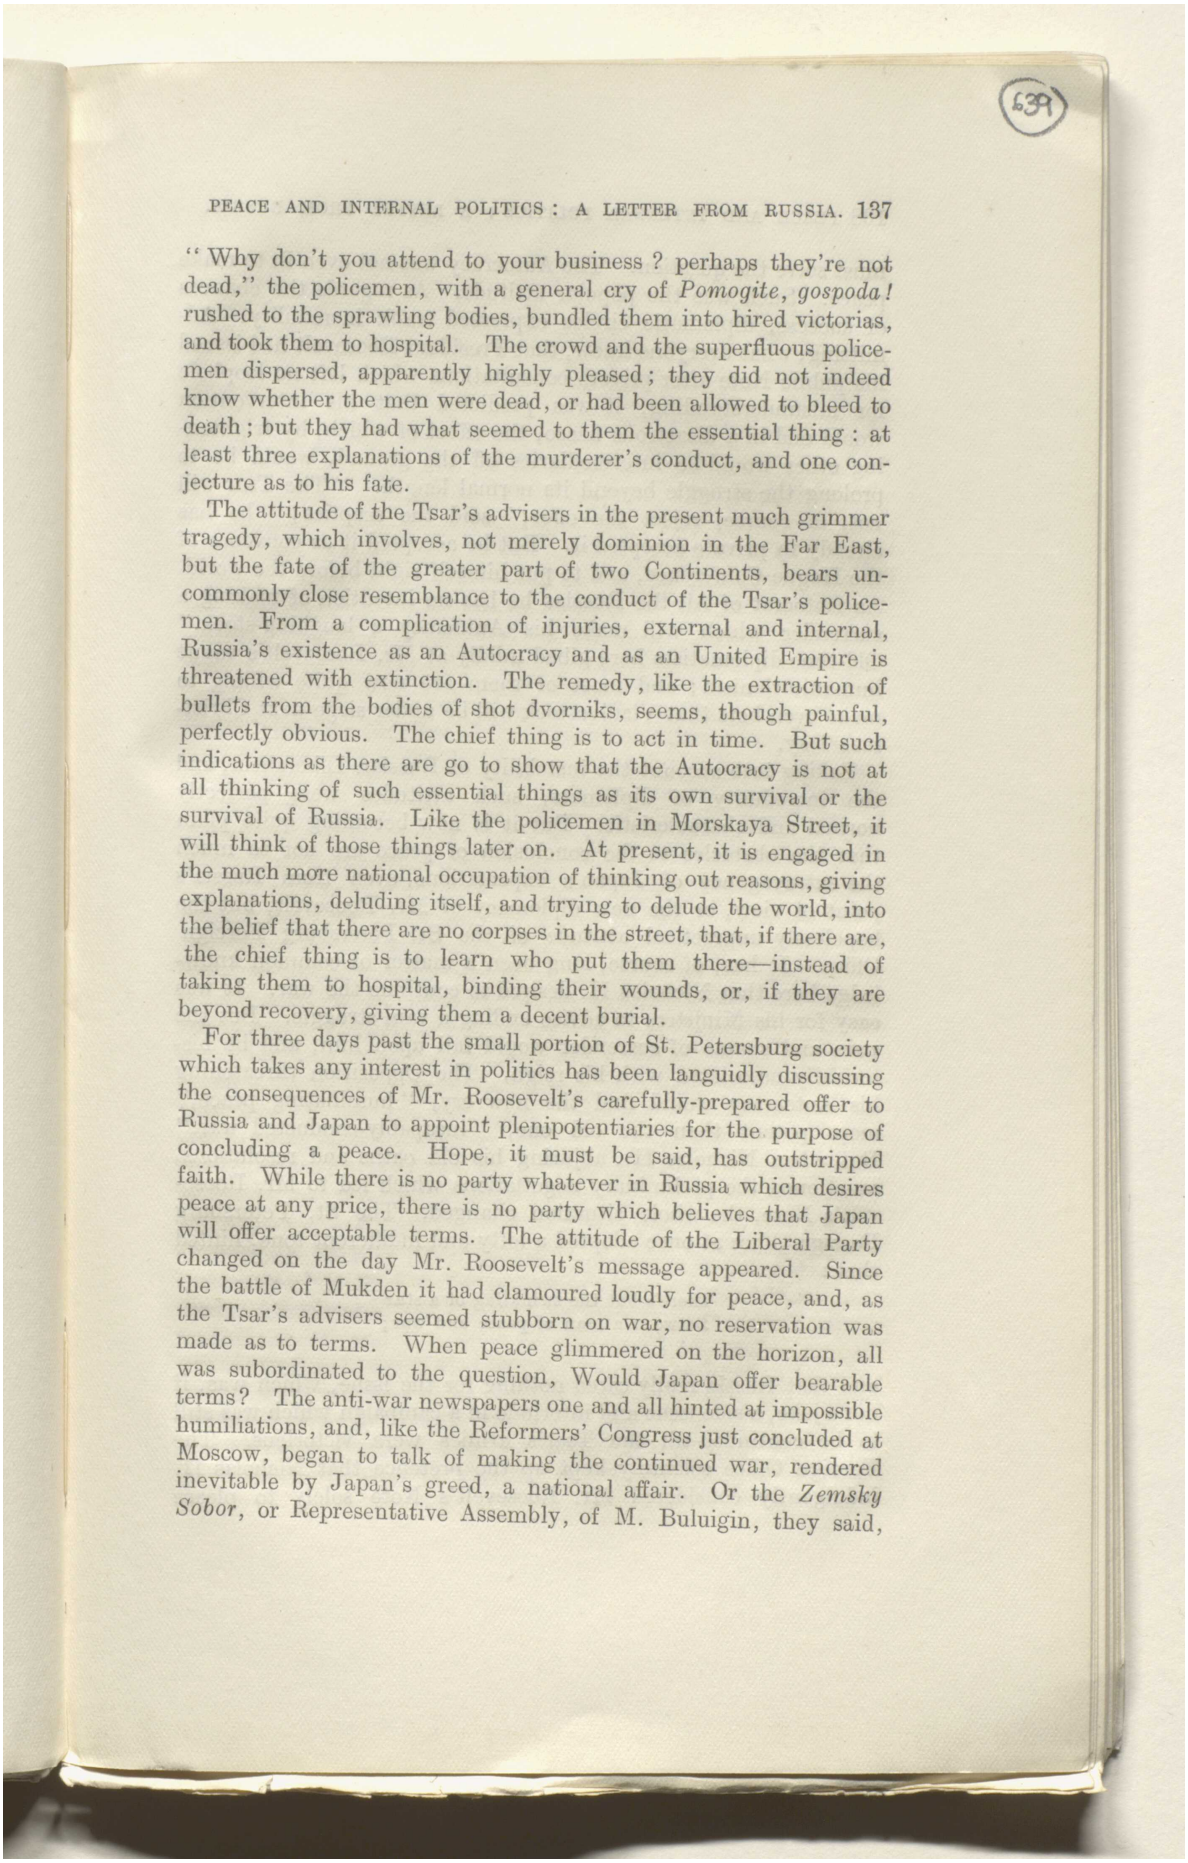
PEACE AND INTERNAL POLITICS: A LETTER FROM RUSSIA.

ST. PETERSBURG, *June 12th.*

No one can live long in Russia without finding strange support of the reactionaries' contention that the Autocracy, in its habits of thought and practice, mirrors perfectly the people. Common to both are procrastination, indifference to essentials, incapacity for action, and love of words. I witnessed a curious instance of this to-day. At half-past one in the morning, a perfect fusillade of revolver-shots woke up the street in which I live. Believing that this was Social-democracy's often-threatened removal of the particular Grand Duke who at this hour in the morning drives home from the Yacht Club some distance down the street, I looked out of the window. A few yards apart, plainly visible in the subdued illumination of the northern "white night," three men sprawled in the ugly, unromantic attitudes of those overtaken by unexpected death. One wore the ordinary policeman's red-braided black tunic; the brass badges on the others' caps showed that they were dvorniks. Round the corner of the street, and out of sight, a fourth man groaned, "I am killed!"



A crowd collected, chiefly composed of dvorniks and policemen. From their exclamations, I gathered that the murderer had been caught; and that, like two of his victims, he was a dvornik. But though everyone seemed to be keenly interested in these unessential facts, into no one's head came the idea of finding out whether the policeman and dvorniks were really dead. From the shoulder of one a dark stream trickled across the pavement. No one paid attention. A heated discussion was going on over the man-slayer's motives. "Aliosha's been crazy ever since Misha was killed by the Japs," shouted a brother dvornik. "Why did you say he did it?" "Drunk, I suppose." "Aliosha's never drunk; he fought the head dvornik of number six, and said he'd do for him." The first-arrived policeman looked at the last speaker irritably, made a note in his book, and said: "You can't hang a drunken man."

Another policeman, in order better to hear the discussion, balanced himself on a hexagonal block of new paving wood. When the blood of the nearest victim trickled to within a few inches of his feet, he sprang on to a block some yards away, and, in doing so, stumbled and knocked a civilian over. This accident seemed to wake everyone up. On the civilian exclaiming angrily,

"Why don't you attend to your business? perhaps they're not dead," the policemen, with a general cry of *Pomogite, gospoda!* rushed to the sprawling bodies, bundled them into hired victorias, and took them to hospital. The crowd and the superfluous policemen dispersed, apparently highly pleased; they did not indeed know whether the men were dead, or had been allowed to bleed to death; but they had what seemed to them the essential thing: at least three explanations of the murderer's conduct, and one conjecture as to his fate.

The attitude of the Tsar's advisers in the present much grimmer tragedy, which involves, not merely dominion in the Far East, but the fate of the greater part of two Continents, bears uncommonly close resemblance to the conduct of the Tsar's policemen. From a complication of injuries, external and internal, Russia's existence as an Autocracy and as an United Empire is threatened with extinction. The remedy, like the extraction of bullets from the bodies of shot dvorniks, seems, though painful, perfectly obvious. The chief thing is to act in time. But such indications as there are go to show that the Autocracy is not at all thinking of such essential things as its own survival or the survival of Russia. Like the policemen in Morskaya Street, it will think of those things later on. At present, it is engaged in the much more national occupation of thinking out reasons, giving explanations, deluding itself, and trying to delude the world, into the belief that there are no corpses in the street, that, if there are, the chief thing is to learn who put them there—instead of taking them to hospital, binding their wounds, or, if they are beyond recovery, giving them a decent burial.

For three days past the small portion of St. Petersburg society which takes any interest in politics has been languidly discussing the consequences of Mr. Roosevelt's carefully-prepared offer to Russia and Japan to appoint plenipotentiaries for the purpose of concluding a peace. Hope, it must be said, has outstripped faith. While there is no party whatever in Russia which desires peace at any price, there is no party which believes that Japan will offer acceptable terms. The attitude of the Liberal Party changed on the day Mr. Roosevelt's message appeared. Since the battle of Mukden it had clamoured loudly for peace, and, as the Tsar's advisers seemed stubborn on war, no reservation was made as to terms. When peace glimmered on the horizon, all was subordinated to the question, Would Japan offer bearable terms? The anti-war newspapers one and all hinted at impossible humiliations, and, like the Reformers' Congress just concluded at Moscow, began to talk of making the continued war, rendered inevitable by Japan's greed, a national affair. Or the *Zemsky Sobor*, or Representative Assembly, of M. Buluigin, they said,

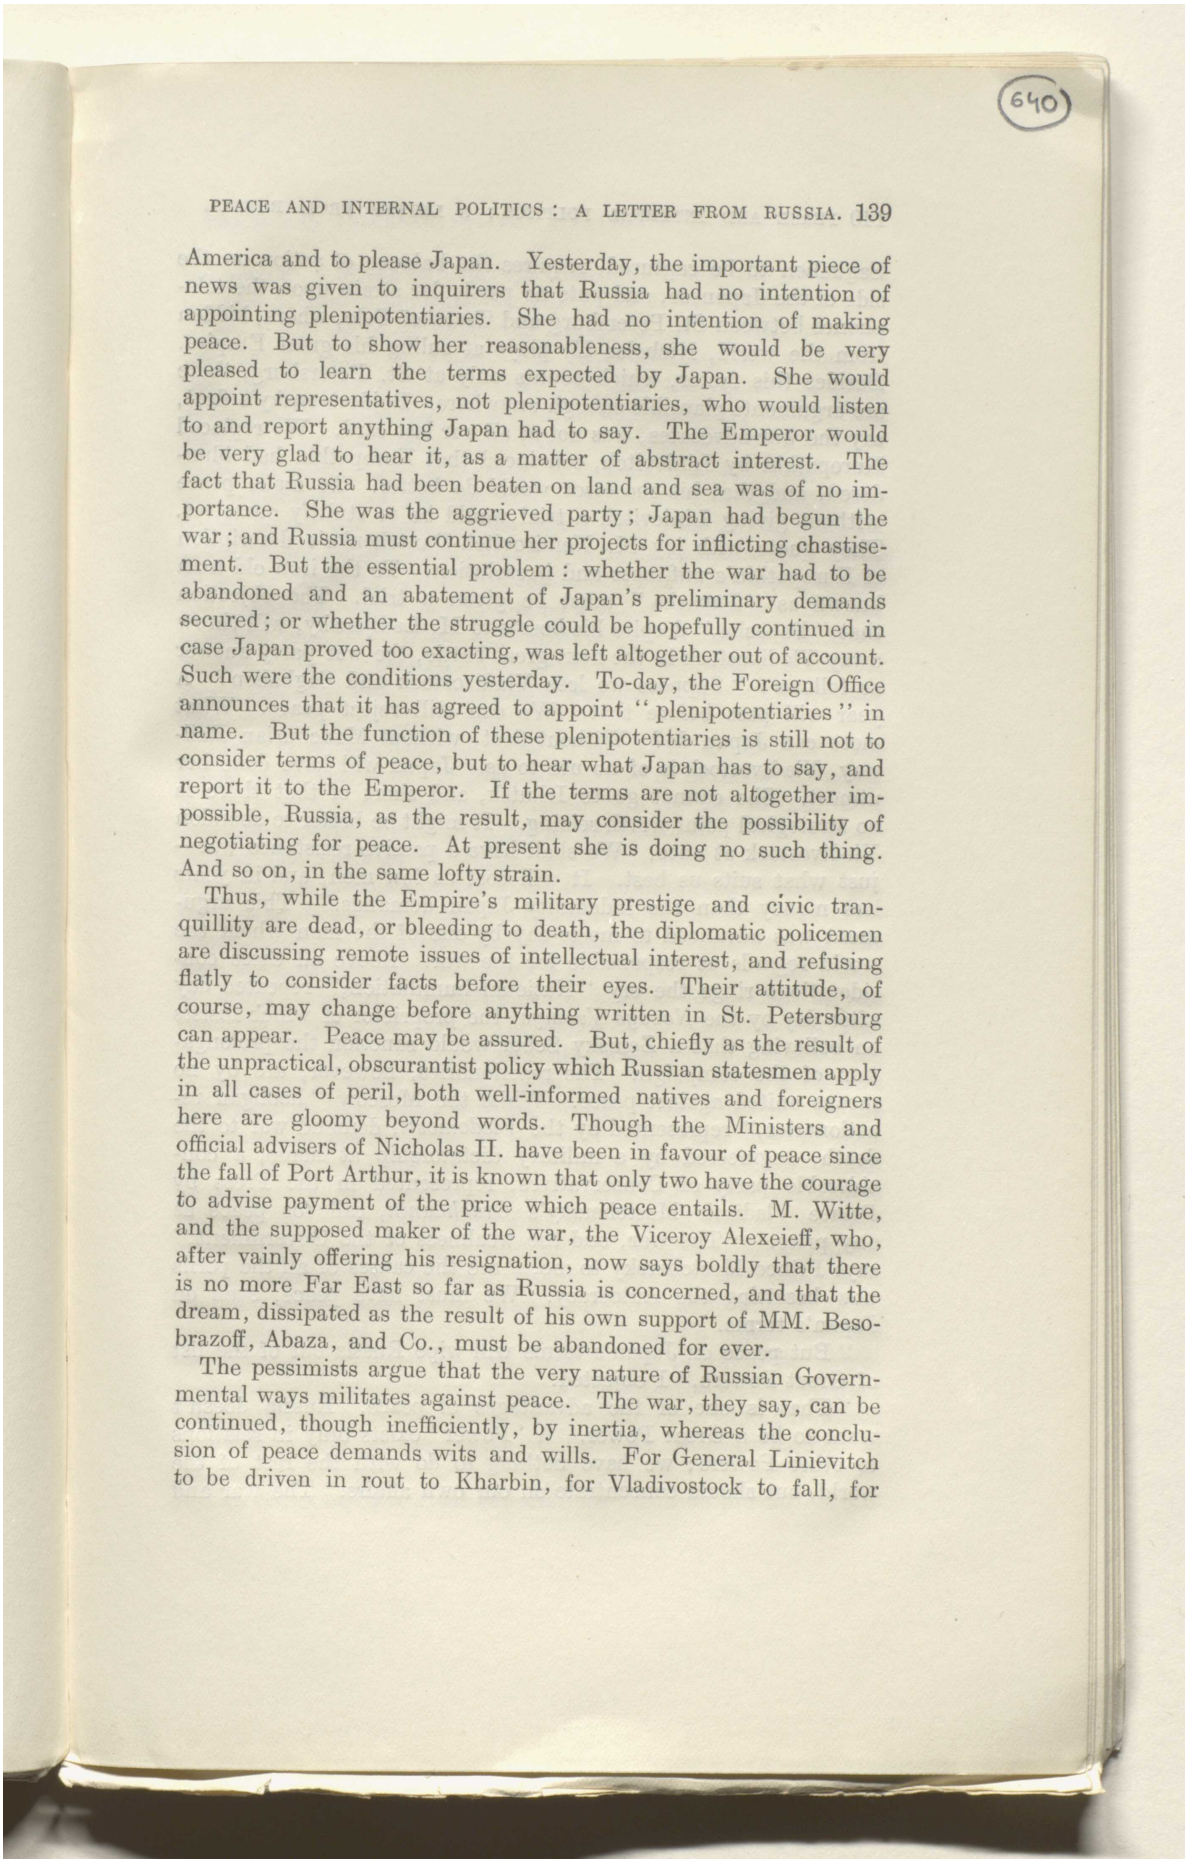
must solve the question. The Autocracy was not even fit to make peace. Such was the popular attitude. As regards the chances of success, diplomatic circles expressed frank incredulity. Admitting, what everyone knew, that President Roosevelt had issued his public Note after private consultations which left no loophole for misunderstanding, it was predicted that his intervention would end in a disastrous fiasco, the effect of which, by frightening other would-be intermediaries off the ground, would be to prolong the struggle beyond its normal length. "The Tsar will not, of course, reject the offer," said the sceptics; "he has already in private accepted it. But he accepted it as convener of the Hague Conference, and to put himself right before the world. As Autocrat of All the Russias he has no intention of making a surrender which will make his Autocracy a laughing-stock." Old-time diplomatists here gibed mildly at Mr. Roosevelt's vague humanitarianism; and most of them are now quite willing to make even bets that Vladivostock will be under siege next Christmas Day.

Taking into account the instability of Russian Liberalism, and the incredulity of diplomats, such attitudes were perfectly normal and characteristic. But it is now becoming quite plain that the obstacles to the conclusion of peace are not so much the extravagance of Japan's expectations, even from Russia's point of view, or the new diplomacy of Mr. Roosevelt, but the hopelessly unpractical attitude of the St. Petersburg Foreign Office. It has, of course, long been a matter of common knowledge here that Nicholas II. desired to continue the war. It was easy for his Ministers to advise ending a vain struggle. But the pain and shame of surrender would fall upon him, and be historically associated with his reign. The Opposition threatening his Autocracy would find the new cry, "humiliating peace," more potent than the old one, "incapably-conducted war." But when Nicholas II., abjuring his old oaths and resolutions, sanctioned the preliminary negotiations which led to Mr. Roosevelt's Note, the whole situation changed. The St. Petersburg Foreign Office at once adopted a lofty and indifferent tone, hinted that:



> There's but the twinkling of a star
> Between a man of peace and war;

and that Russia really cared nothing for the issue, which was, if not a joke, a side issue and interlude in a campaign which was still to be continued till the Tsar's armies were victorious. The Foreign Office solemnly kept up the pretence that Nicholas II. indulgently considered Mr. Roosevelt's Note solely to please

America and to please Japan. Yesterday, the important piece of news was given to inquirers that Russia had no intention of appointing plenipotentiaries. She had no intention of making peace. But to show her reasonableness, she would be very pleased to learn the terms expected by Japan. She would appoint representatives, not plenipotentiaries, who would listen to and report anything Japan had to say. The Emperor would be very glad to hear it, as a matter of abstract interest. The fact that Russia had been beaten on land and sea was of no importance. She was the aggrieved party; Japan had begun the war; and Russia must continue her projects for inflicting chastisement. But the essential problem: whether the war had to be abandoned and an abatement of Japan's preliminary demands secured; or whether the struggle could be hopefully continued in case Japan proved too exacting, was left altogether out of account. Such were the conditions yesterday. To-day, the Foreign Office announces that it has agreed to appoint "plenipotentiaries" in name. But the function of these plenipotentiaries is still not to consider terms of peace, but to hear what Japan has to say, and report it to the Emperor. If the terms are not altogether impossible, Russia, as the result, may consider the possibility of negotiating for peace. At present she is doing no such thing. And so on, in the same lofty strain.

Thus, while the Empire's military prestige and civic tranquillity are dead, or bleeding to death, the diplomatic policemen are discussing remote issues of intellectual interest, and refusing flatly to consider facts before their eyes. Their attitude, of course, may change before anything written in St. Petersburg can appear. Peace may be assured. But, chiefly as the result of the unpractical, obscurantist policy which Russian statesmen apply in all cases of peril, both well-informed natives and foreigners here are gloomy beyond words. Though the Ministers and official advisers of Nicholas II. have been in favour of peace since the fall of Port Arthur, it is known that only two have the courage to advise payment of the price which peace entails. M. Witte, and the supposed maker of the war, the Viceroy Alexeieff, who, after vainly offering his resignation, now says boldly that there is no more Far East so far as Russia is concerned, and that the dream, dissipated as the result of his own support of MM. Besobrazoff, Abaza, and Co., must be abandoned for ever.

The pessimists argue that the very nature of Russian Governmental ways militates against peace. The war, they say, can be continued, though inefficiently, by inertia, whereas the conclusion of peace demands wits and wills. For General Linievitch to be driven in rout to Kharbin, for Vladivostock to fall, for

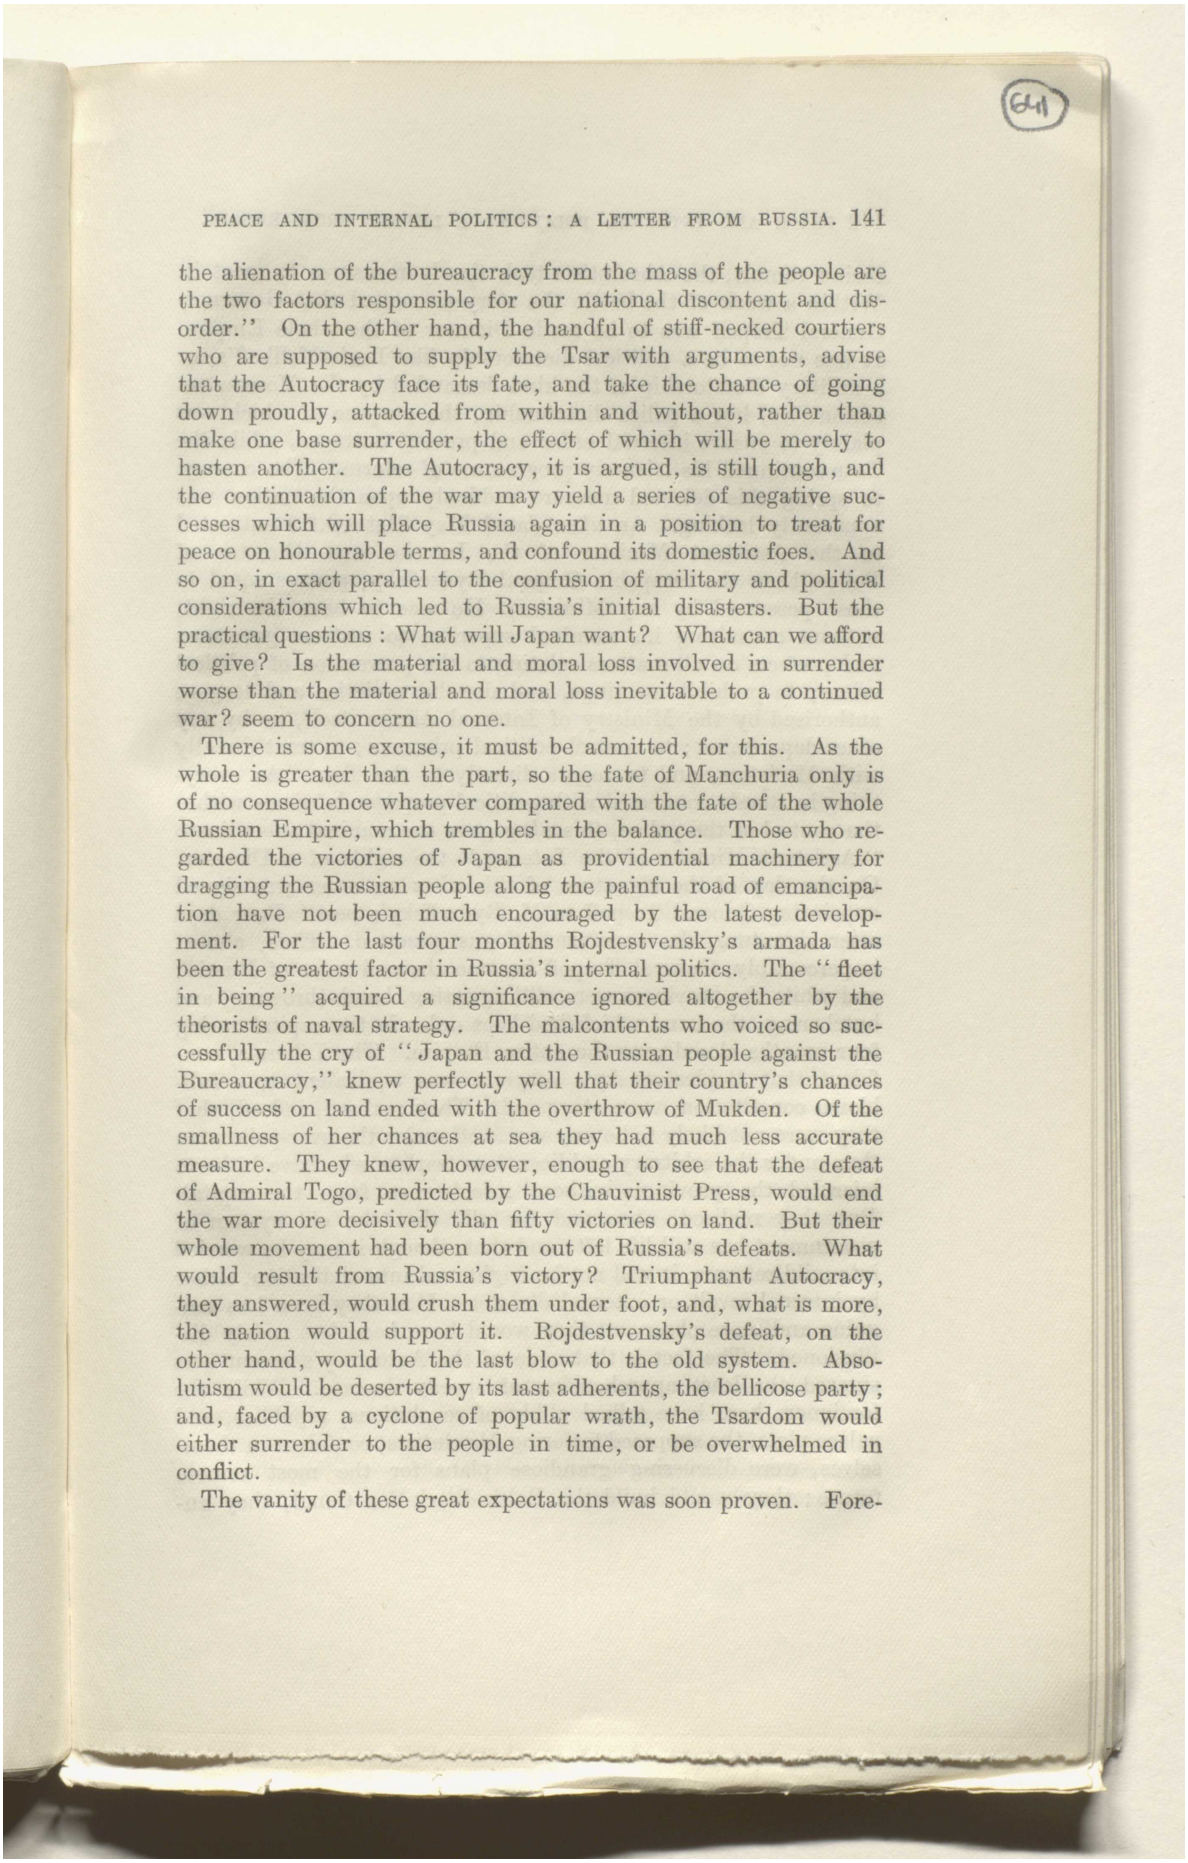
Saghalien to be captured, requires the balance of action on the side of the Japanese, and puts no particular strain upon the telephones between St. Petersburg and Tsarskoë Selo, where, hidden from the world, Nicholas II. plays at ruling his great Empire. Besides this factor, which counts only at St. Petersburg, there are arguments plausible enough anywhere. Rojdestvensky's fleet, say the war advocates, was not at all our last card. We replaced Kuropatkin by Linievitch, convinced that Kuropatkin had blundered, and that his successor would do better. To make peace without giving Linievitch a trial would be to stultify ourselves. They quote with joy M. Nemirovitch-Dantchenko's description of Kuropatkin's unfitness and irresolution. To the iron old man known as "Papasha" must be given a trial. The objection that "Papasha," despite his boasts to M. Ladijensky, will throw away Vladivostock in the next great battle, the war party answer as follows: "Suppose we lose Vladivostock and Saghalien? A year will pass before that. We can still reject peace. What more can Japan do? Without fleet, without Manchurian Railway, Vladivostock is of no use to us. Japan will have done her utmost. She cannot go to Irkutsk, and short of that there is no strategical point worth seizing. It might be better to abandon Vladivostock at once. We shall have a passive resistance war—just what suits us best. It will cost us few men, and in years less money than the indemnity Japan demands." This argument was advanced to me to-day by one of the men whom the world regards as responsible for the war. Above all these considerations rings the cry "National humiliation," repeated day after day by the *Novoye Vremya*, the proprietor of which insists on believing that a Zemsky Sobor would sanction the prolongation of the campaign. The reactionaries, however, are by no means united against peace. While the Moscow "hooligan reactionaries," represented by the *Viedomosti*, demand war to the death, engineered by a military dictatorship at home, a considerable party of Conservatives, represented in the Press by Prince Vladimir Mestchersky's *Grazhdanin*, call for peace at any price. "The war, and the weakness of the Government," says Prince Mestchersky to me, "are the causes of all the perils now besetting the Autocracy. We must have peace, even on Japan's terms."



"But peace on Japan's terms will wipe Russia out of the list of Great Powers," I objected.

"That is one of the advantages of peace. Russia doesn't want to be a Great Power. A 'Power' exists only in relations to other Powers; we have nothing to do with the rest of the world, but should concentrate on our own affairs. The war and

BRITISH LIBRARY

the alienation of the bureaucracy from the mass of the people are the two factors responsible for our national discontent and disorder.'' On the other hand, the handful of stiff-necked courtiers who are supposed to supply the Tsar with arguments, advise that the Autocracy face its fate, and take the chance of going down proudly, attacked from within and without, rather than make one base surrender, the effect of which will be merely to hasten another. The Autocracy, it is argued, is still tough, and the continuation of the war may yield a series of negative successes which will place Russia again in a position to treat for peace on honourable terms, and confound its domestic foes. And so on, in exact parallel to the confusion of military and political considerations which led to Russia's initial disasters. But the practical questions: What will Japan want? What can we afford to give? Is the material and moral loss involved in surrender worse than the material and moral loss inevitable to a continued war? seem to concern no one.

There is some excuse, it must be admitted, for this. As the whole is greater than the part, so the fate of Manchuria only is of no consequence whatever compared with the fate of the whole Russian Empire, which trembles in the balance. Those who regarded the victories of Japan as providential machinery for dragging the Russian people along the painful road of emancipation have not been much encouraged by the latest development. For the last four months Rojdestvensky's armada has been the greatest factor in Russia's internal politics. The ''fleet in being'' acquired a significance ignored altogether by the theorists of naval strategy. The malcontents who voiced so successfully the cry of ''Japan and the Russian people against the Bureaucracy,'' knew perfectly well that their country's chances of success on land ended with the overthrow of Mukden. Of the smallness of her chances at sea they had much less accurate measure. They knew, however, enough to see that the defeat of Admiral Togo, predicted by the Chauvinist Press, would end the war more decisively than fifty victories on land. But their whole movement had been born out of Russia's defeats. What would result from Russia's victory? Triumphant Autocracy, they answered, would crush them under foot, and, what is more, the nation would support it. Rojdestvensky's defeat, on the other hand, would be the last blow to the old system. Absolutism would be deserted by its last adherents, the bellicose party; and, faced by a cyclone of popular wrath, the Tsardom would either surrender to the people in time, or be overwhelmed in conflict.

The vanity of these great expectations was soon proven. Fore-

seeing tumult, the Absolutists took timely measures to meet it. Within a week of the battle the story circulated that Governor-General Trepoff was to be made Dictator of the whole Empire. It was not to be a political dictatorship like Loris-Melikoff's, or a military dictatorship of the kind demanded by the Moscow reactionaries, but a police dictatorship, the purpose of which was plainly to ensure internal order and prevent outrages, while the Tsar continued his leisurely programme of reform. The courage to spring this detested measure suddenly upon the nation was apparently lacking. An *ukaz* dated May 21st (O.S.) entrusted to the Assistant Minister of the Interior and Director of Police, then the incapable General Rydzeffsky, powers equal to those possessed by any Minister. He was to have the right, without consulting his nominal superior, to instruct governors and prefects on all matters relating to the prevention of political crime; to prohibit meetings, and dissolve societies and leagues authorised by the Ministry of Internal Affairs itself, or by any other department; to control political prisoners; to treat directly with Ministers, and to report directly to the Tsar. As everything in Russia connected with political propaganda comes within the control of the police, this *ukaz* gave the nominal subordinate "Assistant Minister of the Interior," the rights of a Dictator. On the day of the signature of this *ukaz* an order was signed appointing General Trepoff to M. Rydzeffsky's post. Four days after signature, the appointment was gazetted. Thus, almost imperceptibly, General Trepoff became the real ruler of Russia; and while the provinces were still agitating, bomb-throwing, and butchering, the hand which had kept order in the capital during four months closed over the entire Empire. The Liberals, confident that Rojdestvensky's *razgrom* was equivalent to a full-blown constitution, were staggered. They realised, indeed, that they were not likely to be any worse off under the over-policeman than under the arbitrary and licentious tsarlets who have hitherto misruled the provinces without interference from the capital. But they realised, once and for all, that the old system of government has still life left; and that, though it may be worried into mild reforms, it will not be frightened into abdication, either by internal revolt or external disaster. Had they been less sanguine and more observant they would have been less rudely disillusioned. The fact is that none of the Autocracy's recent acts showed the least apprehension of speedy decease. While the foreigners here have talked glibly of revolutions, republics, and palace plots, the supposed tottering Absolutists, confident in themselves, were discussing grandiose plans for the most remote future; they would build the Baltic-Black-Sea Canal, they an-

nounced, and do a hundred other things which no Government thinking only of its immediate preservation would have time to dream of.

The Trepoff appointment is disliked not only by the Liberals. The extreme reactionaries also are not pleased, for their demand was for a hectoring, high-stepping dictatorship—which would make a great fuss and do nothing—coupled with an expression of inflexible resolution to continue the war. But the limited number of moderate persons who detest equally Absolutist tyranny and popular license declare that the Trepoff dictatorship is the wisest—indeed the only wise—step taken by the Government since the beginning of the Constitutionalist movement. They have an excellent *prima facie* argument: since January 22nd, nearly every town in the Empire has been visited by murder and pillage. The capital has been the great exception; not a shot has been fired from political motives, scarcely a *nagaika* flourished; the only victims of bomb-throwing have been would-be bomb-throwers themselves. Yet St. Petersburg is the city where, as January showed, the lower-class Opposition is most numerous, wealthiest, most advanced in its political consciousness. Everyone predicted an era of butcheries and barricades. Everyone was wrong. From the hour of Governor-General Trepoff's appointment security reigned. There was no provoking riot to gain for underlings the glory of repression. There was no excessive harshness. There were multitudinous arrests, but not more arrests than under the mild sway of Sviatopolk-Mirsky; and ten Radical daily newspapers thundering unsuppressed against Autocracy could not nerve a single workman to march with a red flag. People wrote and said what they liked. On the morrow of Serge's murder three thousand inflamed students were allowed to meet and call openly for the assassination of "the scoundrel Trepoff, as the scoundrel Serge has already been assassinated." Illegal meetings, with some exceptions, were tolerated, as the late M. Plehve never tolerated them. The Cossack patrols were withdrawn from the streets, and concealed in courtyards—most people, it should be added, discovering them in someone else's courtyard, not their own. A policy, secretive, omniscient, and in its mechanism invisible, replaced the old policy of alternating license, provocation, and reckless repression. After a dozen days appointed for bomb-throwing *en masse* passed serenely, people began to say that Trepoff had got the city in hand. And the city, everyone agreed, was uncommonly pleasant—a Paradise compared with Yalta, Kalisch, or Zhitomir, where half-a-dozen policemen should suffice for the order which half-a-dozen battalions failed to keep. The *Trepoffstchina* had triumphed. If

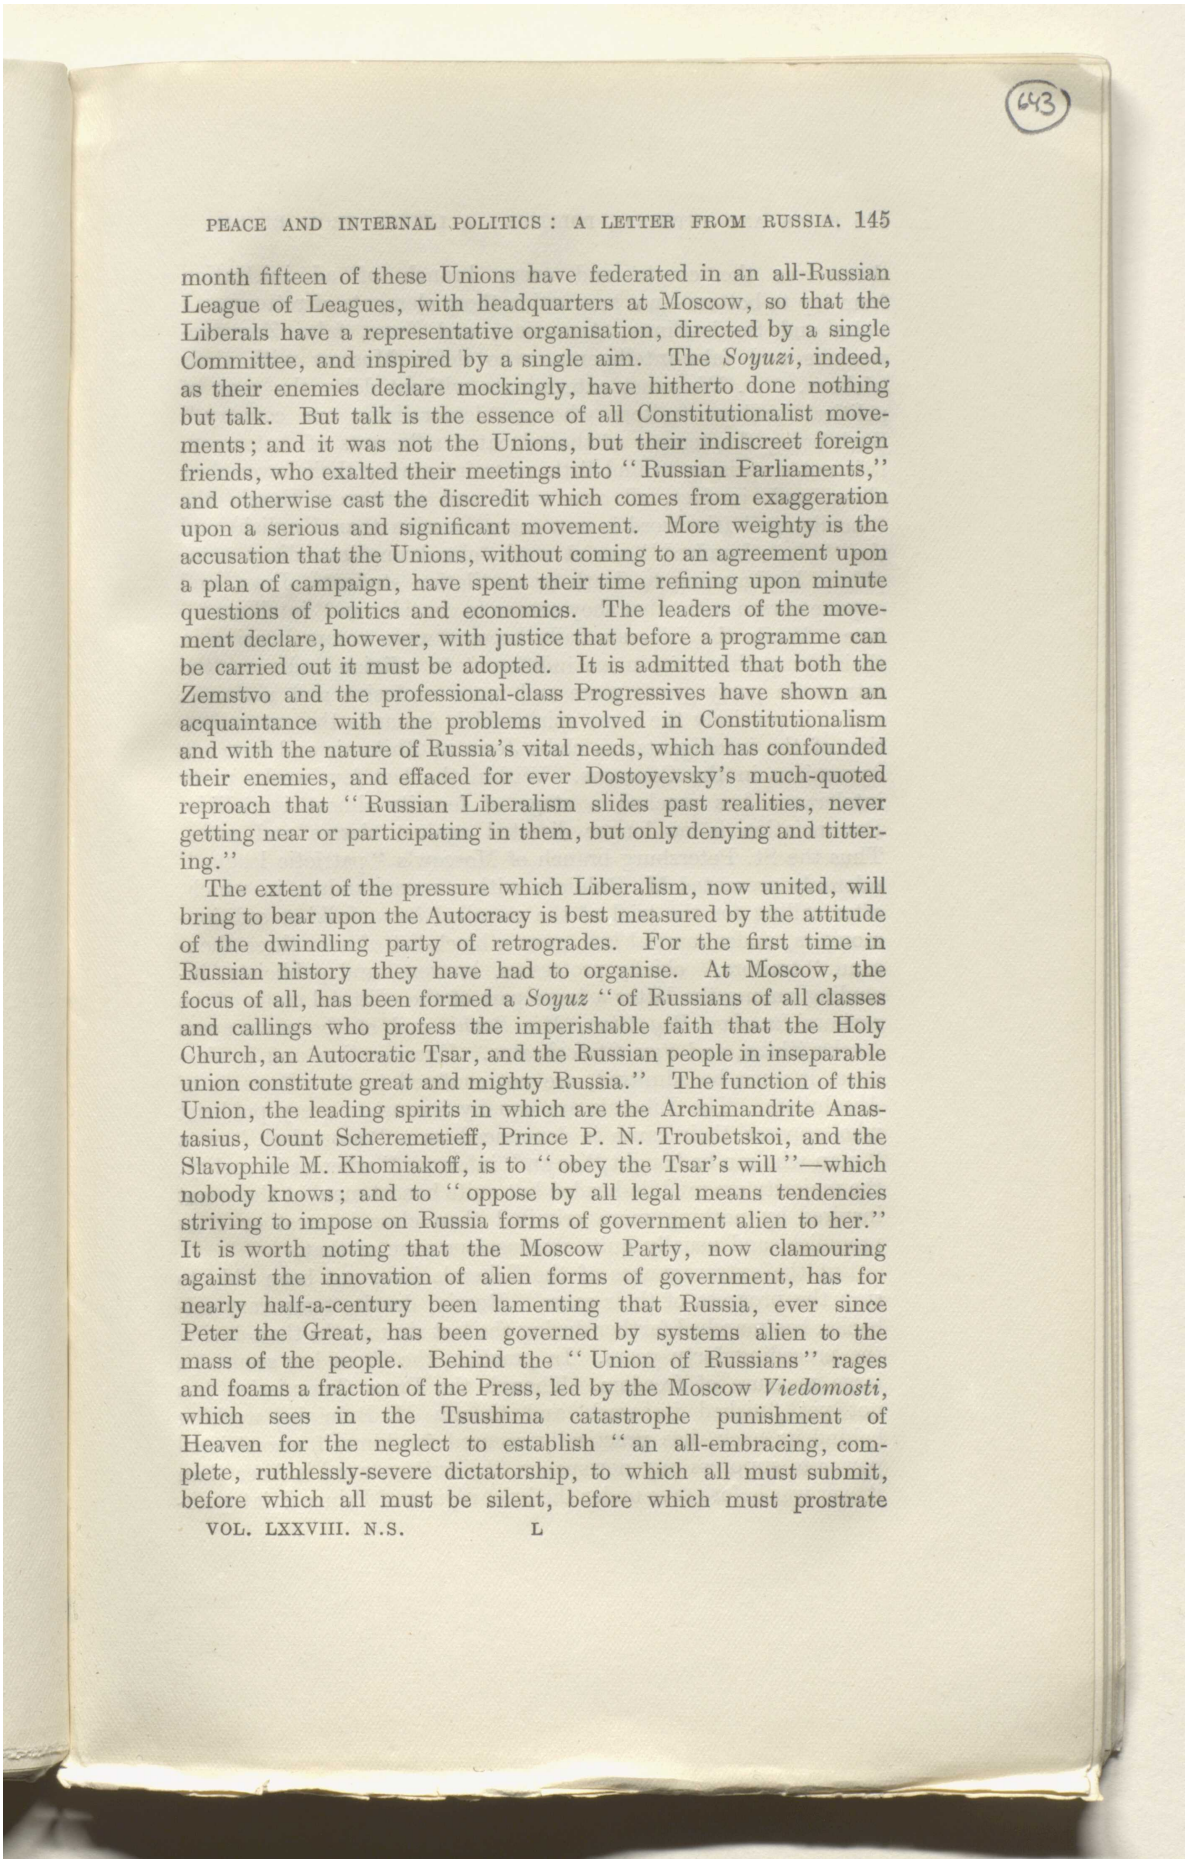
BRITISH LIBRARY



a capable man, ran the argument, without any political training or ideas, could keep order without bloodshed in St. Petersburg, why should he not do the same elsewhere? Russia would get a rest from violence, while the Liberal agitation could continue, as it has continued, under General Trepoff's nose. The Tsar would have a chance to show how far he would reform; the people would have a chance to organise, if necessary, the real forces of resistance. Under the anarchical system which has hitherto obtained, Governmental policy was daily deflected by local outrages, while on their side the people were showing in disorder and vain outrage their weakness, not their strength. At worst the Trepoff *régime* will mean unity of administrative policy in regard to political propaganda. Hitherto, local caprice has been king; and meetings and speeches of a kind freely permitted in one province have been suppressed in another; the story—probably untrue, but characteristic—is even told of one provincial governor forbidding the publication of the Easter Religious Liberty *ukaz*, on the ground that "the Tsar *may* have signed it, but he ought not to have done so." Henceforth the Constitutionalist agitation will face some settled system; and that system, despite General Trepoff's reputation, is more likely to be indulgence than repression. It will certainly not be vacillation between the two.

The Reformers, on their side, are simplifying the struggle. Three months ago—save the Social Democratic and other secret leagues—there was no such thing as a political organisation in Russia. Even the Zemtsvo Party was coherent only by virtue of its connection with the local administrative machinery. To-day, there are at least a score of societies which, though formed avowedly for Constitutionalist propaganda, have usurped in defiance of law the status of authorised corporations. In the history of the Russian Constitutionalist movement indeed nothing is more marked than the multiplication of these *Soyuzi*. Lawyers, doctors, engineers, architects, journalists, and some fifteen less important professions and trades have formally created associations, held congresses, and succeeded in getting their statutes and resolutions published in the Liberal Press. When, as happened in a few cases, the police interfered, the leagues merely changed their place of assembly, or, as did the Congress of Engineers, migrated temporarily to Finland outside the reach of their enemies. Lacking the courage to take wholesale punitive measures the Government has practically given up the struggle; and a *Soyuz Tchinovnikoff*, or Officials' Union, has now come into existence, to prove that the Liberal leaven has permeated the most hopeless element of Russian society. Within the last

BRITISH LIBRARY

month fifteen of these Unions have federated in an all-Russian League of Leagues, with headquarters at Moscow, so that the Liberals have a representative organisation, directed by a single Committee, and inspired by a single aim. The *Soyuzi*, indeed, as their enemies declare mockingly, have hitherto done nothing but talk. But talk is the essence of all Constitutionalist movements; and it was not the Unions, but their indiscreet foreign friends, who exalted their meetings into "Russian Parliaments," and otherwise cast the discredit which comes from exaggeration upon a serious and significant movement. More weighty is the accusation that the Unions, without coming to an agreement upon a plan of campaign, have spent their time refining upon minute questions of politics and economics. The leaders of the movement declare, however, with justice that before a programme can be carried out it must be adopted. It is admitted that both the Zemstvo and the professional-class Progressives have shown an acquaintance with the problems involved in Constitutionalism and with the nature of Russia's vital needs, which has confounded their enemies, and effaced for ever Dostoyevsky's much-quoted reproach that "Russian Liberalism slides past realities, never getting near or participating in them, but only denying and tittering."

The extent of the pressure which Liberalism, now united, will bring to bear upon the Autocracy is best measured by the attitude of the dwindling party of retrogrades. For the first time in Russian history they have had to organise. At Moscow, the focus of all, has been formed a *Soyuz* "of Russians of all classes and callings who profess the imperishable faith that the Holy Church, an Autocratic Tsar, and the Russian people in inseparable union constitute great and mighty Russia." The function of this Union, the leading spirits in which are the Archimandrite Anastasius, Count Scheremetieff, Prince P. N. Troubetskoi, and the Slavophile M. Khomiakoff, is to "obey the Tsar's will"—which nobody knows; and to "oppose by all legal means tendencies striving to impose on Russia forms of government alien to her." It is worth noting that the Moscow Party, now clamouring against the innovation of alien forms of government, has for nearly half-a-century been lamenting that Russia, ever since Peter the Great, has been governed by systems alien to the mass of the people. Behind the "Union of Russians" rages and foams a fraction of the Press, led by the Moscow *Viedomosti*, which sees in the Tsushima catastrophe punishment of Heaven for the neglect to establish "an all-embracing, complete, ruthlessly-severe dictatorship, to which all must submit, before which all must be silent, before which must prostrate

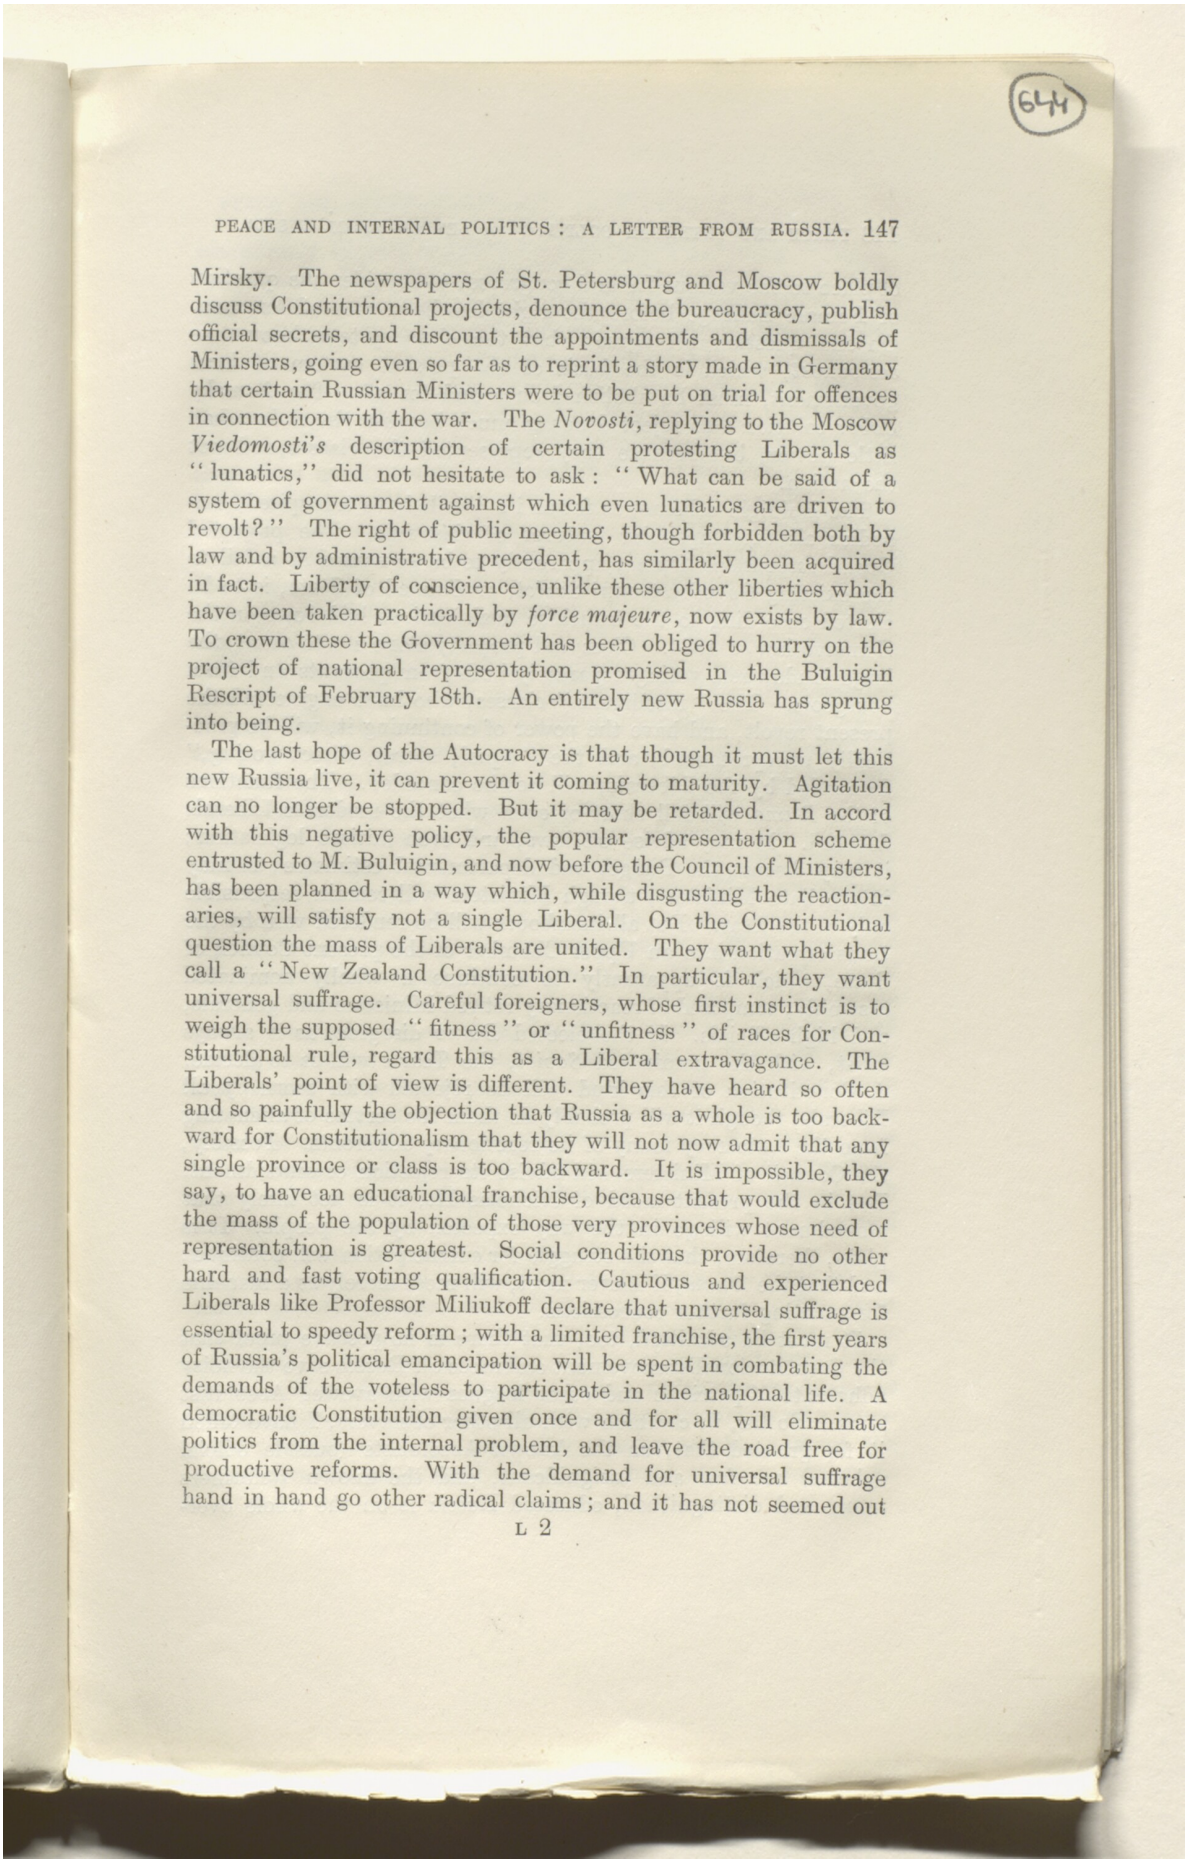
BRITISH LIBRARY



themselves the courts and every branch of administration from top to bottom—not to mention those elements of rottenness: Poles and Suedo-Finns, Armenians and Jews, false Zemstvo-workers and false-intelligents, who defile Moscow with their trickery. . . . We must exterminate without delay the gang of political hooligan-traitors who are demoralising our country." Such being the temper of the educated adherents of Autocracy, it is not surprising to find little restraint among their lower-class allies, and, in fact, all over south and south-west Russia the "hooligans" (the word is now more Russian than English) and the "black hundred" are at work, circulating incendiary pamphlets, bludgeoning to death or mutilation students, Jews, and anyone cursed with what they choose to consider an "intelligent" face. While the Liberals daily become more comprehensive in their sympathies and more indifferent to religion and race, the retrograde party grows more and more exclusive and national; and it is precisely the same spirit which demands the extermination of the intelligents, as clubs Jews at Zhitomir and butchers Armenians in the Caucasus. Within the last few weeks party intolerance has reached a stage of ferocity almost incredible. Denunciation is no longer directed against classes and races. Thus the St. Petersburg branch of Moscow's "patriotic league" solemnly presented M. Buluigin with a memorandum in which, after calling for the trial of the so-called *kramolniki* or sedition-mongers, under martial law, gave a black-list of over three thousand "traitors," chiefly professors, lawyers, and publicists, including among the latter a large part of the editorial staffs of the reviews *Russkoe Bagatstvo*, *Mir Bozhi*, and of the newspapers *Nasha Zhizn*, and *Syn Otetechestva*. Exasperation and intolerance, it must be admitted, are not confined to the adherents of Absolutism. The Liberals are equally incensed; every publicist who opposes their cause is denounced as a "scoundrel," or a "man who can be bought," or an "informer," whereas in reality, the majority are muddle-headed but quite honest men, at the worst inspired by nothing more criminal than class interest or class prejudice, and usually quite unconscious even of that.

But the extravagances of the Liberals have not been able to stop the progress of their cause. Russia, despite temporary setbacks, has marched farther during the last six months than during the preceding forty years. In practice, the Press has secured a large measure of freedom. Though the Press Commission has not yet finished its work, and though M. Buluigin, working behind its back, has practically secured for himself unrestricted power to suppress any newspaper, the written word is freer than it ever was before save under the brief *régime* of Prince Sviatopolk-

BRITISH LIBRARY

Mirsky. The newspapers of St. Petersburg and Moscow boldly discuss Constitutional projects, denounce the bureaucracy, publish official secrets, and discount the appointments and dismissals of Ministers, going even so far as to reprint a story made in Germany that certain Russian Ministers were to be put on trial for offences in connection with the war. The *Novosti*, replying to the Moscow *Viedomosti's* description of certain protesting Liberals as "lunatics," did not hesitate to ask: "What can be said of a system of government against which even lunatics are driven to revolt?" The right of public meeting, though forbidden both by law and by administrative precedent, has similarly been acquired in fact. Liberty of conscience, unlike these other liberties which have been taken practically by *force majeure*, now exists by law. To crown these the Government has been obliged to hurry on the project of national representation promised in the Buluigin Rescript of February 18th. An entirely new Russia has sprung into being.

The last hope of the Autocracy is that though it must let this new Russia live, it can prevent it coming to maturity. Agitation can no longer be stopped. But it may be retarded. In accord with this negative policy, the popular representation scheme entrusted to M. Buluigin, and now before the Council of Ministers, has been planned in a way which, while disgusting the reactionaries, will satisfy not a single Liberal. On the Constitutional question the mass of Liberals are united. They want what they call a "New Zealand Constitution." In particular, they want universal suffrage. Careful foreigners, whose first instinct is to weigh the supposed "fitness" or "unfitness" of races for Constitutional rule, regard this as a Liberal extravagance. The Liberals' point of view is different. They have heard so often and so painfully the objection that Russia as a whole is too backward for Constitutionalism that they will not now admit that any single province or class is too backward. It is impossible, they say, to have an educational franchise, because that would exclude the mass of the population of those very provinces whose need of representation is greatest. Social conditions provide no other hard and fast voting qualification. Cautious and experienced Liberals like Professor Miliukoff declare that universal suffrage is essential to speedy reform; with a limited franchise, the first years of Russia's political emancipation will be spent in combating the demands of the voteless to participate in the national life. A democratic Constitution given once and for all will eliminate politics from the internal problem, and leave the road free for productive reforms. With the demand for universal suffrage hand in hand go other radical claims; and it has not seemed out

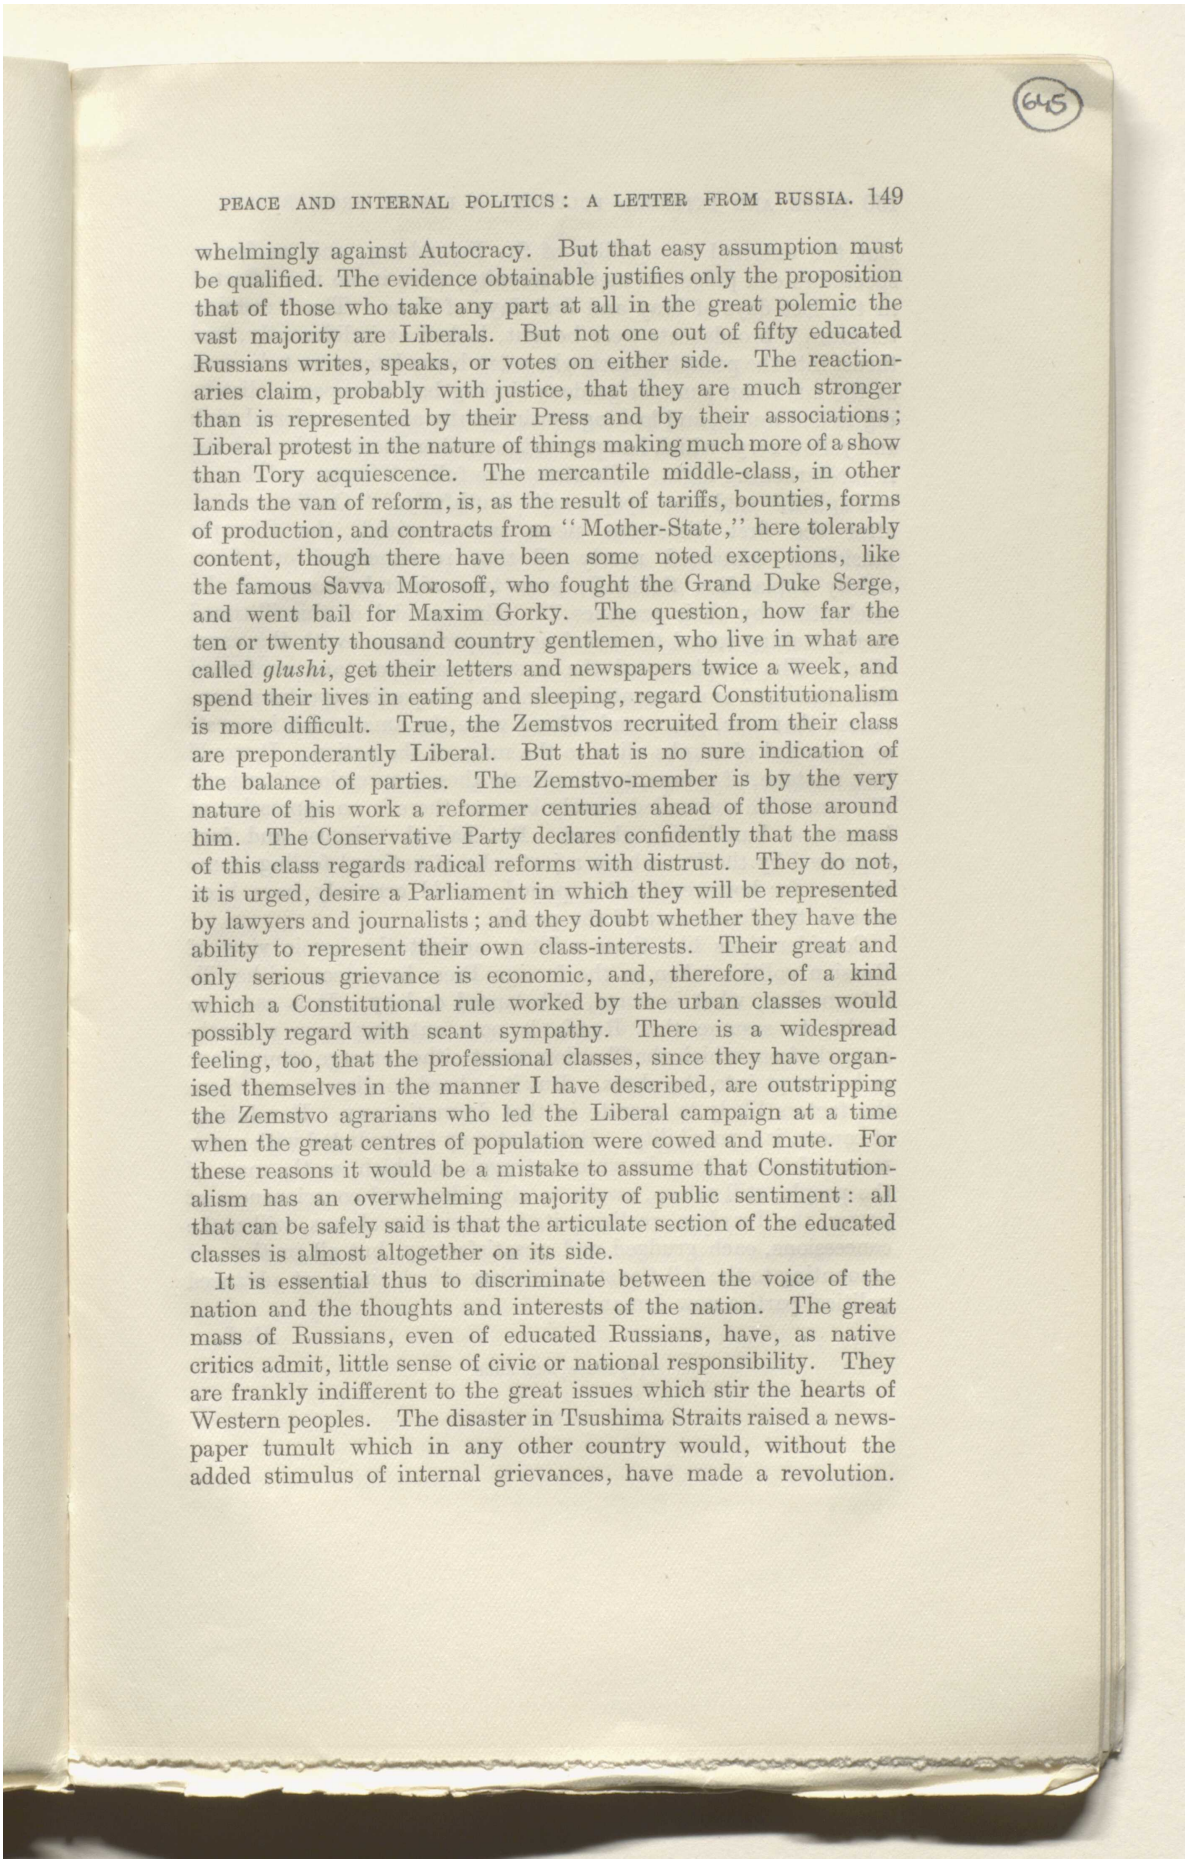
of place to the various Liberal congresses to consider the question of Female Suffrage before the right has been secured for men. On one question all agree; that the class system, known as *soslovnost*, which is the basis of the present system of local government, must be abolished once and for all. The *Zemsky Sobor* solution was rejected not so much because the *Sobors* had little power, but because they represented the classes and not the nation.



The Buluigin scheme, as far as its details have transpired, embodies all the unpopular features of class-rule. The projected *Gosudarstvennaya Duma*, apparently to be so-named as a foil to the existing *Gosudarstvenni Soviet*, or Council of State, is to be elected according to the franchise qualifications laid down in the Zemstvo law of 1864. Class and property alone are to count, the large landowners voting separately both from peasants and from bourgeois. The "intelligent" classes, who have engineered the present revolt, and have the power of continuing it, will be practically unrepresented; and the "equal, secret, direct voting," demanded by the Liberals, will not be conceded. The functions of the *Duma* will fall short of even what the moderate Liberals demand. It may advise on laws, and even initiate legislation; it may discuss the Budget and departmental estimates; it may interpellate Ministers, though Ministers will remain responsible only to the Tsar. But all its labours will be rendered vain by the transformation into an Upper Chamber of the present Council of State, which is apparently to continue a wholly nominated assembly, composed of reactionary retired Ministers and generals, and high officials. If the elected *Duma* disagree, as it always must, with the nominated *Soviet*, the Tsar's will is to decide. A Constitution of this kind will be rejected with scorn by all Liberals, though it will probably do them the service of alienating from the Autocracy many of its reactionary adherents. Possibly, the Council of Ministers will advise its rejection or amendment. But in the present mood of Nicholas II., it is not likely that amendment will go in the way expected by the people. It is plain, therefore, that the struggle for emancipation will continue; and that the *Duma*, if it ever meet, will meet merely as a machine for exacting further concessions.

It must be admitted, too, that there is no positive proof that the Constitutionalist movement embraces all Russia save the noisy adherents of patriotic and other leagues with avowed Absolutist aims. So far, in common with all other observers, I have taken it for granted that, as the known Absolutists (outside official spheres) are few and insignificant, and the known Reformers many and distinguished, educated Russia is on the whole over-

whelmingly against Autocracy. But that easy assumption must be qualified. The evidence obtainable justifies only the proposition that of those who take any part at all in the great polemic the vast majority are Liberals. But not one out of fifty educated Russians writes, speaks, or votes on either side. The reactionaries claim, probably with justice, that they are much stronger than is represented by their Press and by their associations; Liberal protest in the nature of things making much more of a show than Tory acquiescence. The mercantile middle-class, in other lands the van of reform, is, as the result of tariffs, bounties, forms of production, and contracts from "Mother-State," here tolerably content, though there have been some noted exceptions, like the famous Savva Morosoff, who fought the Grand Duke Serge, and went bail for Maxim Gorky. The question, how far the ten or twenty thousand country gentlemen, who live in what are called *glushi*, get their letters and newspapers twice a week, and spend their lives in eating and sleeping, regard Constitutionalism is more difficult. True, the Zemstvos recruited from their class are preponderantly Liberal. But that is no sure indication of the balance of parties. The Zemstvo-member is by the very nature of his work a reformer centuries ahead of those around him. The Conservative Party declares confidently that the mass of this class regards radical reforms with distrust. They do not, it is urged, desire a Parliament in which they will be represented by lawyers and journalists; and they doubt whether they have the ability to represent their own class-interests. Their great and only serious grievance is economic, and, therefore, of a kind which a Constitutional rule worked by the urban classes would possibly regard with scant sympathy. There is a widespread feeling, too, that the professional classes, since they have organised themselves in the manner I have described, are outstripping the Zemstvo agrarians who led the Liberal campaign at a time when the great centres of population were cowed and mute. For these reasons it would be a mistake to assume that Constitutionalism has an overwhelming majority of public sentiment: all that can be safely said is that the articulate section of the educated classes is almost altogether on its side.

It is essential thus to discriminate between the voice of the nation and the thoughts and interests of the nation. The great mass of Russians, even of educated Russians, have, as native critics admit, little sense of civic or national responsibility. They are frankly indifferent to the great issues which stir the hearts of Western peoples. The disaster in Tsushima Straits raised a newspaper tumult which in any other country would, without the added stimulus of internal grievances, have made a revolution.

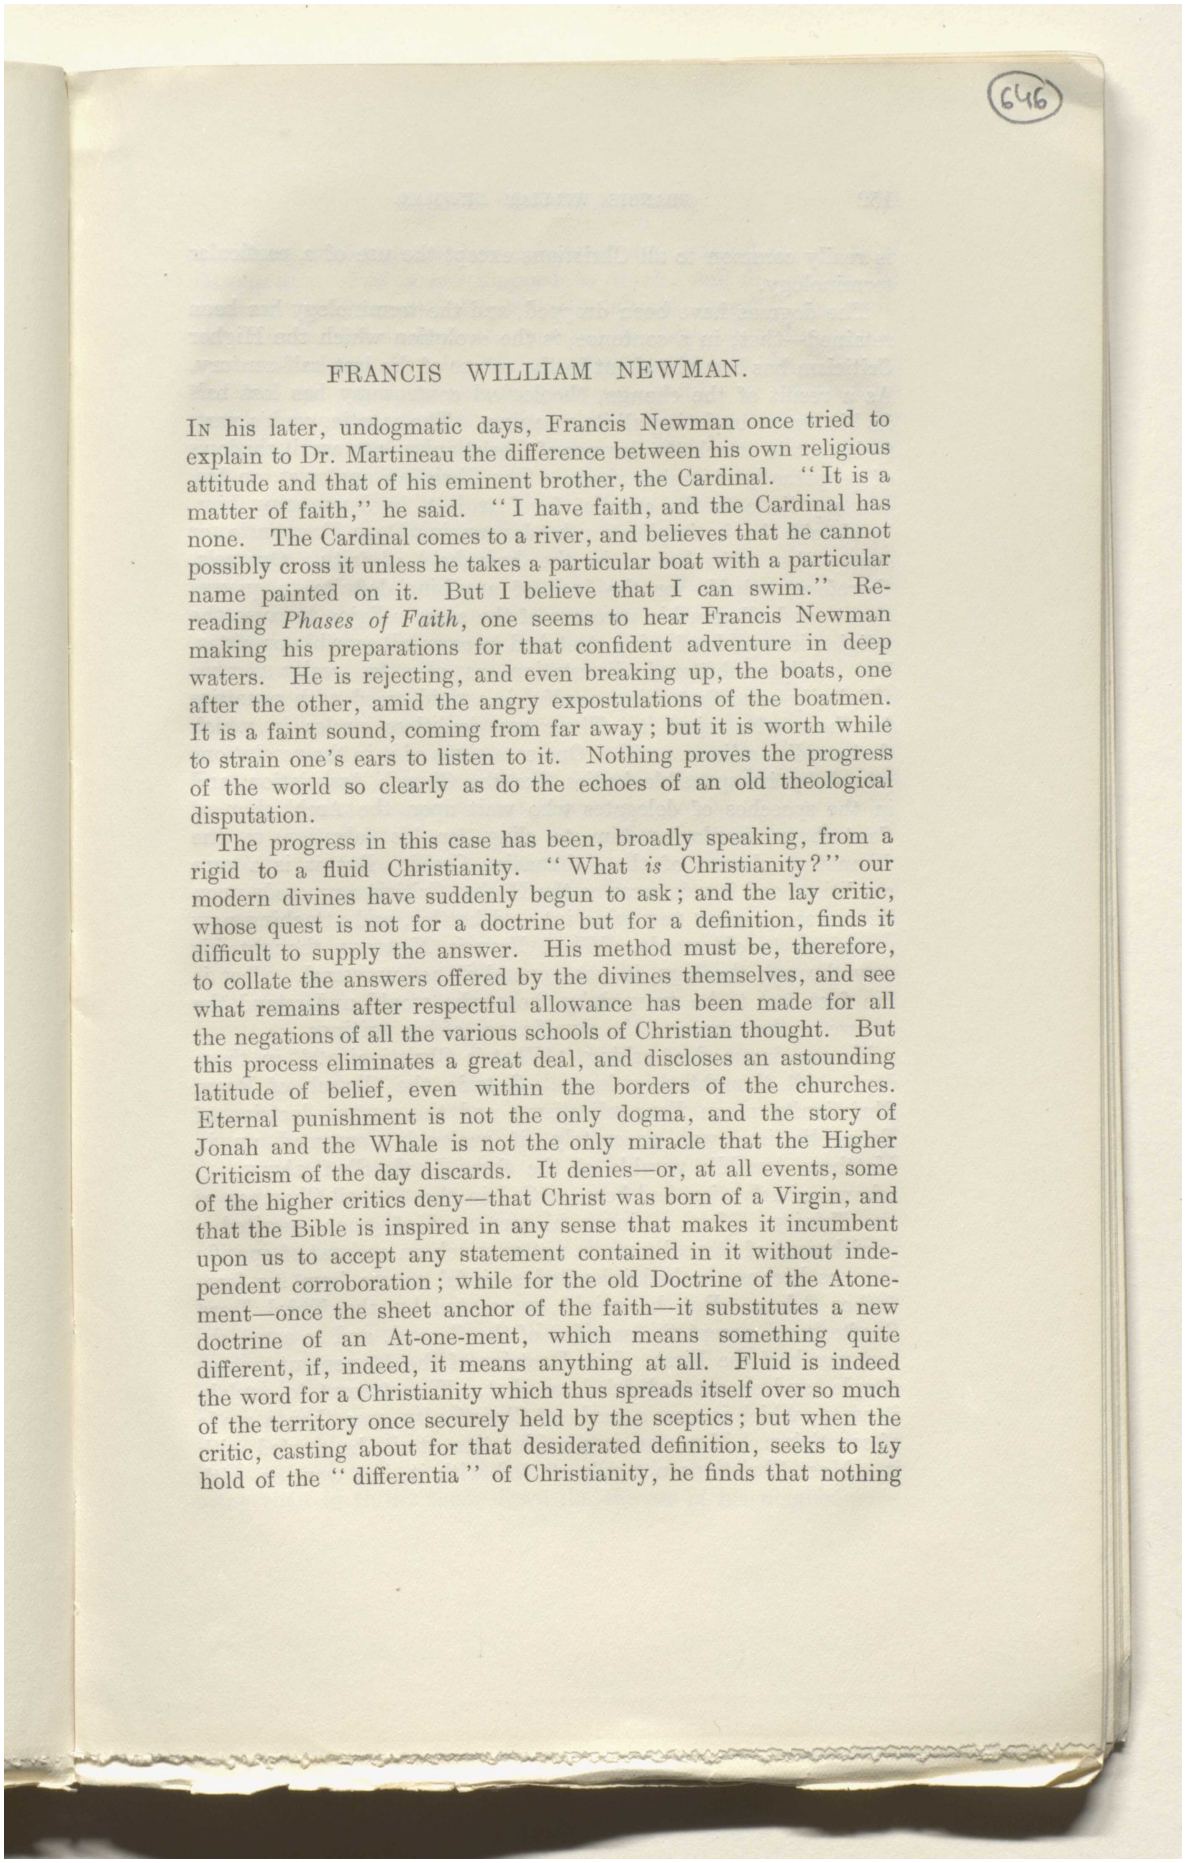
But the external tranquillity of St. Petersburg, and, as far as spectators can judge, its mental serenity, were in no way affected in the last days of May and first days of June. The "evening telegram" broadsheets were bought, looked at indifferently, and thrust into the pockets of men who a few hours later were to be seen at the suburban summer-gardens sipping bad champagne, listening to bad music, and looking sentimentally at the wonderful pink and yellow *zarya* which hangs over the northern horizon through the never-darkening night. Theatres were full. "Songs and dances multiplied," said a newspaper critic truthfully. "On the evening after the first disastrous news was received, the Olympia music-hall contained nearly all that remained of our fleet, noisily applauding Sobinoff; even two admirals honoured the celebration by their presence."[1] The scandal of this ill-timed merry-making raised the usual newspaper storm—with the usual effect. The people voted the newspapers bores, and continued their innocent amusements, leaving the impartial spectator convinced that war, peace and reform were the amateurish interests of a handful of cranks alien to the mass of the nation. It would be a mistake, of course, to exaggerate these impressions; national life cannot be suspended merely because there is no oppression at home and humiliation abroad. But had the disgust and fury expressed by the Press been a just echo of national feeling, some change, for however brief a period, would certainly have been seen in the demeanour of the people.

Considerations like these militate against the heroic view of Russian politics taken in the foreign Press by persons either ill-informed or, what is worse, ill-balanced or lazy. It is easy, no doubt, to assume that Russia is now entering upon a death-struggle from which the Tsardom must either emerge triumphant or be swept into the abyss. But it is hard to discern anywhere the factors likely to operate in that dramatic way. Revolution, of course, is a possibility. But what may be predicted with much more safety is a long-drawn-out struggle in which, as the mass of the people, still asleep, awake to civic ideas and consciousness of power, the Tsardom, realising its increasing weakness, will make concessions, each grudged and unsatisfactory, but all in the end amounting to the full Constitutionalism which the most advanced political parties now demand.



R. L.

(1) *Slovo*, 4th June.

FRANCIS WILLIAM NEWMAN.

In his later, undogmatic days, Francis Newman once tried to explain to Dr. Martineau the difference between his own religious attitude and that of his eminent brother, the Cardinal. "It is a matter of faith," he said. "I have faith, and the Cardinal has none. The Cardinal comes to a river, and believes that he cannot possibly cross it unless he takes a particular boat with a particular name painted on it. But I believe that I can swim." Re-reading *Phases of Faith*, one seems to hear Francis Newman making his preparations for that confident adventure in deep waters. He is rejecting, and even breaking up, the boats, one after the other, amid the angry expostulations of the boatmen. It is a faint sound, coming from far away; but it is worth while to strain one's ears to listen to it. Nothing proves the progress of the world so clearly as do the echoes of an old theological disputation.

The progress in this case has been, broadly speaking, from a rigid to a fluid Christianity. "What *is* Christianity?" our modern divines have suddenly begun to ask; and the lay critic, whose quest is not for a doctrine but for a definition, finds it difficult to supply the answer. His method must be, therefore, to collate the answers offered by the divines themselves, and see what remains after respectful allowance has been made for all the negations of all the various schools of Christian thought. But this process eliminates a great deal, and discloses an astounding latitude of belief, even within the borders of the churches. Eternal punishment is not the only dogma, and the story of Jonah and the Whale is not the only miracle that the Higher Criticism of the day discards. It denies—or, at all events, some of the higher critics deny—that Christ was born of a Virgin, and that the Bible is inspired in any sense that makes it incumbent upon us to accept any statement contained in it without independent corroboration; while for the old Doctrine of the Atonement—once the sheet anchor of the faith—it substitutes a new doctrine of an At-one-ment, which means something quite different, if, indeed, it means anything at all. Fluid is indeed the word for a Christianity which thus spreads itself over so much of the territory once securely held by the sceptics; but when the critic, casting about for that desiderated definition, seeks to lay hold of the "differentia" of Christianity, he finds that nothing

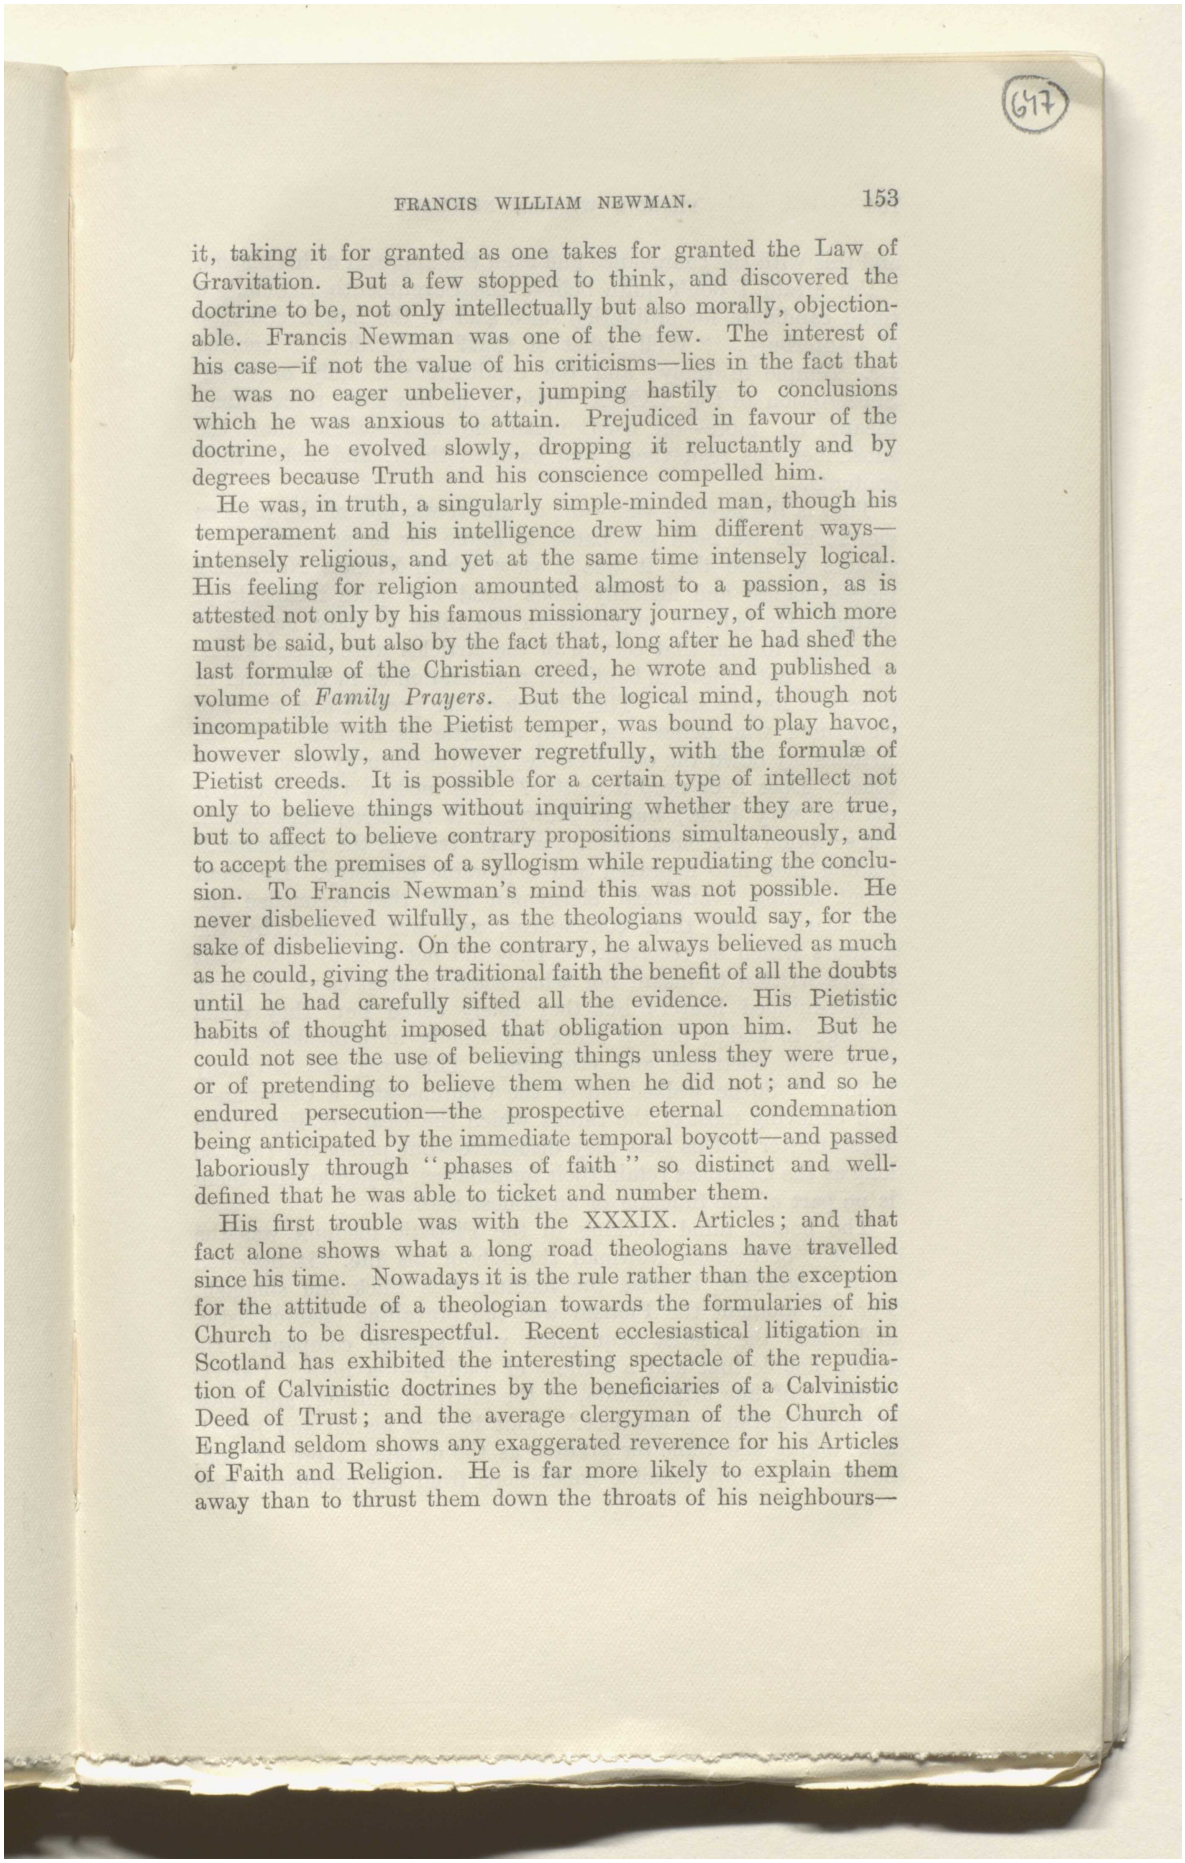
is really common to all Christians except the use of a particular terminology.



The dogmas have been dropped, and the terminology has been retained—that, in a sentence, is the evolution which the Higher Criticism has brought about in the course of the last half-century. As a result of the change, theological controversy has lost half its bitterness by losing all its meaning. The sceptic, on his part, feels that to attack the dogmas of Christianity is to assail shadows of perpetually changing shape. The Christian apologist, on his, can say little to the sceptic, for fear lest, in denouncing him, he should also by implication be denouncing Dean Fremantle, or some other office-bearer in the household of faith. Quarrels, therefore, subside for the lack of anything definite to quarrel about; and all sensible men are of the same religion because the religion is capable of being stretched to cover all sensible opinions. For really embittered disputation—as also for really morbid religiosity—the first thing needful is a rigid creed with penalties for those who reject it. There are doubtless circles in which that condition lingers still. One sees signs of it in the resolutions passed by irresponsible bodies like the Church Association, and in the speeches of delegates who wait upon the Archbishop of Canterbury, imploring him to cling for his salvation to the damnatory clauses of the Athanasian Creed. But it is a rare condition, and it gets rarer as the Higher Criticism proceeds upon its course, pouring new wine into old bottles, and attaching new meanings to old words. When Francis Newman thought his way through theology, it was general if not universal. That is the first fact to be grasped by those who would understand the nature of the man and the significance of his writings.

No one dreamed of asking "What is Christianity?" in those days. All thought they knew. Outside the Church of Rome Christianity mean Evangelicalism; and the central doctrine of Evangelicalism was accurately, if profanely, summed up in Matthew Arnold's parable of the three Lords Shaftesbury. A scheme of salvation had been settled in the Council Chamber of the Trinity. Man, a sinner in sore need of grace, merited a punishment of eternal torture, not so much on account of specific sins, as because he had inherited a sinful nature from his fore-father Adam. But he might, prompted by the Third Lord Shaftesbury, accept the sacrifice of the Second, and so avert the just wrath of the First. The Doctrine of the Atonement was as simple, and as cut and dried, as that. The attempt to explain it away, which is now a mode of Christianity, was then a mode of scepticism. If a man was a Christian at all, he started with it Most Christians not only started with it, but went on with

BRITISH LIBRARY

it, taking it for granted as one takes for granted the Law of Gravitation. But a few stopped to think, and discovered the doctrine to be, not only intellectually but also morally, objectionable. Francis Newman was one of the few. The interest of his case—if not the value of his criticisms—lies in the fact that he was no eager unbeliever, jumping hastily to conclusions which he was anxious to attain. Prejudiced in favour of the doctrine, he evolved slowly, dropping it reluctantly and by degrees because Truth and his conscience compelled him.

He was, in truth, a singularly simple-minded man, though his temperament and his intelligence drew him different ways—intensely religious, and yet at the same time intensely logical. His feeling for religion amounted almost to a passion, as is attested not only by his famous missionary journey, of which more must be said, but also by the fact that, long after he had shed the last formulæ of the Christian creed, he wrote and published a volume of *Family Prayers*. But the logical mind, though not incompatible with the Pietist temper, was bound to play havoc, however slowly, and however regretfully, with the formulæ of Pietist creeds. It is possible for a certain type of intellect not only to believe things without inquiring whether they are true, but to affect to believe contrary propositions simultaneously, and to accept the premises of a syllogism while repudiating the conclusion. To Francis Newman's mind this was not possible. He never disbelieved wilfully, as the theologians would say, for the sake of disbelieving. On the contrary, he always believed as much as he could, giving the traditional faith the benefit of all the doubts until he had carefully sifted all the evidence. His Pietistic habits of thought imposed that obligation upon him. But he could not see the use of believing things unless they were true, or of pretending to believe them when he did not; and so he endured persecution—the prospective eternal condemnation being anticipated by the immediate temporal boycott—and passed laboriously through "phases of faith" so distinct and well-defined that he was able to ticket and number them.

His first trouble was with the XXXIX. Articles; and that fact alone shows what a long road theologians have travelled since his time. Nowadays it is the rule rather than the exception for the attitude of a theologian towards the formularies of his Church to be disrespectful. Recent ecclesiastical litigation in Scotland has exhibited the interesting spectacle of the repudiation of Calvinistic doctrines by the beneficiaries of a Calvinistic Deed of Trust; and the average clergyman of the Church of England seldom shows any exaggerated reverence for his Articles of Faith and Religion. He is far more likely to explain them away than to thrust them down the throats of his neighbours—

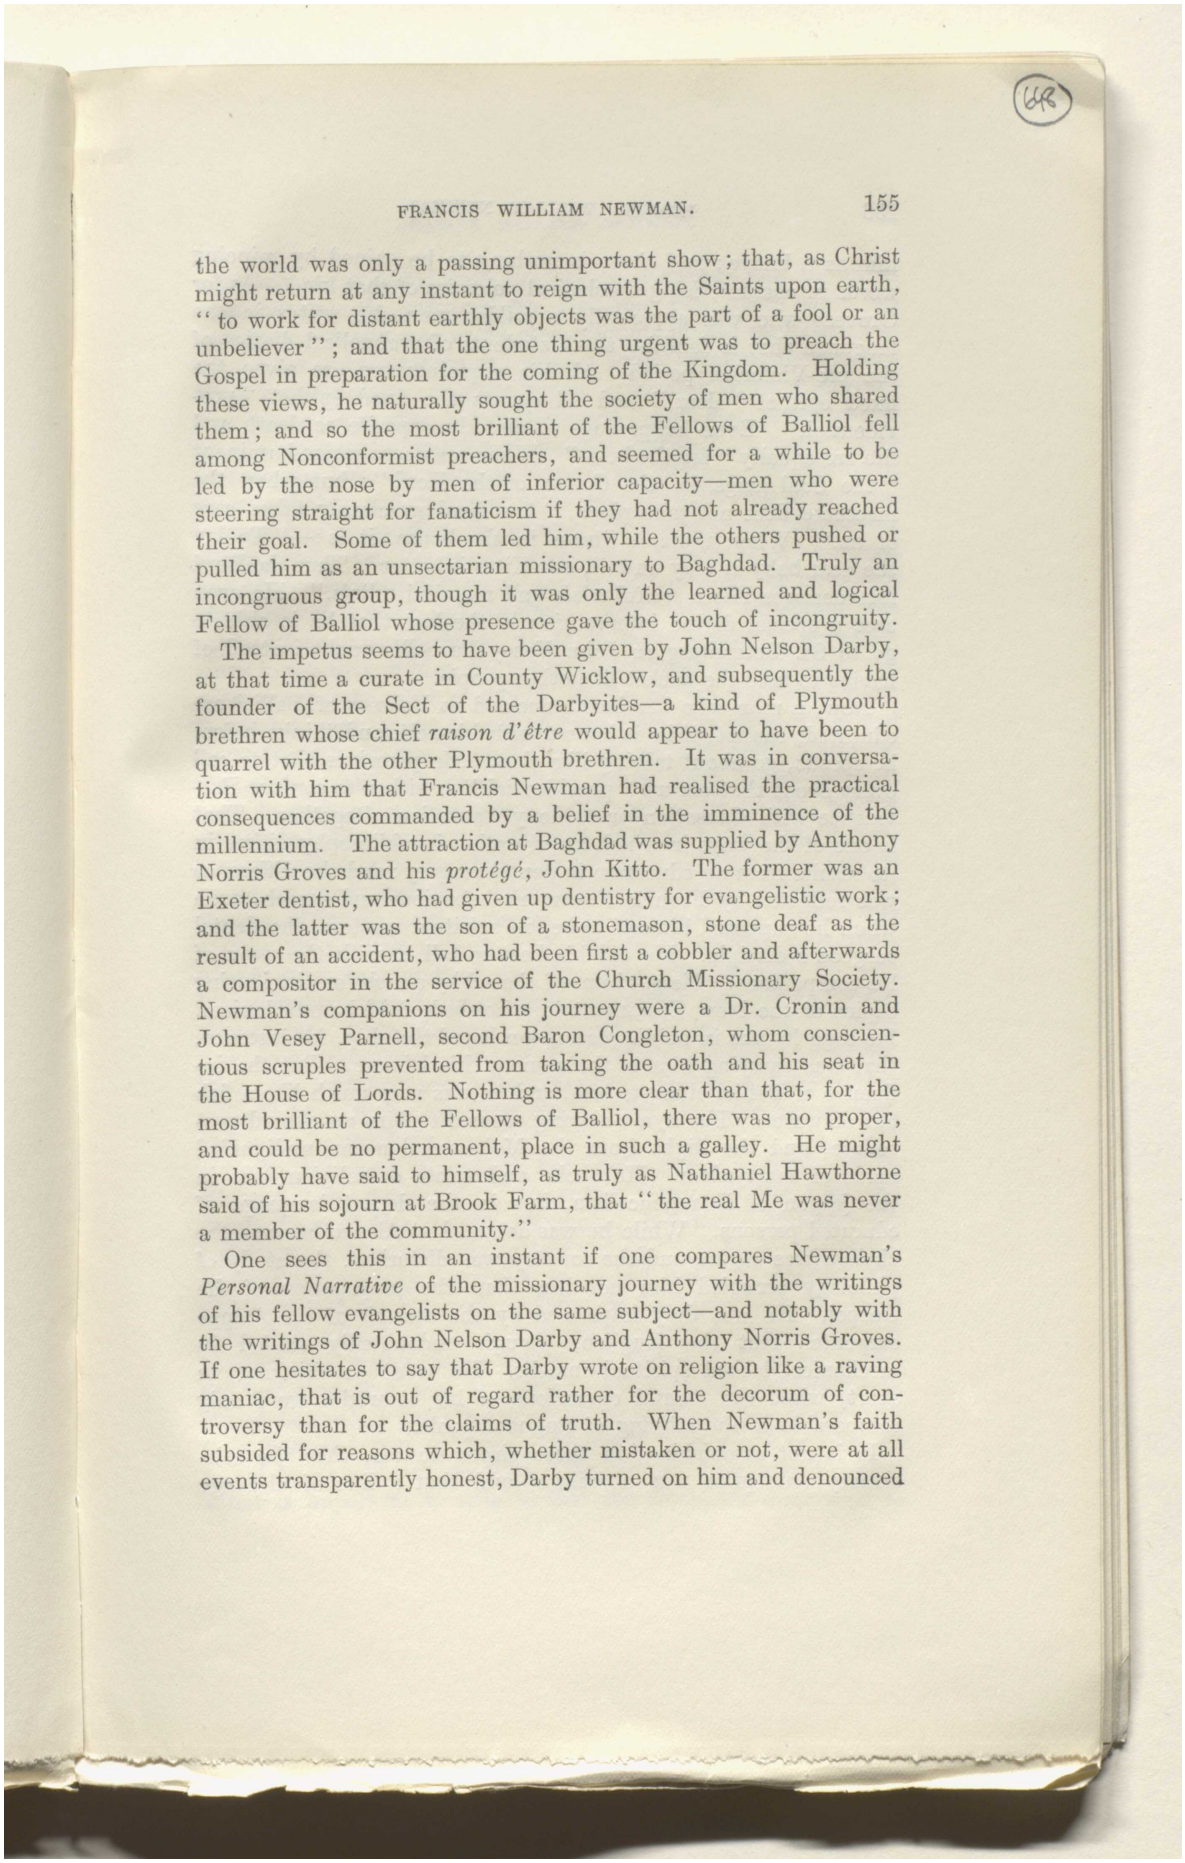
and this with the connivance and even the approval of his bishop. "I'm afraid I don't quite believe the Seventeenth Article," a timid candidate for ordination once said to the late Archbishop of Canterbury. "Well, what of that? Who does?" snorted Dr. Temple in reply; and the candidate was duly ordained. Subscription to the XXXIX. Articles, he has since represented, means no more—or need mean no more—than that the subscriber has read them, and counted them, and noted their contents.



That is the modern view—or, at all events, one of the modern views; and we need not pause to argue for or against it. It suffices to note that it was a view which Francis Newman's piously logical and logically pious mind was quite incapable of taking. He believed implicitly in the Bible in those days, and it seemed to him that certain of the Articles were unscriptural. He could not believe in baptismal regeneration or in the power of priests to forgive sins. The Church at the present day is full of clergymen who believe in them as little as he did. Yet the Articles lay down the one doctrine, and the Liturgy assumes the other. Does it or need it matter? The modern view is that it matters very little; but to Newman it mattered very much. Subscription, it seemed to him, was a "trap for the conscience," leading men into depraved and deplorable casuistry. He went about asking evangelical clergymen how they reconciled the formularies with their consciences, and was shocked by the answers which he received. "They did not seek to know what it was written to mean, nor what sense it must carry to every simple-minded hearer; but they solely asked how they could manage to assign to it a sense not wholly unreconcilable with their own doctrines and preaching. This was too obviously hollow." So he walked out of the Church—still a Christian—still believing most of the things which the Deans of Ripon and Westminster tell us that they disbelieve—but persuaded that, so long as the Churches retain their formularies, to juggle with them is no part of the function of an honest man.

The honest mind working in the Pietistic medium was the "note" of Francis Newman throughout his life. It operated slowly, however, because the medium was thick and sluggish. For the moment the Pietism was the prevailing characteristic, and made the Pietist acquainted with strange company. He was a double first and a Fellow of Balliol—"a man," Carlyle wrote, "of fine attainments, of the sharpest cutting, and most restlessly advancing intellect." But he was logical and literal, and, taking the Bible for granted as the dictated Word of God, he drew the only possible conclusions from the premises: that

BRITISH LIBRARY

the world was only a passing unimportant show; that, as Christ might return at any instant to reign with the Saints upon earth, "to work for distant earthly objects was the part of a fool or an unbeliever"; and that the one thing urgent was to preach the Gospel in preparation for the coming of the Kingdom. Holding these views, he naturally sought the society of men who shared them; and so the most brilliant of the Fellows of Balliol fell among Nonconformist preachers, and seemed for a while to be led by the nose by men of inferior capacity—men who were steering straight for fanaticism if they had not already reached their goal. Some of them led him, while the others pushed or pulled him as an unsectarian missionary to Baghdad. Truly an incongruous group, though it was only the learned and logical Fellow of Balliol whose presence gave the touch of incongruity.

The impetus seems to have been given by John Nelson Darby, at that time a curate in County Wicklow, and subsequently the founder of the Sect of the Darbyites—a kind of Plymouth brethren whose chief *raison d'être* would appear to have been to quarrel with the other Plymouth brethren. It was in conversation with him that Francis Newman had realised the practical consequences commanded by a belief in the imminence of the millennium. The attraction at Baghdad was supplied by Anthony Norris Groves and his *protégé*, John Kitto. The former was an Exeter dentist, who had given up dentistry for evangelistic work; and the latter was the son of a stonemason, stone deaf as the result of an accident, who had been first a cobbler and afterwards a compositor in the service of the Church Missionary Society. Newman's companions on his journey were a Dr. Cronin and John Vesey Parnell, second Baron Congleton, whom conscientious scruples prevented from taking the oath and his seat in the House of Lords. Nothing is more clear than that, for the most brilliant of the Fellows of Balliol, there was no proper, and could be no permanent, place in such a galley. He might probably have said to himself, as truly as Nathaniel Hawthorne said of his sojourn at Brook Farm, that "the real Me was never a member of the community."

One sees this in an instant if one compares Newman's *Personal Narrative* of the missionary journey with the writings of his fellow evangelists on the same subject—and notably with the writings of John Nelson Darby and Anthony Norris Groves. If one hesitates to say that Darby wrote on religion like a raving maniac, that is out of regard rather for the decorum of controversy than for the claims of truth. When Newman's faith subsided for reasons which, whether mistaken or not, were at all events transparently honest, Darby turned on him and denounced

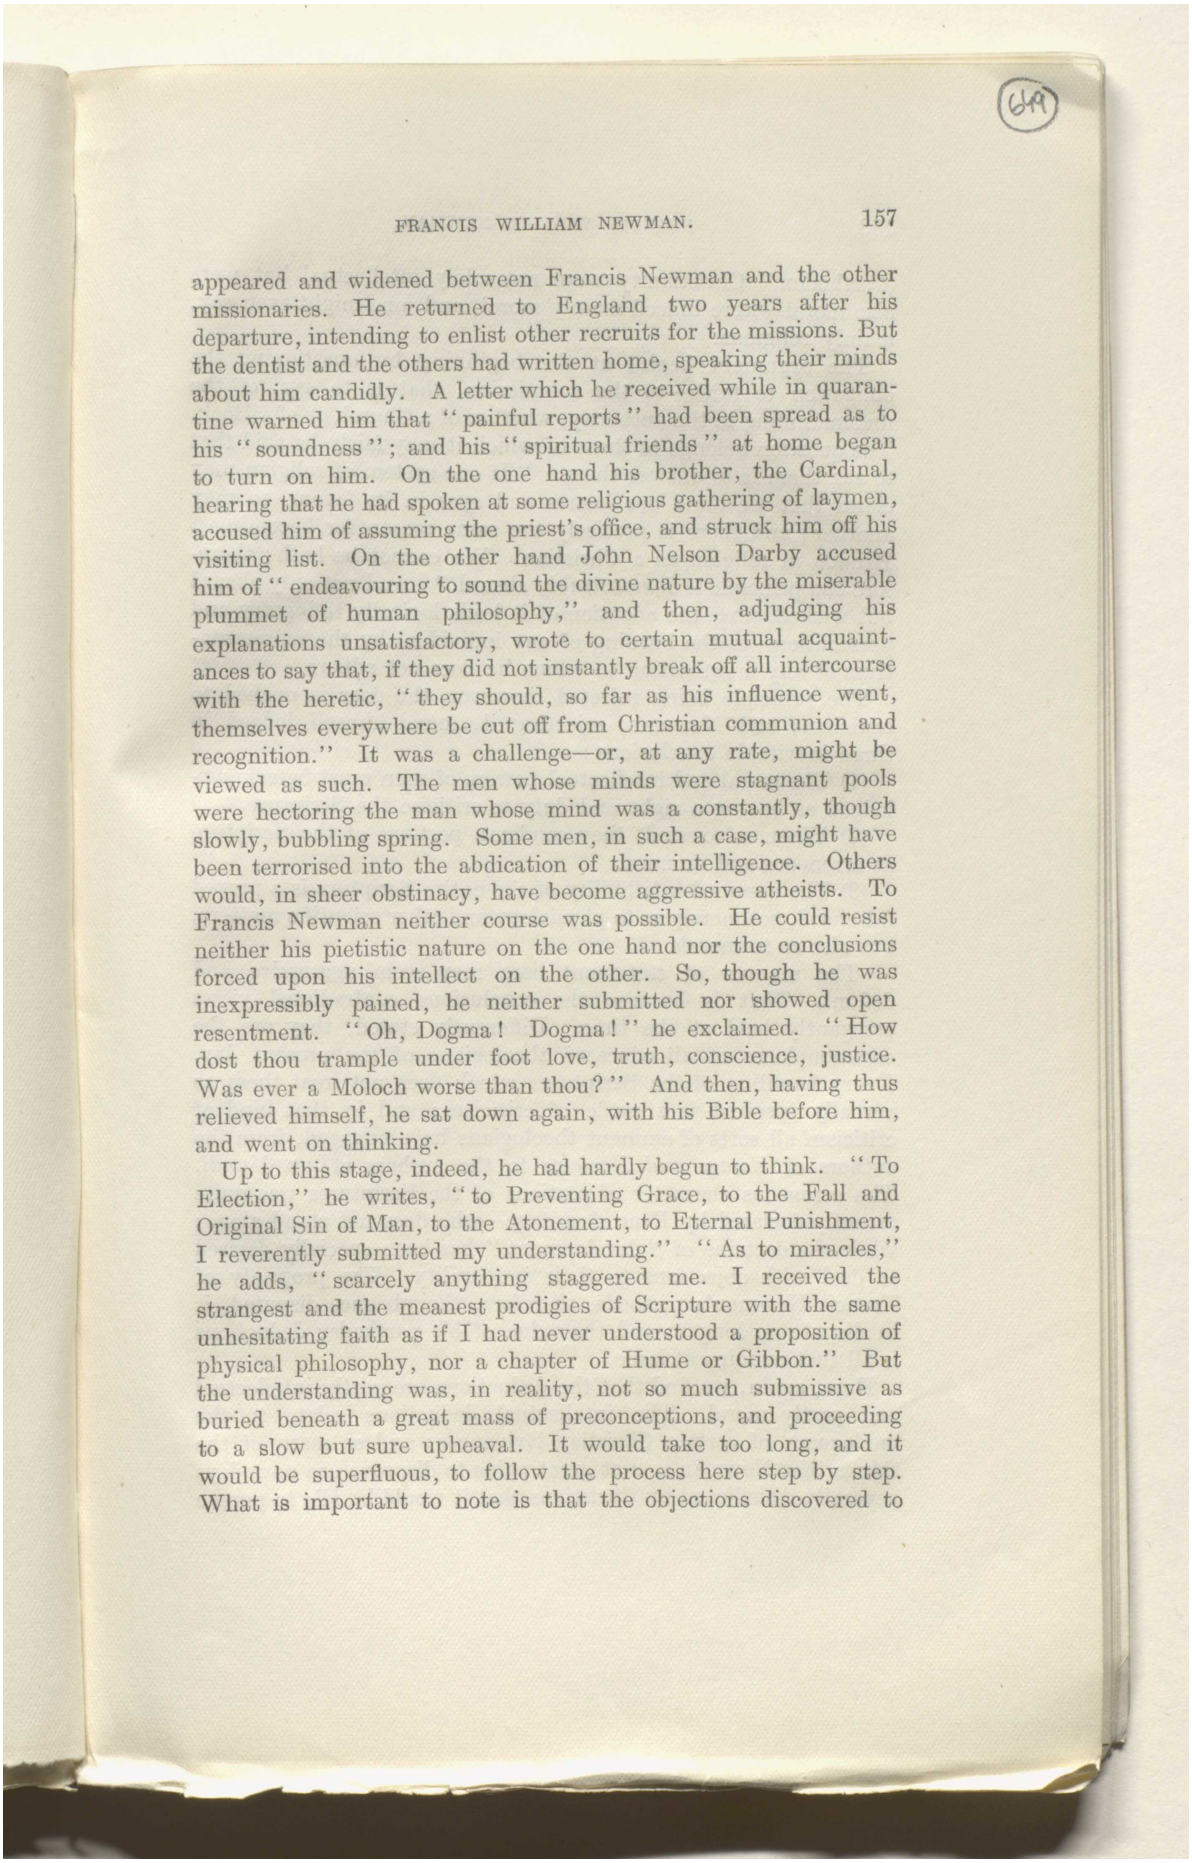
BRITISH LIBRARY

him as a knave; and there is nothing to be gained by mincing words in characterising theological polemics of that kind. As for Groves—who was apparently a milder man—he writes in the language that is familiar to all students of evangelical diaries of the pre-Victorian period. All his acquaintances are given the fixed epithet "dear," and all events the fixed epithet "providential." Even happenings so directly opposite as death and life are equally "for the best." When massacre seems imminent "the Soul longs for the Courts of the Lord"; but when the massacre does not take place, "the Lord graciously takes care of us." When there is illness in the house, it is:—"To-day the dear baby is very unwell, but Kitto is better. Thus the Lord interchanges His merciful trials and merciful reliefs." He even sees a special divine intervention in the fact that he is able to go to St. Petersburg on John Vesey Parnell's yacht instead of having to take the packet like other people.



Now, a man who has been educated as Fellows of Balliol are educated, cannot, if he is honest with himself, and thinks before he speaks, go about talking like that. He perceives that to call every event that occurs "providential," is either to confuse Providence with Causation or to deny Causation altogether. That is one of the ways in which an education in philosophy differs in its results from an education in dental surgery; and the difference was reflected by Francis Newman's behaviour and speech, even when he supposed himself to be, in spiritual matters, the dental surgeon's disciple. He did his best to fall in with the ways of his companions. He got himself chased by a mob for distributing copies of the New Testament in a hot-bed of Mohammedanism. He sang hymns in public places—on board the ship, for instance, that was carrying him to the scene of his labours. But the influence of Balliol clung to him, and he was very much like a fish out of water. The hymn-singing seemed to him an absurd procedure, and the flight from the Mohammedans an undignified mode of martyrdom. He spoke and wrote of religion, not in the jargon of Evangelicalism, but in the decent language of educated persons. While he was detained at Aleppo because the cholera was raging and the country was disturbed, the study of philology occupied him not less than the propagation of the Gospel. He was duly impressed by the remark of the Aleppo carpenter that the English, though undoubtedly skilled in mechanics, lacked spiritual insight. He went on thinking, in short, while the mental operations of his comrades were only comparable to the stirring of stagnant pools.

It is not astonishing, in these circumstances, that the missionary enterprise was a failure, and that a line of cleavage

appeared and widened between Francis Newman and the other missionaries. He returned to England two years after his departure, intending to enlist other recruits for the missions. But the dentist and the others had written home, speaking their minds about him candidly. A letter which he received while in quarantine warned him that "painful reports" had been spread as to his "soundness"; and his "spiritual friends" at home began to turn on him. On the one hand his brother, the Cardinal, hearing that he had spoken at some religious gathering of laymen, accused him of assuming the priest's office, and struck him off his visiting list. On the other hand John Nelson Darby accused him of "endeavouring to sound the divine nature by the miserable plummet of human philosophy," and then, adjudging his explanations unsatisfactory, wrote to certain mutual acquaintances to say that, if they did not instantly break off all intercourse with the heretic, "they should, so far as his influence went, themselves everywhere be cut off from Christian communion and recognition." It was a challenge—or, at any rate, might be viewed as such. The men whose minds were stagnant pools were hectoring the man whose mind was a constantly, though slowly, bubbling spring. Some men, in such a case, might have been terrorised into the abdication of their intelligence. Others would, in sheer obstinacy, have become aggressive atheists. To Francis Newman neither course was possible. He could resist neither his pietistic nature on the one hand nor the conclusions forced upon his intellect on the other. So, though he was inexpressibly pained, he neither submitted nor showed open resentment. "Oh, Dogma! Dogma!" he exclaimed. "How dost thou trample under foot love, truth, conscience, justice. Was ever a Moloch worse than thou?" And then, having thus relieved himself, he sat down again, with his Bible before him, and went on thinking.

Up to this stage, indeed, he had hardly begun to think. "To Election," he writes, "to Preventing Grace, to the Fall and Original Sin of Man, to the Atonement, to Eternal Punishment, I reverently submitted my understanding." "As to miracles," he adds, "scarcely anything staggered me. I received the strangest and the meanest prodigies of Scripture with the same unhesitating faith as if I had never understood a proposition of physical philosophy, nor a chapter of Hume or Gibbon." But the understanding was, in reality, not so much submissive as buried beneath a great mass of preconceptions, and proceeding to a slow but sure upheaval. It would take too long, and it would be superfluous, to follow the process here step by step. What is important to note is that the objections discovered to

"orthodox" Christianity were not solely intellectual but were also moral—were indeed mainly moral, and, one might even say, mainly religious.

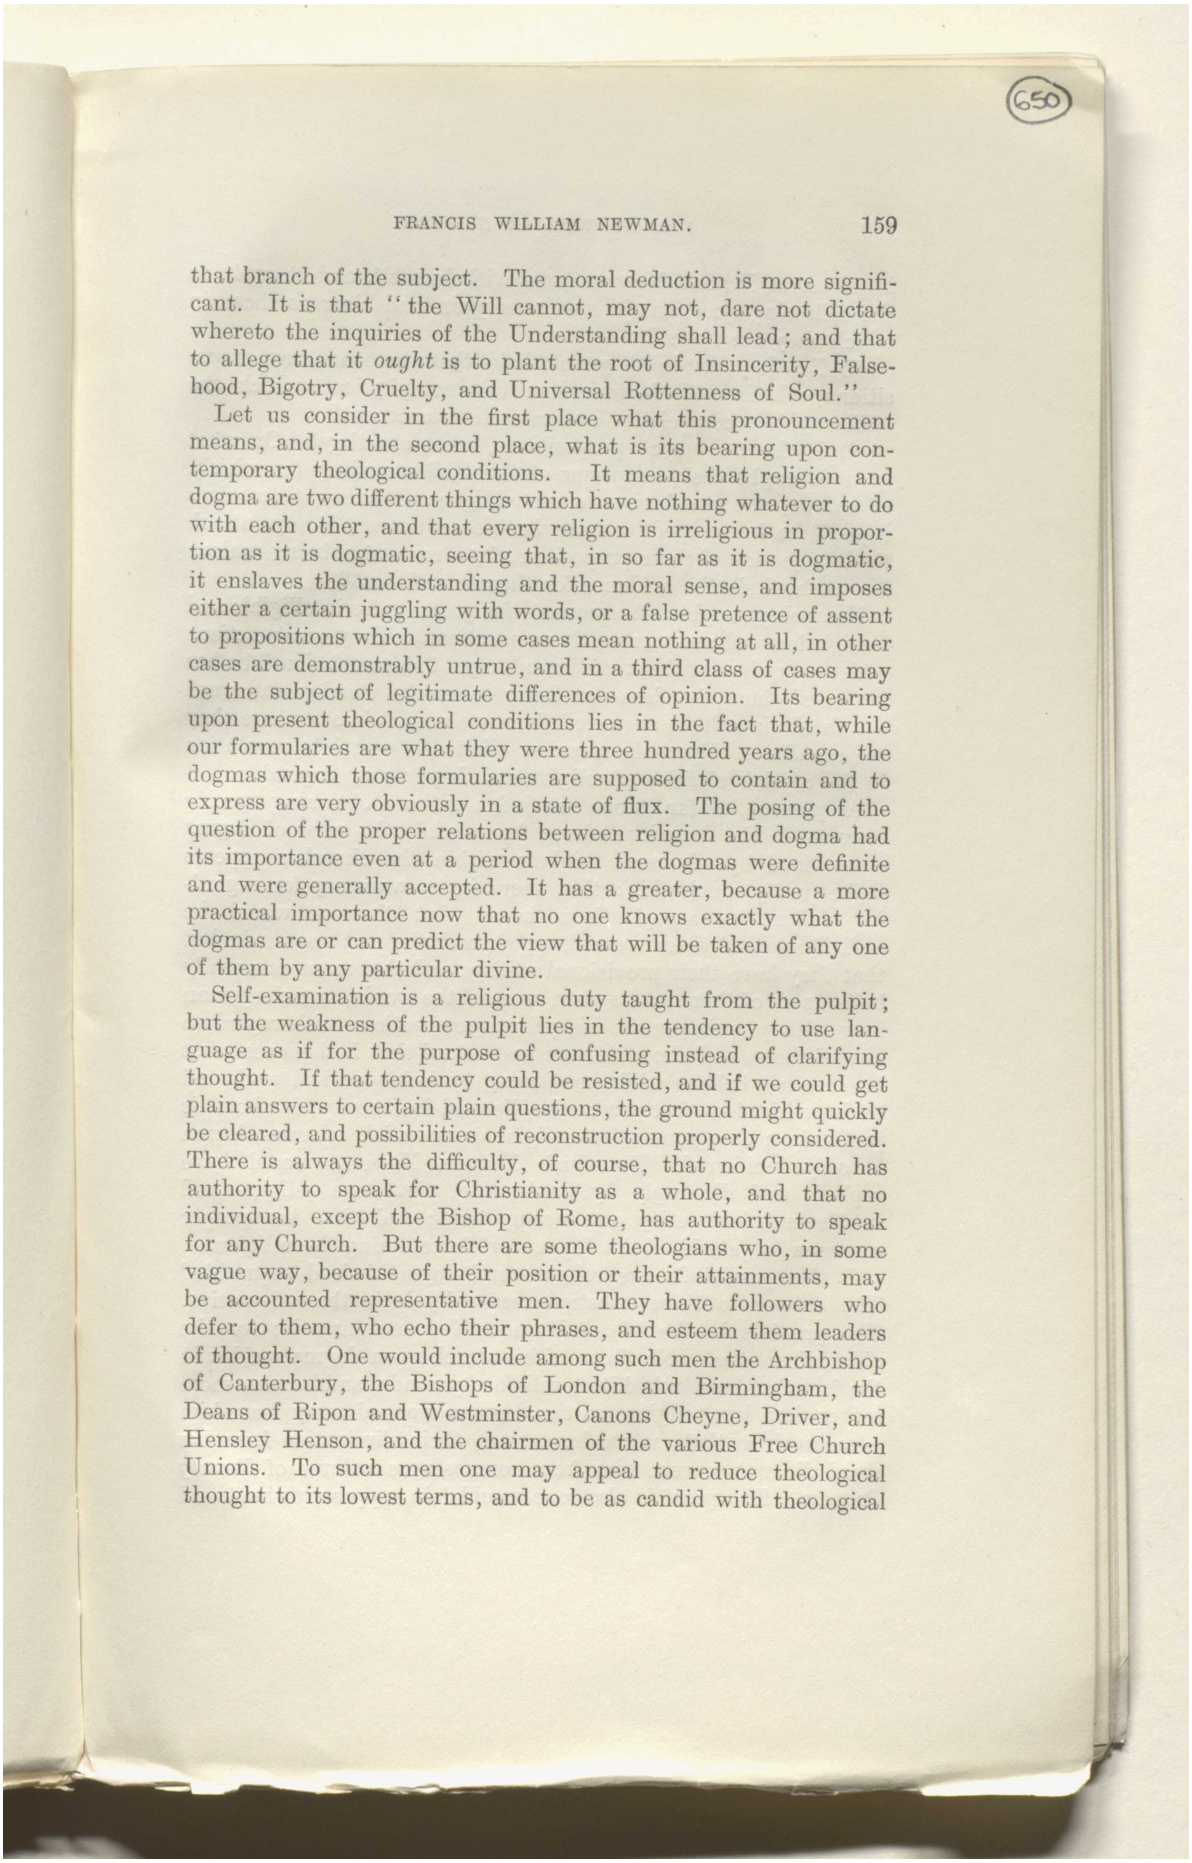
The argument begins at the beginning by questioning the obligation to faith—to the submission, that is to say, of the understanding to the authority, whether of a Church or of a Book. The question belongs to those of which it may fairly be said that to ask them is to answer them. "If one system of religion may claim that we blind our hearts and eyes in its favour, so may another; and there is precisely the same reason for becoming a Hindoo in religion as a Christian. We cannot be both; therefore the principle is *demonstrably* absurd." And not only absurd but wicked, since the adoption of it leads logically to bigotry and persecution—to the burning of any individual by the representatives of any organisation to which he does not adhere.

The principle being rejected, however, the door is opened to criticism; and Newman, rejecting it, found himself lodged in three inevitable conclusions:—

(1) The moral and intellectual powers of man must be acknowledged as having a right and duty to criticise the Scripture.

(2) When so exerted, they condemn portions of the Scripture as erroneous and immoral.

(3) The assumed infallibility of the entire Scripture is a proved falsehood, not merely as to physiology and other scientific matters, but also as to morals.



The manner of statement here may seem aggressive and defiant. That is because the conclusions contradicted views arrogantly held at the time. Differently stated, they are the commonplaces of all educated theologians of the present day. Every handling of the Scriptures which does not treat them as verbally inspired is a mode of criticism; and in that kind of criticism all sorts of eminent theologians have engaged, from the authors of *Essays and Reviews* to the authors of *Lux Mundi*. The erroneous character of portions of the Scriptures was quite recently declared by Dean Armitage—who does not stand alone; while the doctrine of "development" has been specially devised to deal with objections to their immorality. The propriety of Francis Newman's methods, therefore, though once disputed, is in dispute no longer; and the value of his particular deductions is all that remains at issue.

Here, again, we find that the deductions are partly intellectual and partly moral. The intellectual deductions relate to the inadequacy of certain Christian Evidences; and so many of the things that Newman was at great pains to disprove are nowadays generally disbelieved by Christians that it would be idle to pursue

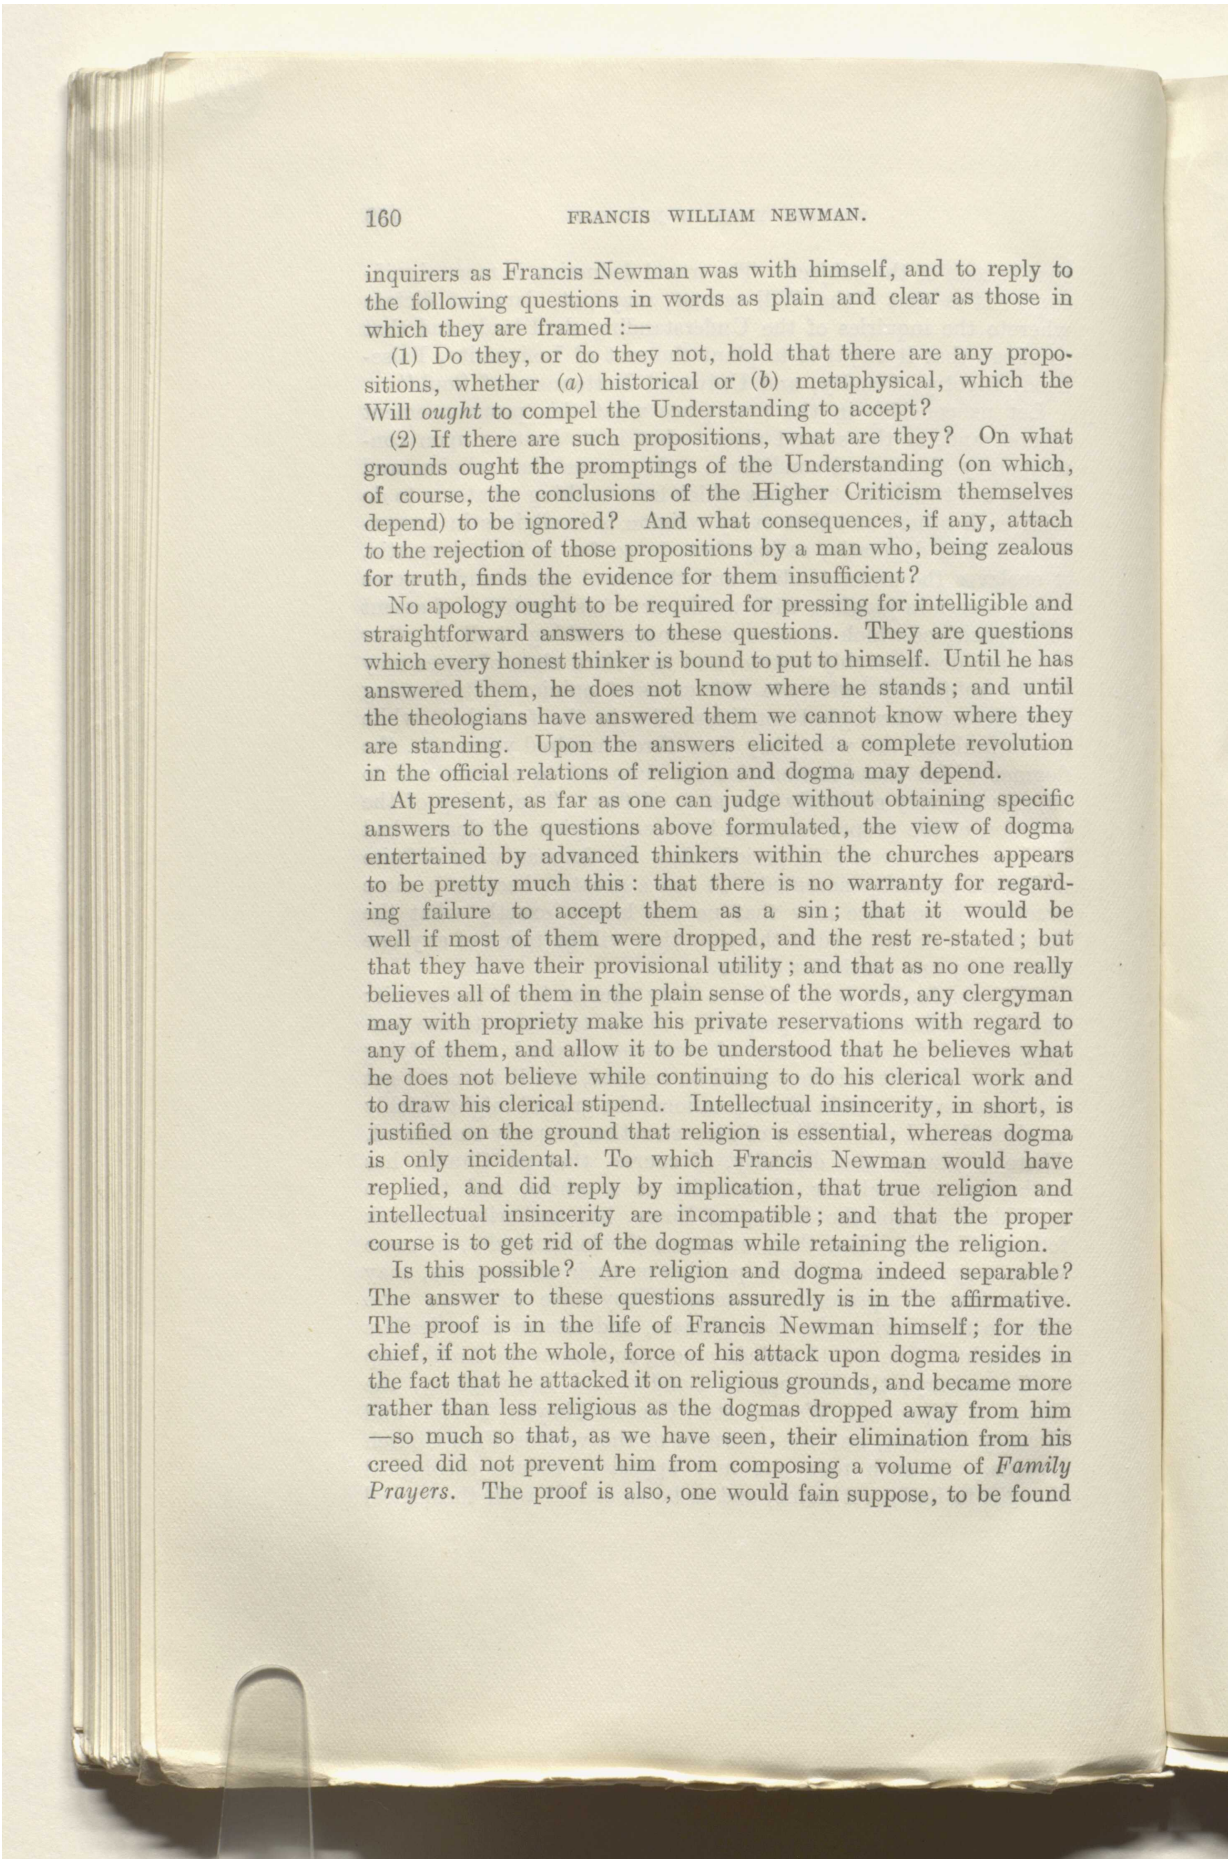
that branch of the subject. The moral deduction is more significant. It is that "the Will cannot, may not, dare not dictate whereto the inquiries of the Understanding shall lead; and that to allege that it *ought* is to plant the root of Insincerity, Falsehood, Bigotry, Cruelty, and Universal Rottenness of Soul."



Let us consider in the first place what this pronouncement means, and, in the second place, what is its bearing upon contemporary theological conditions. It means that religion and dogma are two different things which have nothing whatever to do with each other, and that every religion is irreligious in proportion as it is dogmatic, seeing that, in so far as it is dogmatic, it enslaves the understanding and the moral sense, and imposes either a certain juggling with words, or a false pretence of assent to propositions which in some cases mean nothing at all, in other cases are demonstrably untrue, and in a third class of cases may be the subject of legitimate differences of opinion. Its bearing upon present theological conditions lies in the fact that, while our formularies are what they were three hundred years ago, the dogmas which those formularies are supposed to contain and to express are very obviously in a state of flux. The posing of the question of the proper relations between religion and dogma had its importance even at a period when the dogmas were definite and were generally accepted. It has a greater, because a more practical importance now that no one knows exactly what the dogmas are or can predict the view that will be taken of any one of them by any particular divine.

Self-examination is a religious duty taught from the pulpit; but the weakness of the pulpit lies in the tendency to use language as if for the purpose of confusing instead of clarifying thought. If that tendency could be resisted, and if we could get plain answers to certain plain questions, the ground might quickly be cleared, and possibilities of reconstruction properly considered. There is always the difficulty, of course, that no Church has authority to speak for Christianity as a whole, and that no individual, except the Bishop of Rome, has authority to speak for any Church. But there are some theologians who, in some vague way, because of their position or their attainments, may be accounted representative men. They have followers who defer to them, who echo their phrases, and esteem them leaders of thought. One would include among such men the Archbishop of Canterbury, the Bishops of London and Birmingham, the Deans of Ripon and Westminster, Canons Cheyne, Driver, and Hensley Henson, and the chairmen of the various Free Church Unions. To such men one may appeal to reduce theological thought to its lowest terms, and to be as candid with theological

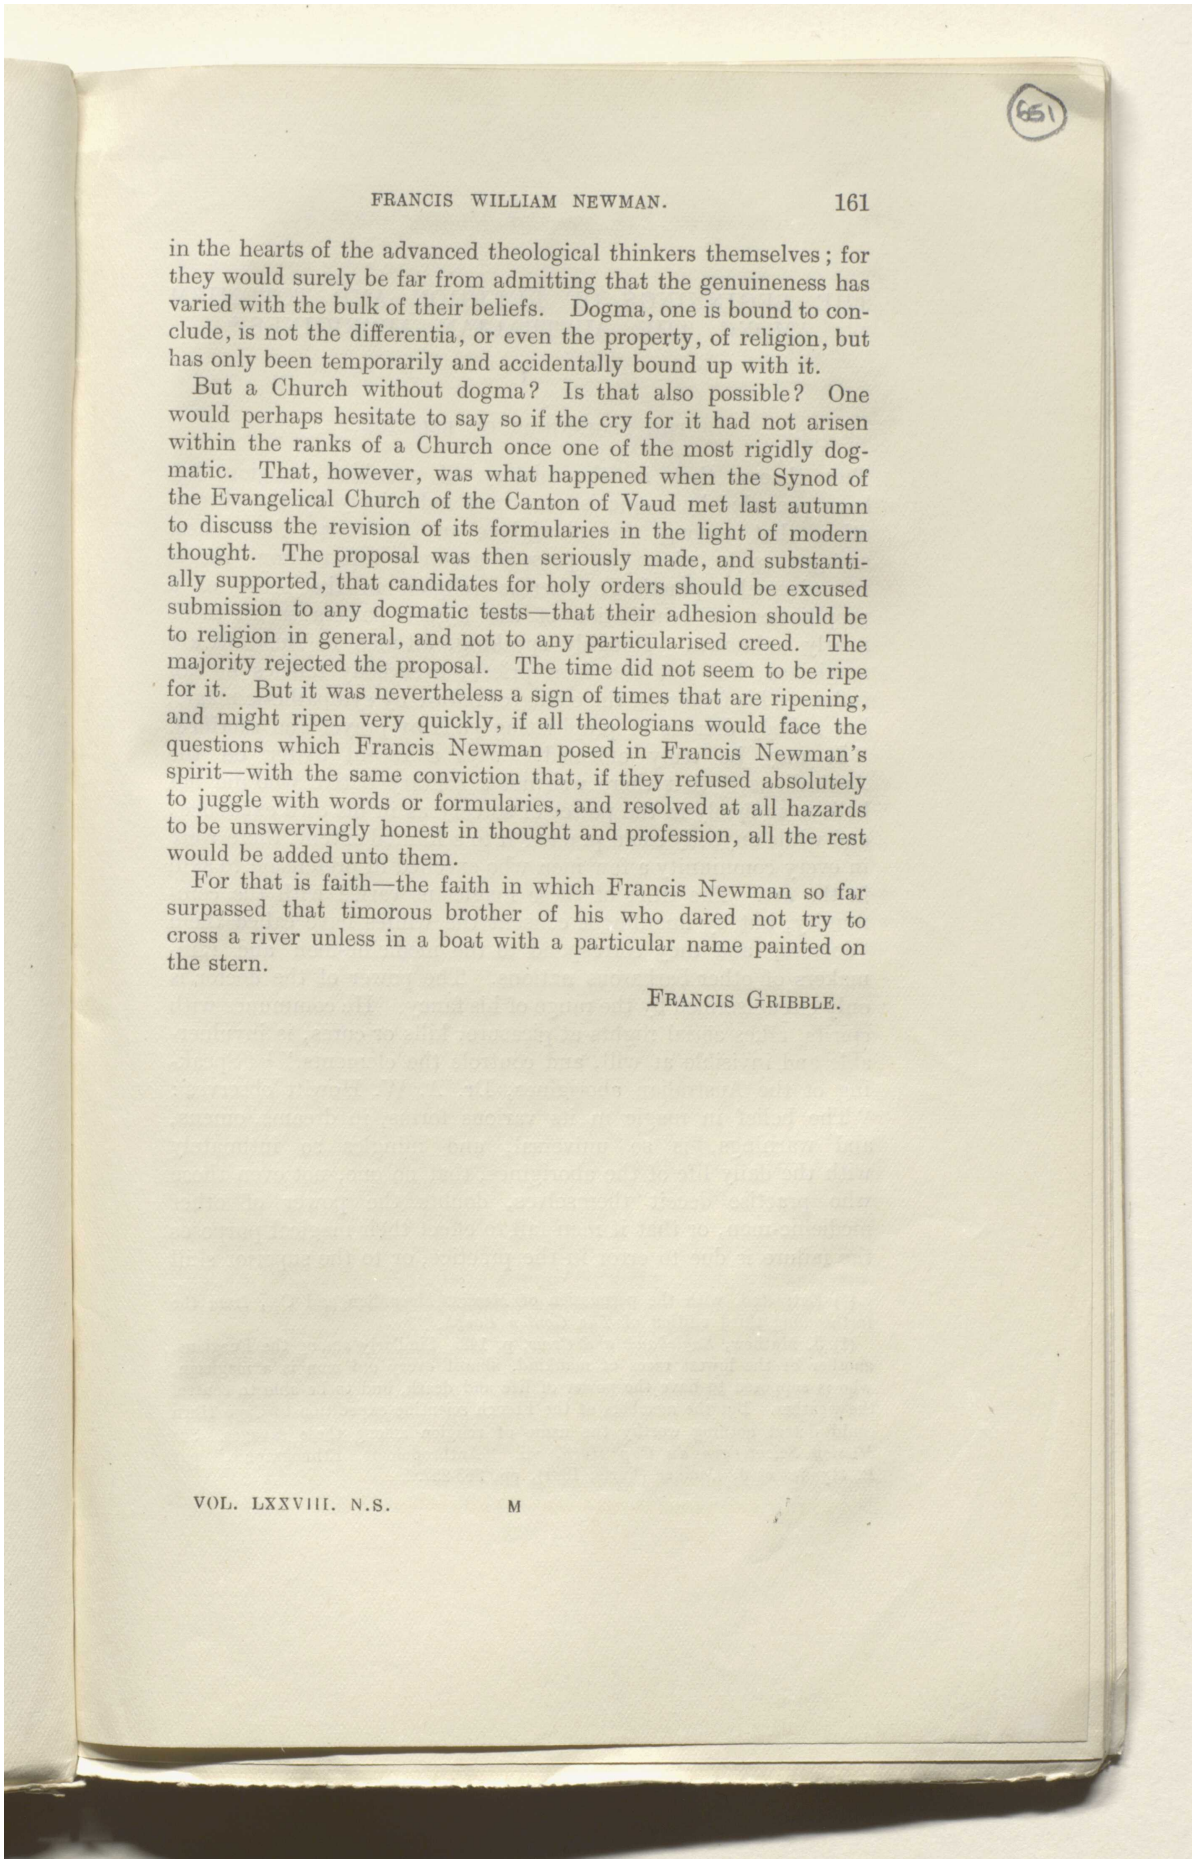
inquirers as Francis Newman was with himself, and to reply to the following questions in words as plain and clear as those in which they are framed:—

(1) Do they, or do they not, hold that there are any propositions, whether (*a*) historical or (*b*) metaphysical, which the Will *ought* to compel the Understanding to accept?

(2) If there are such propositions, what are they? On what grounds ought the promptings of the Understanding (on which, of course, the conclusions of the Higher Criticism themselves depend) to be ignored? And what consequences, if any, attach to the rejection of those propositions by a man who, being zealous for truth, finds the evidence for them insufficient?

No apology ought to be required for pressing for intelligible and straightforward answers to these questions. They are questions which every honest thinker is bound to put to himself. Until he has answered them, he does not know where he stands; and until the theologians have answered them we cannot know where they are standing. Upon the answers elicited a complete revolution in the official relations of religion and dogma may depend.



At present, as far as one can judge without obtaining specific answers to the questions above formulated, the view of dogma entertained by advanced thinkers within the churches appears to be pretty much this: that there is no warranty for regarding failure to accept them as a sin; that it would be well if most of them were dropped, and the rest re-stated; but that they have their provisional utility; and that as no one really believes all of them in the plain sense of the words, any clergyman may with propriety make his private reservations with regard to any of them, and allow it to be understood that he believes what he does not believe while continuing to do his clerical work and to draw his clerical stipend. Intellectual insincerity, in short, is justified on the ground that religion is essential, whereas dogma is only incidental. To which Francis Newman would have replied, and did reply by implication, that true religion and intellectual insincerity are incompatible; and that the proper course is to get rid of the dogmas while retaining the religion.

Is this possible? Are religion and dogma indeed separable? The answer to these questions assuredly is in the affirmative. The proof is in the life of Francis Newman himself; for the chief, if not the whole, force of his attack upon dogma resides in the fact that he attacked it on religious grounds, and became more rather than less religious as the dogmas dropped away from him —so much so that, as we have seen, their elimination from his creed did not prevent him from composing a volume of *Family Prayers*. The proof is also, one would fain suppose, to be found

in the hearts of the advanced theological thinkers themselves; for they would surely be far from admitting that the genuineness has varied with the bulk of their beliefs. Dogma, one is bound to conclude, is not the differentia, or even the property, of religion, but has only been temporarily and accidentally bound up with it.

But a Church without dogma? Is that also possible? One would perhaps hesitate to say so if the cry for it had not arisen within the ranks of a Church once one of the most rigidly dogmatic. That, however, was what happened when the Synod of the Evangelical Church of the Canton of Vaud met last autumn to discuss the revision of its formularies in the light of modern thought. The proposal was then seriously made, and substantially supported, that candidates for holy orders should be excused submission to any dogmatic tests—that their adhesion should be to religion in general, and not to any particularised creed. The majority rejected the proposal. The time did not seem to be ripe for it. But it was nevertheless a sign of times that are ripening, and might ripen very quickly, if all theologians would face the questions which Francis Newman posed in Francis Newman's spirit—with the same conviction that, if they refused absolutely to juggle with words or formularies, and resolved at all hazards to be unswervingly honest in thought and profession, all the rest would be added unto them.

For that is faith—the faith in which Francis Newman so far surpassed that timorous brother of his who dared not try to cross a river unless in a boat with a particular name painted on the stern.

FRANCIS GRIBBLE.

THE BEGINNINGS OF RELIGION AND TOTEMISM AMONG THE AUSTRALIAN ABORIGINES.*

I.

THE BEGINNINGS OF RELIGION.

THE theory that in the history of mankind religion has been preceded by magic is confirmed inductively by the observation that among the aborigines of Australia, the rudest savages as to whom we possess accurate information, magic is universally practised, whereas religion in the sense of a propitiation or conciliation of the higher powers seems to be nearly unknown. Roughly speaking, all men in Australia are magicians, but not one is a priest; everybody fancies he can influence his fellows or the course of nature by sympathetic magic, but nobody dreams of propitiating gods by prayer and sacrifice. "It may be truly affirmed," says a recent writer on the Australians, "that there was not a solitary native who did not believe as firmly in the power of sorcery as in his own existence; and while anybody could practise it to a limited extent, there were in every community a few men who excelled in pretension to skill in the art. The titles of these magicians varied with the community, but by unanimous consent the whites have called them 'doctors,' and they correspond to the medicine-men and rain-makers of other barbarous nations. The power of the doctor is only circumscribed by the range of his fancy. He communes with spirits, takes aërial flights at pleasure, kills or cures, is invulnerable and invisible at will, and controls the elements."[1] Speaking of the Australian aborigines, Dr. A. W. Howitt observes: "The belief in magic in its various forms, in dreams, omens, and warnings, is so universal, and mingles so intimately with the daily life of the aborigines, that no one, not even those who practise deceit themselves, doubts the power of other medicine-men, or that if men fail to effect their magical purposes the failure is due to error in the practice, or to the superior skill

(*) Extracted, with the permission of Messrs. Macmillan and Co., from the forthcoming third edition of *The Golden Bough*.

(1) J. Mathew, *Eaglehawk and Crow*, p. 142. Similarly among the Fuegians, another of the lowest races of mankind, almost every old man is a magician, who is supposed to have the power of life and death, and to be able to control the weather. But the members of the French scientific expedition to Cape Horn could detect nothing worthy the name of religion among these savages. See *Mission Scientifique du Cap Horn*, vii. "Anthropologie, Ethnographie," par P. Hyades et J. Deniker (Paris, 1891), pp. 253-257.

BRITISH LIBRARY

or power of some adverse practitioner."[2] On the same subject Mr. E. M. Curr wrote: "In connection with the manners and customs of our aboriginal race a great motor power is the belief in sorcery or witchcraft. In the everyday life of the Black, a pressure originating in this source may be said to be always at work. As it seems to me, no writer has given this fact quite its due weight, and yet it is impossible to appreciate correctly the manners and customs of our tribes until the more salient features in connection with their ideas about sorcery have been mastered. The groundwork of sorcery amongst the Blacks is the belief that several things of importance can be effected by means of charms and incantations. The tribes differ somewhat in details and ceremonies, but there is no doubt that the system is the same throughout."[3]

Yet though religion, in the sense in which I use that word, seems to be nearly unknown among the Australian aborigines, some of them nevertheless hold beliefs and observe practices which might have grown into a regular religion, if their development had not been cut short by European intervention. Thus in the south-eastern parts of the continent, where the conditions of life in respect of climate, water, and food are more favourable than elsewhere, some rudiments of religion appear in a regard for the comfort of departed friends. For example, certain Victorian tribes are said to have kindled fires near the bodies of their dead in order to warm the ghost, but "the recent custom of providing food for it is derided by the intelligent old aborigines as 'white fellow's gammon.'"[4] Among the Dieri, if the deceased was a person of importance, food is placed for many days at the grave, and in winter a fire is lighted in order that the ghost may warm himself at it.[5] Some of the natives of western Australia keep up a fire for this purpose on the grave for more than a month. But they expect the dead to return to life, for they detach the nails from the thumb and forefinger of the deceased and deposit them in a small hole beside the grave, in order that they may know him again when he comes back to the world.[6] Again, the natives of the Herbert river, in north-east Queensland, often put food and water in the grave, and they deposit with the dead his weapons, ornaments, and indeed everything he used in life. On the other

hand, they generally break his legs to prevent him from wandering at night, and for the same purpose they cut gashes in his stomach, shoulders, and lungs, and fill the gashes with stones.[7] The Turribul tribe placed their dead in trees. If the deceased was a man, they left a spear and a club near him that his spirit might kill game for its sustenance in the future state; but if the deceased was a woman, they laid a yam stick near her body in order that she might dig for roots.[8] Among the Jupagalk, a person in great pain would call on some dead friend to come and help him—that is, to visit him in a dream, and teach him some song whereby he might avert the evil magic that was hurting him.[8a] Customs like these, it is plain, might easily develop into a worship of the dead.

Further, the Queensland aborigines on the Tully River and Proserpine River are wont to call on their totems by name before they fall asleep, and they believe that they derive certain benefits from so doing. For example, if their totem is an animal, it will warn the man who thus invokes it of the approach of other animals and so forth during his sleep; or, if it is itself a dangerous creature, such as a crocodile or a snake, it will not bite or sting the man without serving him with due notice of its intention to injure him. Again, if his totem is thunder or rain, the man who fails to invoke it will lose his power of making thunder or rain at will.[8b] Such beliefs and practices, it is clear, might grow into a regular propitiation or worship of the totems. Again, the Warramunga of Central Australia believe in the existence of a gigantic but wholly fabulous water-snake called Wollunqua, the totem and ancestor of one of their clans. His home is in a rocky gorge which runs into the heart of the Murchison Ranges. In this secluded spot there is a picturesque pool of deep water with a sandy margin on the south and a little precipice of red rock curving round the northern edge. Over these red rocks after rain the water tumbles in a cascade into the pool below, and the rocks are hollowed out below so that they beetle over the water, forming a long shallow cave, from the roof of which roots of trees, that have forced their way down through clefts, hang pendulous. According to the natives, the Wollunqua lives in the water of the pool, and the pendulous roots are his whiskers. They have a tradition that he once came out of the pool and destroyed some men and women, but was at last obliged to retreat under a shower of stones. To prevent him from repeating his ravages they perform ceremonies by which they seem to think that

they can at once propitiate and coerce him. Thus they make a long mound of wet sand and draw wavy bands on it to represent the water-snake. Round this at night they sing and dance by the light of fires until the earliest streak of dawn glimmers in the east. Then they attack the mound fiercely with their weapons and soon demolish it. If shortly afterwards they hear thunder rumbling in the distance, they declare that it is the voice of the water-snake saying that he is pleased with what they have done and that he will send rain. But if the remains of the ruined mound are left uncovered, he growls, and his growl is a peal of thunder. When they hear it they hasten to cover the ruins with branches, lest the snake should come and eat them up. On the other hand, the savage destruction of the mound seems to imply that they can to some extent control the beast by force. The Wollunqua differs from all other known Australian totems in that he is a purely mythical being. He is not the only snake totem of the Warramunga, but he is the most important, and, more than that, he apparently occupies in the native mind the position of a dominant totem.[9] In short, he seems to be a totem on the high road to become a god.

Again, in the south-eastern parts of Australia "a belief exists in an anthropomorphic supernatural being, who lives in the sky, and who is supposed to have some kind of influence on the morals of the natives. . . . This supernatural being, by whatever name he is known, is represented as having at one time dwelt on the earth, but afterwards to have ascended to a land beyond the sky, where he still remains, observing mankind. As Daramulun, he is said to be able 'to go anywhere and do anything.' He can be invisible; but when he makes himself visible, it is in the form of an old man of the Australian race. He is evidently everlasting, for he has existed from the beginning of things, and he still lives. But in being so he is merely in that state in which, these aborigines believe, every one would be, if not prematurely killed by evil magic. . . . In this being, though supernatural, there is no trace of a divine nature. All that can be said of him is that he is imagined as the ideal of those qualities which are, according to their standard, virtues worthy of being imitated. Such would be a man who is skilful in the use of weapons of offence and defence, all-powerful in magic, but generous and liberal to his people, who does no injury or violence to any one, yet treats with severity any breaches of custom or morality. Such is, according to my knowledge of the Australian tribes, their ideal of a headman, and naturally it is that of Biamban, the master, in the sky-country.

Such a being, from Bunjil to Baiame, is *Mami-ngata*, that is, 'our father'; in other words, the All-father of the tribes. . . . Although it cannot be alleged that these aborigines have consciously any form of religion, it may be said that their beliefs are such that, under favourable conditions, they might have developed into an actual religion, based on the worship of Mungan-ngaua, or Baiame. There is not any worship of Daramulun; but the dances round the figure of clay and the invocating of his name by the medicine-men certainly might have led up to it. If such a change as a recognised religion had ever become possible, I feel that it would have been brought about by those men who are the depositaries of the tribal beliefs, and by whom in the past, as I think, all the advances in the organisation of their society have been effected. If such a momentous change to the practice of a religion had ever occurred, those men would have readily passed from being medicine-men to the office of priests." [10]

On the other hand, "the Central Australian natives, and this is true of the tribes extending from Lake Eyre in the south to the far north, and eastwards across to the Gulf of Carpentaria, have no idea whatever of the existence of any supreme being who is pleased if they follow a certain line of what we call moral conduct, and displeased if they do not do so. They have not the vaguest idea of a personal individual other than an actual living member of the tribe who approves or disapproves of their conduct, so far as anything like what we call morality is concerned. . . . It must not, however, be imagined that the Central Australian native has nothing in the nature of a moral code. As a matter of fact he has a very strict one, and during the initiation ceremonies the youth is told that there are certain things which he must do and certain others which he must not do, but he quite understands that any punishment for the infringement of these rules of conduct, which are thus laid down for him, will come from the older men, and not at all from any supreme being, of whom he hears nothing whatever. In fact, he then learns that the spirit creature, whom up to that time, as a boy, he has regarded as all-powerful, is merely a myth, and that such a being does not really exist, and is only an invention of the men to frighten the women and children." [11] The aborigines of Central Australia are not the only people who have invented bugbears for the moral edification of youth. The Ona Indians of Tierra del Fuego pretend that the natural features of their country, such as the woods and rocks, the white mists and running waters, are haunted

by spirits of various sorts, "bogies in which they themselves do not believe, but which are a strong moral aid in dealing with refractory wives and wilful children." To impress this salutary belief on the feminine and youthful mind the men act the part of the spirits, disguised in appropriate costumes. Thus the spirit of the beech forests is represented by a man clad in moss and the bark of trees; the spirit of the lichen-grown rocks is played by an actor who is painted slate-colour, with daubs of red and yellow clay; the spirit of clouds and mist is dressed all in white, with a very long head partly made up of twigs, which are covered with skin and painted. Till they are initiated into these mysteries at the age of fourteen or so, the boys firmly believe in the bogies, and no wonder, inasmuch as they have been chased and scared by them. When the time of their initiation draws near, the lads are seriously exhorted by their elders. They must be keen hunters, and quick to avenge the spilt blood of their family. They must be careful of their own bodies, despising greed, and, above all, letting no woman share their inmost thoughts. At a series of nocturnal meetings they then learn the true nature of the "moral aid" by which their green unknowing youth has been trained in the way it should go. They are in fact introduced to the bogies, who turn out to be members of their own family. Any boy or man who betrays the secret is quietly put to death; and the same fate overtakes any woman who is suspected of knowing more than is good for her.[12]

In regard to the precepts inculcated on Central Australian boys at initiation, Messrs. Spencer and Gillen think it "most probable that they have originated in the first instance in association with the purely selfish desire of the older men to keep all the best things for themselves, and in no case whatever are they supposed to have the sanction of a superior being."[13] "As to the 'discovery' of a high ethical religion amongst the lowest savages there is not, I am convinced, any such thing in Australia. The great difficulty is that we have had statements made on the authority of men like Gason. The latter was a police-trooper, I believe, who was perfectly honest, but at the same time perfectly incapable of dealing with matters such as these. In the days when the evidence of Baiame and Daramulun was collected the importance of securing minute and detailed information was really not realised, nor was it imagined that there were men without any so-called religious ideas; and as I have endeavoured to point out in one of our chapters, it is the easiest thing possible to be

misled by what a native tells you in regard to such a point as this.'' [14]

As an example of the mistakes into which it is possible to fall on this subject, we may take Mr. S. Gason's statement that the Mura-mura of the Dieri is a Good Spirit or Deity,[15] whereas further inquiries have ascertained that the Mura-muras, male and female, young and old, are nothing more than the legendary predecessors or prototypes of the Dieri, who roamed over the country, resembling the present natives in their customs and mode of life, though they excelled them in their magical powers and the wonderful feats they performed.[16] Yet Mr. Gason was an honest man, and he enjoyed the best opportunities for making himself acquainted with the beliefs of the Dieri, for he lived among them on terms of intimacy for years, and he took a special interest in their customs and ideas, bequeathing to us accounts of them which, in spite of some grave mistakes, contain much that is valuable.[17] His error as to the supposed "Good Spirit" of the Dieri only shows how easy it is even for an honest inquirer, with the best intentions and the amplest means of ascertaining the facts, to misinterpret savage ideas in accordance with his own religious creed. Precisely the same mistake which Mr. Gason made as to the Mura-muras of the Dieri, other people have made as to the Balimo of the Basutos in South Africa. On this subject an experienced missionary writes: "The Basutos, like the Caffres in general, had no religious ideas before they came into

contact with the whites. It has been asked whether they knew at least the name of God. Their idea of the divinity must have been very confused, if I may judge by the heathen whom I have associated with for thirteen years. It is the missionaries, I believe, who have employed in the singular the name of God, *Molimo*, 'He who is on high,' for in the language *molimo* would mean 'ancestor,' and was not used except in the plural *Balimo* ('the ancestors'). However it may be with their vague knowledge of the name of God, it is certain that they had no worship, no prayer for the Supreme Being. No ruins of a temple have been found, no vestige of a sacrifice to God, no word designating a priest dedicated to His service. All that was found sixty or seventy years ago, when the first whites arrived in Basutoland, is to be found there to-day among the heathen; that is, the sacrifices to the ancestors."[18] Similarly, Dr. G. M'Call Theal, the learned historian of South Africa, writes of the Bantus in general, of whom the Basutos are a branch: "No man of this race, upon being told of the existence of a single supreme God, ever denies the assertion, and among many of the tribes there is even a name for such a being, as, for instance, the word Umkulunkulu, the Great Great One, used by the Hlubis and others. From this it has been assumed by some investigators that the Bantu are really monotheists, and that the spirits of their ancestors are regarded merely as mediators or intercessors. But such a conclusion is incorrect. The Great Great One was once a man, they all assert, and before our conception of a deity became known to them, he was the most powerful of the ancient chiefs, to whom tradition assigned supernatural knowledge and skill."[19]

Again, there is reason to believe that the accounts which savages give of their religious beliefs are often deliberately fabricated by them in order to deceive the white man. This source of error, though it is not limited to the religious sphere, applies especially to it, since the uncivilised, like the civilised, man is, in general, loth to reveal his most sacred beliefs to any chance inquirer. To win his confidence and elicit his inmost thoughts, it is necessary for the investigator either to have known him intimately for a long time, or to give evidence that he himself has already been initiated into mysteries of the same sort. But the deception practised by the savage sometimes springs from a different motive. In his amiable anxiety to oblige a stranger, he will often tell him whatever he imagines that the inquirer would

like to hear, without the least regard to the truth. Thus it is a custom with the Bantu "not to dispute with honoured guests, but to profess agreement with whatever is stated. This is regarded by those people as politeness, and it is carried to such an absurd extent that it is often difficult to obtain correct information from them. Thus if one asks a man, is it far to such a place? politeness requires him to reply it is far, though it may be close by. The questioner, by using the word far, is supposed to be under the impression that it is at a distance, and it would be rudeness to correct him. They express their thanks for whatever is told them, whether the intelligence is pleasing or not, and whether they believe it or not. Then, too, no one of them ever denies the existence of a Supreme Being, but admits it without hesitation as soon as he is told of it, though he may not once have thought of the subject before."[20]

In regard to the Australian aborigines, it appears that this source of error has also vitiated some of the accounts which have been given of their religious notions. "Many persons try to persuade themselves that they can detect the existence amongst these natives of a true religion and a knowledge of a Supreme Being, but they forget that these Blacks are extremely shrewd, so that when they perceive the object of the conversation, they readily adapt all that they have been taught on this subject to their replies. I have always found that the rigmarole stories which many of them have told me, and which are supposed to represent their religious belief, were founded upon the teachings of missionaries and others."[21] "I am strongly of opinion that those who have written to show that the Blacks had some knowledge of God, practised prayer, and believed in places of reward and punishment beyond the grave, have been imposed upon, and that until they had learnt something of Christianity from missionaries and others the Blacks had no beliefs and practices of the sort. Having heard the missionaries, however, they were not slow to invent what I may call kindred statements with aboriginal accessories, with a view to please and surprise the Whites."[22] In pursuing his researches in this subject, Dr. A. W. Howitt was on at least one occasion surprised, though not pleased, with "kindred statements" of this sort. Wishing to learn the native belief as to Brewin, a spirit whom the Kurnai dread, he questioned two of the most intelligent men, one of whom was a member of the Church of England. After consulting together for a few minutes, one of

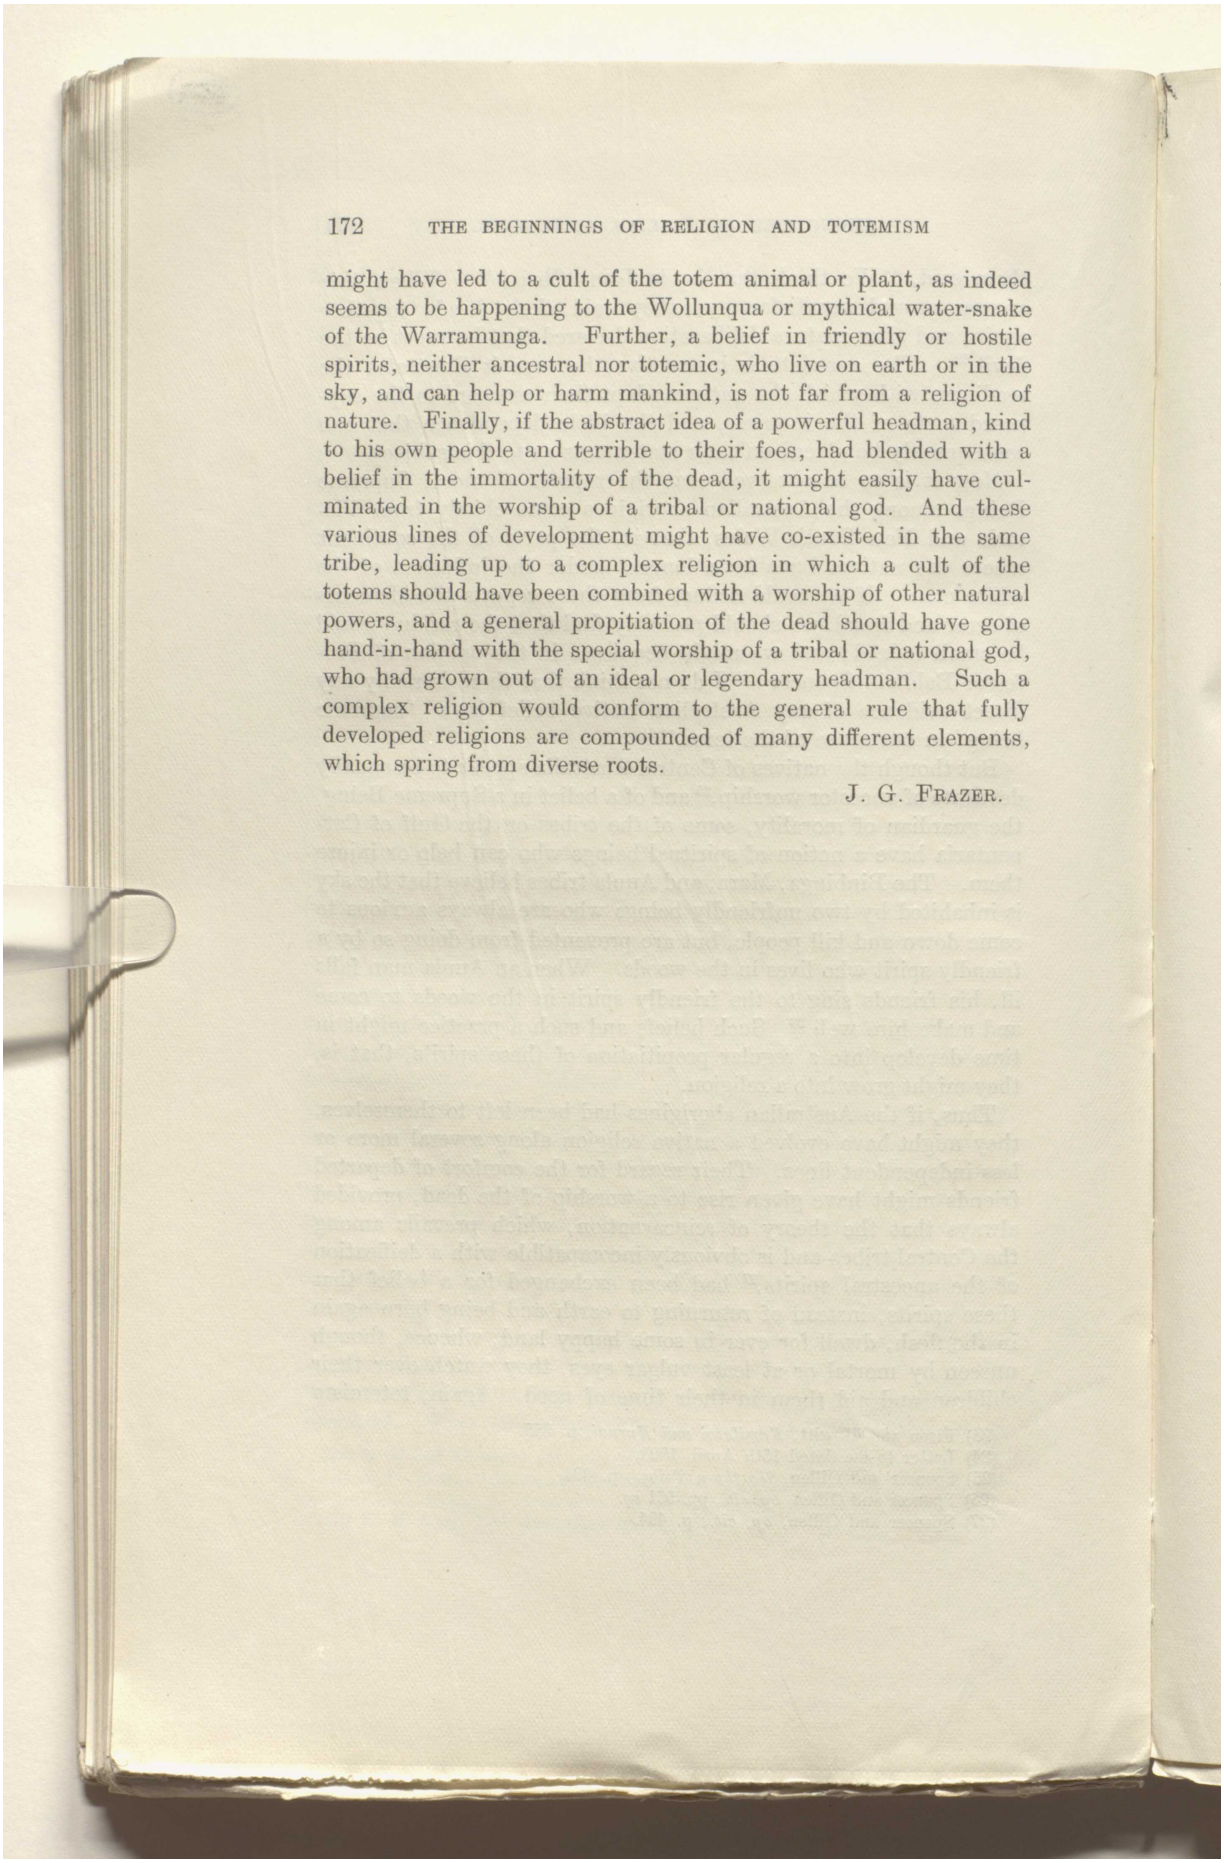
them said, "We think that he is Jesus Christ." When this answer proved unsatisfactory, they laid their heads together again, and after mature deliberation declared that he must be the devil.[23] The anecdote is instructive, because it illustrates the readiness with which the natives adapt their answers to the supposed taste of the inquirer, and the little dependence that can consequently be placed on their statements as to this subject.

Now it is to be observed that the reports of moral Supreme Beings among the Australian aborigines come chiefly from Victoria and New South Wales, that is, the parts of the continent where the natives have been longest under the influence of the white man. If we could deduct from these reports the elements of error and fraud, we should probably find that the residue would be small indeed; and we might acquiesce in the opinion of Professor Baldwin Spencer: "I do not think that there is really any direct evidence of any Australian native belief in a 'supreme being' in our sense of the term."[24]

But though the natives of Central Australia appear to be equally destitute of ancestor worship,[25] and of a belief in a Supreme Being, the guardian of morality, some of the tribes on the Gulf of Carpentaria have a notion of spiritual beings who can help or injure them. The Binbinga, Mara, and Anula tribes believe that the sky is inhabited by two unfriendly beings who are always anxious to come down and kill people, but are prevented from doing so by a friendly spirit who lives in the woods. When an Anula man falls ill, his friends sing to the friendly spirit in the woods to come and make him well.[26] Such beliefs and such a practice might in time develop into a regular propitiation of these spirits, that is, they might grow into a religion.



Thus, if the Australian aborigines had been left to themselves, they might have evolved a native religion along several more or less independent lines. Their regard for the comfort of departed friends might have given rise to a worship of the dead, provided always that the theory of reincarnation, which prevails among the Central tribes and is obviously incompatible with a deification of the ancestral spirits,[27] had been exchanged for a belief that these spirits, instead of returning to earth and being born again in the flesh, dwell for ever in some happy land, whence, though unseen by mortal or at least vulgar eyes, they watch over their children and aid them in their time of need. Again, totemism

might have led to a cult of the totem animal or plant, as indeed seems to be happening to the Wollunqua or mythical water-snake of the Warramunga. Further, a belief in friendly or hostile spirits, neither ancestral nor totemic, who live on earth or in the sky, and can help or harm mankind, is not far from a religion of nature. Finally, if the abstract idea of a powerful headman, kind to his own people and terrible to their foes, had blended with a belief in the immortality of the dead, it might easily have culminated in the worship of a tribal or national god. And these various lines of development might have co-existed in the same tribe, leading up to a complex religion in which a cult of the totems should have been combined with a worship of other natural powers, and a general propitiation of the dead should have gone hand-in-hand with the special worship of a tribal or national god, who had grown out of an ideal or legendary headman. Such a complex religion would conform to the general rule that fully developed religions are compounded of many different elements, which spring from diverse roots.

NOSTALGIA.

BY

GRAZIA DELEDDA,

Author of "Cenere," &c.

Translated by HELEN HESTER COLVILL.

III.

THAT winter was cold in Rome, and the rain seemed endless. Even days which began fine grew suddenly dark; the wind rose, and down came a deluge. Luckily, the showers did not last. Soon the pavements dried, the clouds blew away, the sky became blue, as if smiling at an accomplished jest. The people, however, came home with their clothes drenched, their boots soaking, their chests racked with coughs, and their bosoms with evil temper.

"Your famous Roman sky seems to me a lunatic asylum without any warders," said Regina to her husband; "a bedlam where the raging clouds do whatever they like."

And that rainy winter proved one of the saddest in the young wife's whole life. True, she loved Antonio; the first day he left her to resume his work she felt a profound emptiness, and knew herself henceforth attached to him as firmly as the bark to the tree. But existence in the Casa Venutelli, association with her mother-in-law, the presence of Sor Gaspare, the gloomy bedroom with those immense armchairs, heavy as vulgar destiny, proved altogether unbearable.

And Rome was horrible under the continuous rain, which had something malicious and mocking about it. People hurried through the streets, their faces livid; the women showed petticoat-edges pasted with mud; the heaven itself was soiled; and Regina's soul made shipwreck amid this ocean of mud and water. She would come in drenched and exasperated; within-doors it was cold; there was no fire, and there was continual annoyance. She was uncomfortable at table in those old round chairs, opposite the sarcastic countenance of Massimo, Sor Gaspare's red visage, the enormous panting bosom of Signora Anna. At night she was worse off still on that lumpy mattress, in the cold air which was pervaded by the rumble of the trams, and the melancholy rolling of purposeless carriages.

Was this the life of Rome? Nay, was this Rome? What? This the famous Corso—this narrow, smelly, mud-splashed street, with its carriage loads of old and hideous women, its foot passengers

squashing and treading upon each other like flocks of stupid sheep? And was this St. Peter's? Regina had expected it larger. That the Pincio? It was not beautiful. The Colosseum? She had supposed it more sublime. Where were the grandeur and magnificence? She could discover neither; everything appeared melancholy and hollow. She felt no astonishment at anything except her own impressions, and found a dreary pleasure in the thought that among all the provincials who came to Rome to be overwhelmed, she alone saw things in their true light. Sometimes she made exaggerated display of her own superiority; but self-examination convinced her it was tainted by personal rancour, and she felt sadder than ever. What was it she wanted? What did she expect? She felt sick of some deep wound. In vain she told herself the winter would pass, she would soon leave this distasteful house where everything seemed to freeze and suffocate her. Alas! her own sweet home was never, never to be found again!

After hurried visits to monuments and museums, and a promise of more leisurely re-inspection—promise made by all who fix their dwelling in Rome, and seldom fulfilled under months and years—Regina and Antonio began the (more interesting) round of *appartamenti* to be let.

Between the salary of the one and the dowry of the other, they counted on a fixed income of 3,000 *lire*. Antonio received a small addition from the princess, who had, however, other advisers, and only consulted him in certain affairs which brought her into collision with the Treasury. The means of the young couple would not therefore allow them more than a small "apartment" at fifty or sixty *lire* a month. They began their search in Via Massimo d'Azeglio, where a possibly suitable suite of rooms was to fall vacant in January. Regina, oppressed with doubts, entered a lordly entrance hall, from which led a principal staircase of fine marble. The second stair was perfectly dark at the bottom, but got brighter and brighter as it went up. Regina began to count its steps.

"Eleven, twenty-two, thirty-three, forty-four, fifty-five, sixty-three—you don't tell me there are more?"

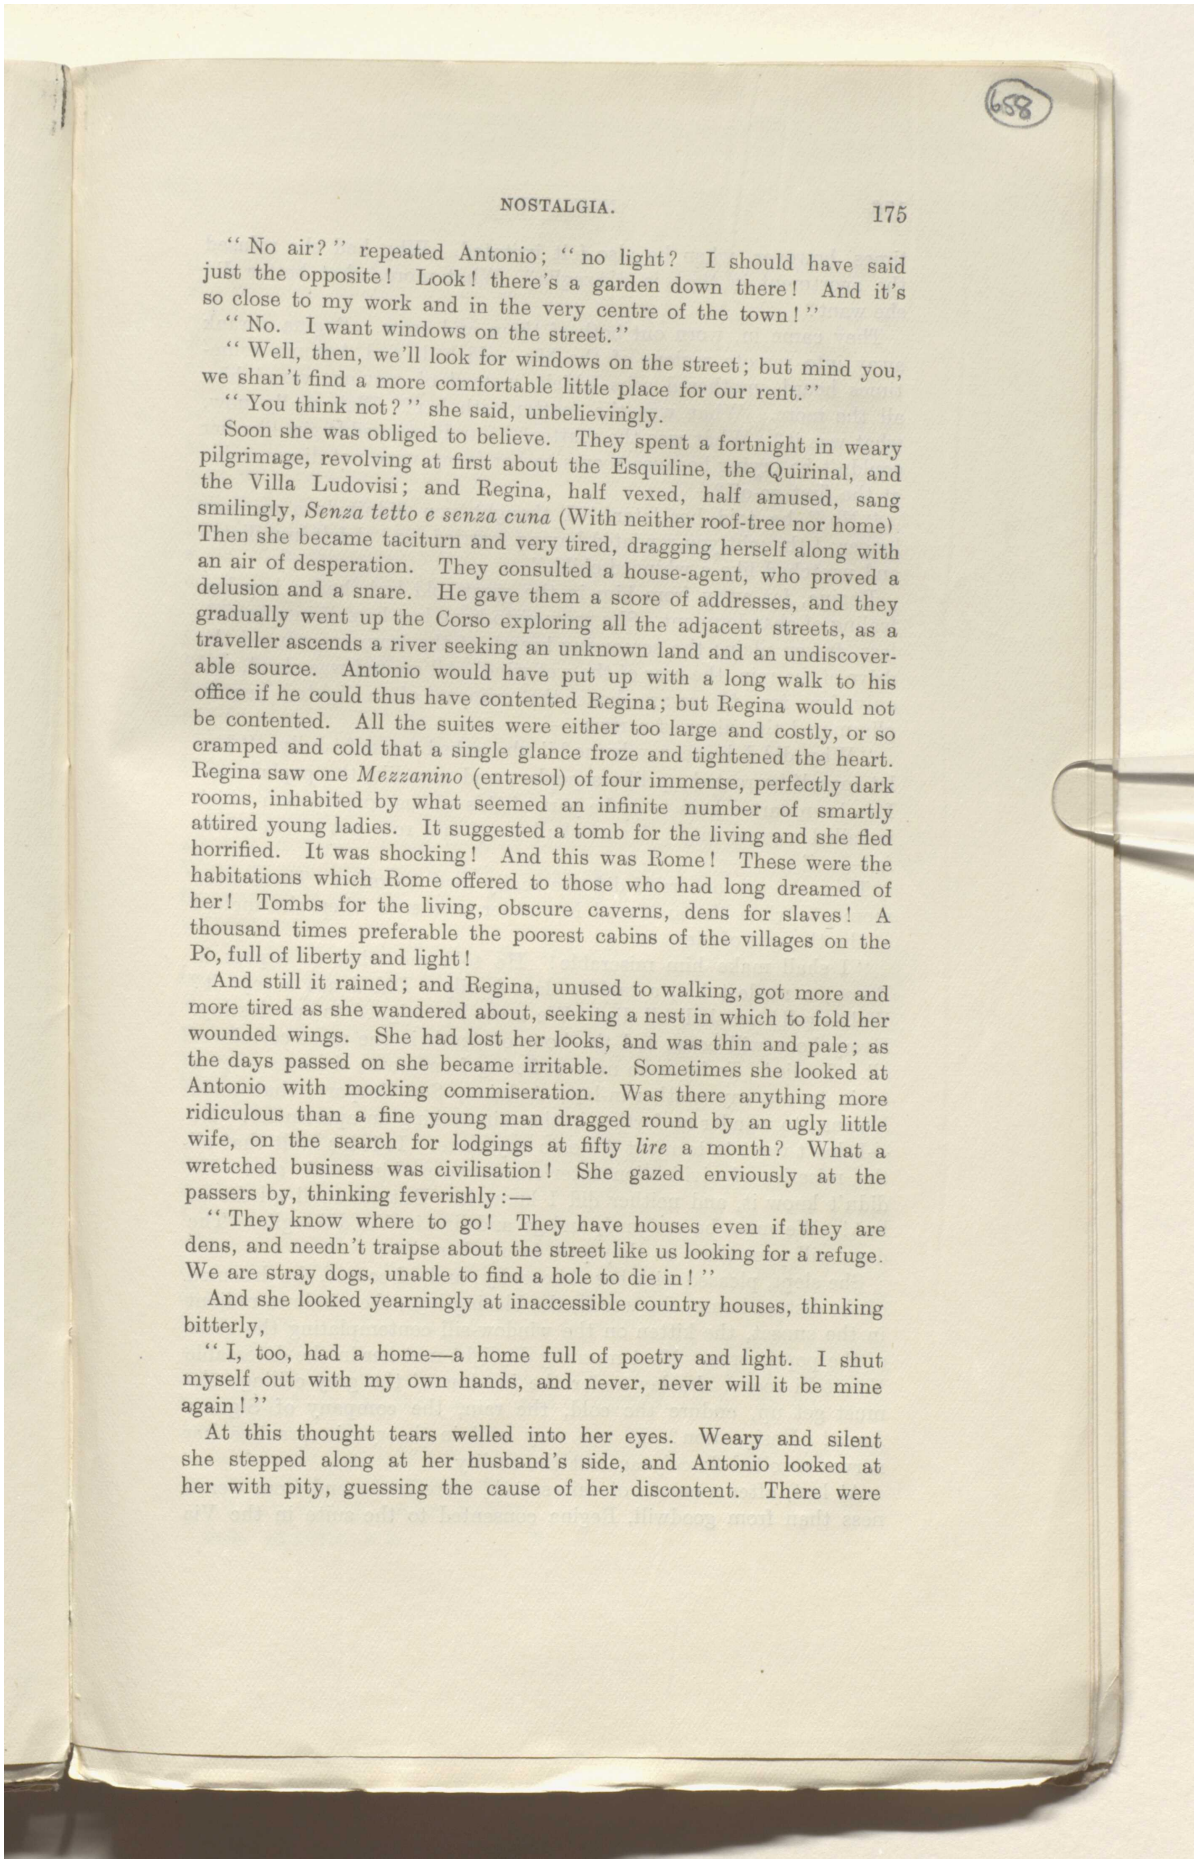
She stopped, her heart beating violently. Antonio smiled indulgently; he took his little queen by the arm and helped her up; the higher they went, the steeper the steps became.

"Eighty-eight; ninety-nine. Goodness! more?"

"Courage!"

"A hundred and ten!"

By the grace of God they had arrived; but before the door was opened, the trembling and panting wife had said bitterly to herself, "Is this where Regina is to live? Never! never!"



The "apartment" was suitable and pretty; a real nest in the heart of the city's great forest of stone. Two windows looked out on a garden; the rest on a court none too clean.

Regina declared at once that there was no air and no light, and in fact that the rooms would not do at all.

BRITISH LIBRARY

"No air?" repeated Antonio; "no light? I should have said just the opposite! Look! there's a garden down there! And it's so close to my work and in the very centre of the town!"

"No. I want windows on the street."

"Well, then, we'll look for windows on the street; but mind you, we shan't find a more comfortable little place for our rent."

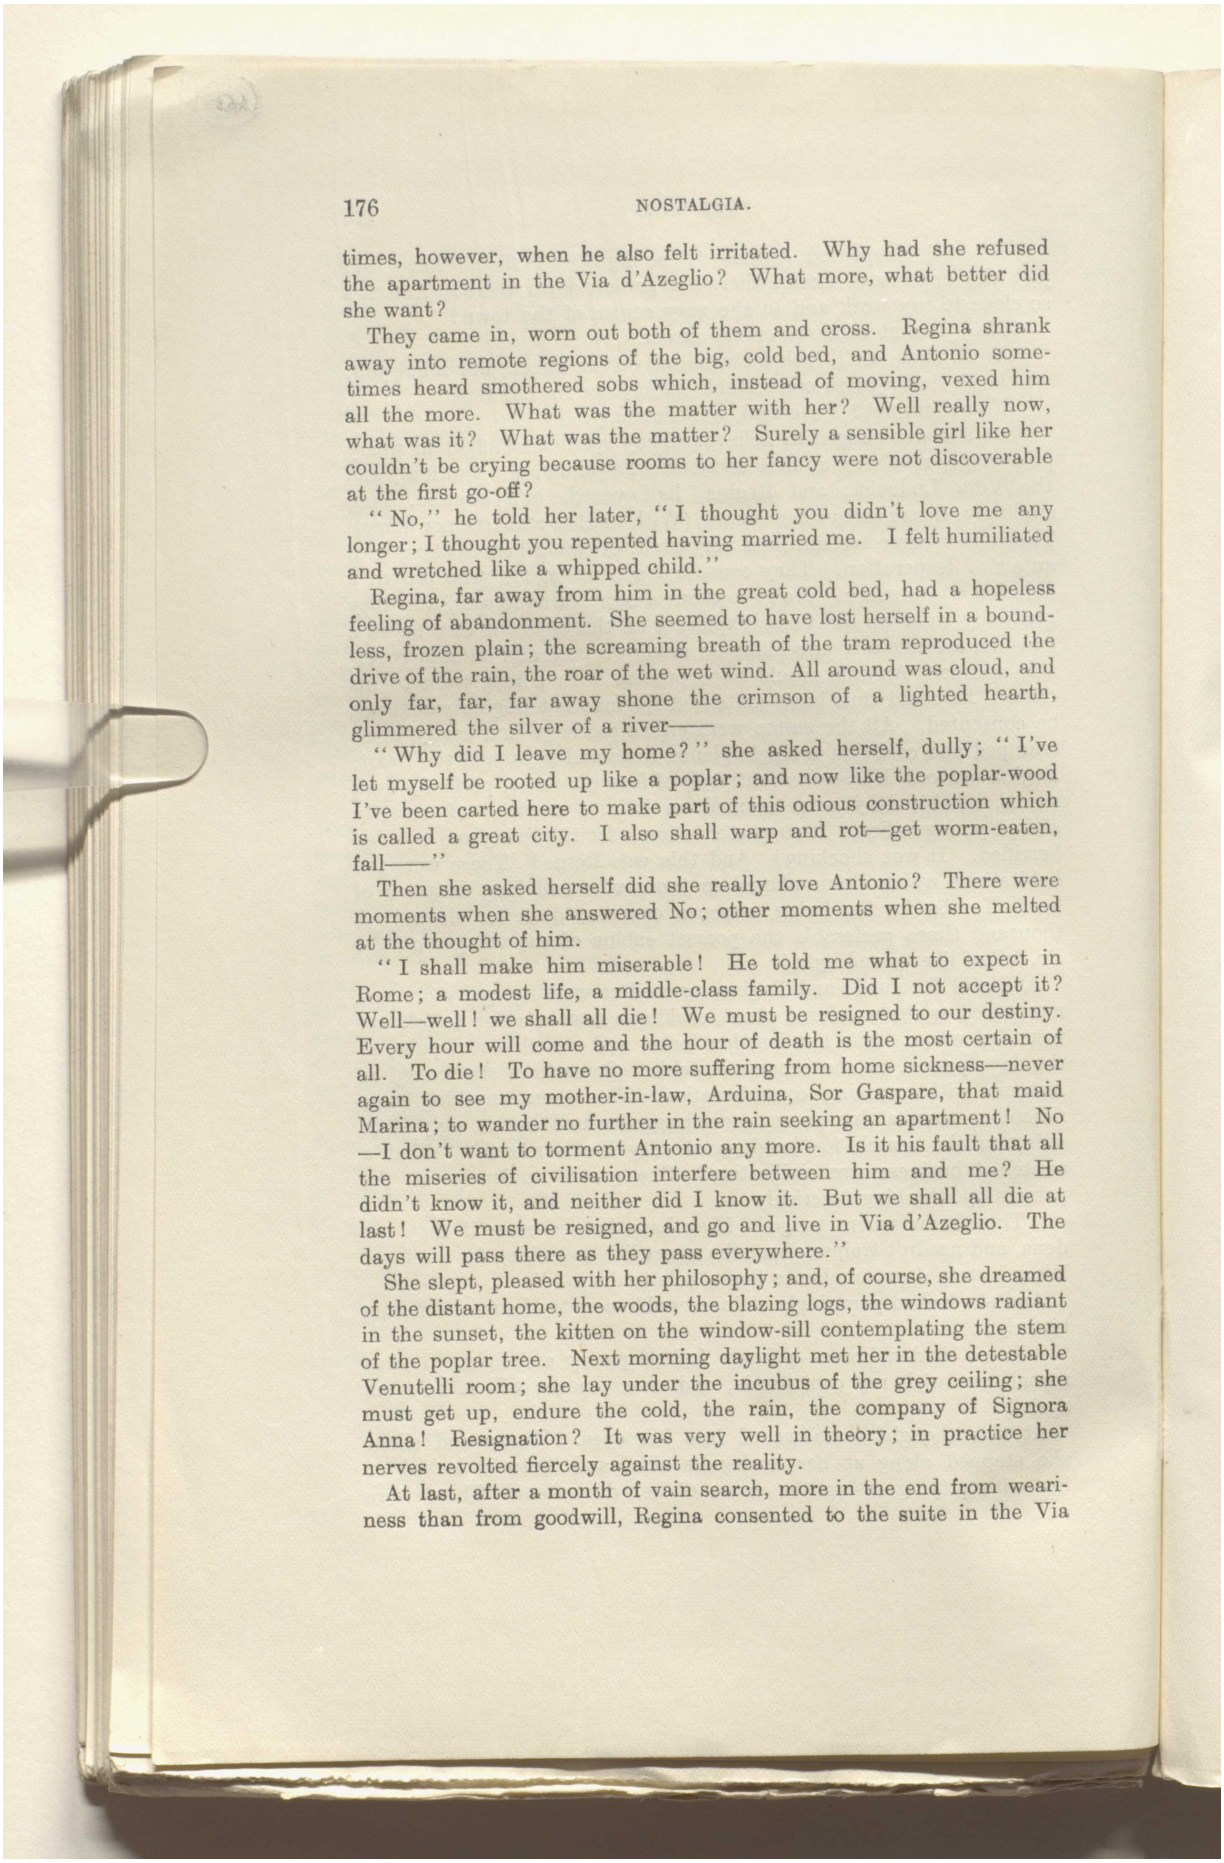
"You think not?" she said, unbelievingly.

Soon she was obliged to believe. They spent a fortnight in weary pilgrimage, revolving at first about the Esquiline, the Quirinal, and the Villa Ludovisi; and Regina, half vexed, half amused, sang smilingly, *Senza tetto e senza cuna* (With neither roof-tree nor home) Then she became taciturn and very tired, dragging herself along with an air of desperation. They consulted a house-agent, who proved a delusion and a snare. He gave them a score of addresses, and they gradually went up the Corso exploring all the adjacent streets, as a traveller ascends a river seeking an unknown land and an undiscoverable source. Antonio would have put up with a long walk to his office if he could thus have contented Regina; but Regina would not be contented. All the suites were either too large and costly, or so cramped and cold that a single glance froze and tightened the heart. Regina saw one *Mezzanino* (entresol) of four immense, perfectly dark rooms, inhabited by what seemed an infinite number of smartly attired young ladies. It suggested a tomb for the living and she fled horrified. It was shocking! And this was Rome! These were the habitations which Rome offered to those who had long dreamed of her! Tombs for the living, obscure caverns, dens for slaves! A thousand times preferable the poorest cabins of the villages on the Po, full of liberty and light!

And still it rained; and Regina, unused to walking, got more and more tired as she wandered about, seeking a nest in which to fold her wounded wings. She had lost her looks, and was thin and pale; as the days passed on she became irritable. Sometimes she looked at Antonio with mocking commiseration. Was there anything more ridiculous than a fine young man dragged round by an ugly little wife, on the search for lodgings at fifty *lire* a month? What a wretched business was civilisation! She gazed enviously at the passers by, thinking feverishly:—

"They know where to go! They have houses even if they are dens, and needn't traipse about the street like us looking for a refuge. We are stray dogs, unable to find a hole to die in!"

And she looked yearningly at inaccessible country houses, thinking bitterly,



"I, too, had a home—a home full of poetry and light. I shut myself out with my own hands, and never, never will it be mine again!"

At this thought tears welled into her eyes. Weary and silent she stepped along at her husband's side, and Antonio looked at her with pity, guessing the cause of her discontent. There were

BRITISH LIBRARY

times, however, when he also felt irritated. Why had she refused the apartment in the Via d'Azeglio? What more, what better did she want?

They came in, worn out both of them and cross. Regina shrank away into remote regions of the big, cold bed, and Antonio sometimes heard smothered sobs which, instead of moving, vexed him all the more. What was the matter with her? Well really now, what was it? What was the matter? Surely a sensible girl like her couldn't be crying because rooms to her fancy were not discoverable at the first go-off?

"No," he told her later, "I thought you didn't love me any longer; I thought you repented having married me. I felt humiliated and wretched like a whipped child."

Regina, far away from him in the great cold bed, had a hopeless feeling of abandonment. She seemed to have lost herself in a boundless, frozen plain; the screaming breath of the tram reproduced the drive of the rain, the roar of the wet wind. All around was cloud, and only far, far, far away shone the crimson of a lighted hearth, glimmered the silver of a river——

"Why did I leave my home?" she asked herself, dully; "I've let myself be rooted up like a poplar; and now like the poplar-wood I've been carted here to make part of this odious construction which is called a great city. I also shall warp and rot—get worm-eaten, fall——"

Then she asked herself did she really love Antonio? There were moments when she answered No; other moments when she melted at the thought of him.

"I shall make him miserable! He told me what to expect in Rome; a modest life, a middle-class family. Did I not accept it? Well—well! we shall all die! We must be resigned to our destiny. Every hour will come and the hour of death is the most certain of all. To die! To have no more suffering from home sickness—never again to see my mother-in-law, Arduina, Sor Gaspare, that maid Marina; to wander no further in the rain seeking an apartment! No—I don't want to torment Antonio any more. Is it his fault that all the miseries of civilisation interfere between him and me? He didn't know it, and neither did I know it. But we shall all die at last! We must be resigned, and go and live in Via d'Azeglio. The days will pass there as they pass everywhere."

She slept, pleased with her philosophy; and, of course, she dreamed of the distant home, the woods, the blazing logs, the windows radiant in the sunset, the kitten on the window-sill contemplating the stem of the poplar tree. Next morning daylight met her in the detestable Venutelli room; she lay under the incubus of the grey ceiling; she must get up, endure the cold, the rain, the company of Signora Anna! Resignation? It was very well in theory; in practice her nerves revolted fiercely against the reality.

At last, after a month of vain search, more in the end from weariness than from goodwill, Regina consented to the suite in the Via

d'Azeglio for one year. Yet on the very day of signing the agreement she repented, abandoning all self-control.

"Was it worth while leaving my home and coming to Rome to live in a box? I shall be suffocated! I shall die!" she cried.

Nor could Antonio longer contain himself.

"Can't you say what it is you want?" he exclaimed in a fury. "Did you imagine you were marrying a prince? You knew all I had to offer! You told me a hundred times you hadn't corrupted your soul with vain ambitions; you said you were robust and unselfish—you said you didn't ask impossible things of life! Why don't you look back instead of always looking ahead? Didn't you say you were a bit of a Socialist? Well then, why don't you compare your condition with that of millions and millions of other women?"

She wept, leaning her forehead against the window pane. Of course it was raining, and it seemed to her that the heavens wept with her. She knew Antonio was right, although he looked at the matter merely on its material side, and did not understand the real causes of her discontent.

However, she laughed through her tears, laughed proudly and ironically.

"If you speak like that, we are done for," she said.

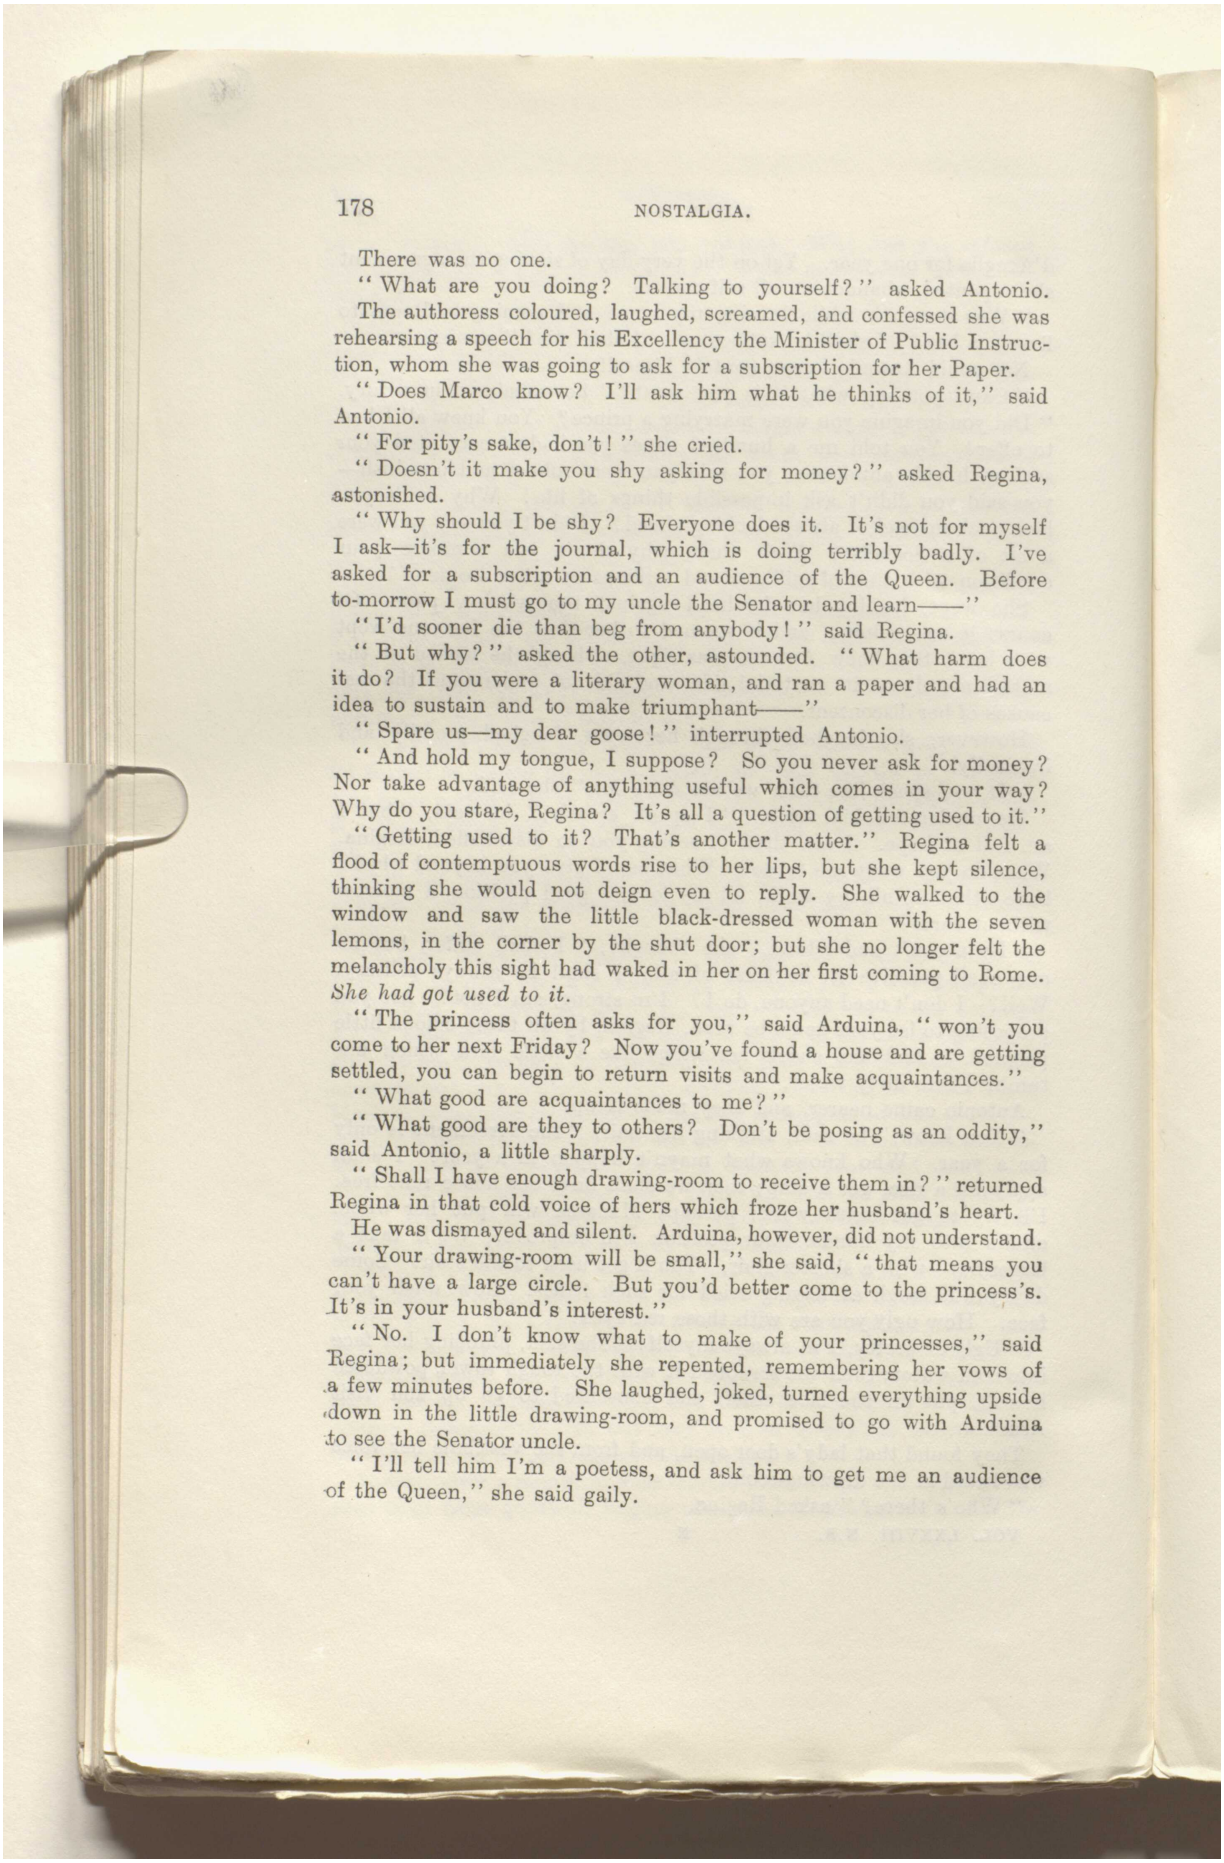
He moderated his voice. "I speak crossly," he said, "but I am full of hope. I am tired of seeing you so dissatisfied, Regina. What do you want me to do? What can I give you beyond what I have—that is, all my work, all my love, a good position, a morrow without cares?"

"He doesn't understand," she thought; "I shall suffer, but no one shall perceive it, he least of all. I shall be always solitary. Well? I don't need anyone, do I? I'm strong, am I not? Are you proposing to let your heart be seen, Regina, by all these odious little people?" And she shook her wings like a little bird which has tumbled into dirty water.

Antonio came nearer, and they made it up.

"You know," he said, stroking her hair, "the agreement is only for a year. Who knows what mayn't happen in a year? I shall apply for a rise, get a step; then we shall have our house rent free. I'll try to get extra work; perhaps Madame will put her whole affairs into my hands. Our position will improve. We'll take a larger flat—with a shorter stair. You'll get used to the stair. Some day you'll laugh at having cried for such trifles. Now wash your face. How ugly you are with those red eyes!"

"Ugly or pretty, I'm always myself!" she said, plunging her face into cold water; then she scrubbed it with the rough towel, powdered herself, put on the lace scarf, and consented to go up and visit Arduina.



They found that lady's door open, and from the vestibule her voice was heard in the drawing-room.

"Who's there?" asked Regina.

There was no one.

"What are you doing? Talking to yourself?" asked Antonio.

The authoress coloured, laughed, screamed, and confessed she was rehearsing a speech for his Excellency the Minister of Public Instruction, whom she was going to ask for a subscription for her Paper.

"Does Marco know? I'll ask him what he thinks of it," said Antonio.

"For pity's sake, don't!" she cried.

"Doesn't it make you shy asking for money?" asked Regina, astonished.

"Why should I be shy? Everyone does it. It's not for myself I ask—it's for the journal, which is doing terribly badly. I've asked for a subscription and an audience of the Queen. Before to-morrow I must go to my uncle the Senator and learn——"

"I'd sooner die than beg from anybody!" said Regina.

"But why?" asked the other, astounded. "What harm does it do? If you were a literary woman, and ran a paper and had an idea to sustain and to make triumphant——"

"Spare us—my dear goose!" interrupted Antonio.

"And hold my tongue, I suppose? So you never ask for money? Nor take advantage of anything useful which comes in your way? Why do you stare, Regina? It's all a question of getting used to it."

"Getting used to it? That's another matter." Regina felt a flood of contemptuous words rise to her lips, but she kept silence, thinking she would not deign even to reply. She walked to the window and saw the little black-dressed woman with the seven lemons, in the corner by the shut door; but she no longer felt the melancholy this sight had waked in her on her first coming to Rome. *She had got used to it.*

"The princess often asks for you," said Arduina, "won't you come to her next Friday? Now you've found a house and are getting settled, you can begin to return visits and make acquaintances."

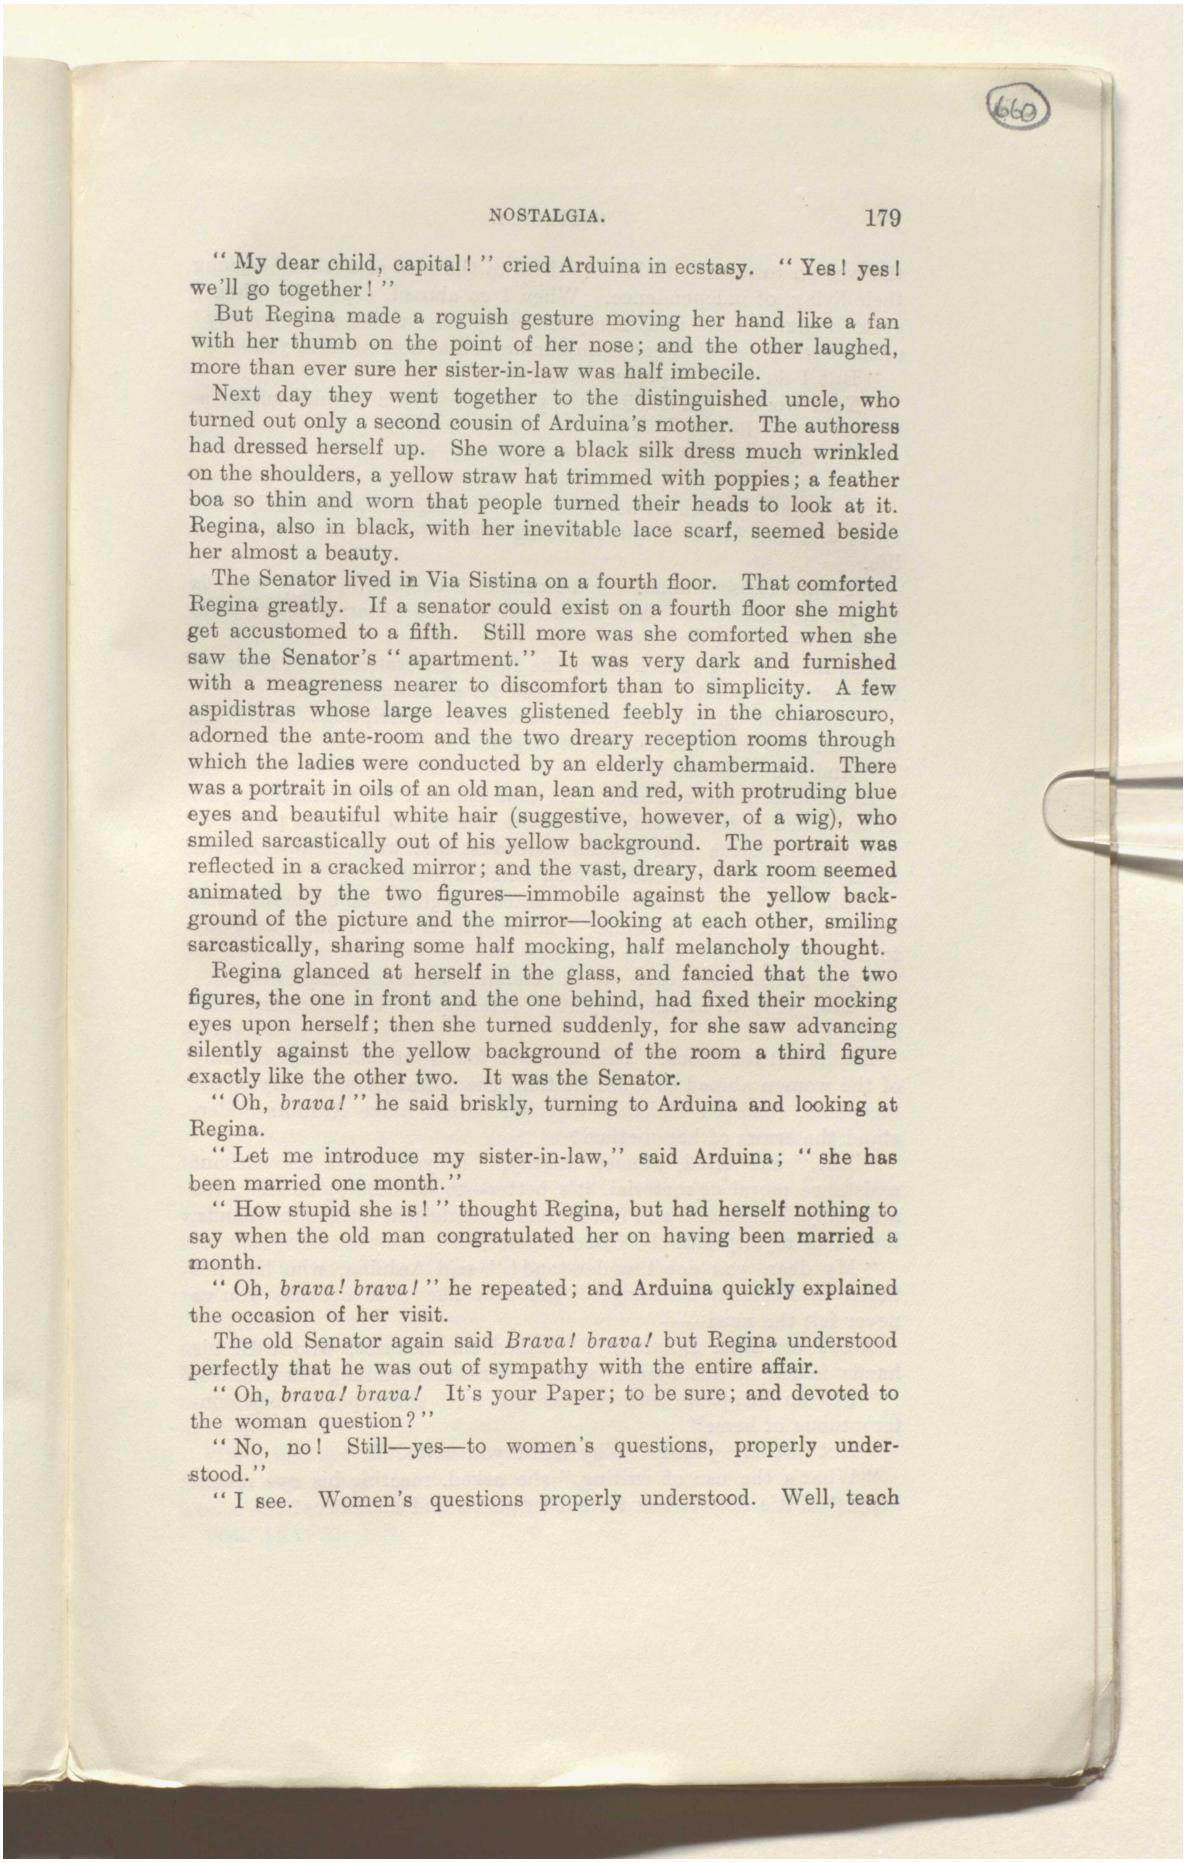
"What good are acquaintances to me?"

"What good are they to others? Don't be posing as an oddity," said Antonio, a little sharply.

"Shall I have enough drawing-room to receive them in?" returned Regina in that cold voice of hers which froze her husband's heart.

He was dismayed and silent. Arduina, however, did not understand.

"Your drawing-room will be small," she said, "that means you can't have a large circle. But you'd better come to the princess's. It's in your husband's interest."



"No. I don't know what to make of your princesses," said Regina; but immediately she repented, remembering her vows of a few minutes before. She laughed, joked, turned everything upside down in the little drawing-room, and promised to go with Arduina to see the Senator uncle.

"I'll tell him I'm a poetess, and ask him to get me an audience of the Queen," she said gaily.

"My dear child, capital!" cried Arduina in ecstasy. "Yes! yes! we'll go together!"

But Regina made a roguish gesture moving her hand like a fan with her thumb on the point of her nose; and the other laughed, more than ever sure her sister-in-law was half imbecile.

Next day they went together to the distinguished uncle, who turned out only a second cousin of Arduina's mother. The authoress had dressed herself up. She wore a black silk dress much wrinkled on the shoulders, a yellow straw hat trimmed with poppies; a feather boa so thin and worn that people turned their heads to look at it. Regina, also in black, with her inevitable lace scarf, seemed beside her almost a beauty.

The Senator lived in Via Sistina on a fourth floor. That comforted Regina greatly. If a senator could exist on a fourth floor she might get accustomed to a fifth. Still more was she comforted when she saw the Senator's "apartment." It was very dark and furnished with a meagreness nearer to discomfort than to simplicity. A few aspidistras whose large leaves glistened feebly in the chiaroscuro, adorned the ante-room and the two dreary reception rooms through which the ladies were conducted by an elderly chambermaid. There was a portrait in oils of an old man, lean and red, with protruding blue eyes and beautiful white hair (suggestive, however, of a wig), who smiled sarcastically out of his yellow background. The portrait was reflected in a cracked mirror; and the vast, dreary, dark room seemed animated by the two figures—immobile against the yellow background of the picture and the mirror—looking at each other, smiling sarcastically, sharing some half mocking, half melancholy thought.

Regina glanced at herself in the glass, and fancied that the two figures, the one in front and the one behind, had fixed their mocking eyes upon herself; then she turned suddenly, for she saw advancing silently against the yellow background of the room a third figure exactly like the other two. It was the Senator.

"Oh, *brava!*" he said briskly, turning to Arduina and looking at Regina.

"Let me introduce my sister-in-law," said Arduina; "she has been married one month."

"How stupid she is!" thought Regina, but had herself nothing to say when the old man congratulated her on having been married a month.

"Oh, *brava! brava!*" he repeated; and Arduina quickly explained the occasion of her visit.

The old Senator again said *Brava! brava!* but Regina understood perfectly that he was out of sympathy with the entire affair.

"Oh, *brava! brava!* It's your Paper; to be sure; and devoted to the woman question?"

"No, no! Still—yes—to women's questions, properly understood."

"I see. Women's questions properly understood. Well, teach

the women to work. Habituate them to the idea of work, of earning their living, of independence. When I go abroad, especially when I go to England, I am immensely struck by the 'moral physiognomy' of the women—so different from our women at home—from you——"

"But I do work!" protested Arduina.

"Your work is not sufficiently profitable if you require subscriptions!" cried Regina.

"Oh, *brava! brava!* And you, I suppose, write too?"

"Oh, no! I don't do anything!"

The Senator looked at her with his mocking and melancholy blue eyes; and she blushed, remembering she had never worked in her life.

"I want subscriptions," said Arduina, "because in Italy work is not yet remunerative. But in the future—the generations we shall educate——" &c., &c., &c.

She made a long speech about the future generations, and returned to her starting point: the urgent need for a subscription.

"Bless the girl! She shall have the subscription!" said the Senator, who was still looking at Regina.

"And the audience also?"

He promised the audience. At that moment he was smiling just as he smiled in the portrait and in the mirror; and Regina perceived that he pitied the poor Italian journalist and was thinking of the moral physiognomy of the working Englishwomen.

"But why the audience?" asked Regina, emboldened and imitating the Senator's smile; "subscriptions are all very well—up to a certain point—but the audience——"

"It's a moral support. With reference to my principles——"

"Yes, yes; a moral support," interrupted the Senator, still smiling.

Regina felt rebellious. This man who found the moral physiognomy of the women abroad so different from the moral physiognomy of the incapable, enslaved Italians—why did he not make Arduina understand the errors of her method?

"But," she cried, almost angrily, "if you can't do without assistance moral or material, it's better—to do nothing at all! We are always despoilers; and it's all one if we despoil fathers, husbands, lovers, or royalty and the Government!"

"My dear, you don't understand!" said Arduina, who had not taken in Regina's meaning; "you talk like that because you've never felt the need——"

"You are from Lombardy?" asked the Senator, who with his hands folded on his breast, amused himself twiddling his thumbs.

"I'm an incapable and useless Italian," she replied, very contemptuous of herself.

"But you are young. Why don't you write?"

"What's the use of writing," she asked, meeting his eye mockingly, "if it's only to ask for subscriptions and audiences?"

The old man, still twiddling his thumbs, rose and took a step towards the younger lady.

"What's your impression of Rome?"

"Bad! It bores me! Town life is so wretched and gloomy. Besides, it does nothing but rain," said Regina, and laughed.

"What makes him stare so?" she thought; "can I possibly have the moral physiognomy of the English ladies?"

The old man stood in front of her, his back to Arduina, whose presence he seemed to have forgotten.

"Town life is wretched," he said, "because it's empty. Our women are full of useless aspirations, and as you say despoil their men, who deteriorate working too hard for their families. In those societies where the woman works also, the man has a free margin for the development of his abilities. In England——"

"But what can we do," repeated Regina, "if we haven't been brought up to work?"

The Senator did not appear to hear her. He drew a picture of English society where the whole middle class, the professional, and the working classes alike kept themselves up in literature, art, politics, and promoted free discussion on all subjects; where the women were not bored, because they worked.

"They have hundreds of authoresses, translators, newspaper correspondents, who make more than 10,000 *lire* every year, some a great deal more. Mrs. H. W.—do you know how much she gets for each of her books?"

Regina did not know.

"More than seven or eight thousand pounds."

Arduina hastily made the calculation.

"More than 200,000 *lire*?" she said, awestruck. "Dear me! I shouldn't like to make all that!"

"Why not?"

"Because I should go off my head!"

"But in Italy——" began Regina.

"In Italy, too, a woman may earn a good deal. Work! work! there's the secret."

Regina left the old Senator's dark and melancholy house with a new ray of light in her mind. Work! work! Yes, she also wanted work! She would begin to write. If she was no good for anything else, at least she might make some money. She wanted work; she wanted money; above all she wanted to live.

"I'll escape from this narrow circle which is strangling me. I'll look life in the face. I'll lose myself in the great streets of Rome, feel the soul of the crowd, write descriptions of the lives of the poor, of those who are bored, of those who seem happy and are not—life as it is——"

When she got home, she looked round with pitying eyes. Yes! Signora Anna and the maid, Arduina and the brothers-in-law, the whole environment and the souls set in it, all moved her to pity.

And this pity gave her a feeling of soft sweet warmth, of profound well-being.

Antonio had not come in, and Regina stayed in her room. She took a book and sat by the closed window. Evening came on. Little by little the warmth which had been the result of the expedition died out. The light failed. Great impalpable veils fell down round her, slowly, one after the other. The book she held in her hand was so futile that she had not been able to read two pages. She shut it up and looked at the sky. But the line of sky above the ugly opposite façade was so ashen and heavy that it gave her the impression of a sheet of metal. Only one little red cloud, a wandering flame, illuminated the ashes of this dead heaven.

Suddenly Regina felt a great emptiness, a great cold within herself. That little cloud had reminded her of the distant hearth fire in her home! of all the little, simple, voiceless things which yet were greater and brighter than all glory, all riches. She thought:—

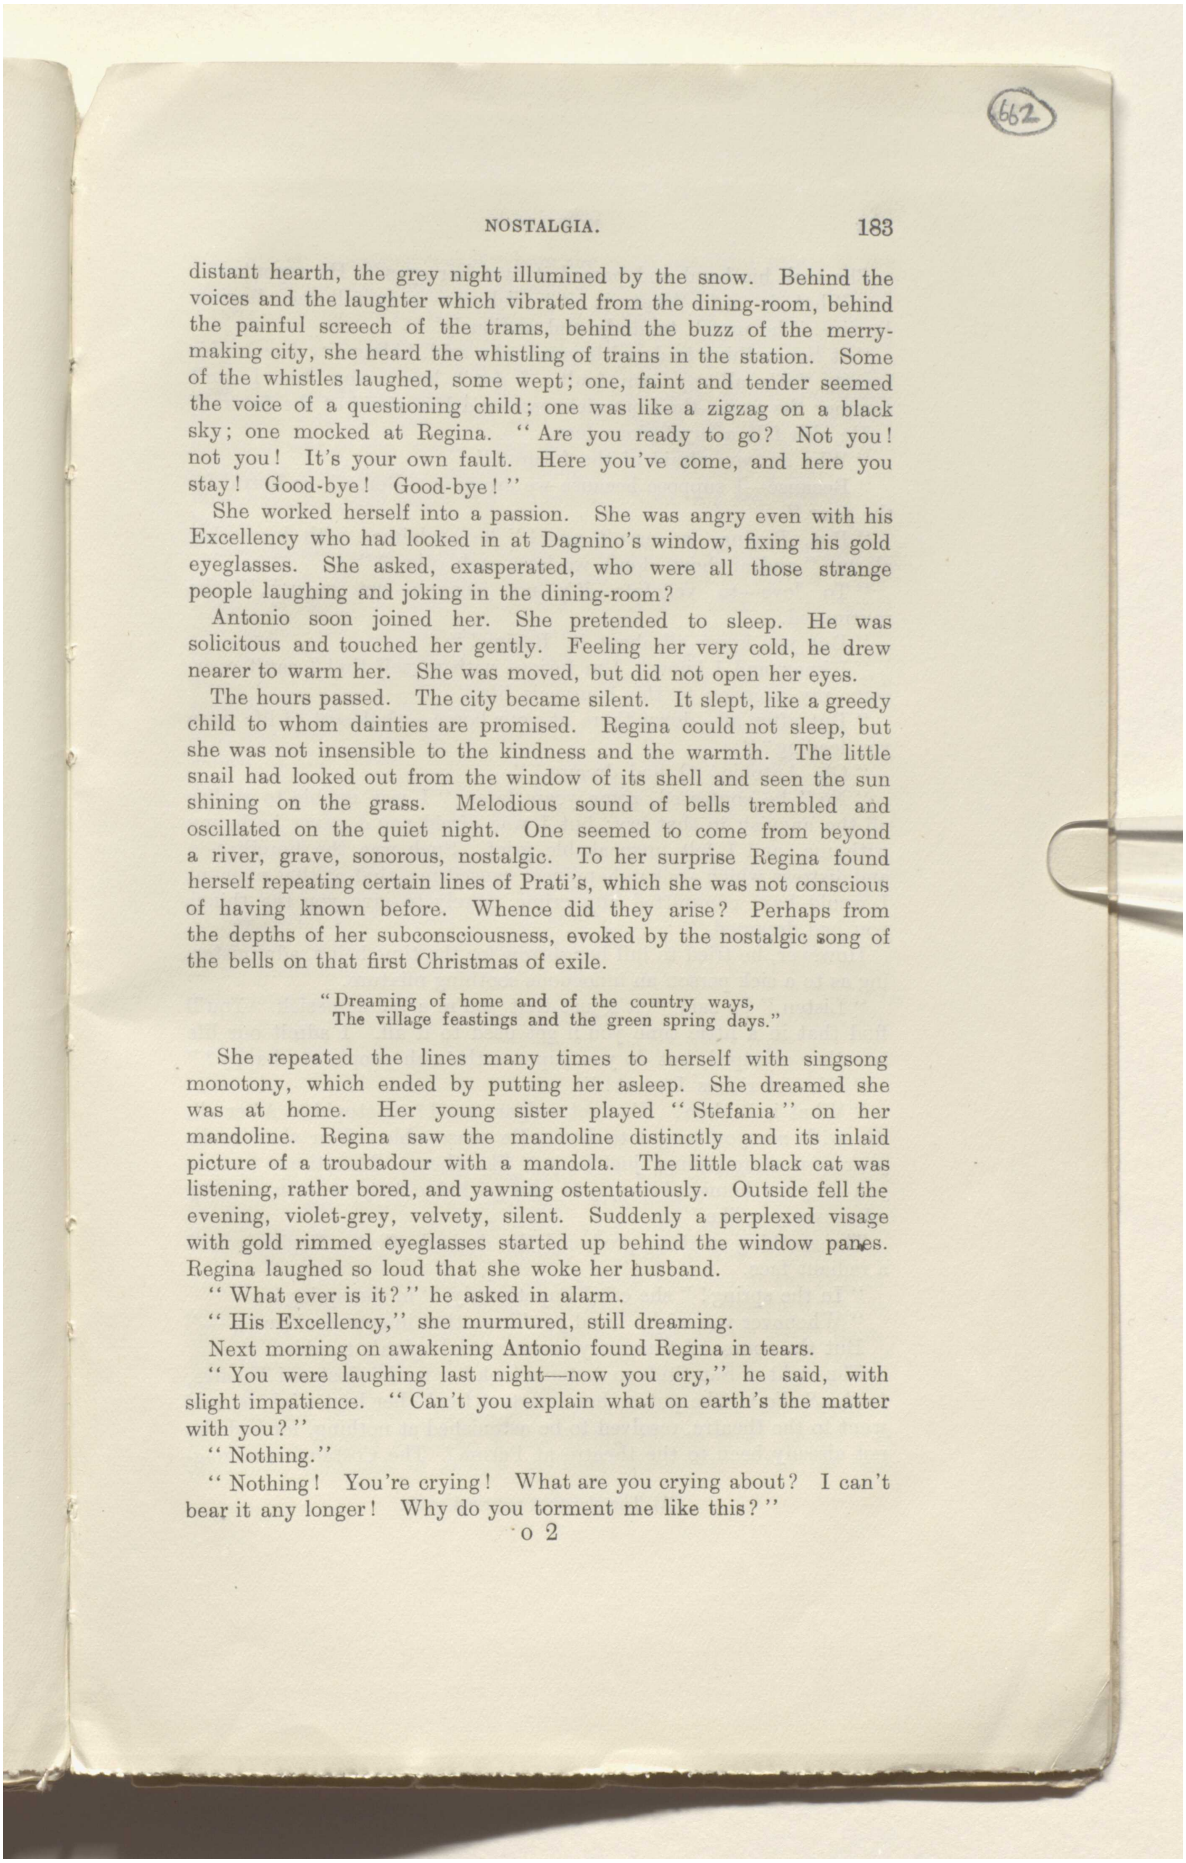
"Work! Money making! Even if it were possible it couldn't give me back my home, my past, my atmosphere! One little reality is worth more than the greatest of ideals.

"What is the Ideal?" she thought further, still watching the slow passing of the cloud; and she copied the old Senator's smile, remembering how he also imagined he had such lofty ideals!

IV.

On Christmas Eve Regina went early to bed, complaining of an indisposition which made Signora Anna thoughtful, but was not suggestive to Antonio. He knew, or thought he knew, the subtle malady which was consuming his wife. He knew its name: Nostalgia; and he left to time the responsibility of its cure.

Regina was no sooner in bed than she began to remember and to meditate. Christmas in Rome! She saw over again the carts of live fowls being drawn through the streets; the ladies passing quickly along with parcels in their hands; the fat pork-butchers looking out from their nauseating shops with the importance of Roman emperors; his Excellency an Under-Secretary of State standing in front of Dagnino's window with a visage of terrible perplexity.



She reflected upon the quarrel which had broken out among Signora Anna, Gaspare, and the maid about wax candles. Marina had gone up and down the stair at least twenty times, each time coming back with parcels, but each time forgetting something. During the whole of lunch and the whole of dinner the brothers, their mother, and the girl had discussed the supplies of food.

Well! it had all produced in Regina a sort of spiritual indigestion. Alone in the great bed, shivering, crumpled up, she was conscious of an unspeakable depression. She felt like a little snail which hears the rain pattering on its shell. And she thought continually of the

BRITISH LIBRARY

distant hearth, the grey night illumined by the snow. Behind the voices and the laughter which vibrated from the dining-room, behind the painful screech of the trams, behind the buzz of the merry-making city, she heard the whistling of trains in the station. Some of the whistles laughed, some wept; one, faint and tender seemed the voice of a questioning child; one was like a zigzag on a black sky; one mocked at Regina. "Are you ready to go? Not you! not you! It's your own fault. Here you've come, and here you stay! Good-bye! Good-bye!"

She worked herself into a passion. She was angry even with his Excellency who had looked in at Dagnino's window, fixing his gold eyeglasses. She asked, exasperated, who were all those strange people laughing and joking in the dining-room?

Antonio soon joined her. She pretended to sleep. He was solicitous and touched her gently. Feeling her very cold, he drew nearer to warm her. She was moved, but did not open her eyes.

The hours passed. The city became silent. It slept, like a greedy child to whom dainties are promised. Regina could not sleep, but she was not insensible to the kindness and the warmth. The little snail had looked out from the window of its shell and seen the sun shining on the grass. Melodious sound of bells trembled and oscillated on the quiet night. One seemed to come from beyond a river, grave, sonorous, nostalgic. To her surprise Regina found herself repeating certain lines of Prati's, which she was not conscious of having known before. Whence did they arise? Perhaps from the depths of her subconsciousness, evoked by the nostalgic song of the bells on that first Christmas of exile.

"Dreaming of home and of the country ways,
The village feastings and the green spring days."

She repeated the lines many times to herself with singsong monotony, which ended by putting her asleep. She dreamed she was at home. Her young sister played "Stefania" on her mandoline. Regina saw the mandoline distinctly and its inlaid picture of a troubadour with a mandola. The little black cat was listening, rather bored, and yawning ostentatiously. Outside fell the evening, violet-grey, velvety, silent. Suddenly a perplexed visage with gold rimmed eyeglasses started up behind the window panes. Regina laughed so loud that she woke her husband.

"What ever is it?" he asked in alarm.

"His Excellency," she murmured, still dreaming.

Next morning on awakening Antonio found Regina in tears.

"You were laughing last night—now you cry," he said, with slight impatience. "Can't you explain what on earth's the matter with you?"

"Nothing."

"Nothing! You're crying! What are you crying about? I can't bear it any longer! Why do you torment me like this?"

She took his hand and passed it over her eyes. He repented.

"What is it? What is it? Tell me—only tell me, Regina, Regina!" he urged, tenderly and anxiously.

"It has nothing to do with you," she said, hiding her face on his breast, "it's all my own fault. I don't know why, but I can't conquer the past—the homesickness—and I'm afraid of the future."

He also felt a mysterious fear.

"Why are you afraid of the future?"

"Because—I suppose because we are poor. Rome is so horrid for the poor."

"But, Regina, we aren't poor!" he exclaimed with increasing alarm, "and anyhow, don't we love each other?"

"To love—to vegetate—it's not enough—not enough," she murmured.

"But you knew all about it, Regina!"

"I knew and I know. I'm furious with myself that I can't overcome my aversion to this bourgeois life."

"But after all—down there at your home—what sort of life were you leading?"

"Oh, Antonio! I had dreams!"

"No," he confessed, some years later, "I was unable to realise all the anguish in that cry; but I was afraid you'd never be happy with me, and I felt unspeakable grief. Such was the humiliation and distress which your unhappiness caused me, that at that moment I would have committed any crime merely to give you the things you had dreamed."

However, he tried to lull her sorrow for the time being, administering as to a sick person an innocuous soothing mixture.

"Listen," he said, "it's just that you're a bit homesick. You'll find that in a little time you'll get used to it all. I admit our life is rather cramped, but do you suppose the rich people are happy?"

"It's not riches I want!"

"What is it then? *I*'m not vulgar, am I? or stupid? After all, it's with *me* you've got to live. Be reasonable. You shall make your own surroundings just as you like them. Meantime, to cure you of your homesickness, you can go home to your own country whenever you like."

The soothing mixture produced the desired effect. Regina raised a radiant face.

"In the spring!" she cried impetuously, "in the spring!"

"Whenever you wish. And you'll see that in course of time——"

But the course of time only augmented Regina's trouble.

The night of San-Stefano Antonio took her to the Costanzi Theatre, to the *Sedie*.[1] She put on her smartest frock, her best trinkets, and went to the theatre, resolved to be astonished at nothing, for had she not already been to the theatre at Parma? The Costanzi was mag-

nificent; an enormous casket where the most beautiful pearls in the capital shone on feminine shoulders resplendent with "*Crema Venus.*" Even the pit was splendid, a field of great flowers sprinkled with the dew of gems and gold. And in spite of her experience at the Parma theatre, Regina felt sufficiently bewildered. Her short-sighted eyes, dazzled by the brilliant light, were half shut; and it was much the same with the eyes of her soul. She raised her opera glass and looked at one of the boxes. The lady there was plain in feature but extremely fashionable; Regina thought her painted, decked with false hair, her eyes artificially darkened. None the less, she envied her.

She looked round. Little by little her envy swelled, overflowed, became hateful. She would have liked the theatre burned down. Then she perceived that a lady near her was looking at the boxes just as she was, perhaps with the same criminal envy in her heart. She felt ashamed of herself, put down the glass, and after this did not look at the seats above her again. But on her own level, in the furthest row of the *Poltrone*,[1] she saw a long row of smartly dressed men and women who always and only stared at the boxes. No one looked at the *Sedie*. The people there were an inferior race, or actually non-existent for the ladies and gentlemen in the *Poltrone*.

"We are nothing! We are the microbes which fill the void," thought Regina.

Then she perceived another strange fact, that she herself felt for the *Sedie* and the gallery the very same contempt which was felt by the people of the boxes and the stalls.

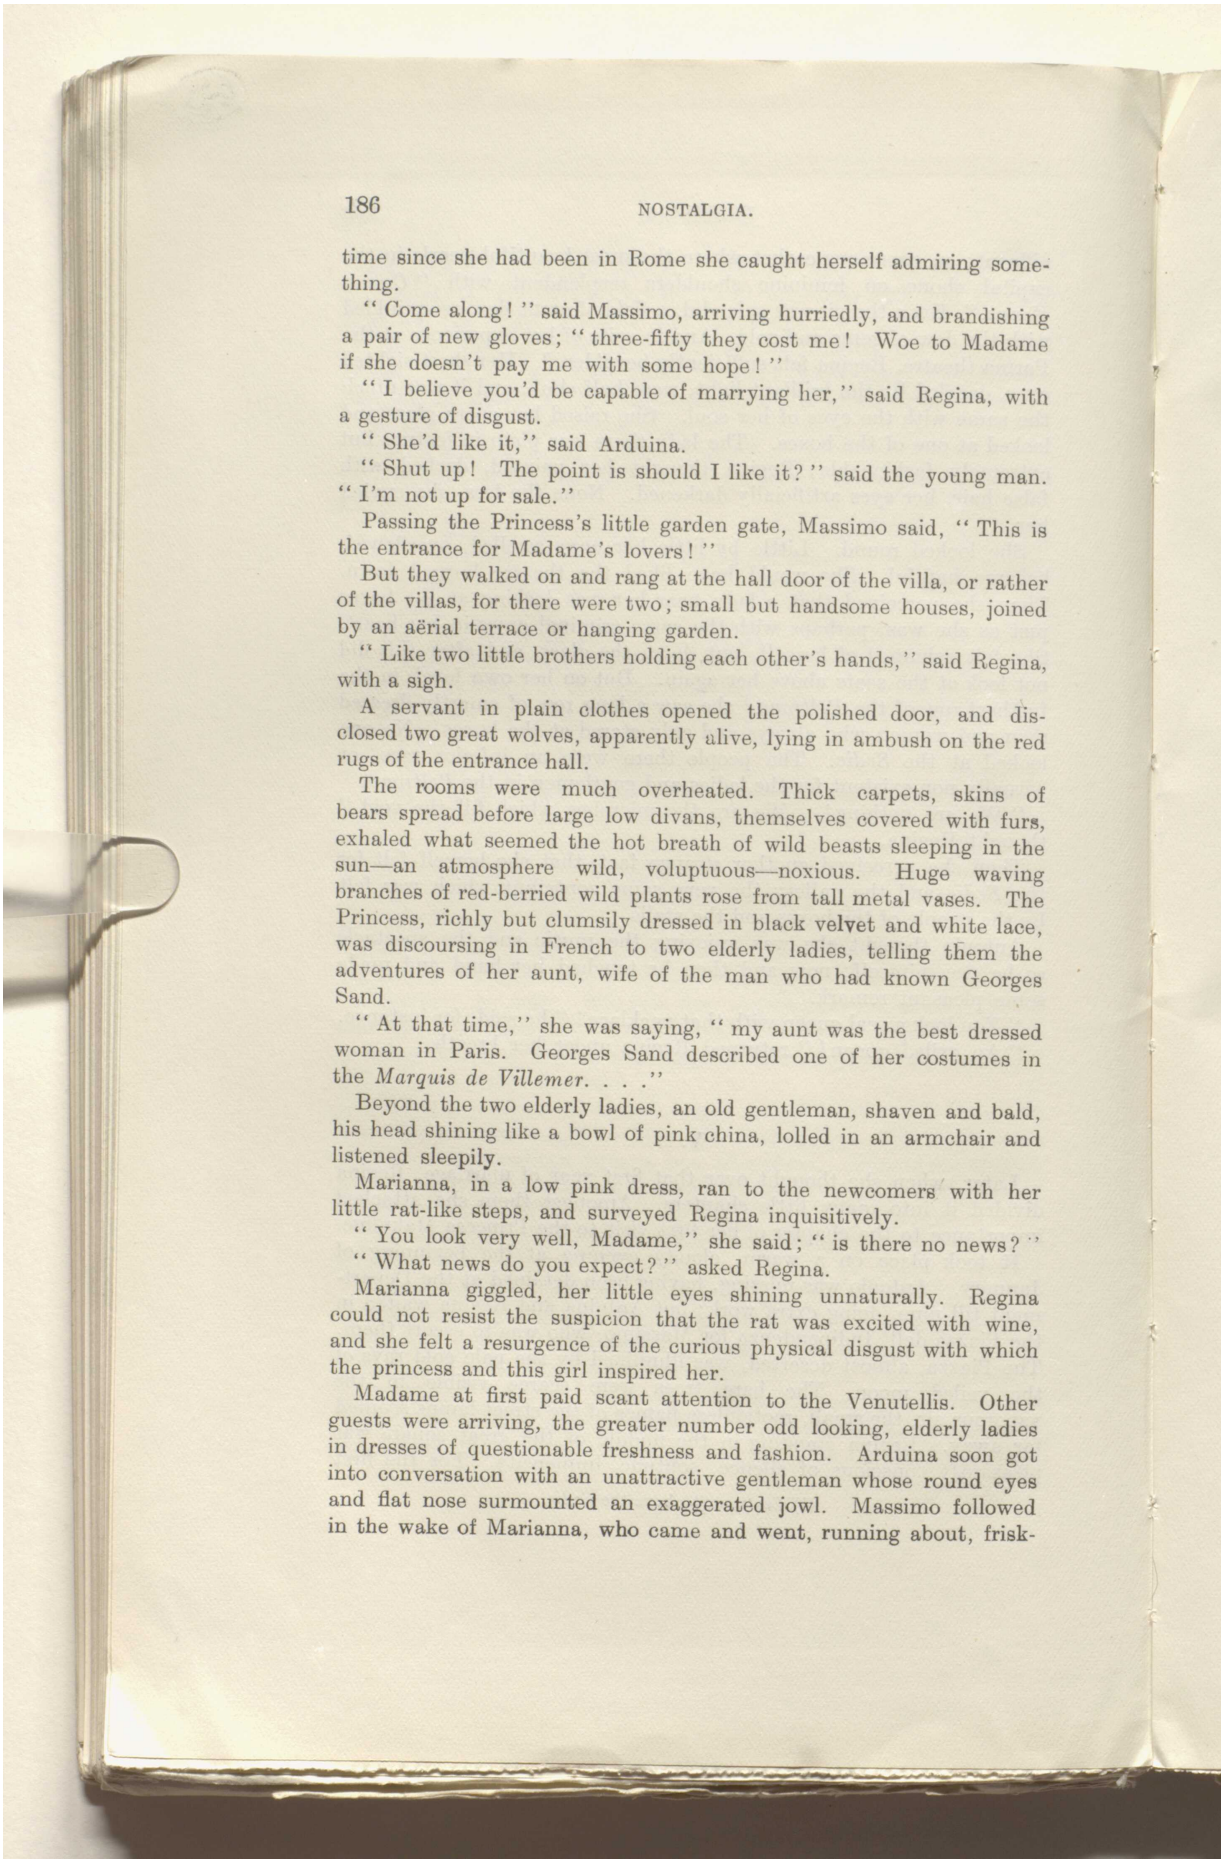
Antonio thought she was enjoying the music and the spectacle as he was himself; now and then he touched her hand and made some pleasant remark.

"You look a real queen with that necklace!" he said, for instance.

"An exiled queen!" returned Regina under her breath.

V.

Later, when she thought over that first year of marriage, Regina divided it into many little chapters. Amongst them she attached importance to the chapter of her first visit to the Princess Makuline.



It took place on a warm, cloudy evening at the beginning of January. Antonio was missing, having been detained at the Department till nine, doing extra work; but Arduina and Regina waited in the Piazza dell' Indipendenza for Massimo, who was to escort them. The Piazza, almost deserted, was illumined by the pale gold rays of the veiled moon. The bare trees were scarce visible in the vaporous air, the small, motionless flames of the street lamps seemed far away. Regina standing in the middle of the great square was pleasantly conscious of silence, solitude, immensity. For the first

time since she had been in Rome she caught herself admiring something.

"Come along!" said Massimo, arriving hurriedly, and brandishing a pair of new gloves; "three-fifty they cost me! Woe to Madame if she doesn't pay me with some hope!"

"I believe you'd be capable of marrying her," said Regina, with a gesture of disgust.

"She'd like it," said Arduina.

"Shut up! The point is should I like it?" said the young man. "I'm not up for sale."

Passing the Princess's little garden gate, Massimo said, "This is the entrance for Madame's lovers!"

But they walked on and rang at the hall door of the villa, or rather of the villas, for there were two; small but handsome houses, joined by an aërial terrace or hanging garden.

"Like two little brothers holding each other's hands," said Regina, with a sigh.

A servant in plain clothes opened the polished door, and disclosed two great wolves, apparently alive, lying in ambush on the red rugs of the entrance hall.

The rooms were much overheated. Thick carpets, skins of bears spread before large low divans, themselves covered with furs, exhaled what seemed the hot breath of wild beasts sleeping in the sun—an atmosphere wild, voluptuous—noxious. Huge waving branches of red-berried wild plants rose from tall metal vases. The Princess, richly but clumsily dressed in black velvet and white lace, was discoursing in French to two elderly ladies, telling them the adventures of her aunt, wife of the man who had known Georges Sand.

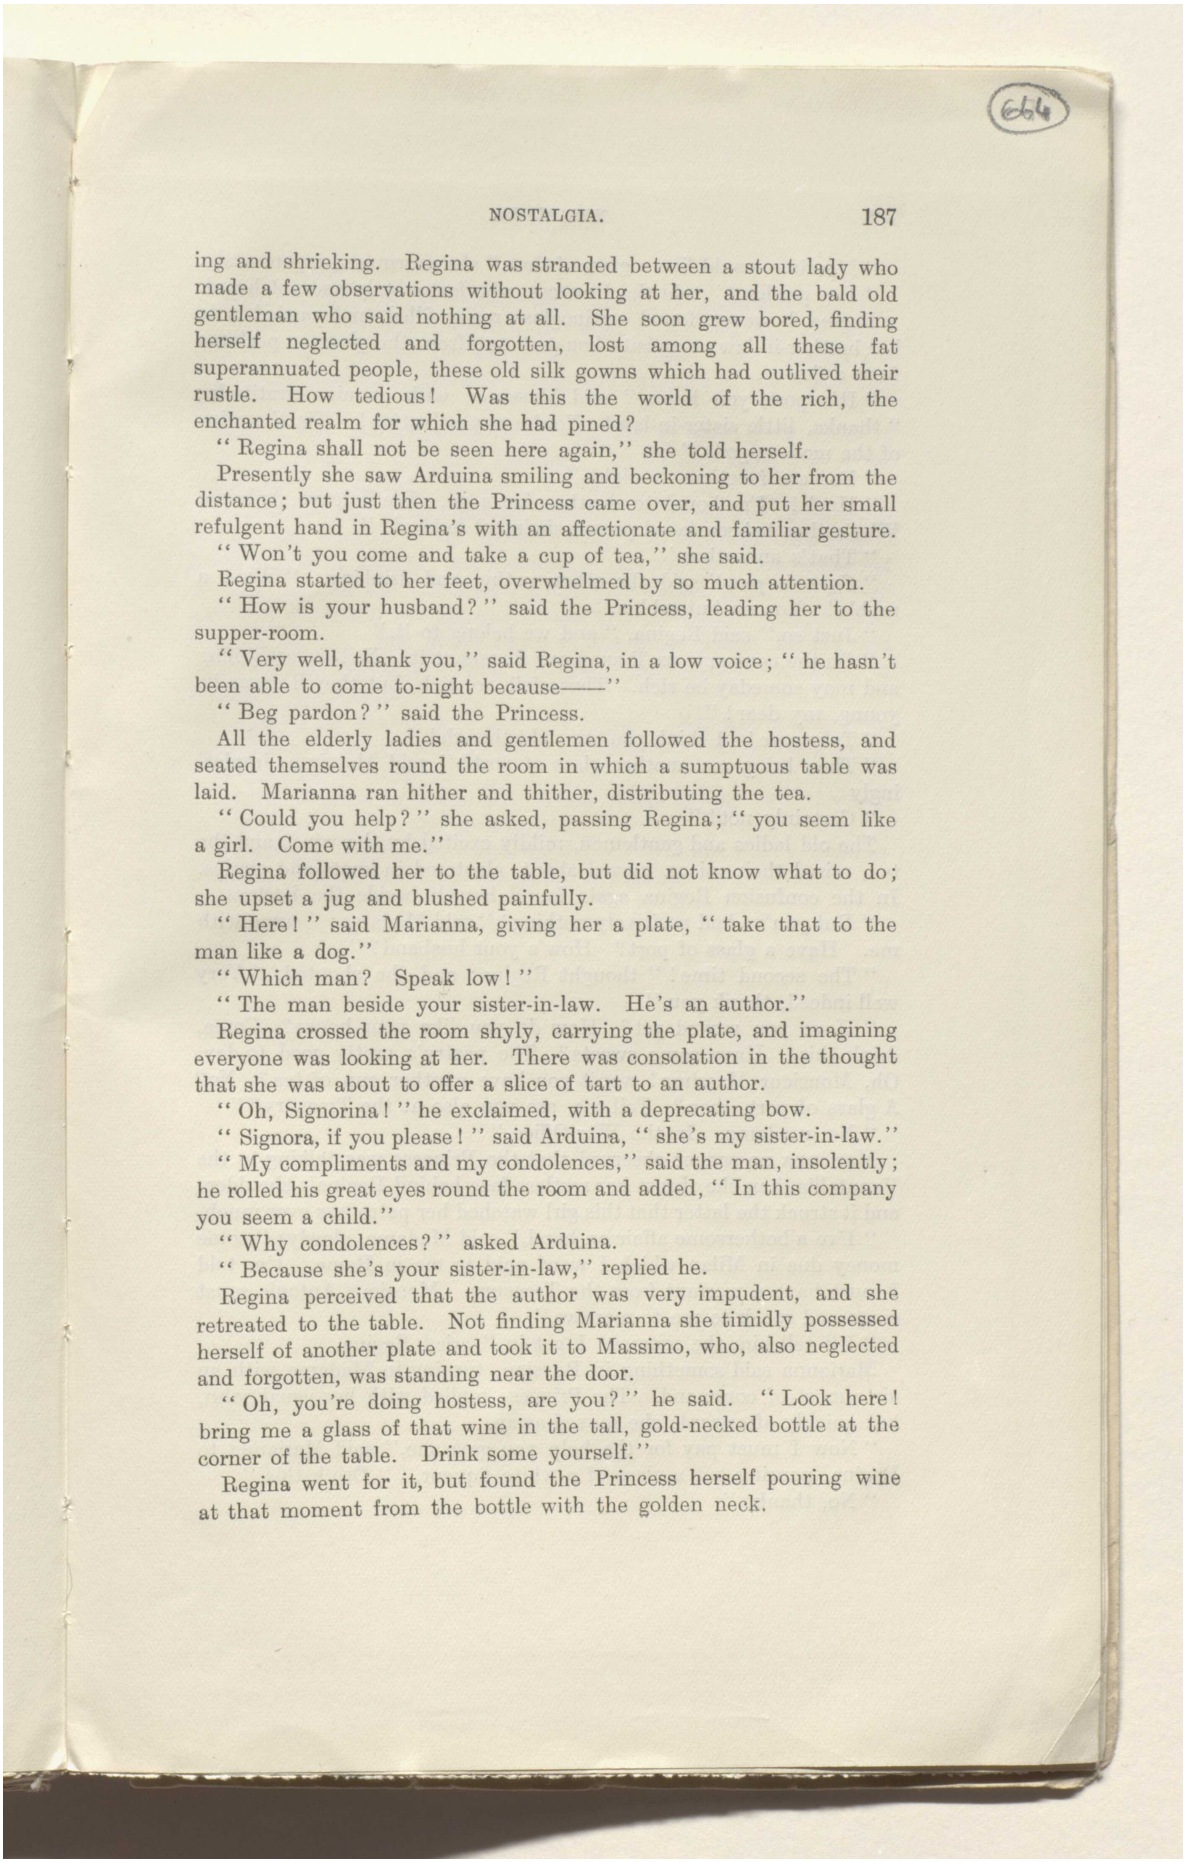
"At that time," she was saying, "my aunt was the best dressed woman in Paris. Georges Sand described one of her costumes in the *Marquis de Villemer*. . . ."

Beyond the two elderly ladies, an old gentleman, shaven and bald, his head shining like a bowl of pink china, lolled in an armchair and listened sleepily.

Marianna, in a low pink dress, ran to the newcomers with her little rat-like steps, and surveyed Regina inquisitively.

"You look very well, Madame," she said; "is there no news?"

"What news do you expect?" asked Regina.



Marianna giggled, her little eyes shining unnaturally. Regina could not resist the suspicion that the rat was excited with wine, and she felt a resurgence of the curious physical disgust with which the princess and this girl inspired her.

Madame at first paid scant attention to the Venutellis. Other guests were arriving, the greater number odd looking, elderly ladies in dresses of questionable freshness and fashion. Arduina soon got into conversation with an unattractive gentleman whose round eyes and flat nose surmounted an exaggerated jowl. Massimo followed in the wake of Marianna, who came and went, running about, frisk-

BRITISH LIBRARY

ing and shrieking. Regina was stranded between a stout lady who made a few observations without looking at her, and the bald old gentleman who said nothing at all. She soon grew bored, finding herself neglected and forgotten, lost among all these fat superannuated people, these old silk gowns which had outlived their rustle. How tedious! Was this the world of the rich, the enchanted realm for which she had pined?

"Regina shall not be seen here again," she told herself.

Presently she saw Arduina smiling and beckoning to her from the distance; but just then the Princess came over, and put her small refulgent hand in Regina's with an affectionate and familiar gesture.

"Won't you come and take a cup of tea," she said.

Regina started to her feet, overwhelmed by so much attention.

"How is your husband?" said the Princess, leading her to the supper-room.

"Very well, thank you," said Regina, in a low voice; "he hasn't been able to come to-night because——"

"Beg pardon?" said the Princess.

All the elderly ladies and gentlemen followed the hostess, and seated themselves round the room in which a sumptuous table was laid. Marianna ran hither and thither, distributing the tea.

"Could you help?" she asked, passing Regina; "you seem like a girl. Come with me."

Regina followed her to the table, but did not know what to do; she upset a jug and blushed painfully.

"Here!" said Marianna, giving her a plate, "take that to the man like a dog."

"Which man? Speak low!"

"The man beside your sister-in-law. He's an author."

Regina crossed the room shyly, carrying the plate, and imagining everyone was looking at her. There was consolation in the thought that she was about to offer a slice of tart to an author.

"Oh, Signorina!" he exclaimed, with a deprecating bow.

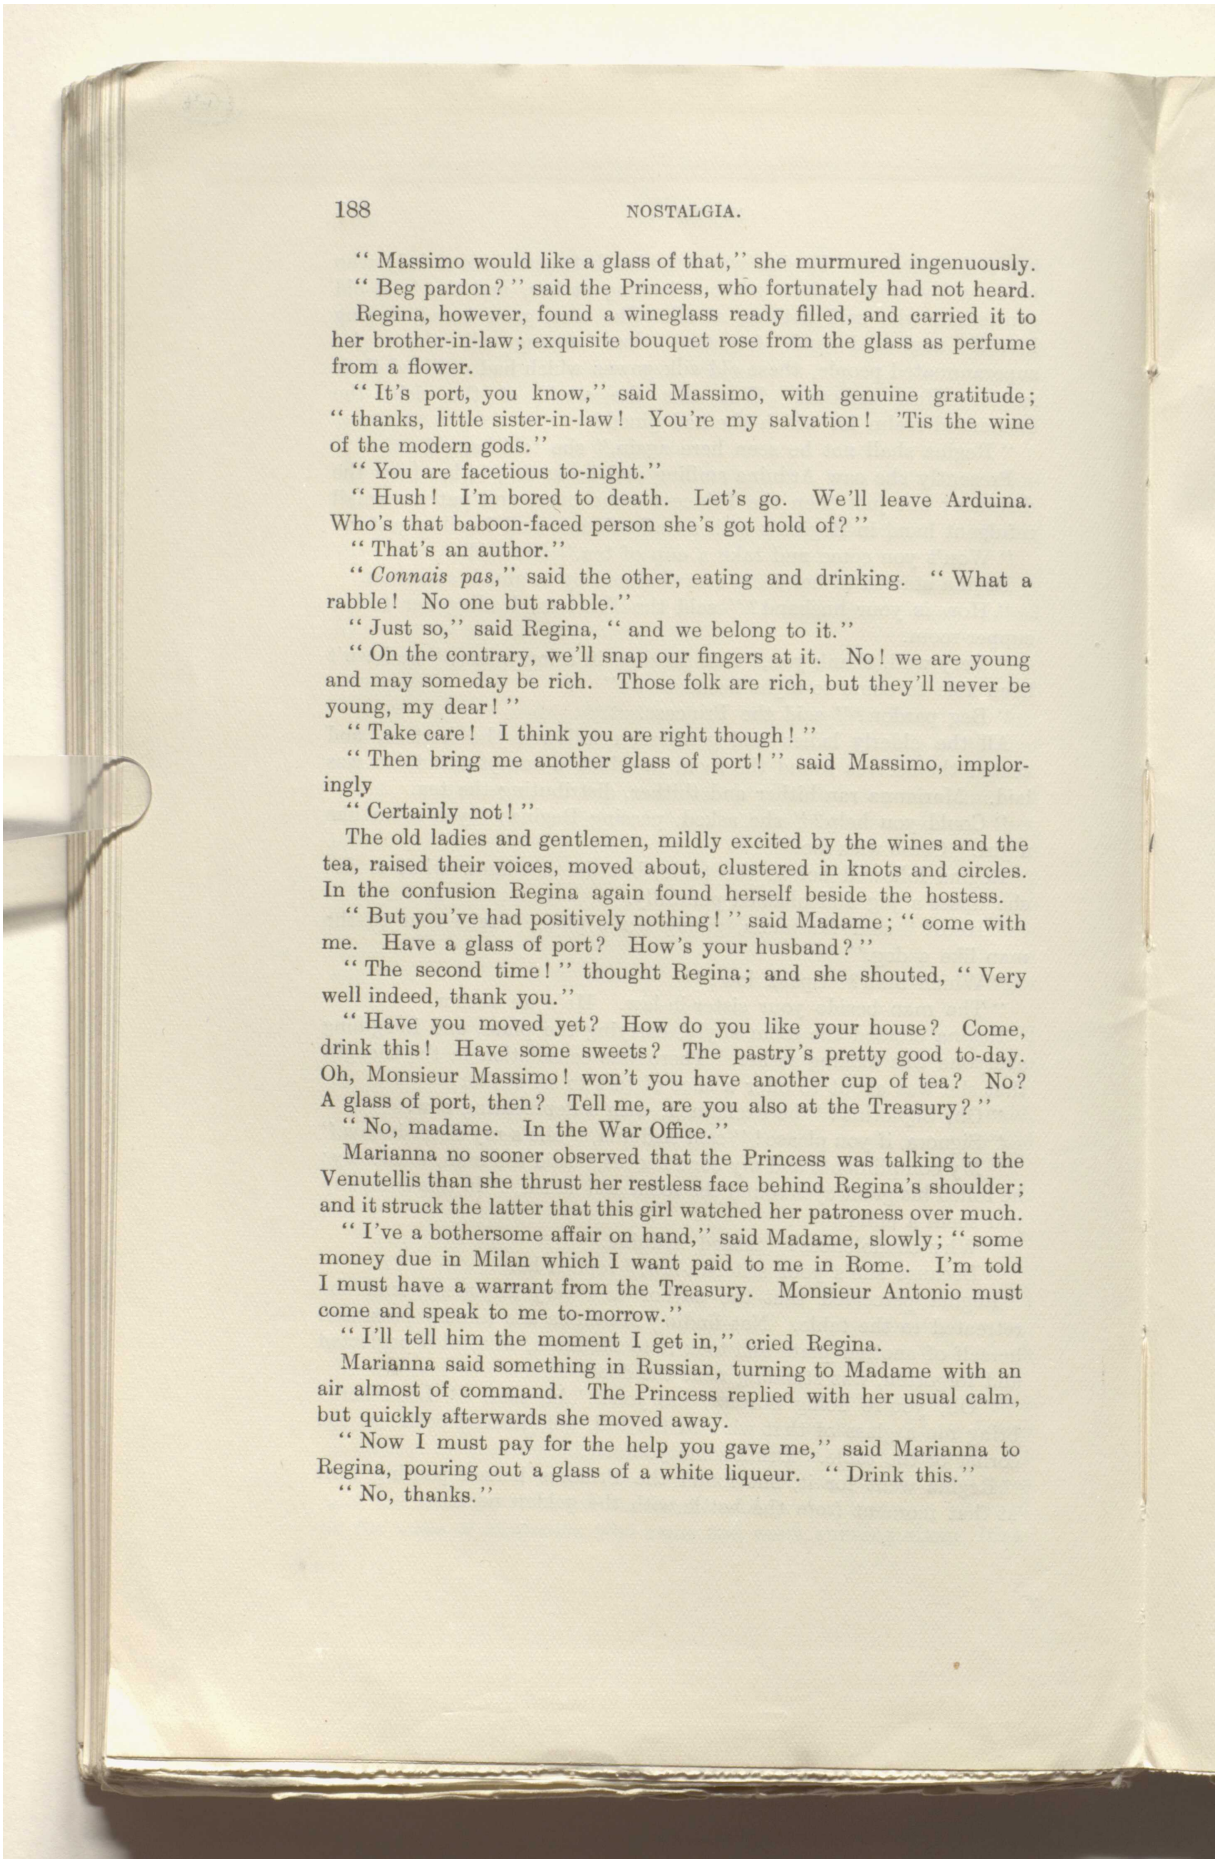
"Signora, if you please!" said Arduina, "she's my sister-in-law."

"My compliments and my condolences," said the man, insolently; he rolled his great eyes round the room and added, "In this company you seem a child."

"Why condolences?" asked Arduina.

"Because she's your sister-in-law," replied he.

Regina perceived that the author was very impudent, and she retreated to the table. Not finding Marianna she timidly possessed herself of another plate and took it to Massimo, who, also neglected and forgotten, was standing near the door.



"Oh, you're doing hostess, are you?" he said. "Look here! bring me a glass of that wine in the tall, gold-necked bottle at the corner of the table. Drink some yourself."

Regina went for it, but found the Princess herself pouring wine at that moment from the bottle with the golden neck.

"Massimo would like a glass of that," she murmured ingenuously.

"Beg pardon?" said the Princess, who fortunately had not heard.

Regina, however, found a wineglass ready filled, and carried it to her brother-in-law; exquisite bouquet rose from the glass as perfume from a flower.

"It's port, you know," said Massimo, with genuine gratitude; "thanks, little sister-in-law! You're my salvation! 'Tis the wine of the modern gods."

"You are facetious to-night."

"Hush! I'm bored to death. Let's go. We'll leave Arduina. Who's that baboon-faced person she's got hold of?"

"That's an author."

"*Connais pas*," said the other, eating and drinking. "What a rabble! No one but rabble."

"Just so," said Regina, "and we belong to it."

"On the contrary, we'll snap our fingers at it. No! we are young and may someday be rich. Those folk are rich, but they'll never be young, my dear!"

"Take care! I think you are right though!"

"Then bring me another glass of port!" said Massimo, implor-ingly

"Certainly not!"

The old ladies and gentlemen, mildly excited by the wines and the tea, raised their voices, moved about, clustered in knots and circles. In the confusion Regina again found herself beside the hostess.

"But you've had positively nothing!" said Madame; "come with me. Have a glass of port? How's your husband?"

"The second time!" thought Regina; and she shouted, "Very well indeed, thank you."

"Have you moved yet? How do you like your house? Come, drink this! Have some sweets? The pastry's pretty good to-day. Oh, Monsieur Massimo! won't you have another cup of tea? No? A glass of port, then? Tell me, are you also at the Treasury?"

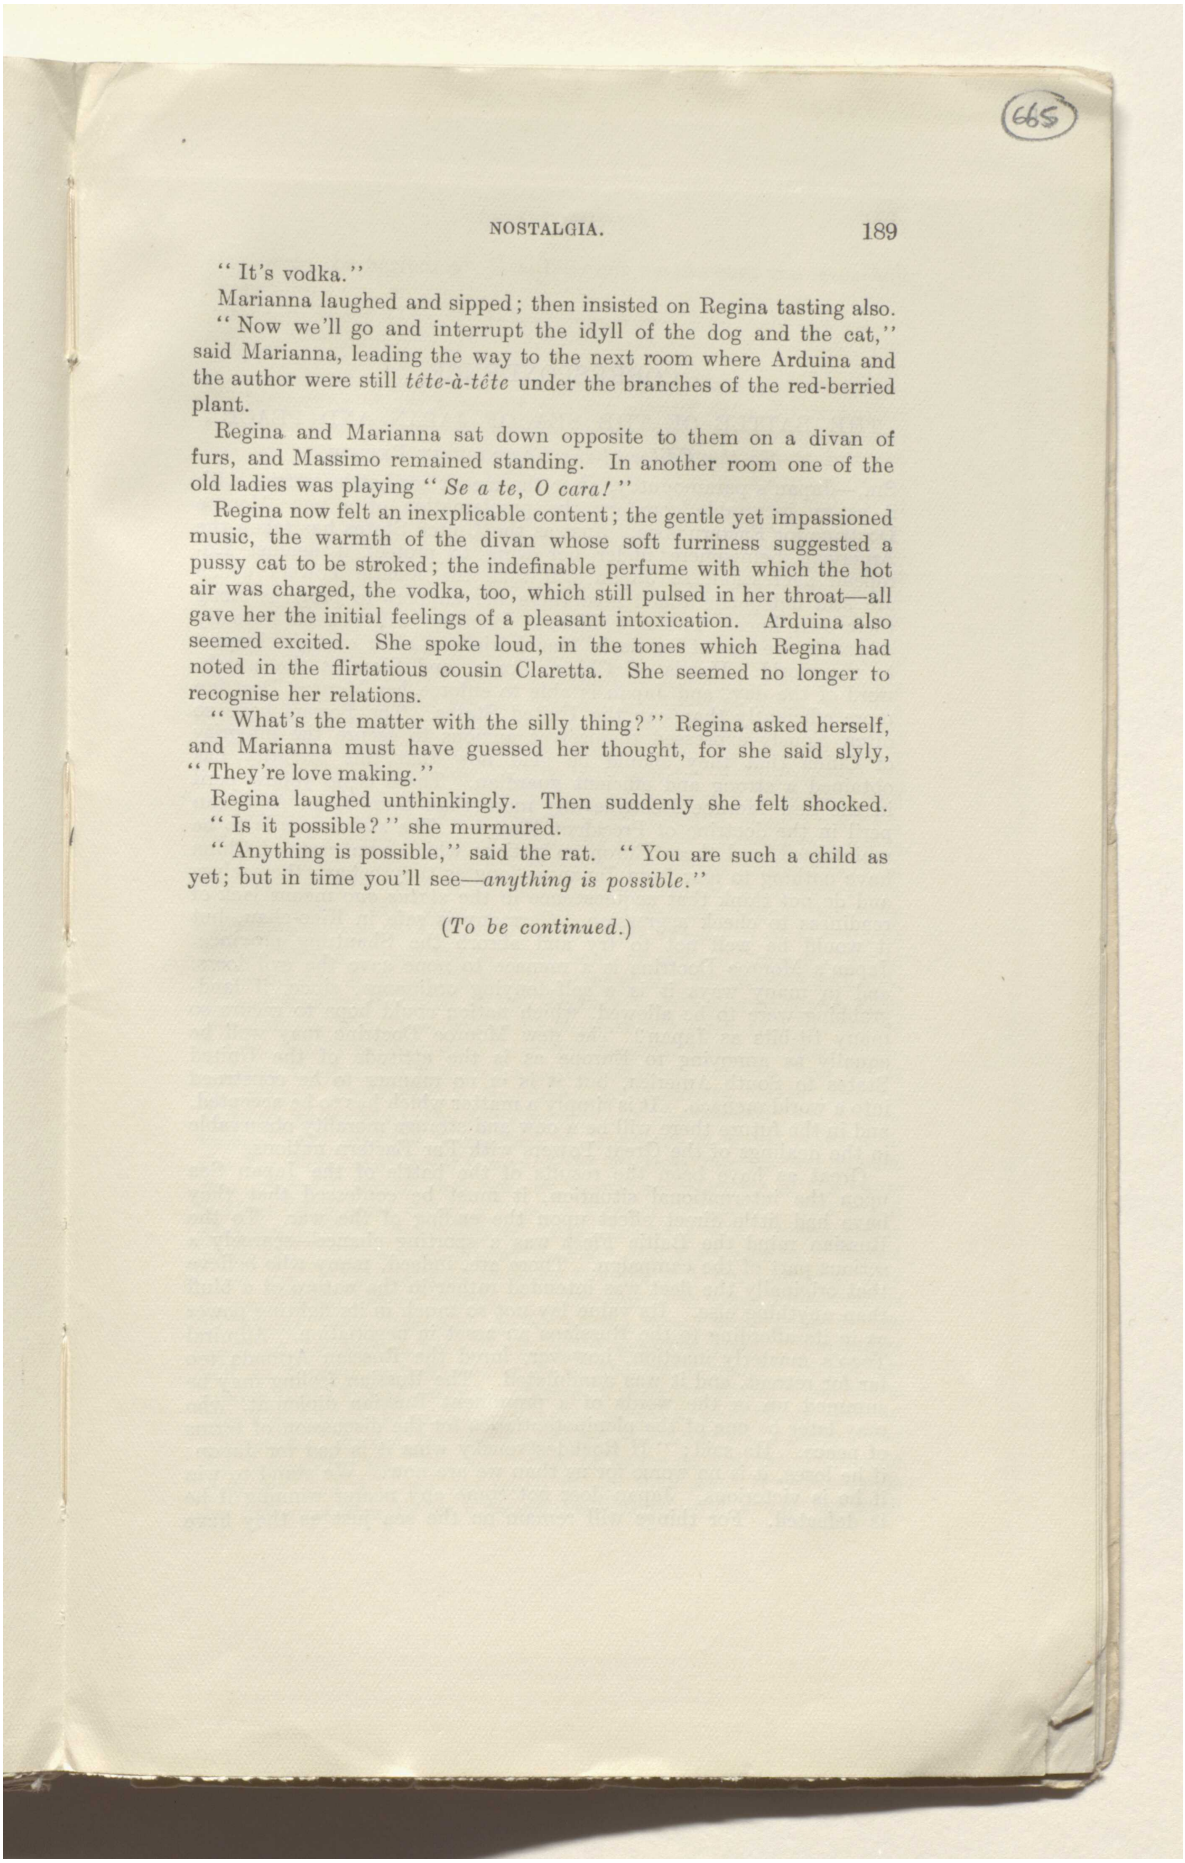
"No, madame. In the War Office."

Marianna no sooner observed that the Princess was talking to the Venutellis than she thrust her restless face behind Regina's shoulder; and it struck the latter that this girl watched her patroness over much.

"I've a bothersome affair on hand," said Madame, slowly; "some money due in Milan which I want paid to me in Rome. I'm told I must have a warrant from the Treasury. Monsieur Antonio must come and speak to me to-morrow."

"I'll tell him the moment I get in," cried Regina.

Marianna said something in Russian, turning to Madame with an air almost of command. The Princess replied with her usual calm, but quickly afterwards she moved away.



"Now I must pay for the help you gave me," said Marianna to Regina, pouring out a glass of a white liqueur. "Drink this."

"No, thanks."

"It's vodka."

Marianna laughed and sipped; then insisted on Regina tasting also.

"Now we'll go and interrupt the idyll of the dog and the cat," said Marianna, leading the way to the next room where Arduina and the author were still *tête-à-tête* under the branches of the red-berried plant.

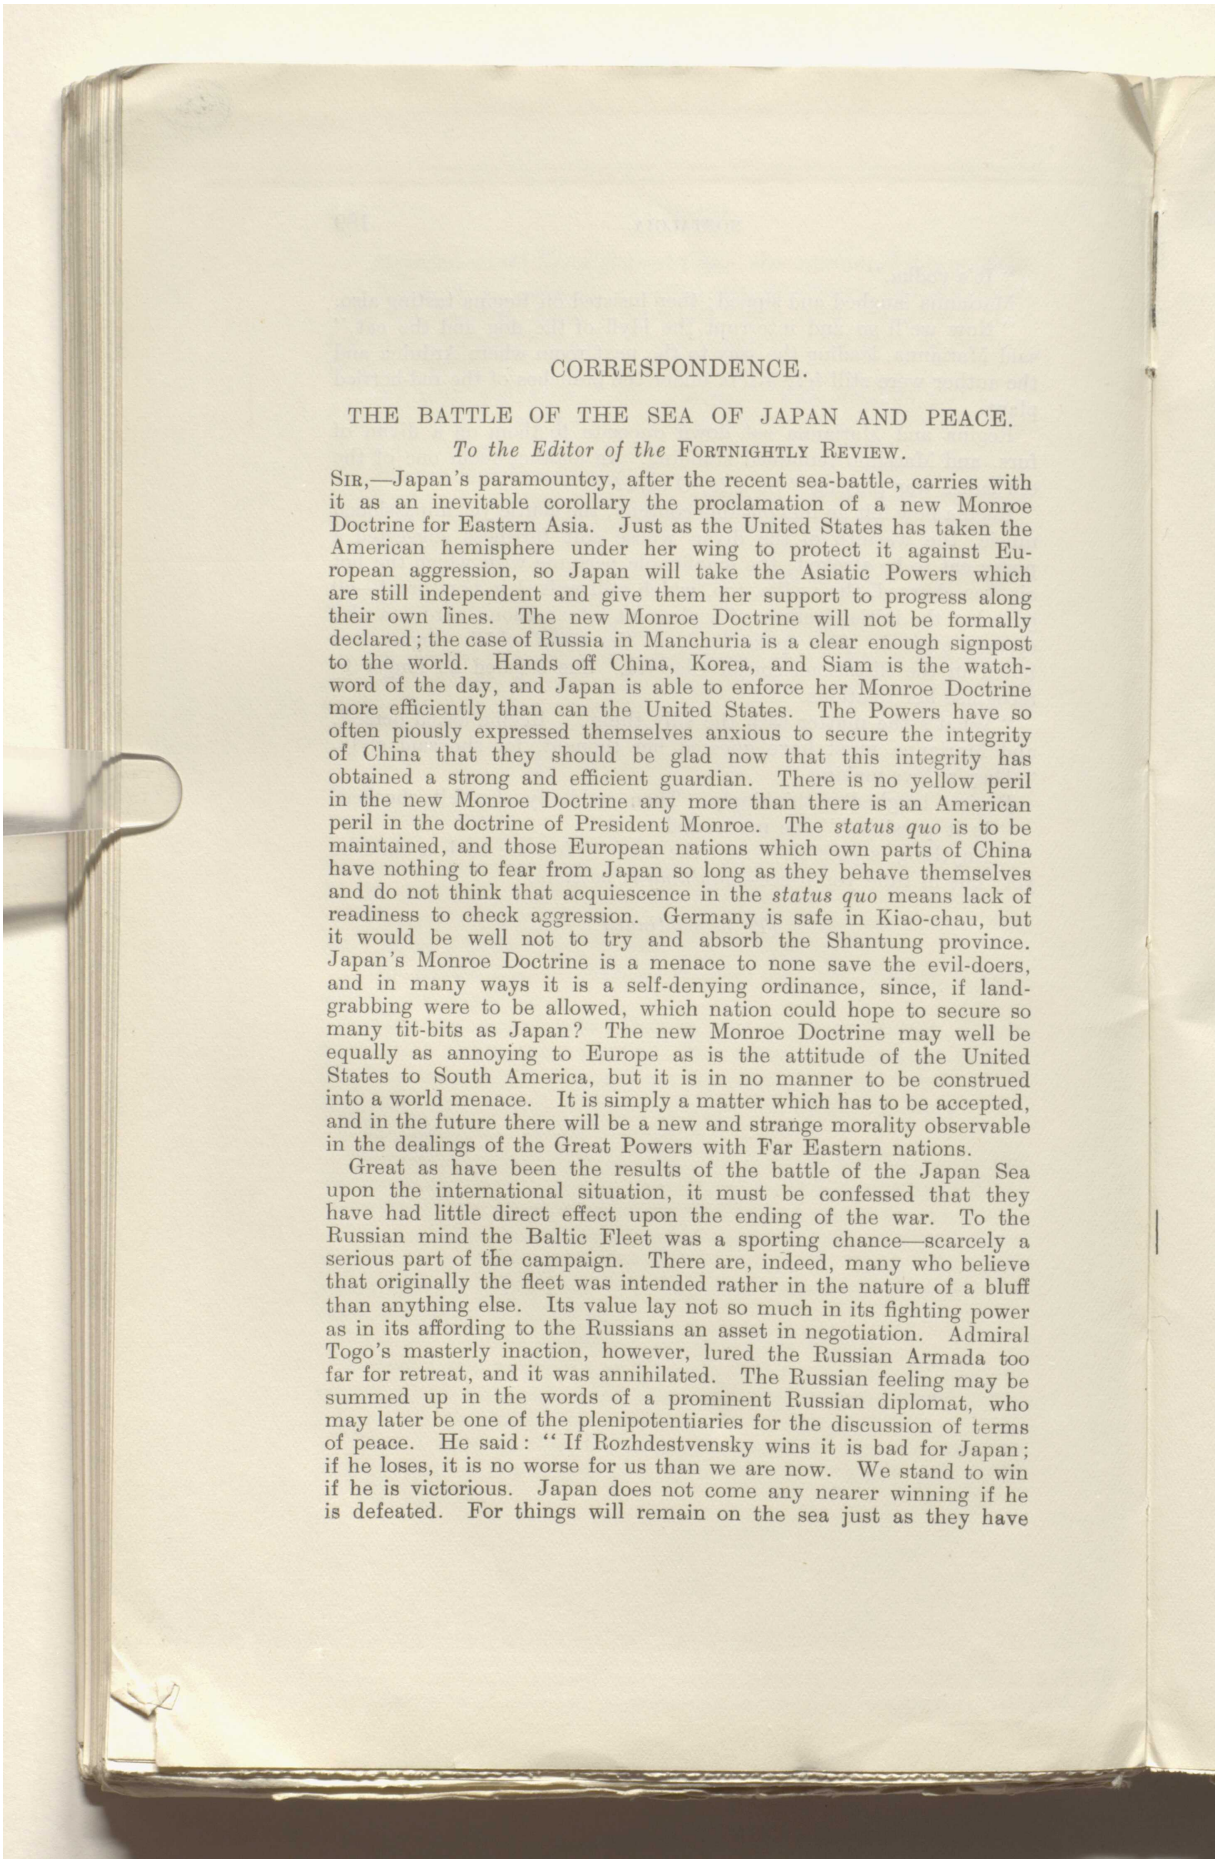
Regina and Marianna sat down opposite to them on a divan of furs, and Massimo remained standing. In another room one of the old ladies was playing "*Se a te, O cara!*"

Regina now felt an inexplicable content; the gentle yet impassioned music, the warmth of the divan whose soft furriness suggested a pussy cat to be stroked; the indefinable perfume with which the hot air was charged, the vodka, too, which still pulsed in her throat—all gave her the initial feelings of a pleasant intoxication. Arduina also seemed excited. She spoke loud, in the tones which Regina had noted in the flirtatious cousin Claretta. She seemed no longer to recognise her relations.

"What's the matter with the silly thing?" Regina asked herself, and Marianna must have guessed her thought, for she said slyly, "They're love making."

Regina laughed unthinkingly. Then suddenly she felt shocked.

"Is it possible?" she murmured.



"Anything is possible," said the rat. "You are such a child as yet; but in time you'll see—*anything is possible.*"

(*To be continued.*)

CORRESPONDENCE.

THE BATTLE OF THE SEA OF JAPAN AND PEACE.

To the Editor of the FORTNIGHTLY REVIEW.

SIR,—Japan's paramountcy, after the recent sea-battle, carries with it as an inevitable corollary the proclamation of a new Monroe Doctrine for Eastern Asia. Just as the United States has taken the American hemisphere under her wing to protect it against European aggression, so Japan will take the Asiatic Powers which are still independent and give them her support to progress along their own lines. The new Monroe Doctrine will not be formally declared; the case of Russia in Manchuria is a clear enough signpost to the world. Hands off China, Korea, and Siam is the watchword of the day, and Japan is able to enforce her Monroe Doctrine more efficiently than can the United States. The Powers have so often piously expressed themselves anxious to secure the integrity of China that they should be glad now that this integrity has obtained a strong and efficient guardian. There is no yellow peril in the new Monroe Doctrine any more than there is an American peril in the doctrine of President Monroe. The *status quo* is to be maintained, and those European nations which own parts of China have nothing to fear from Japan so long as they behave themselves and do not think that acquiescence in the *status quo* means lack of readiness to check aggression. Germany is safe in Kiao-chau, but it would be well not to try and absorb the Shantung province. Japan's Monroe Doctrine is a menace to none save the evil-doers, and in many ways it is a self-denying ordinance, since, if land-grabbing were to be allowed, which nation could hope to secure so many tit-bits as Japan? The new Monroe Doctrine may well be equally as annoying to Europe as is the attitude of the United States to South America, but it is in no manner to be construed into a world menace. It is simply a matter which has to be accepted, and in the future there will be a new and strange morality observable in the dealings of the Great Powers with Far Eastern nations.

Great as have been the results of the battle of the Japan Sea upon the international situation, it must be confessed that they have had little direct effect upon the ending of the war. To the Russian mind the Baltic Fleet was a sporting chance—scarcely a serious part of the campaign. There are, indeed, many who believe that originally the fleet was intended rather in the nature of a bluff than anything else. Its value lay not so much in its fighting power as in its affording to the Russians an asset in negotiation. Admiral Togo's masterly inaction, however, lured the Russian Armada too far for retreat, and it was annihilated. The Russian feeling may be summed up in the words of a prominent Russian diplomat, who may later be one of the plenipotentiaries for the discussion of terms of peace. He said: "If Rozhdestvensky wins it is bad for Japan; if he loses, it is no worse for us than we are now. We stand to win if he is victorious. Japan does not come any nearer winning if he is defeated. For things will remain on the sea just as they have

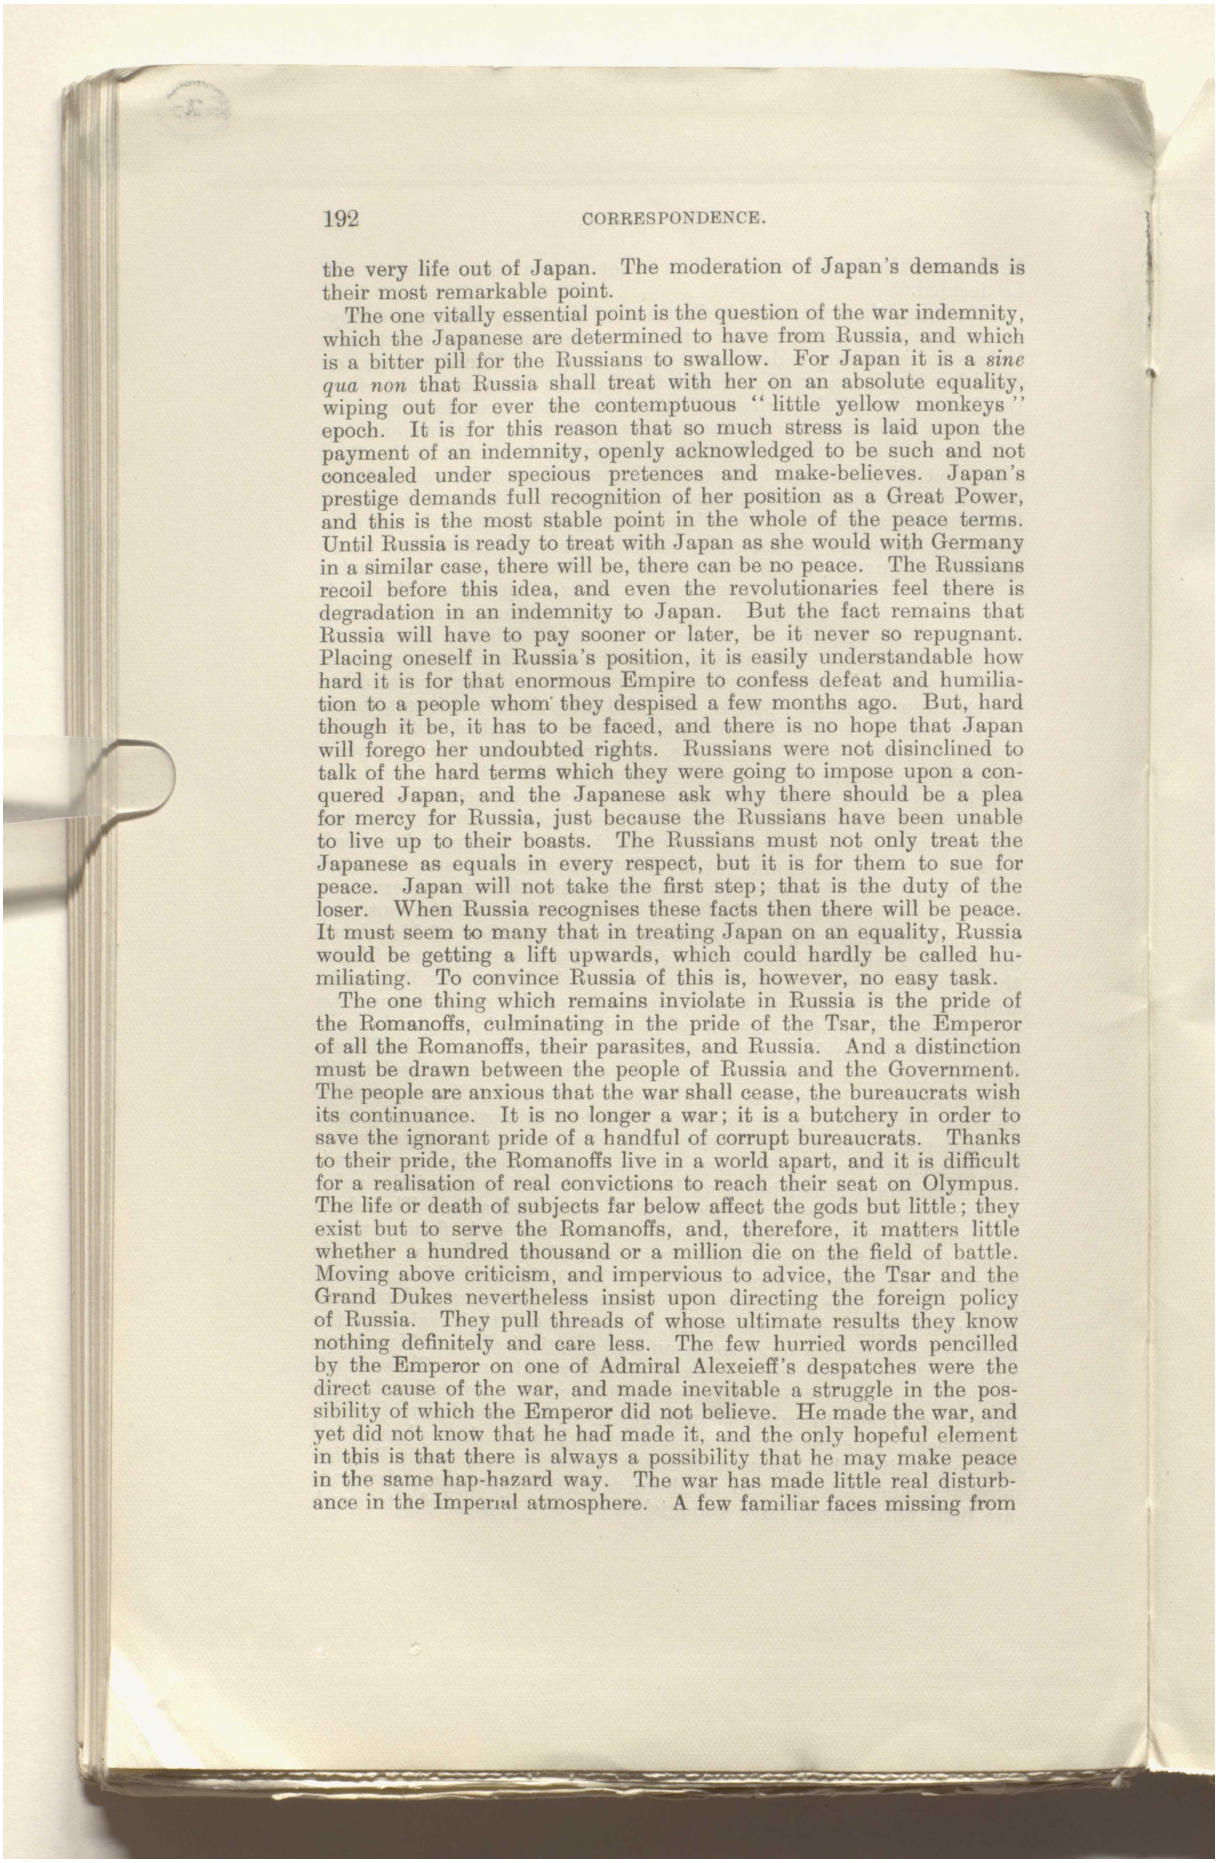
مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY



been since the beginning. And it is not on sea that the issue will be decided."

This being the case, the annihilation of the fleet, although annoying and amazing, could not be expected to exercise a great effect upon Russia in producing a desire for peace at once. The Japanese, on the other hand, expected to defeat the Russian Fleet, and, therefore, the happening of the expected has not altered their determination to secure their object. It has facilitated their operations and has laid bare all of Russia's Far Eastern possessions, but it has not altered at all the Japanese terms of peace. It must be remembered that Japan is fighting for peace and future security, and not at all for gain and annexation; therefore, continued successes do not augment the demands to be made from Russia. The Japanese terms are a fixed quantity, and do not contain clauses expressly included in order to be cut out in negotiating. It is a case of all the cards being on the table and Japan having all the winning ones. Victories make no difference in the terms; they only facilitate Japan's obtainment of them. M. Witte is reported to have told an interviewer that "Japan, of course, would not think of concluding peace unless it were assured for fifty years. She will undoubtedly refuse to begin negotiations except in Japan with a person furnished with special powers. Russia could, of course, drag on the war for five years with the possibility of success if it were not for internal events, to which the Government remains obstinately deaf and blind. And that is what I consider really terrible about Russia's present position. Every hour's delay brings us lower and lower." Remarkable words for a Russian to utter, and yet M. Witte has struck nearer the mark than many who have much better opportunities for observation. Japan's terms have been dealt with in a previous article, but may be briefly summarised here:—The absolute evacution of Manchuria by the Russians, and the handing back of the provinces to China; the cession to Japan of the Russian lease of the Kwantung Peninsula, with possibly a reversion to the conditions of the peace terms after the Chinese War; the cession of the entire Manchurian railway to Japan, and its handing over to an international company; the Russo-Chinese Bank to be regarded as a Government concern, and all its concessions disallowed; a free hand for Japan in Korea, and no Russian interference; the transformation of Vladivostock into a commercial port, and the prohibition of dockyards or Naval stations in the Far East; the handing over of the interned Russian war vessels was originally desired, but may be waived in deference of the value of there being some sort of a Russian Fleet in the Baltic. The island of Sakhalin is to be ceded to Japan together with fishing rights along the coasts of the Ussuri Province and Kamtchatka. Russia must pay an indemnity of at least £100,000,000, and this sum may increase if the war be prolonged. Theoretical or paper undertakings by Russia Japan does not desire, having tested their value in the past; all concessions have to be on the practical plane. Manchuria will be thrown open to the trade of the world under Chinese administration; indeed, it is by placing it upon an international plane that Japan hopes to secure an effective barrier against future Russian aggression. Except for the cession of Sakhalin, the railway, and the indemnity, the Japanese terms of peace do not touch Russian property, and it is not too much to say that these three demands are little punishment for a vanquished enemy, who sought to crush

BRITISH LIBRARY

the very life out of Japan. The moderation of Japan's demands is their most remarkable point.

The one vitally essential point is the question of the war indemnity, which the Japanese are determined to have from Russia, and which is a bitter pill for the Russians to swallow. For Japan it is a *sine qua non* that Russia shall treat with her on an absolute equality, wiping out for ever the contemptuous "little yellow monkeys" epoch. It is for this reason that so much stress is laid upon the payment of an indemnity, openly acknowledged to be such and not concealed under specious pretences and make-believes. Japan's prestige demands full recognition of her position as a Great Power, and this is the most stable point in the whole of the peace terms. Until Russia is ready to treat with Japan as she would with Germany in a similar case, there will be, there can be no peace. The Russians recoil before this idea, and even the revolutionaries feel there is degradation in an indemnity to Japan. But the fact remains that Russia will have to pay sooner or later, be it never so repugnant. Placing oneself in Russia's position, it is easily understandable how hard it is for that enormous Empire to confess defeat and humiliation to a people whom they despised a few months ago. But, hard though it be, it has to be faced, and there is no hope that Japan will forego her undoubted rights. Russians were not disinclined to talk of the hard terms which they were going to impose upon a conquered Japan, and the Japanese ask why there should be a plea for mercy for Russia, just because the Russians have been unable to live up to their boasts. The Russians must not only treat the Japanese as equals in every respect, but it is for them to sue for peace. Japan will not take the first step; that is the duty of the loser. When Russia recognises these facts then there will be peace. It must seem to many that in treating Japan on an equality, Russia would be getting a lift upwards, which could hardly be called humiliating. To convince Russia of this is, however, no easy task.

The one thing which remains inviolate in Russia is the pride of the Romanoffs, culminating in the pride of the Tsar, the Emperor of all the Romanoffs, their parasites, and Russia. And a distinction must be drawn between the people of Russia and the Government. The people are anxious that the war shall cease, the bureaucrats wish its continuance. It is no longer a war; it is a butchery in order to save the ignorant pride of a handful of corrupt bureaucrats. Thanks to their pride, the Romanoffs live in a world apart, and it is difficult for a realisation of real convictions to reach their seat on Olympus. The life or death of subjects far below affect the gods but little; they exist but to serve the Romanoffs, and, therefore, it matters little whether a hundred thousand or a million die on the field of battle. Moving above criticism, and impervious to advice, the Tsar and the Grand Dukes nevertheless insist upon directing the foreign policy of Russia. They pull threads of whose ultimate results they know nothing definitely and care less. The few hurried words pencilled by the Emperor on one of Admiral Alexeieff's despatches were the direct cause of the war, and made inevitable a struggle in the possibility of which the Emperor did not believe. He made the war, and yet did not know that he had made it, and the only hopeful element in this is that there is always a possibility that he may make peace in the same hap-hazard way. The war has made little real disturbance in the Imperial atmosphere. A few familiar faces missing from

BRITISH LIBRARY

the *levée* or the Court, a few added opportunities of making money by contracting or corruption, these are the principal effects upon the Romanoff family. And yet it is in the palaces of the Romanoffs that the peace will be decided upon when it comes. Not in the ministries, but in the homes of the Tsar, the Grand Dukes and their satellites must peace be sought. In these mysterious backwaters the policy of Russia is framed, and it is no exaggeration to say that often the whisper of a Grand-ducal mistress has more weight in framing Russian national policy than all the advice of Count Lamsdorff or M. Witte. The Romanoffs are not to be forced into peace; they may be cajoled or diplomatically led in that direction; otherwise, there is small chance of their arriving. The knowledge that the days of the dynasty as autocratic rulers are numbered tends to harden the heart of the Emperor and encourage him to go on with the war at all costs. This brief survey of the conditions existing in Russia is necessary to enable one to gain some adequate idea of the obstacles in the way of peace.

The battle of the Japan Sea afforded an opportunity for international action, and formed the pretext for President Roosevelt to address a note to the two combatants urging upon them the advisability of a cessation of hostilities, and the appointment of plenipotentiaries to discuss terms of peace. This humane action on the part of the President has won him many praises, some of them deserved. But to trace the origin of these peace proposals is to see that the credit is not due so much to the President of the United States as to those who induced him to speak. It is perfectly certain that he had very definite guarantees before he took upon himself a task which might otherwise have lowered his prestige at a moment when home affairs demand he should hold a maximum amount of consideration. To ascribe to Roosevelt all the credit of the proposals is like assuming that the voice which issues from the gramophone is everything. The unique position of irresponsibility in international affairs occupied by the United States marked out the President as the most effective mouth-piece for international opinion.

The reason for the peace movement is easily found. It is because of the growth of the "German Peril," or rather the "Kaiser Peril." Europe and the world is menaced by the ambitions, untrammelled by morality, of an able man, brought up on Bismarckian ideas, whose genius makes him intensely erratic. Russia's preoccupation in the Far East has given to the German Emperor an unusual opportunity to demonstrate his power. The absence of Russian troops on Germany's Eastern frontier has enabled the Kaiser to turn his whole attention to the West. Morocco afforded him an opportunity to throw a stone into the new *entente* of Western Europe, which has for object the isolation of Germany. Adequate grounds for interference were no more necessary than they were to the English kings when they claimed the throne of France. Disregard of a *fait accompli*, formerly acquiesced in, enabled the German Emperor to effectually frighten France and cause much disturbance in Downing Street. Lord Lansdowne saw the whole fabric of his diplomatic campaign threatened with destruction, and took immediate steps to co-operate with France to check the German aggression. The peace proposals of President Roosevelt are the direct outcome of Lord Lansdowne's action. To quote the able correspondent of the *Times* in Paris:—"The equilibrium of Europe is disturbed, and no Power

has felt the absence of Russian influence in Continental politics so much as France. The fact is that at the present moment it is at a very low ebb, and the one object of French foreign policy must necessarily be to restore it, at least in part, as speedily as possible. Otherwise, the increasingly preponderant influence of Germany must naturally damage the splendid position which of late years has been acquired by France through peaceful methods having the consolidation of peace for their object. Consequently, France not only ardently desires to see the end of the war, but also wishes for a lasting peace." That sums up the attitude of Great Britain, France, and the United States towards Germany and the war. It is essential that the war should cease and the Russian troops from the Far East come back to Germany's Eastern frontier and the Kaiser be checked. Russia's weakness as a formidable bogey has been sufficiently demonstrated, and yet she can be of value in restraining the much more pressing danger presented by the Germans. The Russian troops may not be very good, but their presence on the frontier will at once divide the German forces and reduce the German policy to saner methods. The Russian troops must come home! is the despairing cry of a badly frightened France. Great Britain alone could have done little to persuade the Russians of the urgency of the case, and, in fact, little was directly done save to point out the foolishness of throwing away the Near East as well as the Far by a futile continuance of the war with Japan. But through France plenty of pressure could be and was brought to bear. France did not even refrain from threatening her ally with a collapse of the artificially sustained Russian bonds if peace were not speedily approached. In reply to Russia's declaration that she would rather spend money on continuing the war than on the payment of an indemnity, the French informed the Russian authorities that, while they would gladly raise a Russian indemnity loan, they would not touch a war loan on any consideration whatever. The United States also put considerable pressure on Russia to induce her to accept a proposal to discuss terms with Japan. America also suffers from an untrammelled Germany, since the South American republics might in the near future well create difficulties similar to that in Morocco.

Japan offered cordial co-operation when approached on the matter by Great Britain, recognising as she does to the full the vital importance of international equilibrium. She was assured that there was no question of her giving up her essential demands, including the indemnity. "If it can be done, will you be ready to help us settle the matter up, without prejudice to yourself?" was the way the proposal was placed before Japan. Waging no war of aggression, the Japanese are quite ready to stop hostilities whenever the necessary guarantees for the preservation of peace and the maintenance of Japanese prestige can be obtained. Japan has shown her power and her accession to the paramountcy of the Far East, and fully recognises that it may be easier to obtain her terms when semi-officially supported by several Great Powers. Not that there will be any direct support, but the pressure put on to Russia to make peace on the one hand and the acknowledgment of Japanese rights on the other, tend to help along the acceptance of the necessary terms by Russia. Advantage has also been taken of the opportunity to enter thoroughly into the question of the enlargement and renewal

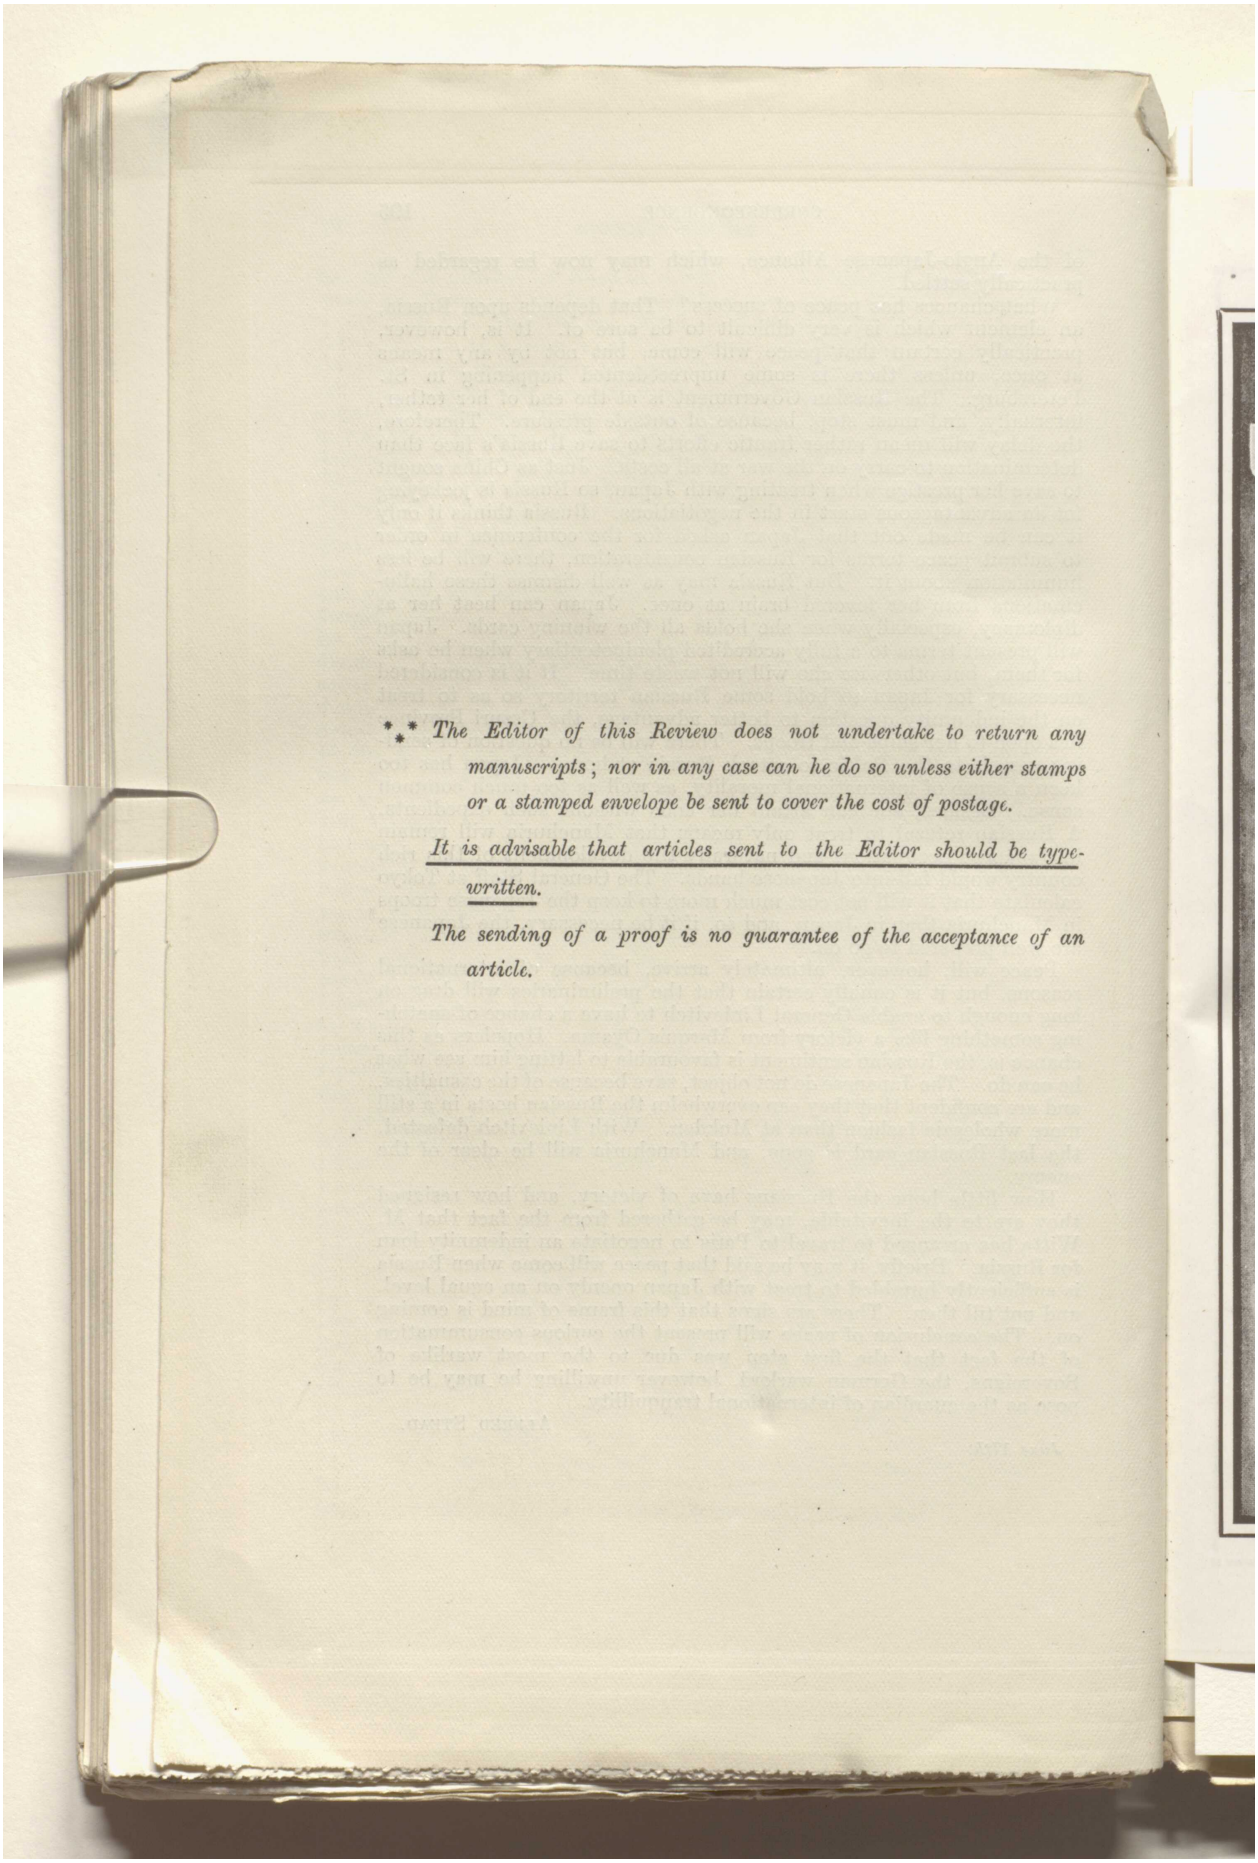
of the Anglo-Japanese Alliance, which may now be regarded as practically settled.

What chances has peace of success? That depends upon Russia, an element which is very difficult to be sure of. It is, however, practically certain that peace will come, but not by any means at once, unless there is some unprecedented happening in St. Petersburg. The Russian Government is at the end of her tether, internally, and must stop, because of outside pressure. Therefore, the delay will mean rather frantic efforts to save Russia's face than determination to carry on the war at all costs. Just as China sought to save her prestige when treating with Japan, so Russia is jockeying for an advantageous start in the negotiations. Russia thinks if only it can be made out that Japan asked for the conference in order to submit peace terms for Russian consideration, there will be less humiliation about it. But Russia may as well dismiss these hallucinations from her fevered brain at once. Japan can beat her at diplomacy, especially when she holds all the winning cards. Japan will present terms to a fully accredited plenipotentiary when he asks for them, but otherwise she will not waste time. If it is considered necessary for Japan to hold some Russian territory so as to treat on the indemnity question to better advantage, the Ussuri Province lies open to her ships and troops. There will be no question of sending vessels to the Baltic to attack Russia at home. Japan has too keen a sense of international morality, as well as too much common sense. Besides, she can attain her ends without such expedients. A Russian refusal to treat only means that Manchuria will remain in Japanese occupation, and naturally the development of this rich country would fall into Japanese hands. The General Staff at Tokyo calculate that it will not cost much more to keep the Japanese troops in Manchuria than in Japan, and so, if it be necessary, the Japanese are well prepared to go on.

Peace will, however, ultimately arrive, because of international reasons, but it is equally certain that the preliminaries will drag on long enough to enable General Linievitch to have a chance of snatching something like a victory from Marquis Oyama. Hopeless as this chance is, the Russian sentiment is favourable to letting him see what he can do. The Japanese do not object, save because of the casualties, and are confident that they can overwhelm the Russian hosts in a still more wholesale fashion than at Mukden. With Linievitch defeated, the last Russian card is gone, and Manchuria will be clear of the enemy.

How little hope the Russians have of victory, and how resigned they are to the inevitable, may be gathered from the fact that M. Witte has arranged to travel to Paris to negotiate an indemnity loan for Russia. Briefly, it may be said that peace will come when Russia is sufficiently humbled to treat with Japan openly on an equal level, and not till then. There are signs that this frame of mind is coming on. The conclusion of peace will present the curious consummation of the fact that the first step was due to the most warlike of Sovereigns, the German warlord, however unwilling he may be to pose as the guardian of international tranquillity.



ALFRED STEAD.

June 17th.

DISTINCTIVE SYSTEM OF ASSURANCE

THE SOCIETY was founded in 1837, and the Accumulated Funds now exceed **Thirteen Millions Sterling.**

LIFE ASSURANCE.

Distinctive features—

Moderate Premiums.

Large Immediate Assurances.

Large Bonuses to those who prove to be good lives.

Expenses of Management are moderate; and as there are no Shareholders all Surplus goes to the Policyholders.

ENDOWMENT ASSURANCES form a Special Class by themselves, receiving the Whole Surplus arising therefrom.

EXAMPLES.

LIFE ASSURANCE. The Premiums are so moderate that the yearly sum charged by many other first-class Offices for £1000 (With Profits) will here usually secure from the commencement as much as £1200 or thereby.

A person, age 30, may secure £500 at death, with right to Bonus Additions, for an Annual Payment of £10:11:8 during life, or of £13:9:7 during 25 years only.

PROVISION FOR THE YOUNG. For £10 annually, a Parent or Guardian of a child under one year old, may secure to it an Assurance of £805, with Bonus Additions, payable at age 55, or at death if previous should that event happen after age 21.

If the Assurance were payable at death only, after 21, the amount would be £1276, with right to Bonus Additions.

All Premiums returnable should the child die before 21. Medical Examination is dispensed with in these cases, and there are no restrictions on future residence or occupation.

PENSION FOR ADVANCED AGE combined with PROVISION AT DEATH. A person, age 30, for an Annual Payment of £14:3:9, ceasing before age 65, may secure £500 at death, with right to Bonus Additions, together with an Annuity of £25 for the remainder of life, commencing at age 65.

The Assured, on attaining age 65, is possessed of a Paid-up Policy, with Bonus Additions, payable at death, and is in receipt of a fixed Income for remainder of life.

ENDOWMENT ASSURANCES receive the whole Profits arising under this Class in the form of an Annual Bonus from the commencement.

A Premium of £17:14:7, at age 30, limited to 30 payments, secures £500, with Bonuses, to the Assured at age 60, or to his representatives in event of earlier death.

SUPPLIED TO THE ROYAL HOUSEHOLD.

Vibrona

THE IDEAL TONIC WINE.

WHAT IT IS.

NOT only during the period of convalescence after illness but in a variety of circumstances imposing heavy strain on the physical and nervous system, the need of a TONIC is often felt. There is perhaps no actual malady, but the whole system is in a weak and debilitated condition, and the consciousness of want of strength and energy is most distressing. A TONIC is evidently necessary, but the important question arises, which of the many claimants to public favour is supported by the mature judgment and approval of the Medical Profession.

Fortunately this is a point not difficult to decide.

Medical experience has conclusively proved that the best, the most reliable and the most uniformly successful TONIC is VIBRONA.

VIBRONA is not made the subject of extravagant advertising, neither does it claim to be a panacea for all the ills which flesh is heir to.

VIBRONA has been justly described as the SUPREME TONIC and the best evidence of its unique properties is to be found in the fact that the world-wide reputation which VIBRONA enjoys is mainly due to the spontaneous personal testimony of those who having experienced its remarkable energising powers are glad to recommend it to their friends.

VIBRONA must not be confounded with Coca and other medicated wines whose stimulating properties are almost wholly dependent on the alcohol they contain. The tonic action of VIBRONA is cumulative; that is to say, it continues to exert its effect in a gradually increasing degree until the whole system feels strengthened and invigorated. The appetite improves, the digestive functions acquire a healthy activity, and both mental and physical exertion can be borne without abnormal fatigue or exhaustion.

WHAT IT DOES.

LETTERS are being constantly received from physicians in all parts of the world testifying to the splendid results which have attended the use of VIBRONA in cases of every-day occurrence in which a thoroughly trustworthy and efficient TONIC is the one thing needed. An abstract of these Reports (omitting the names and addresses of the writers) will be supplied on request. The originals are always open to the inspection of any Member of the Profession.

In depressed conditions of the system, arising from overwork, worry or sleeplessness; in convalescence from severe illness such as INFLUENZA, PNEUMONIA, or TYPHOID; in recovery from surgical operations, or to conserve the forces during any critical period, the restorative power of VIBRONA cannot be over estimated.

In NEURALGIA and INSOMNIA it is no exaggeration to say that VIBRONA acts like a charm, obstinate cases which have withstood every other form of treatment being frequently completely cured after two or three Liqueur glasses of VIBRONA have been taken at suitable intervals.

Persons residing in, or visiting localities where Malarial Fever exists should make it a rule to take at least one Liqueur glass of VIBRONA every day. This will not only materially increase the power to resist infection, but, in the event of an attack, will greatly mitigate its severity and hasten convalescence.

In all tropical climates, even where Malaria is absent, VIBRONA is indispensable to European residents. As a recuperative Tonic in depressed conditions of the system and as a restorative after Enteric Fever, Influenza, and other exhausting diseases, VIBRONA stands absolutely unrivalled.

A liqueur glass of VIBRONA acts as a prompt restorative, and its agreeable flavour is much appreciated by invalids and others to whom ordinary Tonics are distasteful.

Vibrona THE IDEAL TONIC WINE is supplied in bottles containing *40 Tonic doses* by all first-class Chemists, Wine Merchants and Stores. Price in Great Britain *3/9*.

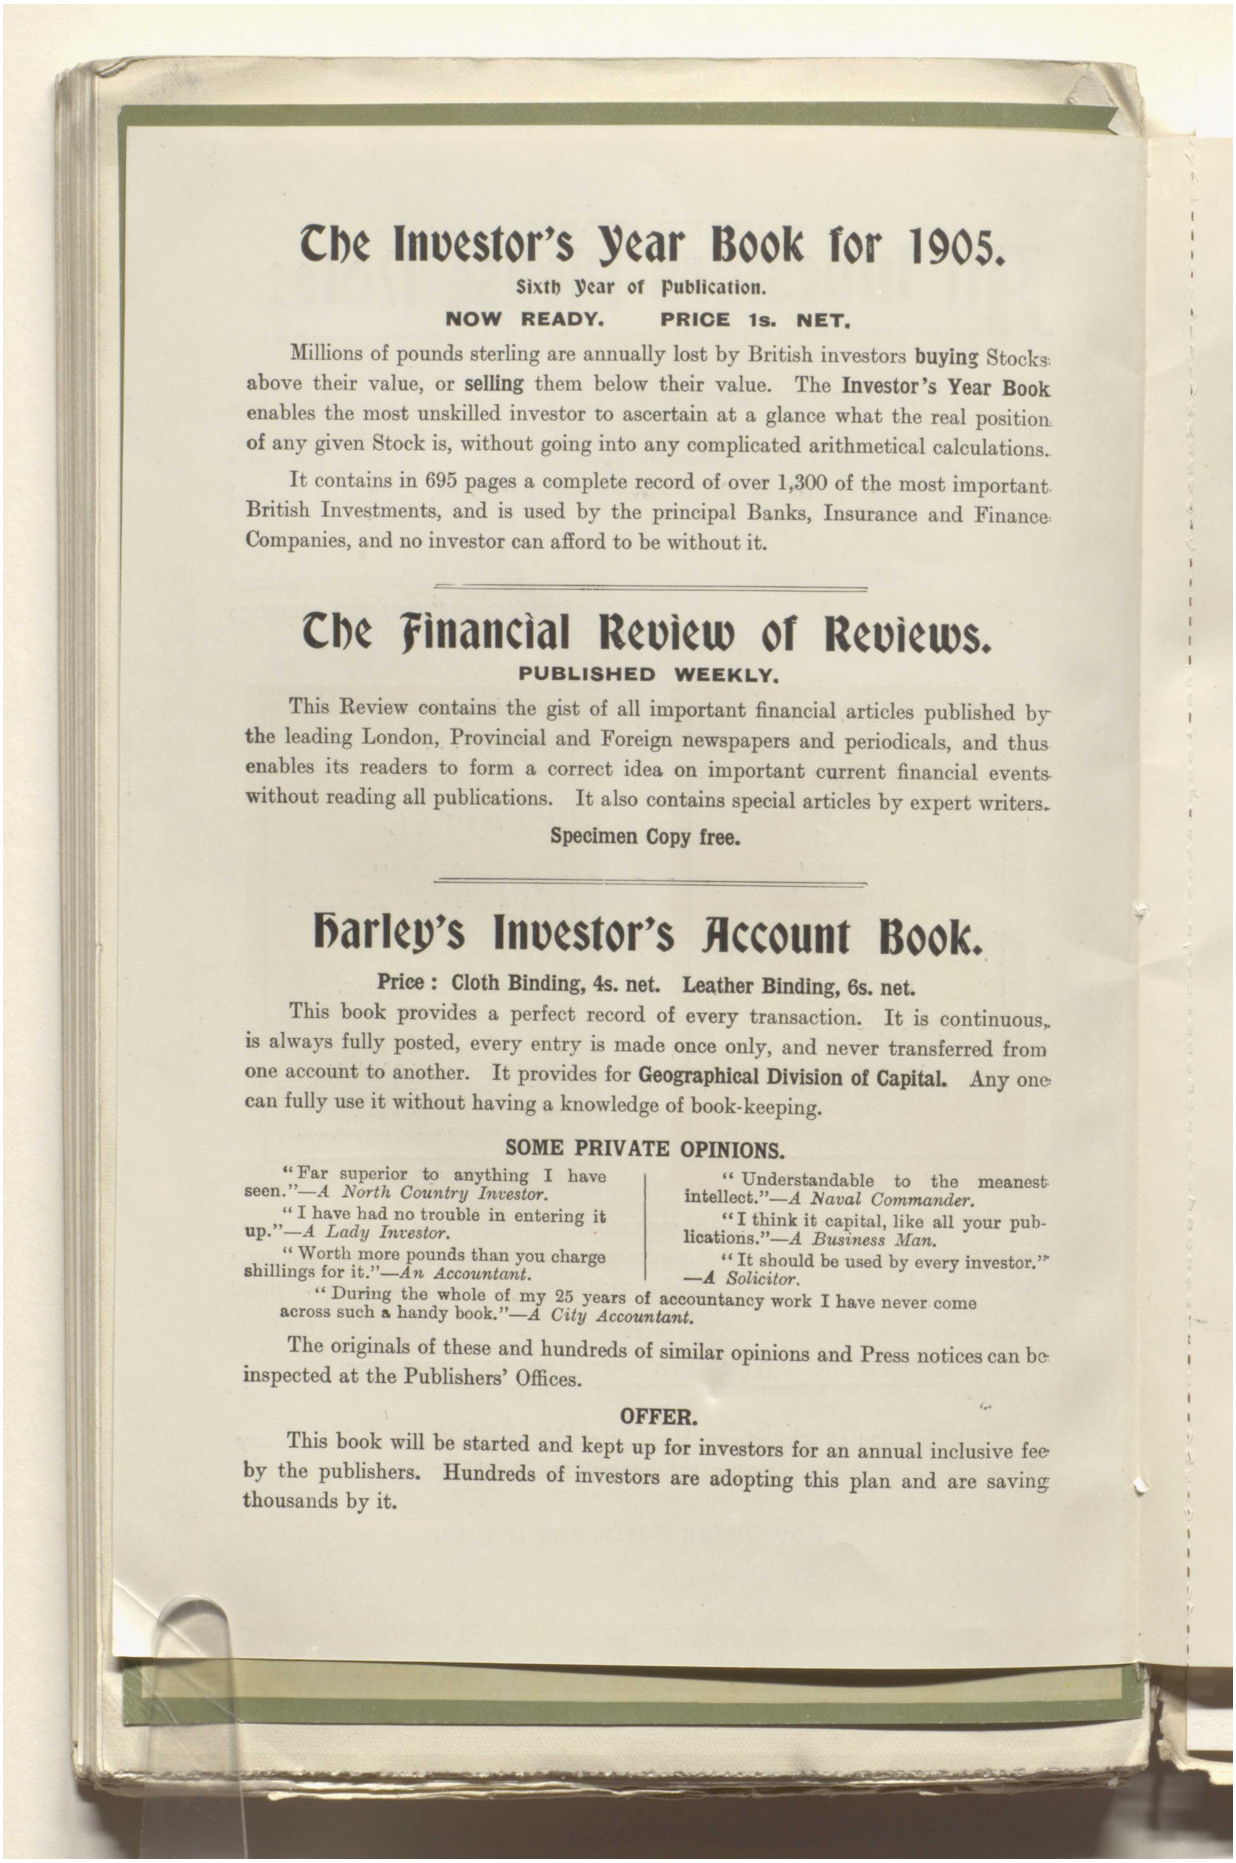
All Investors Please Note:

The **FINANCIAL NEWS** of March 31, 1905, explains in a long article how capital and income can be made safe by a geographical distribution of investments. **"HOW TO MANAGE CAPITAL"** and its companion volume **"HOW TO PROTECT CAPITAL,"** explains the theory of geographical distribution, and should be read by all investors interested in this subject.

The **TIMES** of September 13, 1904, deals in a leading article with the same subject of distribution, and concludes that: **"Investors may study with advantage the influence of Geography on Investment."**

Money invested in Stocks and Shares in the ordinary way is unsafe, and fluctuates considerably in capital value and income-producing power. The above two little books explain in simple language how capital spread over a wide geographical area is

STABLE IN VALUE AND REGULAR IN DIVIDENDS.



The adoption of this scheme is easily carried out, does not necessitate any cash outlay, and will more than repay the small trouble of learning it.

BRITISH LIBRARY

The Investor's Year Book for 1905.

Sixth Year of Publication.

NOW READY. PRICE 1s. NET.

Millions of pounds sterling are annually lost by British investors **buying** Stocks above their value, or **selling** them below their value. The **Investor's Year Book** enables the most unskilled investor to ascertain at a glance what the real position of any given Stock is, without going into any complicated arithmetical calculations.

It contains in 695 pages a complete record of over 1,300 of the most important British Investments, and is used by the principal Banks, Insurance and Finance Companies, and no investor can afford to be without it.

The Financial Review of Reviews.

PUBLISHED WEEKLY.

This Review contains the gist of all important financial articles published by the leading London, Provincial and Foreign newspapers and periodicals, and thus enables its readers to form a correct idea on important current financial events without reading all publications. It also contains special articles by expert writers.

Specimen Copy free.

Harley's Investor's Account Book.

Price : Cloth Binding, 4s. net. Leather Binding, 6s. net.

This book provides a perfect record of every transaction. It is continuous, is always fully posted, every entry is made once only, and never transferred from one account to another. It provides for **Geographical Division of Capital.** Any one can fully use it without having a knowledge of book-keeping.

SOME PRIVATE OPINIONS.

"Far superior to anything I have seen."—*A North Country Investor.*

"I have had no trouble in entering it up."—*A Lady Investor.*

"Worth more pounds than you charge shillings for it."—*An Accountant.*

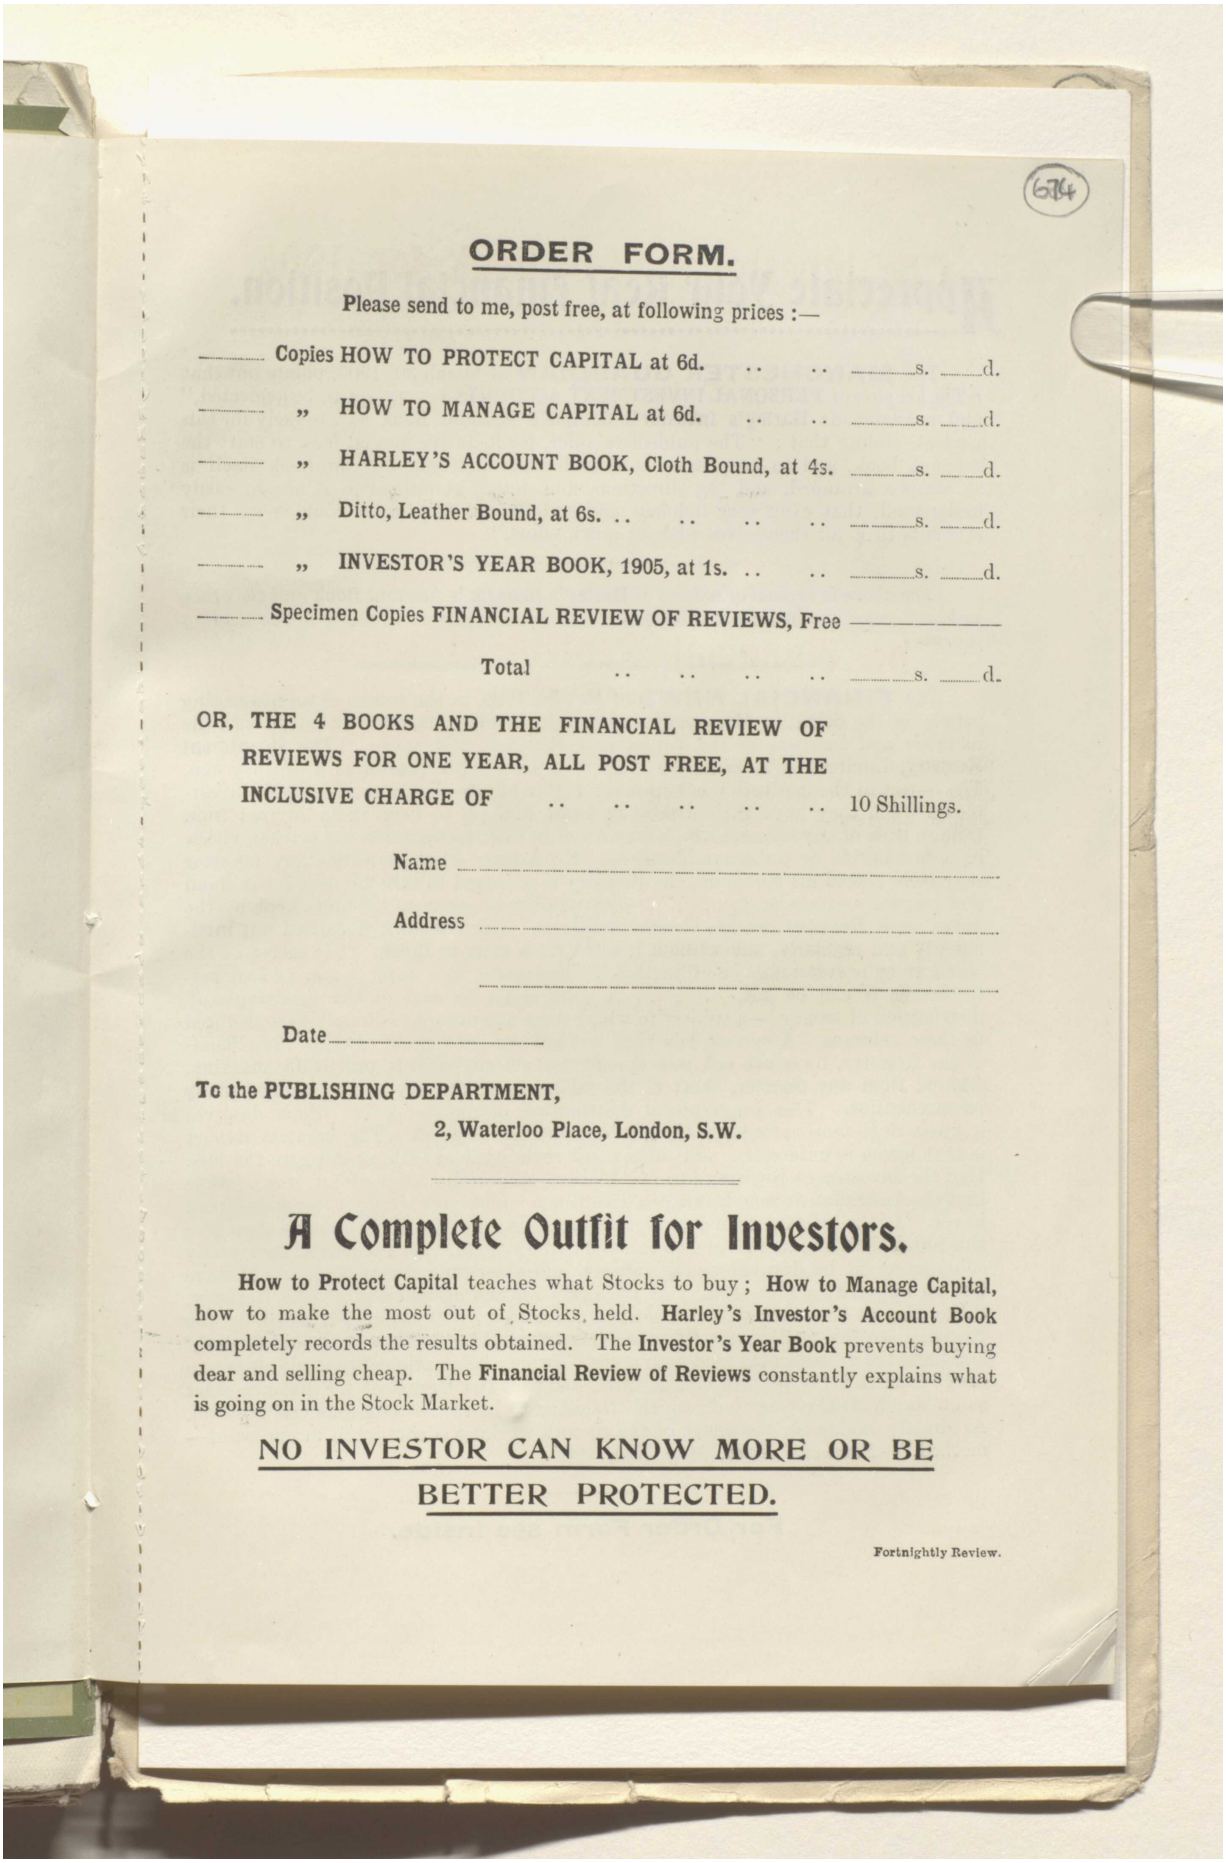
"Understandable to the meanest intellect."—*A Naval Commander.*

"I think it capital, like all your publications."—*A Business Man.*

"It should be used by every investor."—*A Solicitor.*

"During the whole of my 25 years of accountancy work I have never come across such a handy book."—*A City Accountant.*

The originals of these and hundreds of similar opinions and Press notices can be inspected at the Publishers' Offices.



OFFER.

This book will be started and kept up for investors for an annual inclusive fee by the publishers. Hundreds of investors are adopting this plan and are saving thousands by it.

BRITISH LIBRARY

Appreciate Your Real Financial Position.

The **MANCHESTER GUARDIAN** of March 30, 1905, points out that "The keeping of **PERSONAL INVESTMENT ACCOUNTS** is very apt to be neglected," and recommends **Harley's Investor's Complete Account Book** as a remedy for this neglect, adding that: "The publishers offer, for inclusive annual fees, to start the account book, and to keep it up to date for any investor, but the book itself is so simply arranged, and the directions and forms contained in it are so easily understood, that even very indolent and unbusinesslike persons could keep their accounts in it for themselves without much effort."

The above is typical of notices of **Harley's Investor's Account Book** *and the other publications of the* **Investment Registry** *which have appeared in many of the leading journals.*

The **FINANCIAL NEWS** of May 30, 1905, in the course of an interesting article on the **Scientific Management of Investor's Accounts,** deals at length with the methods and business of the Investment Registry, and says: "**The Investment Registry,** Limited, of 2, Waterloo Place, was founded a quarter of a century ago. The object of the institution is two-fold: (1) to advise clients as to suitable investments when they have their capital in hand, and (2) to keep them advised from time to time of any changes which may occur in their securities in the market, either in a favourable or unfavourable sense. No matter what securities any investor may have placed his money in, the Registry is prepared to take his account in hand and generally supervise it. . . . The number of separate accounts kept by the Investment Registry reaches several thousands, and **the work is carried out intelligently and regularly, and without a hitch from start to finish.** The secret of the whole thing is systematic co-ordination. The system, in a word, is now as near perfection as it can be got. . . . A word must be said of the 'geographical distribution of money'—a subject to which some attention has already been devoted in these columns. A system has been worked out with great care by the officials of the Registry, by which risk is so spread that **the capitalist is, practically speaking, assured from any disaster, short of the falling in of the sky or something equally comprehensive.** This geographical distribution of money is one which deserves a great deal more attention than it customarily receives. The greatest danger is that which is unforeseen, and subsequent repining does little to mitigate the loss. Had the Investment Registry's principles been universally followed out, it is possible that the Australian financial crash of a decade ago might have wrought less widespread havoc. In the brief limits of a newspaper article it is impossible to do more than give this rough sketch of so vast and so complicated a system. As a matter of fact, many columns might be devoted to the subject, and even then the layman would have but an imperfect understanding of the daily routine carried out by the Registry. Some idea of the work may be gleaned from two small books published by the Registry, entitled respectively **'How to Protect Capital'** and **'How to Manage Capital,'** and **these the investor may read with profit.** It may be mentioned that the chairman of the concern is Sir John Rolleston, M.P., and that the figures of the balance-sheet as at March 30 this year indicate the Registry to be in a strong financial position. As already explained, the secret of the smooth working is comprised in one word—method."—*Financial News, May 30th,* 1905.

THE

SIMPLEX

PIANO-PLAYER

A MARVEL OF THE 20th CENTURY.

Enquirer's First Question.

"How does the SIMPLEX differ from other Piano-Players?"

Moore and Moore's Answer.

"Essentially and vitally both in construction and musical result."

CONSTRUCTION.—In the words of the *St. James's Gazette*, it has "the clever device of a clockwork motor to move the perforated rolls in place of the now hopelessly antiquated bellows arrangement."

The pedals, therefore, are entirely relieved from winding the rolls, and only control the pneumatic fingering.

The improvement on the old style is startling. The pedalling becomes light and responsive, that all gradations of tone instantaneously follow the pressure of the feet, *without affecting time*, which is controlled by the hand independently.

Accenting levers are thus done away with, and the mechanism so simplified that derangement is practically impossible, while the working is smooth and *silent*.

No injury is done by the SIMPLEX to the finest piano.

MUSICAL RESULT.—The SIMPLEX enables the performer to play with *personal and individual sympathetic expression*, which is the vital element of true music, and totally different from machine-made music with *mechanical effects*.

PRICE: **£52** NET, OR BY DEFERRED PAYMENTS.

May be hired, and hire allowed if purchased. Terms on application.

Sole Agents (City of London):

MOORE & MOORE,

PIANOFORTE MAKERS (Founded 1838),

BRITISH LIBRARY

Journal of the Society of Arts,

No. 2,480. Vol. XLVIII.

FRIDAY, JUNE 1, 1900.

All communications for the Society should be addressed to the Secretary, John-street, Adelphi, London, W.C.

Notices.

INDIAN SECTION.

Thursday, May 24; the Right Hon. Sir Francis Henry Jeune, K.C.B., D.C.L., in the chair. The paper read was "English Criminal Procedure and the Indian Code of Criminal Procedure: a Comparison." By Sir John Scott, K.C.M.G., D.C.L.

The paper and a report of the discussion will be published in a future number of the *Journal*.

FOREIGN & COLONIAL SECTION.

Monday, May 28; the Right Hon. Sir Henry H. Fowler, G.C.S.I., M.P., in the chair. The paper read was "Imperial Telegraphic Communication." By Sir Edward Sassoon, Bart., M.P.

The paper and a report of the discussion will be published in a future number of the *Journal*.

CONVERSAZIONE.

The Society's *Conversazione* will take place at the Natural History Museum, Cromwell-road, S.W. (by permission of the Trustees of the British Museum), on Wednesday Evening, the 20th June, from 9 to 12 p.m.

The following portions of the Museum will be open:—On the Ground Floor—the Central Hall, British Saloon, and the Fossil and Mammalia and Reptilia Galleries; on the First Floor—the East and West Corridors.

Each member is entitled to a card for himself (which will not be transferable), and a card for a lady. In addition to this, a limited number of tickets will be sold to members of the Society, or to persons introduced by a member, at the price of 5s. each, if purchased before the date of the *Conversazione*. On that day the price will be raised to 7s. 6d.

These tickets will only be supplied to non-members on presentation of a letter of introduction from a member.

Members can purchase these additional tickets by personal application, or by letter addressed to the Secretary. In all cases of application by letter a remittance must be enclosed. Each ticket will admit one person, either lady or gentleman.

Light refreshments (tea, coffee, ices, claret cup, &c.) will be supplied.

Proceedings of the Society.

TWENTY-THIRD ORDINARY MEETING.

Wednesday, May 30, 1900; Spencer Wilkinson in the chair.

The following candidates were proposed for election as members of the Society:—

Apcar, Apcar Alexander, 11, Russell-street, Calcutta, India.
Gladstone, Henry Neville, 4, Whitehall court, S.W.
Hayward, F. D., 9, Gracechurch-street, E.C.
Jarman, Arthur, The University, Sydney, New South Wales.
Murti, P. N. Krishna, C.I.E., Bangalore, Mysore, India.
Nixon, Major-General John Pigot, care of Messrs. Henry S. King and Co., 45, Pall-mall, S.W.
Wood, Reginald, Fen Moor, Bottisham Lode, Cambridgeshire.

The following candidates were balloted for and duly elected members of the Society:—

Bull, Henry, 1, Queen's-gate-terrace, S.W.
Dwarkadas, Naranjee, 53, Esplanade-road, Fort, Bombay, India.
Mango, A., Messrs. Foscolo, Mango and Co., Constantinople, Turkey.
Middleton, Reginald Empson, 17, Victoria-street, Westminster, S.W.
Morris, Captain R., 3rd Bengal Cavalry, Hissar, India.
Rao, Viskvanatt Patankar Madhava, C.I.E., Bangalore, India.
Rastamji, C., Rutlam, Central India.
Wheeler, Oswald, 76, Heathwood-gardens, Old Charlton, S.E.

The Chairman, in introducing Mr. Colquhoun, said his qualifications to speak on the subject of Central Asia were unique. After spending many years in the service of the Indian Government, he made a name for himself by his journeys across the great peninsula which separated India from the Chinese Empire, a country in which of late we had learned to

BRITISH LIBRARY

take a deeper interest. After that he had a long and very interesting experience in South Africa, being the first Administrator of Mashonaland. Since then he had published a series of remarkable books, of which the first described his journey between Upper Burmah and the basin of the Yangtse. He had again visited China, and travelled extensively in the far East and in the Russian dominions, which were so rapidly increasing. He had, therefore, seen more of Asia than most Englishmen, and had enjoyed exceptional opportunities of forming an opinion on Asiatic questions, so that no doubt the paper would be of the most interesting description.

The paper read was—

RUSSIAN CENTRAL ASIA: COUNTRIES AND PEOPLES.

By Archibald R. Colquhoun.

No attempt is made, in the following paper, to deal with the political problems which arise from the presence of the Russians in Central Asia, a territory hitherto abandoned to the many tribes and peoples, some wild and uncivilised, who have inhabited the land for generations. Many of these native states were rich and prosperous, and, although Oriental, highly organised; others were mere congeries of nomad families. All present features of great interest and novelty. Of the steady progress of Russia east and southwards I have spoken elsewhere, I propose to-night to give a brief account of some of the people she has encountered in this progress and the countries which have come under her flag during the last half century. The variety of races, the differing conditions both of climate and geography which are found in these countries and peoples are not only interesting in themselves, but, when we reflect that they are already practically consolidated into well organised Russian provinces, afford an excellent illustration of the tenacity of purpose characteristic of the Slav race, and also of their power of assimilation. Their success in this direction must be largely attributed to the fact that they are themselves partly Oriental, and so akin to the people they have conquered.

The territory described as Central Asia is bounded by Siberia on the north, by the Chinese Empire on the east and south-east, Afghanistan and Persia on the south, and on the west by the Caspian Sea and European Russia. It originally consisted of three kingdoms, known as the Central Asian Khanates of Bokhara, Khokand, and Khiva, of the Khirgiz Steppes, the half desert country of the Tekkés, the oasis of Merv, and the districts of Kuldja, Ferghana, Zarafshan, and the Pamirs. These are now, roughly speaking, divided into the provinces of Orenburgh in the north (including a large slice of Siberia), Turkestan and East Turkestan central and east, and Transcaspia on the west. Bokhara retains its native ruler and form of government, but is under Russian suzerainty.

The climate of Central Asia varies considerably from north to south, and may be roughly divided into three zones. The northern zone extends as far south as latitude 45°, and includes the lower course of the Syr Daria to Fort No. 2, and the lower course of the Ili. The climate in this zone is what is known as "continental," with very hot summers and very cold winters. Snow remains on the ground for about three months, while the summer is extremely hot, and lasts from four to five months. The central zone includes the towns of Perovsky, Turkestan, Aulieata, and Vierny, with the middle course of the Syr Daria and a large portion of the Kyzyl Kum sands. Here the winter may be compared to that of Central Germany, while at Vierny grapes ripen, though not so well as further south. The southern zone is tropical, and includes Kuldja, besides those towns which lie either in the same latitude or south of Tashkent. Kuldja owes its comparatively high temperature to its sheltered position, being surrounded by high mountains, which protect it from the north-easterly winds so prevalent in the rest of the central zone. Fruits of a delicate nature flourish—peaches, apricots, pomegranates, and grapes. The winter, though cold, is short, snow seldom remaining on the ground for longer than a month. There is, however, a great deal of rain, the rainy season lasting from about March till October.

The district of Hodjent, acquired by Russia in 1874, lies south of Tashkent, and with the valley of Zarafshan is the most fertile part of Central Asia, and was for some time a disputed point between Bokhara and Khokand. The country here is better wooded than most parts of Central Asia, and also better watered; everywhere one sees the beautiful gardens which are the joy and pride of all dwellers in Central Asian towns. These gardens surround most of the cities, and are often used as summer residences, the Russians even having adopted the fashion, and camping out in roomy tents and pavilions during the hot months. Peach, cherry, and apple trees

make these gardens beautiful, and it is much to be regretted that, owing to the scarcity of coal, these orchards are being largely cut down for fuel.

With regard to mineral produce, the lack of good coal in Central Asia is likely to prove a serious drawback to its development, although the improvement in communications will largely remedy the defect. Since the acquisition of Turkestan, the Government have made great efforts to discover really productive coal-beds; but although coal exists scattered pretty widely over Central Asia, all that has been obtained hitherto is of inferior quality, and broken up into small fields. As for other minerals, it is curious, considering the trifling amount of gold found in this part of Russia's new possessions, to remember that her first step towards Asia was initiated by Peter the Great because he had heard so much of the gold to be found on the banks of the Oxus. Lead-ore is the most abundant mineral, but this cannot be mined with any great profit on account of the dearness of fuel and difficulty of transport.

There are several different races inhabiting Central Asia, but, broadly speaking, they are all of Persian or Turkish descent. A part of the country was undoubtedly inhabited in early times by the Sacæ, or Scythians, an Aryan race who were, to a large extent, dispossessed and driven out by the Turkish tribes who overran the country. The descendants of this ancient race are still found in considerable numbers, often clustered together in mountain villages, to which they have been gradually driven by the succeeding waves of Russian invasion. A curious testimony to the antiquity of the race is the fact that their language retains many words of Aryan derivation which are not known in modern Persian. The Tadjiks, as they are called, are distinguished, not only in appearance, but in character, from the tribes of Turkish descent. The typical Tadjik is large, thickly bearded, vain with the childish vanity common in primitive races, lazy, untruthful, and morally corrupt. He despises his less subtle Uzbek neighbour, who returns the sentiment, but is nevertheless compelled to make use of the sharper wit of the Tadjik. The Uzbeks, who form a large proportion of the population in Central Asia, are a tribe, or congeries of tribes, of much the same origin as the Kirghiz, being founded by Turkish immigrants who flocked into the country both before and after the time of Genghiz Khan. Unlike the Kirghiz, however, the Uzbeks have little of the Mongol element. They speak a Turkic dialect, and retain, at all events traditionally, their old division into clans or families, the names of which in some cases perpetuate long-forgotten tribes. One clan is that of the Kiptchaks, whose martial habits and traditions made them a chief factor in the army of Khokand. The most numerous race, in the western part of Central Asia at all events, is the Kirghiz, also perhaps the most interesting.

This tribe really consists of two distinct races. The true one, the *Kara* or "Black Kirghiz," is found principally in the valleys of the Thian-Shan and Altai Mountains, and is unmistakably of Turkish origin. Descriptions found in Chinese writings of a very early date show that at that time the prevailing type was characterised by light hair and fair skin, which would not apply to the average Kirghiz of the present day, although such may still be met with here and there,

The other race, which inhabits the greater part of the province of Turkestan and the steppes bordering it, called by the Russians "Kassak-Kirghiz," is more impregnated with the Mongol element than the Kara-Kirghiz. They have largely intermarried with the Kalmuks, and their aristocracy, or "white bones," claim descent from Genghiz Khan, while their various traditions describe them as being descended from a "red-haired dog," or (a more poetical story) as veritable "Children of the Mist." Both legends suggest the great antiquity of the race, as is usual with aboriginal tribes of undoubted pre-historic origin, both in America and Australia. The claim of descent from an animal is found with other Asiatic tribes, and is always supposed to denote considerable age.

Although he has now lost his independence, the Kirghiz still retains many curious and characteristic traits, one of these being an incurable contempt for a settled or town life. "Sart," the term applied to merchants and townsfolk, is used contemptuously, and would be much resented by a true Kirghiz, who has a scoffing proverb to the effect that "when a Sart becomes rich he builds a house, a Kirghiz buys more wives." When on the move they live in *kibitkas*, or field tents, stretched on light wooden frames, and resembling the Mongolian *yourtas*. These *kibitkas* are exceedingly portable, and can be packed for a journey in less than an hour. The Kirghiz, as a rule, are of swarthy complexion, and are short and sturdy in build, the men shaving the head, but

Qatar National Library

allowing the beard to grow, while the women wind yards of cotton stuff about their heads. The male attire consists usually of a pair of baggy leather breeches, a coarse shirt, and one or more rough coats, the head being covered with a skull-cap and a conical hood of sheepskin or felt. On special occasions a red velvet coat and a tall felt hat, with turned-up brim, are worn by the well-to-do. Polygamy was adopted by the race at the time when the Russians forced Mohammedanism upon them, and the position of their women folk is not enviable. When a man wishes to marry he buys a wife, or one is bought for him by his relations, and once the *kalym*, or purchase-money, is paid, the wife becomes the mere chattel of her husband, who generally treats her with less consideration than he does his cattle. He can divorce her with the greatest ease, and her family may then attempt to sell her again. However much she may be ill-treated she has no redress, the utmost that can happen being a remonstrance from her relations to the husband for "depreciating her market value;" whilst even if he killed her, under Kirghiz law he had no more serious penalty to encounter than a fine. "A woman has only half as much soul as a man," says a Kirghiz proverb; and the men of the tribe evidently act up to this belief. The more serious crimes are now amenable to Russian law, but smaller matters are settled before certain chosen elders, who are not paid for their services, but receive a portion of every fine they inflict. Hitherto little has been done by Russia to civilise the tribes under her dominion, and such a thing as a Kirghiz school is practically unknown. Although Mohammedanism is nominally their religion, the Kirghiz do not trouble much about doctrine, many of them still adhering to the old *Shaman*, or devil-worship, while ancestor-worship is still largely practised.

It may be said, perhaps, that the principal object of Kirghiz existence is the breeding of cattle and horses, to which nearly the whole of their time is devoted. In bartering his cattle the Kirghiz does not make a feature of honesty, and will invariably cheat whenever he gets the chance.

Fond as he is of horse-flesh, his sheep—of which he has a famous fat-tailed breed called the *Kurdiak*—are perhaps nearest to the heart of the Kirghiz. All over Central Asia and in Southern Siberia mutton is the staple food, and the nomads who inhabit the steppe regions are accustomed to eat it in tremendous quantities. The allowance for a Mongol driver of a caravan, for instance, is a leg of mutton per man per day; but it must be added that should meat fail, the Mongol is not only capable of foregoing his favourite food, but of existing on fare so coarse and scanty that no European could support life on it. The nomads, as a rule, do not take much trouble over the preparation of their food, boiling it in a pot, and taking it out in handfuls as it seems to them sufficiently cooked, or gnawing the flesh from the bones, which they return to the pot again. A very delicate dish, and one set before honoured guests, is composed of the tails of sheep; and the shin-bone of this useful animal is carried by superstitious Kirghiz as an amulet, and is also used in divination. His sheep are, indeed, so important to the Kirghiz or Uzbek, or to any native of Central Asia, that it is etiquette to suppose, for the sake of courtesy, that every man possesses flocks, and in greeting him the first inquiry must be not for *his* health but for *theirs*.

The favourite drink of the Kirghiz is made from brick-tea, but *kumis*, or mares' milk, is drunk, as among the Mongols, to produce intoxication, for which purpose also is used a kind of beer, distilled from grain, called *buza*, which has a stupefying effect.

On the whole the Kirghiz are a simple and credulous people, not particularly brave. Owing to their skill as trackers, in which they rival the Red Indians, they make excellent scouts.

The Kalmuks, with whom, as has been said, the Kirghiz have largely intermarried, are another race of Central Asian nomads, who originated in a confederacy of Mongol tribes living in Zungaria, on the north-western borders of the Chinese Empire, and combining together to resist the aggressions of another tribe of kindred origin. This confederacy, known as the Oirat, made attacks on China, and at one time took the Emperor prisoner, and marched to the walls of Peking. Internal dissensions, however, broke the power of the Oirat, and some of the tribes migrated to Siberia, probably receiving at that time the name of "Kalmuk," which in Turkic dialect means "remnant." Zungaria still remained in the possession of the same tribes, whose fratricidal wars and quarrels finally ended in their becoming vassals to China. Meanwhile, the Kalmuks had been driven further and further, till finally they crossed the Ural, and settled in the lower region of the Volga. Finding her new subjects in Zungaria inclined to rebel, China took a

Qatar National Library

short way of quieting them by a wholesale massacre, and as the country was left desolate, towards the middle of the 18th century, military colonies of Manchus were formed and Chinese criminals sent, while large numbers of agriculturists were deported from Eastern Turkestan. The last-named became known as *tarantchis*, and occupied a position analogous to that of Russian crown peasants. Although Mohammedans, they lived among their Buddhist neighbours quite amicably, and the only difference made by the preponderance of the Chinese element was in the unveiling of their women. Another element was added in 1771, when the Kalmuks, hearing that their mother-country had been depopulated, returned *en masse*, taking eight months on the journey, and suffering much both from want and the attacks of the Kirghiz. When they arrived they found the country occupied by the Chinese, and having no alternative, except to fall into the hands of Kirghiz or Russians, they settled down on the pasture lands, became subject to the Chinese, and devoted themselves to the breeding of cattle and horses. The Kalmuks are all Buddhists, and are completely Mongolian in type and customs. This district, known, from the name of the Manchu settlement which dominated it, as Kuldja, was annexed by Russia, but returned to China on her fulfilling certain conditions.

On the western side of Central Asia there are many different families or tribes of Turkomans, who are somewhat similar in habits to the Kirghiz, although some, like the Tekkés, live partly in villages and are agriculturists. No race offered more stubborn resistance to the Russians than the Tekkés, and none suffered more. In the Turkoman campaigns orders were given to spare neither age nor sex, and whole families were slaughtered and entire districts laid waste.

In most of the cities of Central Asia, besides these, are found many fragments of other races—Persians, originally brought as slaves; Arabs, believed by some to have been the original introducers of Mohammedanism; Hebrews, who have been settled in the country for centuries, and who have the characteristics for which their race is remarkable all over the world; Hindoos, who come and go for commercial purposes; and also many families of gipsies, known usually at Liuli, who lead a nomad life, trading in horses, while their women tell fortunes, cure the sick, and carry on a small traffic.

Theoretically nearly all the native peoples of Central Asia profess Mohammedanism, but many of the tribes know little more of it than the name of the prophet, and some not even that. The nomads retain many practices which have no connection with Islam, and it is only in the large cities that there is any attempt at ceremonial worship. Great religious laxity prevails all over Central Asia, and the fanaticism observable among the Dervishes, who gain a living by exhibiting themselves in a religious frenzy, and even torturing themselves at times, is rather a matter of business than of true devotion.

Education among the native inhabitants is in the hands of the *mullahs* or priests, and is generally limited to such matters as have a bearing on religion or law. The foundation of colleges, where the higher religion and law are taught, has for ages been a favourite form of piety, and some still exist which were founded four and five hundred years ago. Both pupils and professors are supported from the revenues of the college, the latter receiving in addition voluntary gifts from parents of the pupils. There are also primary schools, generally attached to each mosque, and here the boys from the age of five are instructed first in the alphabet, and then in the reading of the Koran and about seven other books, which they read and copy without understanding, as they are written in Persian and Turki and never translated into the dialect of the district. To know the Koran by heart confers at once rank and sanctity on the happy accomplisher of that feat. This is usually an effort entirely of memory, as few are acquainted with Arabic, though many have read illegal translations and know the substance of what they recite. Superstition is extremely rife, especially among the nomad tribes, who attach mystic meaning to such events as the appearance of crows (as in Western Europe), magpies, and other birds and beasts. A favourite method of divination is by roasting the shin bone of a sheep and watching its appearance as it burns, from which the future is predicted by certain signs.

As regards religion, the Russians have always acted with the greatest wisdom and tolerance, never in any way interfering with the worship and practice of the conquered tribes, except that they have abolished the native functionaries whose business was to compel the performance of religious rites. Missionary projects have been by no means encouraged, although in the garrisons and in one or two towns there are Christian

BRITISH LIBRARY

churches, and a Bishop of the province of Turkestan. The Russians have acted with less wisdom in arranging the administration of their new provinces; and, in trying to force upon the natives systems foreign to their customs and characters, they have earned a certain amount of unpopularity. One instance is the method of local government by natives elected by vote, under the surveillance of the Russian Government. This, with modifications, has been tried among Kirghiz, Uzbeks, and in the chief towns. The people left to themselves would always elect men of influence and popularity—their former leaders—who, for obvious reasons, are not acceptable to the Russians, so that the system has degenerated into mere farce, and is viewed with contempt by the natives, the men chosen being merely the tools of Government.

The advent of the Russians in Central Asia has naturally made a great difference in many of the towns which, originally entirely Oriental in character and appearance, now present the curious contrast of European streets and squares, occupied by officials and their families in the unpicturesque garb of the Western world, side by side with the native towns, old, in some cases, with an age which makes such cities as York mere infants; trodden by countless generations of conquerors,—Macedonians, Scythians, Arabs, Persians, Mongols; and which have succumbed—is it for ever?—to a greater than these, a race from the West.

The further one penetrates into the heart of Asia the less has this modernising influence made itself felt; so that between Orenburg, which is really on the borders of civilisation, and Samarkand there is a wide gulf.

Perhaps one of the most typical towns under the new *régime* is Tashkent, the capital of the province of Turkestan and a city of very ancient origin. Mention is made in the 7th century by a Chinese traveller of a city, either on the same spot, or near the site of the present one.

Briefly, its history up to a certain point is the story of the struggle between the two sovereigns of Bokhara and Samarkand, and when both were subdued by the Tartar chief, Genghiz Khan, it remained in the possession of his descendants until reconquered by a Khan who ruled over both Bokhara and Samarkand. Then came the Kirghiz, who held it for more than a hundred years, till it fell before an enterprising ruler of Zungaria, and after a short time achieved a semi-independence, being alternately overlorded by Khokand and Bokhara. It was in the struggle with Khokand that General Tchernaieff, fearing that Tashkent would fall into the hands of the hostile Amir of Bokhara, to whom the inhabitants—between Scylla and Charybdis—had appealed for help, invested the city with a comparatively small army, and being fortunate enough to kill the Regent of Khokand in the first engagement and to cut off the water supply of the city, entered by two gates simultaneously, chased the Khokandians and Bokharans out of the city, and received the unconditional surrender of the natives. The Russian rule was firmly established, and order maintained by native police, who still seem to work well under their new masters.

A Russian colony, with the Governor-General in his palace as the centre, and the usual military and civil officials and their families, has now its own quarter, side by side with the quaint Oriental town of Tashkent. The little houses of Russian merchants and officials are whitewashed, trim, and neat; the governor's palace has an ornamental garden round it, laid out in artificial lakes and little hills and dales, where a military band plays every evening. There are stiff public buildings, a wide square, an ugly little church, and a new improved bazaar has been erected at great cost, which has, however, entirely failed in its object of drawing the trade of the town from the native quarter, and so subjecting it more completely to Government influence. The natives did not take kindly to this arrangement, and the trade of Tashkent is still carried on in the old bazaar, which has probably existed in much the same form for hundreds of years.

The bazaar is a most important feature of life in all Oriental countries, and, as all bazaars in Central Asia have a family likeness, that of Tashkent will serve as a very fair type. No changes or improvements have been effected in it since the Russian occupation. The street, as the gate is neared, grows narrower, and little shops cluster on either side; in the bazaar itself it is exceedingly narrow, rough, and ill-paved. A very favourite method of paving in Central Asia is by laying large blocks of stone, between which are channels of mud in winter, and in summer of thick white dust. Over these the Kirghiz bumps along on his camel, quite unconcerned, and if the pedestrian does not keep carefully to the raised side-walk of mud he may be knocked over or jostled by these camels. The shops are small wooden huts of one or, at most, two rooms,

the front of which is taken down bodily to show the interior. In the centre, on a mat, the seller sits cross-legged, or perhaps it is a manufacturer with his tools in hand. Round him are displayed his wares, and there is little room for his customers, who must stand outside to do their bargaining. There is none of the hurry and bustle of European shopping; the merchant displays no undue eagerness to sell his goods, and the buyer is equally self-possessed and leisurely. Theoretically there are thirty-two different trade guilds, which must be represented in the bazaar; practically there are more. Each guild is supposed to have thirty-two branches, and each must have a different shop; thus, in brass-working (sometimes very beautifully done) one will make the bowl or ewer, another the bottom, another the lid, a fourth will solder them together, while at a fifth, with a sharp chisel, the decoration is worked out. Almost every trade has its own street, the shops on either side being devoted to shoe, or harness, or crockery-making in all their different branches.

The Kirghiz have a special quarter of their own in the great bazaar of Tashkent, and here is sold the really beautiful felt made by the women, also coarse carpets and other articles of nomad manufacture. Here and there are arched gateways, behind which are caravanserais, some used by local merchants for storing their goods, and others as hostelries for foreigners. Here the merchandise lies about in piles, the camels and horses stabled around the sides of the court, while overhead the merchants "live, move, and have their being," in an atmosphere which is, luckily, peculiar to bazaars.

Every Mussulman city, to be *en règle*, must have a "Jumma," or mosque, large enough to hold all the inhabitants on Fridays. Looking from the platform of the mosque in Tashkent (whence the mullah calls to prayers), one sees apparently nothing but a flat clay plain, beyond which rises a hill with another mosque, and the domed roof of a bath. This plain is composed of the mud roofs of the bazaar, for the streets are so narrow that one can only see them from below, and as the roofs are often overgrown with grass and poppies, this adds to the illusion. The barber's shop is also the chemist's, and here soap—very unpleasant in smell—is sold, and also the cosmetics which a good Mussulman lady is enjoined to use in order to preserve her beauty and so please her husband.

The natives of Tashkent are mostly Uzbeks, with a few Tadjiks, Tartars, Kirghiz, Hindoos, and others who come to trade. The population is difficult to gauge, but is probably over 120,000.

The Hindoos are the great money-lenders of Central Asia, and have their own caravanserais in most towns, but under Russian rule, unlike that of the English in India, land does not pass by sale or mortgage into their hands. The Jews are also numerous, and have enjoyed greater freedom (little though that be now) since the advent of the Russians. Formerly in many towns they were confined to a certain quarter and treated with much contempt, having very few civil or municipal rights, and being compelled to wear a girdle of common rope as a badge of their nationality.

Cotton and silk goods, of course, occupy a large portion of the bazaar, and in the booths one can see the men at work with their rough machines of wood, dexterously manipulating reels and turning spindles. The embroidery of robes is also done by men, and is in very great demand, the robe or material being stretched over a wooden hoop, the pattern roughly chalked, and the work executed with a kind of crochet-needle, with which the silken thread is pulled into a chain-stitch. There is no liquid measure in Central Asia, everything being reckoned by weight, and the standard varies in almost every town. The coins also, the most common of which is known as the *tenga*, have different values in different parts. The Russians have tried to regulate this, and are introducing their own money, which now passes current all over Central Asia.

The native houses of the better class in Tashkent, as in other Central Asian cities, have three, or at least two, courts. The first, if there are three, is used as a stable for the animals, which are accommodated in sheds round the sides. The second is the man's court, on two sides of which are the balconies of the house; while a third, frequently, has a sort of platform, used as a terrace, where the master and his friends sit to get the full benefit of the air. The house generally contains one large room, opening on the portico—the guest-chamber, with one or two smaller ones opening into it. The doors are often beautifully carved, and instead of hinges they hang on a sort of pivot let into the lintel and threshold. Windows, as a rule, there are none, but a small open space above the doors, with lattice-work let in, either open or covered with white paper, glass being still uncommon in the typical native house. The ceilings are very curious and

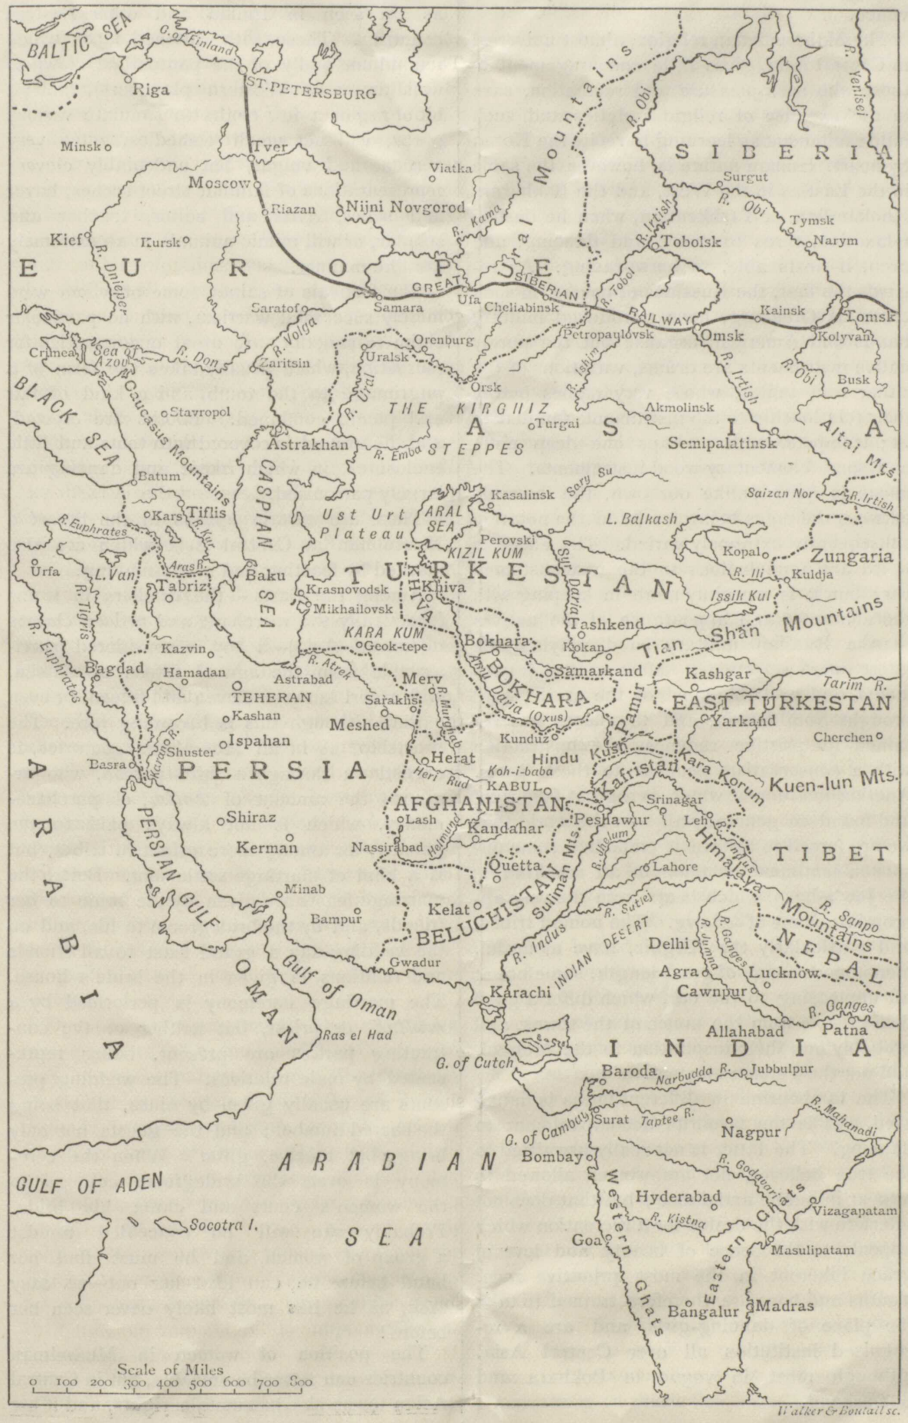
Qatar National Library

sometimes strikingly pretty, being composed of small round willow boughs set in between the rafters, and picked out in colours, with an occasional touch of gold. The walls are plastered and frequently painted with pictures of fruit, flowers, or small arabesques, and there are numerous niches with arched tops which act as shelves, on which are stored books, clothes, crockery, or food. There is usually very little furniture, unless the merchant has become bitten with the craze to imitate the Russians, in which case there are cheap tables and chairs of a conventional type imported from Russia, for such things are not made in Tashkent. The truly native house, however, contains little but rugs and mattresses, with perhaps a small round table, or a carved or painted wooden cupboard. The women's quarters are very much the same in arrangement and furniture, except that they may have a broad bed—the *charpoy* of India—made of a wooden frame with a network of ropes, raised a few feet from the floor. The usual bed is merely a rug or a thin mattress stretched on the ground. In many of the rooms a small basin is let into a corner of the floor, with a jug standing by, for the numerous ablutions required by the Mussulman's religion.

The merchant who lives in this house is attired in a pair of loose white trousers made of cotton, and tied round his waist with a cord and tassels. His shirt, also of light-coloured cotton, is very long, with a small slit for the neck, and wide sleeves; over this he wears a *tchapan*, or two or three, according to the weather. This garment is a long coat, cut very sloping at the neck, and with enormous sleeves, much too long for convenience, but satisfying the Asiatic sense of propriety, which requires that the hands be covered. The *tchapan* is of cotton or silk in summer, often striped or patterned in the most gorgeous colours; in winter one gown will be made of cloth and lined with fine sheepskin or fur. A scarf or small shawl is twisted round the waist, and a turban, either of striped cotton or, if the wearer is a *mullah* or distinguished for piety, of white material is wound round the head over a little embroidered skull cap.

The dress of the women is very similar, but their gowns are more often of silk, and many strings of beads, gold, and gems are worn round the neck, with bracelets, anklets, hair ornaments, and sometimes nose-rings. Outside they wear a thick veil of woven horsehair and a dark-blue or green cloak with long sleeves. The class of women who go abroad unveiled is such that even Jewesses and others, whose religion does not demand it, cannot venture out without these hideous garments. This applies, however, only to the purely Mussulman cities. In the east, where the Buddhist element is strong, an unveiled woman is occasionally seen, while the custom has never obtained among the Kirghiz and other nomad tribes, whose Mohammedanism is even less than skin deep.

Although there are hotels in Tashkent, and in many other Central Asian towns, they are by no means according to Western ideas of comfort, resembling in arrangement the caravanserai already described. The food of the country is mutton, mutton, mutton! In the town there is some attempt to vary the method of cooking; but, as a rule, the dishes are too greasy and insipid for European palates. Wine can be got in Tashkent, imported from Russia, at fabulous prices, but the native drink is green tea, black tea having been only introduced by the Russians, and this is sometimes thickened with cream or melted tallow, and sometimes flavoured with a small dried lemon.



The walls of Tashkent are said to have been sixteen miles round, but were largely demolished by the Russians to make barracks and parade-grounds. Outside these walls and the gardens surrounding them is the open steppe, over which are dotted numerous villages, mostly inhabited by either Tartars or Kirghiz, the races who mingle in the city keeping apart here. One is a sort of summer residence for the governor and his little court, and at another is a large establishment for the breeding and improvement of horses, nominally a private enterprise, but in reality subsidised by Government, which realises the importance of a plentiful supply of horses from a strategical point of view.

Altogether, Tashkent is a curious and typical example of East meeting West. The modern Russian soldier and his Paris-dressed wife rub shoulders with the Usbek or Kirghiz, whose ancestors were Khans and Beks in this country at a time when Russia was a mere congeries of half-savage States; or with the Mongols, whose warrior kings in the days of old not only conquered Russia, but a great portion of the then known world; or with the Tadjiks, of almost prehistoric origin, former owners of the soil, who were dispossessed by Kirghiz and Mongol alike, but still retain their individuality. All these varying peoples have accepted the yoke of their Western conquerors. The Oriental is, above all, a fatalist, and he recog-

nises the inevitable wave of Russian advance.

The Mohammedan religion, almost universal in Central Asia, gives little encouragement to those who seek pleasure and recreation, save in the exercise of religious duties and such mild excitement as learning to recite the Koran by heart. Human nature is, however, the same in the East as in the West, and the Bokharan, Khokandian, or Tashkentian, when he desires relaxation, turns to music and dancing, and even, if he is able, to horse-racing. As regards the first, the Russians of course, in such cities as Orenburg, have introduced military bands and American organs; but the purely native instruments are drums, variations of the zither and guitar, whose very names betray their relationship to the instruments familiar to us; trumpets, with perhaps one deep note, and some elementary wood instruments. The music is quite unlike our own, the intervals between the notes being less, and the notation consequently extremely varied. The effect is weird and unmelodious to the unaccustomed ear; but it is certainly more in keeping with the character and appearance of the natives than a Russian military band playing the latest opera selections. Most of the instruments, and probably much of the music, were brought from Persia, and the latter has retained its pristine rudeness of construction with a conservatism peculiar to these parts. Another instrument which is a great favourite, and found so generally all over the world that we are forced to believe it embodies some unspoken sentiment common to all mankind, is the Jew's-harp, which bears here the very appropriate name of *tchang*. The nomad tribes, and particularly the Kirghiz, have mournful, monotonous songs of great length, some not at all unpleasing to the ear, which differ a good deal in style from the music of the towns, and probably owe their inspiration to the Mongol, and not the Persian element.

The tambourine in different forms is much used, and is the favourite accompaniment to dancing. The latter is not really permitted to the true believer, nor are women allowed to appear in public and dance; but that does not interfere with the desire for a recreation which appeals to the sense of beauty and love of grace inherent in the most primitive race. Youths and boys are therefore trained to take the place of dancing-girls, and are a recognised institution all over Central Asia, although most in vogue in Bokhara and Samarkand.

Besides dancers, there are comedians, such as are seen in Indian and other Eastern countries. These, with whitened faces (which remind one oddly of the pantomime clown so well known to Western playgoers), and a bit of rag or a few cloths to simulate various garbs, will act small comedies, often very obscene and vulgar, but undeniably clever; representations of familiar street scenes, buyer and seller, *Kazi* and suitor, teacher and scholar, or will mimic animals in an extremely life-like manner.

The festivals of saints, some of whom were merely successful warriors, with no particular claim to sanctity, are great opportunities for recreation, which usually takes the form of a pilgrimage to the tomb, and a kind of fair and picnic combined. Booths are erected, and the ground is covered with tents and little enclosures, in which music and dancing are largely patronised.

There are certain epochs in the life of a Mussulman in Central Asia which are also marked by feasting and merry-making.

Among the Sarts — the dwellers in towns (practically the merchant and artisan classes of Central Asia)—a boy is considered marriageable from the age of fifteen or sixteen, and a girl between eleven and fifteen, or even earlier, although this is becoming rare. The courtship, as in all Mussulman countries, is carried on through a third person, who arranges the amount of *kalim*, or purchase-money, which is not always paid to the parents, as among more primitive tribes, but is a kind of marriage settlement. Before the marriage feasts are given by the bride to her friends, and by the bridegroom to his, and on the wedding-day a grand feast to all friends and relations is given in the bride's house. The marriage ceremony is performed by a *mullah*, or priest, but neither of the contracting parties are present, being represented by male relatives. The wedding presents are usually given by nines, that being the sacred number; and the guests not only bring, but receive, gifts. When the ceremony is over, the bridegroom can go to the women's court and claim his bride. Probably she will be concealed amidst a group of women, and he must find her hand before he can lead her out—no easy task, as he has most likely never seen her before!

The position of women in Mussulman countries can never be enviable, but in Central Asian towns she has certain rights, and if her

مكتبة قطر الوطنية
Qatar National Library

husband does not provide for her in the way his means allow, or that by rank she is entitled to, she can complain to the *Kazi*, or judge, a native functionary who in many places has been allowed by the Russian conquerors to continue in his former position. The *Kazi*, if he think fit, can empower her to borrow money on her husband's account, or even sell his property to obtain what she wants. Divorce is, however, easy for the husband, who need give no reason, but must, if he parts with her, return to his wife all her belongings. She can also obtain a divorce if she can show good reason; and there is no obstacle to her re-marriage unless her husband curses her, as he may if she has been guilty of any heinous crime.

The nomads naturally cannot afford the feasts which are the great indulgence and dissipation of the Sarts. Still, they have their own idea of amusements, and foremost among these are horse-racing and a game played on horseback called *Kok-bura*, or "grey wolf." The latter reminds one of polo, if one can imagine polo played on a vast steppe, with sometimes as many as a hundred players. One man has a dead kid slung from his saddle-bow, and the object of the others is to bear away this kid and carry it safely to the judge. The skill of the Kirghiz in managing their horses, and the keen zest with which they enter into the game, make it very exciting and interesting to watch. As for horse-racing, it is a passion with all the nomads; and camel-racing is also popular, the ungainly beasts being sometimes driven by women or girls. The number of entries for a single horse-race got up at Orenburg not many years since was over a thousand. Rather a difficult post must be that of starter on a Central Asian race-course!

The Russian Government does everything in its power to foster the breeding of horses—a very important matter in such a vast territory, where the maintenance of order is largely dependent upon irregular mounted troops. There are large studs for cavalry and artillery remounts in the Orenburg district and Turkistan; but, indeed, wherever a Cossack is found, there will be horses. These hardy soldiers, themselves only second cousins to the Kirghiz whom they have subdued, are, like the nomads, born horsemen; but, unlike them, they take an interest in the improvement of their breed of horses.

Travelling in Central Asia is usually accomplished either on horseback or in a cart resembling the Russian *taratass*, and is neither comfortable nor speedy unless good animals have been procured. The Russian post-roads in Central Asia are not level *chaussées*, but merely show the direction of the track, which is marked out by post relays, and a few settlements and towns. The posting stations are generally kept by a rich Cossack, who manages this in addition to farming and keeping an inn. He has to provide by contract a certain number of post-horses and *telegas*. The postal communications are under the control of a *smoitritel*, usually an old soldier, who examines all the passports, and has also to see to the replenishing of the inevitable *samovar*, getting a few copecks for his trouble. The station has a bare whitewashed room for the convenience of travellers, containing little furniture but a table, some wooden stools, and the tea apparatus. Sometimes the posting station is a Kirghiz tent, and in past days not unfrequently consisted of nothing but a water-cask and a post besmeared with Russian colours. The *telega*, or posting car, is a small open wooden cart, scarcely five feet in length, resting on four small wooden wheels, and running on two wooden axles. In the steppes the wheels frequently have neither metal rims nor boxes, so that the axles catch fire in spite of being perpetually greased. A feather and a jar of grease are an essential part of a traveller's equipment, and he must personally and at short intervals superintend the greasing if he wishes to avoid a break-down and the serious consequences. On the front box of the *telega* the coachman, or *jemschtchik*, is perched, and the traveller must make a seat of a bundle of straw, or his bag lashed to the cart. To this he must stick as closely as he can, while the Cossack horses gallop madly with the *telega*, which is innocent of springs, across the trackless steppe, over streams and hills and trunks of trees. The traveller after a few days of this sort of journey is almost deprived of feeling, indeed of any sensation, and those unaccustomed to it require some time to recover; yet the couriers, who carry important despatches, travel so night and day for several days, only waiting at each posting-station for tea, while fresh horses are brought. Innumerable glasses of tea, a few biscuits and eggs, frequently form their diet on the journey, and sometimes not even this. The difficulty of transporting troops and arms in such a country and for such distances may readily be imagined, and it is marvellous to think that Tamerlane traversed

these deserts with a million men. Modern armies, with their elaborate organisation—especially intricate commissariat and ambulance—can never accomplish what has been done in the past on many occasions by hordes of nomad horsemen; subsisting like the hardy animals that carried them on what they could pick up on the almost barren steppe—roots, dried meat, or a bird shot and hastily cooked.

One of the most characteristic features of life in all parts of Central Asia is the custom of present giving, which has attained proportions undreamt of in Western lands, though even there it is still an important factor in social life. Presents in Central Asia are by no means voluntary or spontaneous, being given and received as a matter of course, and it is not customary to return thanks for gifts until one is congratulated on receiving them, when thanks must be returned — not for the gift, but for the congratulations. They would become a serious tax were it not that whoever receives a present must promptly give one in return. Among the Kirghiz (who carry the custom to great lengths, despite the fact that their only wealth consists practically of the tent they live in and their flocks), etiquette demands, for instance, that at a funeral feast every mourner that attends must receive a present; but then he must always bring one with him, and the two must be of equal value, so that the proprieties are satisfied, and no one is either loser or gainer in this game of forfeits. Amusing stories are told of gifts sent to each other by the rulers of the various Khanates, in pre-Russian days, which eventually found their way back to the original sender. This system in Central Asia is a great nuisance to a stranger, who, wishing to join at all in social life, is confronted at the outset by what seems an overwhelming tax on his resources and ingenuity. A native who offers the smallest civility or present—a bunch of grapes or flowers—will remark, as he does so, "*Sillau keryak*"—a present is necessary.

All over Central Asia we find traces of a civilisation so old that it has been entirely forgotten, and nothing remains to tell us what were the races who dwelt there, or how they fell from their high estate. On the north bank of the Syr Daria, all along the valley, are numerous ruins which mark the site of former cities; and legend says that this district, now a wilderness with an occasional Russian fort or small half-savage town, was once so densely populated that from Kashgar to the Sea of Aral "the nightingale could fly from branch to branch, and the cat walk from house-top to house-top." No investigations have as yet given a clue as to the identity of the once busy dwellers in this fertile valley, nor why their towns fell into decay. The country is quite capable of supporting a population; in summer, plants and flowers of many varieties bloom on the steppes, and the brush which grows on the river banks forms a cover for quantities of pheasants, geese, partridges, and other game.

Nearly all the tribes who, until the Russian era, possessed the soil in Central Asia, date themselves back to Genghiz Khan; but an account of his conquests, given by a Chinese statesman who accompanied that warrior during his progress West, in the early years of the 13th century, gives a description of many towns which existed then and are still standing, such as Hodjent, Samarkand, and Bokhara. It is almost certain that Central Asia was never under a homogeneous rule. Genghiz Khan, sweeping from east to west, gathered up all the little tribes, and destroyed many ancient kingdoms; but he immediately divided his immense territories between his sons, and they, when their turn came, did likewise, so that the family of Genghiz became a sort of hereditary aristocracy over the whole of Central Asia. Thus, among Kirghiz, Kara-Kirghiz, Kalmuks, Uzbeks, and all tribes which have any of the Mongol element, the "white bones" still love to boast of their descent from the conqueror.

When one considers the numbers of races which have met, amalgamated, or in many cases simply settled down side by side in Central Asia, one cannot be surprised at a certain amount of confusion in their method of reckoning time. Simplest of all, the Kirghiz, having no era from which to date their years, use a twelve-year cycle, and give to each cycle the name of an animal, the names being arranged in a certain sequence. The day of the year is not regarded at all, every one born in the same year being considered as of the same age. The Kirghiz day is divided into four parts—sunrise, eating-time, midday, and sunset. Seven days make a week, or *atna*, while the year is divided into twelve solar months, bearing names corresponding to the signs of the zodiac in Arabic. This calendar is far more complete and sensible than that now being introduced by Russia — the Julian, which is already more than twelve days out of its reckoning. Besides these zodiacal names, the Kirghiz,

like all simple people, have given titles to the months descriptive of their occupations at different times of the year; and, much as the English labourer talks of sowing-time, harvest, and hay-harvest, the nomad speaks of lambing-time, mare-milking season, and the slaughtering season. The Kirghiz are well acquainted with the stars, by which they steer their path in the desert, as well as using them to calculate time. The same solar year, with twelve months named after the zodiacal signs, is in use among all agriculturists, the months having in Tashkent alternately thirty and thirty-one days, while the last month has in ordinary years only twenty-nine, with an extra day every four years. In other cities, another system is adopted, rather less regular, and containing one month of thirty-two days and two of twenty-nine—a method common to agriculturists in Persia as well as Central Asia, and in the former country also used by Government in the assessment of taxes. A rhyme, resembling our own "Thirty days hath September," is commonly used in both countries to keep the different days of the month in the memory. There is also the ordinary Mussulman calendar, consisting of a lunar year, used in all religious documents and by the educated classes generally, and since the Julian calendar has been introduced by the Russians, great confusion has inevitably ensued.

Such, briefly, are the conditions of life and main characteristics of the people of Russian Central Asia, who, by their incorporation into the great Russian Empire, have acquired an importance which could never have been theirs while they remained broken up into a number of petty States. Never, since the short period of the ascendency of Genghis Khan, has Central Asia been united under a homogeneous rule. I have not time to enter into details of the methods adopted by Russia in managing this vast territory, but it is sufficient to say that her rule, though quasi-military, is on the whole beneficent; and that although she makes little attempt to civilise, she partly, no doubt for that very reason, succeeds in securing the peace of her new, and at first unwilling, subjects. An unswerving policy, merciless to all signs of revolt, coupled with very little interference in their lives and habits, is the golden key of Russia in her dealings with the conquered; and with this she has not only opened the gates of Central Asia for herself, but has effectually locked them against every other Power.

The question of communications is one which is never absent from the schemes of Russia. What she has already done to link the far distant parts of her possessions to their sovereign and head cannot be recapitulated in this paper, nor have I time to describe the measures which are being taken in Central Asia itself. It is enough to say that Russian lines made by Russians for Russia now run longitudinally across Asia, from Moscow to the China sea, from Batum in Transcaspia to the western gates of the Chinese Empire, and to the Herat province, the key of Afghanistan, which is the outwork of India. New lines will soon join her present Trans-Caspian system with the European-Russian railways and thus provide alternative routes to the present inconvenient transhipment across the Caspian. The importance of these railways in a practically riverless country does not need to be emphasized, and the rate at which these lines are carried out, especially that through Kusk southwards, shows what importance Russia attaches to railway communications.

DISCUSSION.

The CHAIRMAN said Mr. Colquhoun had so closely confined himself to ethnographical and geographical information that it was rather difficult to discuss the paper, without touching upon some of those larger questions which he had judiciously avoided, though he felt sure he held very decided views upon them. He had referred in one place to a proverb which showed that at one time the country from Tashkent to the Sea of Aral was thickly inhabited, and said there was no explanation of how those towns fell into decay. It appeared to him that the greater part of Central Asia belonged to the comparatively rainless belt which stretched right across Asia and Africa, and that the secret of its fertility and prosperity was largely a matter of irrigation. He imagined that in such countries, irrigation had always been the affair of the Government, and he would ask if it was not the case that after the first prosperous period of Mussulman conquest, few Governments had been sufficiently energetic and permanent to maintain those systems of irrigation by which the country was at one time made prosperous and populous. The practical interest in the question of Central Asia arose from the necessity which was laid on Great Britain to fulfil her responsibilities and maintain her position in India, and from the probability that the constant advance of Russia across these regions, and her gradual absorption of these various tribes must, sooner or later, lead to a conflict for supremacy in Asia between Russia and England. These feelings were at the back of all their minds when these questions were discussed, and could not be suppressed. For this

reason he regretted to find that the paper was limited to Russian Central Asia, as there seemed a possibility of Russian expansion very much further to the East, beyond the Pamirs, towards the high tableland between the Khokandland Mountains and the Himalayas, and he wished Mr. Colquhoun had gone a little into the ethnology of that district, and shown the connection between that part which was now Russian and the region further East, to which, in all probability, Russia was directing her eyes. He had been much struck with the passages referring to the Russian administration, of which a sample was the statement that no change was to be observed in the bazaars of Tashkent since the Russian occupation. He would like to ask if that was typical of the Russian administration, for as all who had been in India were aware, the British administration could not be charged with that sort of neglect. You could not go into a bazaar in India without seeing—not great changes in the ways and customs of the natives, but the beneficent results of the British system, not merely in preserving order, but in facilitating trade and business. In another passage a contrast was drawn between the two systems, which was favourable to the Russian, which did not allow—as the English did in India—the land to pass into the hands of mere moneylenders. No greater weakness existed in the position of Great Britain in India than that due to the fact that especially in the Panjab and the north-west, owing to the introduction of the English system of law and mortgages, the Hindoo moneylenders were much strengthened in their position. Previously the country had been somewhat disturbed, and the farmers could not borrow to any serious extent. Under the protection of British law, the land became more valuable, and the farmers were able to borrow more largely; after a few years the farmer found he could not pay, and then the moneylender produced his mortgage and got possession of the land. Thus the native farmer, who was a Mussulman and an admirable soldier, was in too many cases dispossessed by the moneylender, who was not a soldier, and was not particularly attached to British rule. In some parts of India this had been the cause of widespread discontent, and many were hoping that some change would be effected during the present vice-royalty.

Mr. F. H. Skrine said he had listened to the paper with great interest, because he had travelled in Central Asia himself, and last year in collaboration with Mr. Denison Ross, wrote a book called "The Heart of Asia," in which they described the scenes related by Mr. Colquhoun. He could bear testimony to the accuracy of his description in the main, but noticed one or two minor inaccuracies. Mr. Colquhoun referred to Kuldja as being within the tropics; he was not quite sure of the latitude, but it was at a great elevation, and was as healthy as any part of Europe. The speaker had seen at Samarcand, Askabad, and other Central Asian towns, Russian colonists from Kuldja who looked the picture of health; but that did not apply to all parts of Central Asia. His friend, General Kurapatkine, the Minister of War, had founded thirteen or more military colonies towards the frontiers of Afghanistan, which had proved failures; the children were ricketty and the men took to drink, and he believed it was in contemplation to break them up or move them eastwards. Again, it was said that no good coal was found in that region, but he had seen in the museum at Samarkand lumps of coal equal to the best Welsh, and was told by a young Scotchman, who has settled there, that mountains of coal of the finest quality were to be found in the valley of the Zerafshan. There were also other minerals, and he believed there was a veritable Klondike lying buried in the mountains beyond Samarcand. They had heard a great deal about the Khirghiz, but, in his opinion, they were not nearly so interesting a race as the Turkomans, who had a nobility of character and mien which recalled their ancestors, the Parthians, who at one time set the whole empire of Rome at defiance. Amongst them women had a high position; they were treated as equals, and bore the mark of independence in their queenly gait. With the Turkomans alone in Central Asia did women take their proper place, and it would be a great loss to civilisation if a type like that were allowed to perish. The Russians had found it necessary to show great severity in putting down signs of Turkoman independence, and the result was that they were disappearing like the red men described by Fenimore Cooper. Another matter for regret was the disappearance of the Turkoman horse, which within living memory was superior to any animal ever foaled for his endurance, docility, and affection for his master. The breed was now dying out, because the raids in which it were so important a feature had been sternly repressed. The horses now bred in Central Asia were very poor creatures indeed, and, in fact, the Cossacks were mounted on ponies from the Caucasus and the Don. He was pleased to see that Mr. Colquhoun had shown an impartial spirit in dealing with the Russian administration. He (Mr. Skrine) had gone from the bottom almost to the top of the Civil Service in Bengal, and had governed millions in his time, so that he went to Central Asia with some knowledge of how to manage Oriental races; and his impression was that the Russian Government was beneficent, and sought the well-being of the subject peoples. Many mistakes, of course, had been made. With regard to the Kirghiz, it was unfortunate that the native chieftains had been superseded by a sham system of election; but those chieftains had too much power for an autocratic Government. With regard to Turkestan proper he must say the Russian administrators had shown a sympathy and consideration for the people, such as was only to be paralleled in British India, the administration of which he believed was to a great extent copied. In India

BRITISH LIBRARY

we still had the school of John Lawrence, Henry Montgomery, and many others; and in Russia there was a class of men of the same characteristics, called the school of Abramoff, after whom was named a boulevard in Samarcand, and who had left a grand reputation behind him in Central Asia. The district officers and subordinates were about on a par with the same class of men in India, and the people of Central Asia were, on the whole, about as happy as those in our own territory. He had no doubt that the change in climate referred to was largely due to defective irrigation. In 1780 Merv was the most glorious city in Central Asia. The stems of vines there were as thick as a man's body, they bore tons of grapes, and the fields yielded four or five crops a year—all owing to enormous irrigation works; but when the Amir of Bokhara invaded it in 1780 he destroyed the grand embankment across the river above Merv, and the whole country went out of cultivation. He had ridden over miles and miles of desert, like the Sahara, but scattered with ruins, and no doubt the same process had been at work elsewhere. About the time of our Queen Elizabeth the river Oxus suddenly changed its course, and many thousands of square miles, formerly watered by it, became a hopeless desert.

Mr. E. E. THORBURN said you could not have irrigation without water, and you could not have water without rain, and according to his reading, the reason why Central Asia was desiccated, was that owing to the cutting down of the forests and other causes, the rainfall had very much decreased. With regard to the Chairman's remark about the passing of agricultural land in the Punjab to professional moneylenders, chiefly Hindoos, he might say that there was every probability of a law being passed this summer at Simla, under which the power of alienation by agriculturists to non-agriculturists would be limited to a period of 15 years, after which the land would return to the family of the alienor.

Mr. MARTIN WOOD referring to the Chairman's remarks as to what was in everybody's mind when thinking of the advance of Russia in Central Asia, said he thought the present paper tended to confirm the opinion, now thoroughly established, that whereas Russia was impregnable to us in Central Asia, so we in India were impregnable to Russia. With regard to the aridity of the country, it was generally acknowledged that want of rain was owing to want of forests, and the origin of this desiccation must be the destruction of the forests by conquerors and the improvidence of the people. He was glad to hear from Mr. Skrine that coal existed there, and also to hear his remarks on the Turkomans. They must all regret the manner in which these were massacred by their Russian conquerors, but he thought that much the same kind of treatment was applied to the Khirghiz as early as 1870.

Mr. COLQUHOUN, in reply, said in the present paper it was not open to him to enter upon the questions of policy and politics, in which he was especially interested; and in discussing these countries and peoples, the line of demarcation was so very indistinct, that it was difficult to say where Central Asia ended and the neighbouring countries began, and one had therefore to be all the more cautious. It was very difficult not to stray into subjects of much more vital interest; and, as the Chairman had indicated, the real point of interest lay not in the countries of which he had been speaking, but in the Central Asia which was gradually approaching India, making its way steadily, year by year, down to the Persian Gulf, and which had already made its way across thousands of miles to the Far East, and had now firmly established itself in the China seas, and was driving a wedge right through the whole Chinese empire. But these questions were not within the scope of the paper; he could only indicate briefly his conviction that if Russia was as busy as she could be in pushing forward her railways, the object was not simply pacific and commercial, but strategic. No one in his sober senses who had been in those regions, or who took a map of Asia and tried to recall the stages of the Russian advance, could bring himself to believe that the object of this rapid expansion could be anything but a political one. With regard to the question of irrigation, no doubt many parts of this region were very prosperous at one time, and the Russians themselves entertained the hope that by means of irrigation they might be restored to their former fertility. Mr. Thorburn, the distinguished author of "Our Asiatic Neighbours," had rightly indicated that irrigation would be extremely difficult in Central Asia. The conditions were very similar to those in another part of the world, in which great interest was taken just now, viz., South Africa, where in the great central plateau reaching from Cape Colony to the Zambesi and again northwards, the timber which once existed had been cut down or wasted by fire, and the deficient rainfall had not enabled it to be replaced. Afghanistan and Persia were outside of his subject, but he must remind them that Russia, though not actually in occupation of Herat, was near it, and was making her way south, yet the whole of this movement did not seem to attract any attention in this country. It seemed inevitable under our political system that the country could only give its attention to one thing at one time, and while we were engaged in South Africa most important events occurred elsewhere which no one seemed to notice. Amongst these were what was now happening in the north of China, in the neighbourhood of Japan, and in Central Asia, as well as what was being accomplished by the partner of France in Morocco. He had no desire to make too much of the contrast between the Russian and British modes of administration, but there was a great difference. He did not think that

Russia had done much for the education and improvement of the natives, such as Britain had done for India, but he quite agreed with the Chairman, that the English policy in the north-west provinces with regard to moneylenders had not been altogether wise, and that we had alienated to a large extent the sympathies of the people on the frontier, the real fighting backbone of India. No one who had been in India could doubt the impolicy of this. The moment we lost the confidence of the fighting races, we should find it extremely hard to hold our own; and the Hindoo moneylenders, although glib of speech and clever, had no military instinct. He was not sure that the fact of a specimen of coal being found in a museum was proof that it could be found in payable quantities in the country. Coal might exist, but so far it had not been worked, and the Russians reckoned this one of the great drawbacks to the country. Mr. Skrine's comparison of the disappearance of the Turkomans to that of the Red Indians was very apt; they were probably one of the most interesting races in that part of the world, though he was not aware that they possessed all the fine qualities Mr. Skrine had attributed to them. Russia was not the only Government which, under somewhat similar conditions, neglected to preserve a breed of horses. There was not a country in the world, except Central Asia, where horses could be bred and reared so well as in South Africa, and yet we had seen a force of 240,000 men there kept idle for weeks, if not months, for want of horseflesh. He had received great courtesy and kindness from the Russian officials, but he did not take quite the same view of them as Mr. Skrine. No doubt wherever they went they replaced the existing system by something rather better, but it was a very different system from that introduced by our countrymen into India. There was no liberty of the Press or of speech, and, however well the country might be administered it was by a despotic and autocratic Power, and under such rule you could not expect officials to be what Anglo-Indian officials were, working under a free constitution. The Government of India had made many mistakes, and was still making them, but the endeavour was always to elevate and educate the native. In Russia they did nothing of the sort; they simply ruled for their own advantage. He could not subscribe to the theory propounded by Mr. Martin Wood, for he was quite certain England was not impregnable in India, and unless measures were taken to arrest the Russian advance through Central Asia to the Persian Gulf and the Indian Ocean, there would be grave difficulties in the future. Russia might be impregnable in the heart of Central Asia, but when she came towards the Persian Gulf and to the China Seas he did not think she was at all impregnable.

The CHAIRMAN then proposed a cordial vote of thanks to Mr. Colquhoun, which was carried unanimously, and the proceedings terminated.

TRANS-SIBERIAN RAILWAY.

According to *L'Economiste Français* the length of rails laid down in nine years amounted to 3,356 miles, which gives an average of 373 miles per year. Communication will be established this year between the European continent and Vladivostock, partly by rail and partly by steamship; the time occupied for the journey will be about 17 days. The total length of the Trans-Siberian railway, including the line from Manchuria, will be 5,512 miles.

MEETINGS FOR THE ENSUING WEEK.

MONDAY, JUNE 4...Royal Institution, Albemarle-street, W., 5 p.m. General Monthly Meeting.

TUESDAY, JUNE 5...Royal Institution, Albemarle-street, W., 3 p.m. Mr. R. Warwick Bond, "Ruskin, the Servant of Art."

Anthropological, 3, Hanover-square, W., 8½ p.m. Dr. J. G. Garson, "The Metric System of Identification used in Great Britain" (illustrated with lantern slides).

WEDNESDAY, JUNE 6...Geological, Burlington-house, W., 8 p.m.

Archæological Association, 32, Sackville-street, W., 8 p.m.

Obstetrical, 20, Hanover-square, W., 8 p.m.

Archæological Institution, Oxford-mansion, Oxford-street, W., 4 p.m.

THURSDAY, JUNE 7...Linnean, Burlington-house, W., 8 p.m. 1. Mr. E. S. Goodrich, "A Viviparous Syllid Worm." 2. Dr. A. Staff, "The Genera Phæconeuron Gilg and Dicellandra Horkf." 3. Miss Embleton, "The Structure and Affinities of Echiurus Unicinctus."

Chemical, Burlington-house, W., 8½ p.m. 1. Mr. W. S. Mills, "Diphenyl and dialphyl-ethylene-diamines, their nitro-derivatives, nitrates, and mercurochlorides." 2. Dr. S. Ruhemann and Mr. H. E. Stapleton, "Condensation of ethyl acetylenedicarboxylate with bases and β-ketonic esters." 3. Dr. H. A. D. Jowett, "The constitution of pilocarpine." 4. Drs. F. D. Chattaway, K. J. P. Orton, and W. H. Hurtley, "The nitrogen chlorides derivable from m-chloroacetanilide and their transformations." 5. Dr. A. Lapworth, "Derivatives of cyanocamphor and homocamphoronic acid."

Royal Institution, Albemarle-street, W., 3 p.m. Rev. Canon Ainger, "Chaucer." (Lecture III.)

United Service Institution, Whitehall-yard, S.W., 3 p.m. Mr. A. R. Colquhoun, "The Great Trans-Siberian Railway."

FRIDAY, JUNE 8...Royal Institution, Albemarle-street, W., 8 p.m. Weekly Meeting. 9 p.m. Dr. A. Macfadyen, "The Effects of Physical Agents in Bacterial Life."

Astronomical, Burlington-house, W., 8 p.m.

Physical, Chemical Society's Rooms, Burlington-house, W., 5 p.m. 1. Dr. S. W. Richardson, "The Magnetic Properties of Iron and Aluminium Alloys" (Part II.). 2. Mr. W. Campbell, "Note on Crystallisation produced in Solid Metal by Pressure." Dr. C. H. Lees, "The Viscosity of Mixtures of Liquids and of Solutions."

SATURDAY, JUNE 9.. Botanic, Inner Circle, Regent's-park, N.W., 3¾ p.m.

Royal Institution, Albemarle-street, W., 3 p.m. Sir Frederick Bridge, "The Growth of Chamber Music." (Lecture III.)

Disease of Plants. Six Lectures. By J. L. W. THUDICHUM, M.D. (1887.) Price 1s.

Machines for Testing Materials, especially Iron and Steel Three Lectures. By Prof. W. C. UNWIN, F.R.S. (1887.) Price 1s.

Chemistry of Substances taking part in Putrefaction. and Antisepsis. Four Lectures. By JOHN M. THOMSON, F.R.S.E. (1887.) Price 1s

Alloys. Three Lectures. By Prof. W. CHANDLER ROBERTS-AUSTEN, F.R.S. (1888.) Price 1s.

Our Milk, Butter, and Cheese Supply. Three Lectures. By RICHARD BANNISTER, F.I.C., F.C.S. (1888.) Price 1s.

Elements of Architectural Design. Four Lectures. By H. H. STATHAM. (1888.) Price 1s.

Bacterial Purification of Sewage. Four Lectures. By Dr. SAMUEL RIDEAL, F.I.C. (1889.) Price 1s.

Cycle Construction and Design. Four Lectures. By ARCHIBALD SHARP, M.Inst.C.E. (1899.) Price 1s

Leather Manufacture. Four Lectures. By Prof. HENRY R. PROCTER, F.I.C. (1899.) Price 1s.

Energies of Gravity, Vitality, Affinity, Electricity, Light, and Heat, especially with Reference to the Measurement and Utilisation of them. Seven Lectures. By the Rev. ARTHUR RIGG, M.A. (1873.) Price 2s.

PRICE ONE SHILLING.

REPORT OF THE CONFERENCE ON

CANALS AND INLAND NAVIGATION.

Held by the Society of Arts on Thursday and Friday, May 10, 11, 1888.

PRICE ONE SHILLING.

REPORT OF THE SOCIETY OF ARTS' MOTOR TRIALS

HELD IN 1889.

With a Paper by Prof. A. B. W. KENNEDY, F.R.S.,

"On the Objects and Methods of the Society of Arts' Motor Trials."

To be obtained on application to the SECRETARY, Society of Arts.

BRITISH LIBRARY

EDUCATIONAL.

KING'S COLLEGE, LONDON.

The General Education of King's College, London, is conducted in several distinct but connected Faculties and Divisions, viz.:—

I. **THE FACULTY OF THEOLOGY.**
1. Morning Course. 2. Evening Course.

II. **THE FACULTY OF ARTS** (including General Literature, Secondary Teachers' Training Course, Day Training College, and Oriental Studies. Day and Evening Classes).

III. **THE FACULTY OF SCIENCE.**
Consisting of: A. THE DIVISION OF NATURAL SCIENCE (including the Department of Bacteriology. Day and Evening Classes). B. THE DIVISION OF ENGINEERING, ARCHITECTURE, AND APPLIED SCIENCES (Day and Evening Classes).

IV. **THE FACULTY OF MEDICINE** (including the Hospital and the Department of Public Health).

V. **THE DEPARTMENT FOR LADIES** (carried on at 13, Kensington Square).

VI. **KING'S COLLEGE SCHOOL** (established at Wimbledon Common).

VII. **THE CIVIL SERVICE & COMMERCIAL DEPARTMENT.**
1. Strand School, suitable for Commerce and the Civil Service.
2. Evening Classes for the Civil Service; Day Classes for Female Appointments in G.P.O.

A separate Prospectus is prepared for each of these Faculties and Departments, and will be forwarded on application to the SECRETARY, King's College, Strand, W.C.

THOUSANDS have Benefited by our well-known method of improving

BAD WRITING

Marvellous Changes Effected. Individual Tuition in Book-keeping, Typewriting, Shorthand, Languages, &c., for the Society of Arts Examinations.

SMITH & SMART (ESTAB. 1840), **59, Bishopsgate Within.**

SOCIETY FOR THE ENCOURAGEMENT OF ARTS, MANUFACTURES, AND COMMERCE.

CANTOR LECTURES.

The following Cantor Lectures, delivered before the Society of Arts, have been published separately, and may be obtained at the Society's House, John-street, Adelphi, W.C.

Photographic Chemistry. Three Lectures. By Professor R. MELDOLA, F.R.S. (1891.) Price 1s.

Pigments and Vehicles of the Old Masters. Three Lectures. By A. P. LAURIE, M.A. (1891.) Price 1s.

Mine Surveying. Three Lectures. By B. H. BROUGH, F.G.S. (1892.) Price 1s.

Developments of Electrical Distribution. Four Lectures. By Prof. GEORGE FORBES, F.R.S. (1892.) Price 1s.

Recent Contributions to the Chemistry and Bacteriology of the Fermentation Industries. Four Lectures. By Prof. PERCY F. FRANKLAND, Ph.D., F.R.S. (1892.) Price 1s.

The Practical Measurement of Alternating Currents. Four Lectures. By Prof. A. J. FLEMING, M.A., D.Sc., F.R.S. (1893.) Price 1s.

Heat Engines other than Steam. Four Lectures. By H. GRAHAM HARRIS, M.Inst.C.E. and M.E. (1889.) Price 1s. 6d.

Instruments for Measuring Radiant Heat. Four Lectures. By C. V. BOYS, A.R.S.M., F.R.S. (1889.) Price 1s.

The Decoration and Illustration of Books. Three Lectures. By WALTER CRANE. (1889.) Price 1s.

Light and Colour. Four Lectures. By Capt. W. de W. ABNEY, C.B., R.E., F.R.S. (1889.) Price 1s.

Egyptian Tapestry. Two Lectures. By ALAN S. COLE. (1889.) Price 1s.

Modern Developments of Bread-making. Three Lectures. By WILLIAM JAGO, F.C.S., F.I.C. (1890.) Price 1s.

Colour and Colouring. Three Lectures. By Prof. A. H. CHURCH, M.A., F.R.S. (1890.) Price 1s.

Design applied to Wood-carving. Three Lectures. By LEWIS FOREMAN DAY. (1890.) Price 1s.

Stereotyping. Three Lectures. By THOMAS BOLAS, F.R.S., F.I.C. (1890.) Price 1s.

Gaseous Illuminants. Three Lectures. By Professor VIVIAN B. LEWES. (1891.) Price 1s.

Electric Transmission of Power. Three Lectures. By GISBERT KAPP, C.E. (1891.) Price 1s.

Generation of Light from Coal Gas. Four Lectures. By Prof. VIVIAN B. LEWES. (1893.) Price 1s.

Mosaic: its History and Practice. Two Lectures By C. HARRISON TOWNSEND, F.R.I.B.A. (1893.) Price 1s.

Detection and Estimation of Small Quantities of Inflammable Gas or Vapour in the Air. Four Lectures. By FRANK CLOWES, D.Sc., F.I.C. (1894.) Price 1s.

Photometry. Three Lectures. By Captain W. DE W. ABNEY, C.B., F.R.S. (1894.) Price 1s.

Type-writing Machines. Two Lectures. By HENRY C. JENKINS, A.M.Inst.C.E. (1894.) Price 1s.

Explosives and their Modern Development. Four Lectures. By Professor VIVIAN B. LEWES. (1894.) Price 1s.

Means for Verifying Ancient Embroideries and Laces. Three Lectures. By ALAN S. COLE. (1895.) Price 1s.

Recent American Methods and Appliances Employed in the Metallurgy of Copper, Lead, Gold, and Silver. Four Lectures. By JAMES DOUGLAS. (1895.) Price 1s.

Commercial Fibres. Three Lectures. By Dr. D. MORRIS, C.M.G. (1895.) Price 1s.

The Arc Light. Three Lectures. By Prof. SILVANUS P. THOMPSON, D.Sc., F.R.S. (1895.) Price 1s.

Mechanical Road Carriages. Three Lectures. By W. WORBY BEAUMONT, M.Inst.C.E. (1895.) Price 1s.

Japanese Art Industries. Two Lectures. By ERNEST HART, D.C.L. (1895.) Price 1s.

The Alternate Current Transformer. Four Lectures. By Dr. J. A. FLEMING, F.R.S. (1896.) Price 1s

Precious Stones. Two Lectures. By HENRY A. MIERS, M.A., F.R.S. (1896.) Price 1s.

Applied Electro-Chemistry. Four Lectures. By JAMES SWINBURNE. (1896.) Price 1s.

Chemistry of Metals and Alloys Employed for Building and Decorative Purposes. Three Lectures. By Prof. J. M. THOMSON, F.R.S., F.C.S. (1896.) Price 1s.

Use of Gas for Domestic Lighting. Three Lectures. By Prof. VIVIAN B. LEWES. (1897.) Price 1s.

Industrial Uses of Cellulose. Three Lectures. By C. F. CROSS, F.C.S. (1897.) Price 1s.

Material and Design in Pottery. Four Lectures. By WM. BURTON, F.C.S. (1897.) Price 1s.

Alloys. Four Lectures. By Prof. W. C. ROBERTS-AUSTEN, C.B., F.R.S. Four Lectures. (1897.) Price 1s.

Design in Lettering. Four Lectures. By LEWIS F. DAY. (1897.) Price 1s.

Gutta Percha. Three Lectures, with Appendixes. By Dr. E. F. A. OBACH. (1898.) Price 2s. 6d.

Decorative Bookbinding. Three Lectures. By CYRIL DAVENPORT. (1898.) Price 1s.

The Principles of Design in Form. Four Lectures. By HUGH STANNUS. (1898.) Price 1s.

The Thermo-Chemistry of the Bessemer Process. Three Lectures. By Prof. W. NOEL HARTLEY, F.R.S. (1898.) Price 1s.

Electric Traction. Four Lectures. By Prof. C. A. CARUS WILSON. (1898.) Price 1s.

Acetylene. Four Lectures. By PROF. VIVIAN B. LEWES. (1899.) Price 1s.

Journal of the Society of Arts,

No. 2,527. Vol. XLIX.

FRIDAY, APRIL 26, 1901.

All communications for the Society should be addressed to the Secretary, John-street, Adelphi, London, W.C.

Notices.

THE COUNCIL.

At their meeting on Monday, 22nd inst., the Council appointed Sir Owen Tudor Burne, G.C.I.E., K.C.S.I,, and Sir Owen Roberts, M.A., D.C.L., Treasurers of the Society, to fill the vacancies caused by the death of Mr. Francis Cobb, and the appointment of Sir Frederick Bramwell, Bart., F.R.S., as President of the Society. The Council also filled the vacancies thus caused in the Vice-Presidentships by the appointment of Sir William Abney, K.C.B., F.R.S., and Sir George Birdwood, K.C.I.E., C.S.I., M.D., as Vice-Presidents.

CANTOR LECTURES.

The first lecture of the course on "Alloys" was delivered on Monday evening, 22nd inst., by Sir William Chandler Roberts-Austen, K.C.B., F.R.S.

The second lecture, to be delivered on Monday, April 29th, will be fully illustrated by experiments on the use of metal as fuel.

The lectures will be published in the *Journal* during the autumn recess.

PRACTICAL EXAMINATIONS IN MUSIC.

The Practical Examinations in Vocal and Experimental Music will be conducted by Ernest Walker, M.A., Mus. Doc. Oxon., and Mr. Burnham Horner, Examiners, at the House of the Society, and will commence on Monday, 24th June.

The last day for receiving applications is Friday, 10th May.

Particulars can be obtained on application to the Secretary.

Proceedings of the Society.

INDIAN SECTION.

Thursday evening, March 18; Sir Dennis Fitzpatrick, K.C.S.I., in the chair.

The Secretary of the Section read a letter from the Earl of Hardwicke, expressing his regret that, owing to public business, he was unable to take the chair.

The paper read was—

THE GREEK RETREAT FROM INDIA.

By Colonel Sir Thomas Hungerford Holdich, R.E., K.C.I.E., C.B.

Early Indian history may be said to be written in a large book containing a curious intermixture of blank pages, of historical facts buried so deep under a load of mythological legend as to be beyond recognition by any but advanced Sanscrit scholars, and of very creditable and readable history, graphically and truthfully told, the style of which might well serve as a model to historians of all time. The legends are Sanscrit, the history is Greek, and the blank pages occur at uncertain intervals; but they are nowhere so blank as immediately preceding and after the most trustworthy history.

The history of Alexander's exploits, as told by several Greek historians, are those which stand out in clearest contrast to the myths of the earliest Sanscrit writings, or to the scholarly, though as yet incomplete, compilations derived from archæological or numismatic sources, which fill up uncertain intervals on the blank pages which occur between the records of Greek and Arab conquests.

It is to the Greek story that I now propose to call your attention, and it is Alexander's retreat from India that I propose to follow through districts once well known to classical and mediæval writers; but which have been buried for some centuries in geographical obscurity.

Although several Greek historians have concerned themselves with Alexander's career, it is mainly to one of them (Arrian) that for simplicity's sake I shall refer; and though many able scholarly writers in modern times have traced out his remarkable story with more or less precision through the phases of his advance into India and his conquests on the Indus, none of them have been able to account satisfactorily for the details given by Arrian of his retreat from India to Persia, for want of accurate geographical knowledge of the country he passed through.

مكتبة قطر الوطنية
Qatar National Library

Several rather complicated problems in connection with that historic retreat have been unriddled in the course of surveying Makran, and much that it has been very difficult to reconcile to the general reputation for truthfulness of Arrian's history only requires a little patient examination into the inevitable physical changes of conformation which the north-western coast of India has undergone during twenty-two centuries to become explicable on fairly reasonable grounds.

We need not trouble ourselves now about the ethnographical features of Makran and Southern Baluchistan, though probably no corner of Asia presents such a focus of interest to the ethnographer as does this meeting place of almost all the representative races of the world. Aryan, Semitic, Dravidian or Turanian, Ethiopian and Negro, types of them all may here be found in close juxtaposition, and here be studied individually. These countries were well enough known to the Greeks. Herodotus writes of them 150 years before Alexander's time, including them in the 14th and 17th Satrapies of the Persian Empire, and he mentions tribes by name whose descendants may be traced under almost their old designations even to this very day. Alexander led Greeks into India, but Greeks had been at the gates of India before him; and those who have studied the manner of his entrance into the country have good grounds for conjecture that he selected an apparently haphazard route because it carried him to the north of the Hindu Kush and across the Kaoshan pass, within reach of Kyrenian settlements in Bactria.

But whilst we need not trouble ourselves with more than Arrian tells us of the people occupying the line of Alexander's retreat to Persia, we must give a little attention to the general configuration of the country, and to such changes in land and coast construction as we have been able to trace by the ordinary processes of surveying, without claiming any specially scientific basis of examination.

The difficulty of restoring to the map of India an outline of the ancient geography of Sind and the Indus delta is one which has baffled many generations of scholars. The vagaries of the river Indus, even within the limits of historic record, once flowing in a channel to the Rann of Katch, with a possible branch to the Bay of Cambay; at another time cutting its way under the frontier hills far to the west of Jacobabad; anon splitting the limestone ridges at Sukkur, with the very probable assistance of an earthquake, and taking to itself a new channel altogether; circling the walls of a great city like Hyderabad at one time, and then suddenly leaving it stranded and dry—changes such as these render this river, even before the delta is reached, a hopeless feature for reference with regard to the position of places said once to have been near its banks. Within the limits of the delta the confusion of hydrography becomes even more confounded, and until we possess a trustworthy map of the Indus riverain districts which will include some at least of the old delta channels, we must remain in the dark as to the real position of those branches of the river which Alexander explored from Patala, and of the shape and nature of those islands which were then accumulating to form the future delta. I shall follow General Haig's pamphlet in this part of my subject, believing him to have had the best opportunities for observing, as he has also the highest reputation for accuracy in recording his observations.

But when we pass beyond the limits of the plains of Sind and the Indus delta, westward, so long as we travel inland, there is not the same difficulty in deciphering ancient geography. From Alexander's days till now the "everlasting hills" have preserved their general conformation. Within these hills can we but identify certain obligatory points and the beginnings of a route, we can easily follow that route along recognised lines which have never shifted. We can trace Alexander's path with certainty if we can but identify some few landmarks here and there. It must be remembered that the Greek army which retreated from India did not all follow Alexander. The heavy baggage and the elephants, under the command of Krateros, followed an inland route from Sind to Kirman, about which we are told very little indeed. Another division of the Greek army under Nearkhos was conveyed on ships by the coast line to Persia and the Tigris, and about this voyage we are told much more than about Alexander's own movements. In spite, however, of the meagreness of information concerning the route taken by Krateros we can infer a great deal on the negative evidence that it was impossible for him to move heavy baggage or elephants except along certain lines: and again, in spite of the almost minute details with which we are favoured by Arrian about the ever-memorable voyage of Nearkhos, we find very great difficulty in identifying the exact ports, harbours, and coasting stations which he visited, on account of the shifting configuration of the coast line.

Not that the changes which have occurred on the coast line between Karachi and Persia are at all comparable to the remarkable transformation which has overtaken the Indus delta, but there are nevertheless many marked changes, especially on that part of the coast which is most subject to monsoon influences. Islands have disappeared wholesale in some parts; they are in the process of disappearing in others; here the coast has gained on the sea, whilst there the sea has appreciably deepened its soundings and lapped up the shore. On the whole, in spite of submerged islands, the land has gained on the sea. Apart from the Indus delta, which has consolidated and pushed out seaward to an extent which I believe to be greater than General Haig estimates, there has been immense land growth north of Karachi. At Karachi itself the port engineers will tell you of the difficulty that exists in keeping the harbour open; were artificial means of deepening the bar to be abandoned, four or five years of unchecked silting would destroy Karachi as an open port. Even now it is possible at low tide to walk out to the well-known Oyster rocks, once outside the harbour, and the recent lengthening of the pier opposite Clifton is quite practical testimony enough to the rapidity of shore growth at that point of the coast. I have reason to think that immediately north of Karachi the sea extended at no distant date far up the bed of the Liari stream. Following the coast westwards to Cape Monze there is probably little change in the last 2,000 years till we round that cape. Thence it is impossible to say what may have happened as far as the coast indentation at Bidok Lak. At any rate from Bidok Lak northwards there is a wide tract of very recent shore formation along which the road to Bela runs. But clearly no such road existed as late as the 10th century A.D. Sonmiani marks a sort of cul-de-sac for all monsoon currents. All about Sonmiani vast deposits of sand have accumulated which gradually, under the action of the south-west wind, have assumed the form of dunes, and have consolidated themselves along the coast (with the assistance of a scanty saline vegetation) into a natural bund or protection seawards. Only within the last few years the fishing town of Sonmiani has retired altogether from the coast. It is now impossible to approach that place except on the top of an exceptionally high tide. It is true that this is not due entirely to monsoon deposits of sand. Some ten years ago very heavy floods turned the local river, the Vindar, into a raging mud torrent, and at once there were mud deposits enough spread out in front of Sonmiani to reduce navigation to a matter of approach in shallow "dugouts." Twelve miles north of Sonmiani is a large depression (slightly under sea level) known as "Sirondha," which is usually a fresh water lake, but is occasionally quite dry. This was at no very distant date a commodious harbour, or arm of the sea, which has extended north in historic times at least as far as Liari and possibly further. South-west of Liari some of the land formation is probably very ancient as we shall see. Westwards along the Makran coast there are many indications of local changes, some of which will be noticed as we follow the course of Nearkhos in his Indus built ships. Enough has been said to justify some deviation from the track followed hitherto by Oriental scholars in tracing out the route of this memorable retreat.

About the beginning of September 326 B.C. Alexander left Patala with a part of his army to push his way through the country of the Arabii and the Oritæ to Gadrosia (or Makran) and Persia. The Arabii occupied the country between Karachi and the Purali—or river of Lus Bela—and the Oritæ and Gadrosii apparently combined with other tribes to hold the country that lay beyond the Purali—or Arabius. He had previously done all that a good general can do to ensure the success of his movements by personally reconnoitring all the approaches to the sea by the various branches of the Indus; by pacifying the people and consolidating his sovereignty at Patala so as to leave a strong position behind him entirely subject to Greek authority; and by dividing his force so as to utilise the various arms with the best possible effect. This force was comprised in three divisions, one under Krateros included the heavy transport and invalids, and this was despatched to Persia by a route which was evidently as well known in that day as it is at present. It is never contended by any historian that Alexander did not know his way out of India. On the contrary, Arrian distinctly insinuates that it was the perversity of pride, the "ambition to be doing something new and astonishing" which "prevailed over all his scruples" and decided him to send his crank Indus built galleys to the Euphrates by sea, and himself to prove that such an army led by "such a general" could force a passage through the Makran wilderness where the only previous records were those of disaster. He had heard that Cyrus and Semiramis had

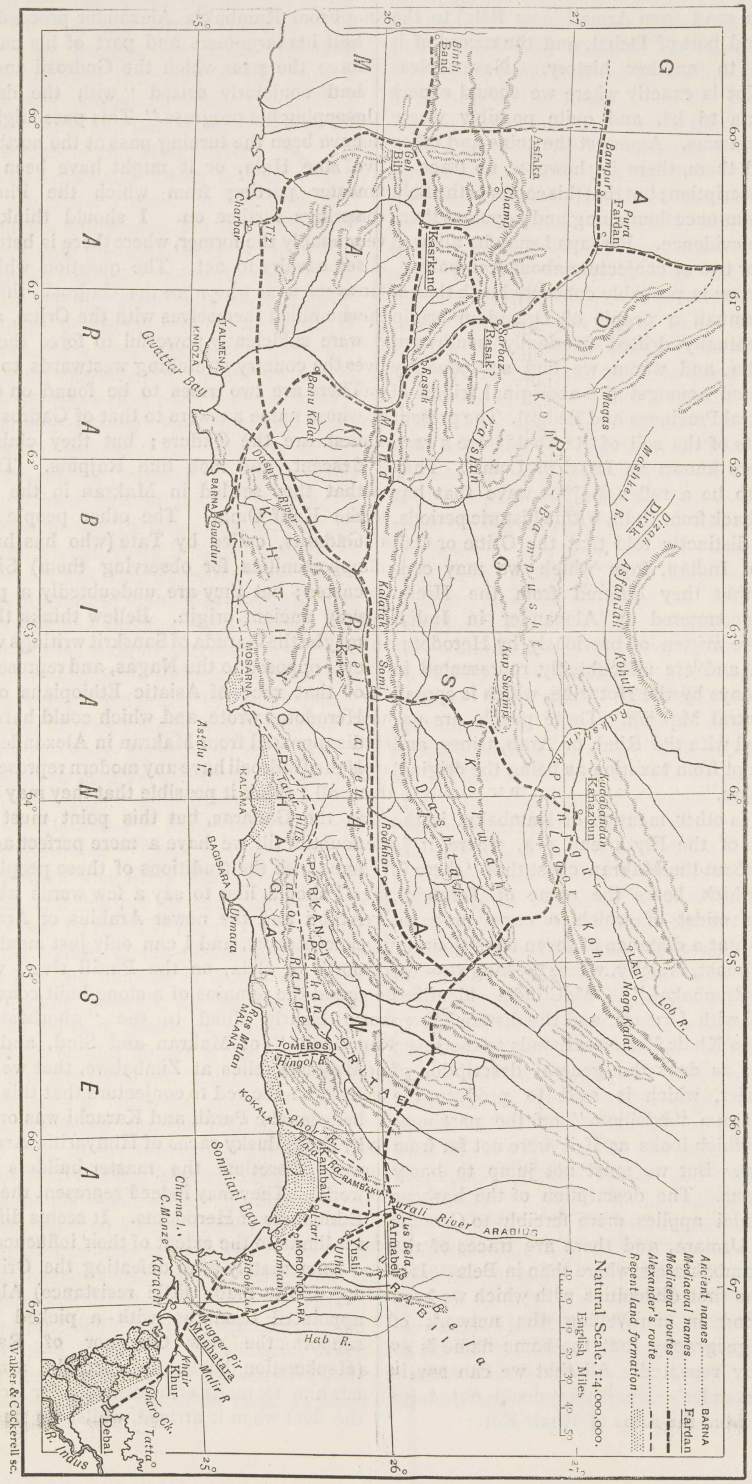
failed, and that decided him to make the attempt.

We can follow Krateros no further than to point out that his route was probably by the Mulla (and not the Bolan) pass to Kalat and Quetta. Thence he must have taken the Kandahar route to the Helmund, and following that river down to the fertile and well-populated plains of lower Sistan (or Drangia) he crossed the Kirman desert by a well known modern caravan route, and joined Alexander at or near Kirman; for Alexander was "on his way to Karmania" at the time that Krateros joined him and not at Pura (the capital of the Gadrossii) as suggested by St. John. One interesting little relic of this march was dug up by Captain Mackenzie, R.E., during the construction of the fort on the Miri at Quetta. A small bronze figure of Hercules was brought to light, and it now rests in the Asiatic Society's museum at Calcutta, in testimony of the fact that some part of the heavy baggage was abandoned *en route*.



Alexander, as we have said, left Patala about the beginning of September. But where was Patala? This problem I leave to General Haig, and to Sir H. E. M. James, the late Commissioner of Sind, to decide. Probably it was neither Hyderabad (as suggested by General Cunningham) nor Tatta, as upheld by other authorities, but about thirty miles S.E. of the former and sixty miles E.N.E. of the latter, in which locality indeed there are ruins enough to satisfy any theory. From Patala we are told by Arrian that he marched with a sufficient force to the Arabius; and that is all. But from Quintus Curtius we learn that it was nine marches to Krokala (a point easier of identification than most from the preservation of the name which survived through mediæval ages in the Karak—the much-dreaded pirate of the coast—and can now be recognised in Karachi) and five marches thence to the Arabius. He started in cool moonsoon weather. His route, after leaving Krokala, is determined by the natural features of the country as then existing. There was, as I have already stated, no shore route in these days. Alexander followed the subsequent mediæval route which connected Makran with Sind in the days of Arab ascendancy, a route that has been used as a highway into India for nearly eight centuries. It is not the route which now connects Karachi and Lus Bela, but as it belongs to a later mediæval phase of history I will say no more about it than Arrian says. I have already pointed out that the sea extended at least to Liari, in the basin of the Purali or Arabius, and we are, therefore, obliged to locate the position of his crossing that river as being not far south of Bela; where in Alexander's time it was "neither wide nor deep," and in these days is almost entirely absorbed in irrigation. This does not, I admit, altogether tally with the five marches of Quintus Curtius. It would amount to over a hundred miles of marching, some of which would be heavy, though not very much of it; but the discrepancy is not a serious one. The Arabius may have been far to the east of its present channel—indeed, there are old channels which indicate that it was so, and it does not follow that the river was crossed at the point at which it was struck. The reason for placing this crossing so far north is that room is required for subsequent operations. After crossing we are told that Alexander "turned to his left towards the sea" (from which he was evidently distant some space) and with a picked force he made a sudden descent on the Oritæ. He marched one night only through desert country and in the morning came to a well-inhabited district. Pushing on with cavalry only he defeated the Oritæ, and then later joining hands with the rest of his forces he penetrated to their capital city. For these operations he must necessarily have been hedged in between the Purali and Hala range, which he clearly had not crossed as yet. Now we are expressly told by Arrian that the capital city of the Oritæ was but a village that did duty for the capital, and that the name of it was Rambakia. The care of it was committed to Hephæstion, that he might colonise it after the fashion of the Greeks. But we find that Hephæstion certainly did not stay long there—and could only have left the native village as he found it, with no very extensive improvements. It would be most interesting to decide the position of Rambakia. What we want to find is an ancient site, somewhere approaching the sea coast, say thirty or forty miles from the crossing of the Purali, in a district that might once have been cultivated and populous. We have found two such sites—one now called Khair Kot to the north-west of Liari commanding the Hala pass, and another called Kotawari south-west of Liari, and very near the sea. The latter has but recently been uncovered from the sand, but an existing mud wall, and its position on the coast indicate that it is not old enough for our purpose. The other, Khair Kot, is an undoubted relic of mediæval Arab supremacy. It is the Kambali of Edrisi on

the high road from Armail (now Bela) to the great Sind port of Debal, and the record of it belongs to another history. Nevertheless Khair Kot is exactly where we should expect Rambakia to be, and quite possibly where Rambakia was. Amongst the coins and relics collected there, there is, however, no trace of Greek inscription; but that this corner of the Bela district was once flourishing and populous there is ample evidence. Perhaps I may be allowed a word or two of conjecture about Rambakia.

The name is probably connected with that of the Rhamnai, a people of Dravidian origin who eventually drifted gradually southward into India, and whom we find subsequently represented amongst the aboriginal tribes of the Central Provinces and Bengal. The present occupants of the soil of Rambakia are a race of Rajputs known as Lassi or Lumri. They appear to be a reflex Rajput wave that has washed back from India within historic periods. We are distinctly told that the Oritæ or Oxii were not Indian, from which we may conjecture that they differed from the Hindu races encountered by Alexander in India. They were written of previously by Herodotus as Utoi, and are undoubtedly represented in modern days by the Hot tribe, which is spread over Central Makran. These people are unconnected with the Rind, or Arab, tribes, and are exempt from taxation as being the original landowners.

There is other mention of Rambakia in the Periplus of the Erythræan sea, where it is written about the Makran coast that "there is a bay which bears the name of Terabdoi, from the midst of which a cape projects. Behind it, at a distance of seven days' journey from the coast, is a city, where the king resides, called Rambakai." McCrindle identifies Terabdoi with Urmara, and the distance from Urmara to Khair Kot corresponds to the seven marches, as does the general description of the district, which is said to produce the fragrant gum "bdellium" on the part near the sea, which looks as if it were not far from the coast. But we must not jump to hasty conclusions. The description of the harbour of Terabdoi applies more forcibly to Gwadur than to Urmara, and there are traces of the name Rambakia elsewhere than in Bela. It is one of the first difficulties with which we have to contend in unravelling the network of ancient geography that the same name is so constantly repeated. All that we can say is that Alexander's Rambakia could not have been far from the ruins of Khair Kot.

From Rambakia Alexander proceeded with half his targeteers and part of his cavalry to force the pass which the Godrosii and Oritæ had conjointly seized "with the design of stopping his progress." This pass might either have been the turning pass at the northern end of the Hala, or it might have been on the water parting from which the Phur river springs further on. I should think it was probably the former, where there is better room for cavalry to act. The question which now meets us is who were the Gadrosii, the people who allied themselves with the Oritæ, and who were sufficiently powerful to force their name to the country stretching westwards to Persia. There are two tribes to be found on the Bela whose name answers to that of Gadrosii. The first are the Gadurs; but they claim Arab descent, and look like Rajputs. They say that they settled in Makran in the days of the Kalif Omar. The other people are the Gadaras, called by Tate (who has had good opportunities for observing them) Sidi half-castes; but they are undoubtedly a people of very ancient origin. Bellew thinks that they may be the Garuda of Sanskrit writings who were ever opposed to the Nagas, and representatives of that race of Asiatic Ethiopians of whom Herodotus wrote, and which could hardly have disappeared from Makran in Alexander's time. If the Gadrosii have any modern representatives at all I think it possible that they may be found in the Gadaras, but this point must remain doubtful till we have a more perfect acquaintance with the traditions of these people.

I should like to say a few words about the Arabii and the newer Arabius or Arabis, but time is short, and I can only just mention that north of Bela, on the Puráli river, we have found the remains of a stone-built construction so clearly allied to the "ghorbastas" or "bunds" of Makran and Sind, and to the Mashona relics at Zimbabwe, that we may at least be allowed to conjecture that this country between the Puráli and Karachi was once held by those dusky races of Himyaritic Arabs who were aforetime the master-builders of the world. They may indeed represent the Asiatic Ethiopians of Herodotus. It seems difficult to set limits to the extent of their influence.

Immediately after defeating the Oritæ (who apparently made little resistance) Alexander appointed Leonatus with a picked force to support the new Governor of Rambakia (Hephœstion having rejoined the army) and left him to make arrangements for victualling the fleet when it arrived, whilst he pushed on

BRITISH LIBRARY

through desert country into the territory of the Gadrosii by "a road very dangerous," and drawing down towards the coast. He must then have followed the valley of the Phur to the coast, and pushed on along the track of the modern telegraph line till he reached the neighbourhood of the Hingol river. We are indebted to Aristobalus for an account of this track in Alexander's time. It was here that the Phœnician followers of the army gathered their myrrh from the tamarisk trees; here were the mangrove swamps; and of the euphorbias, which still dot the plains with their impenetrable clumps of prickly "shoots or stems, so thick set that if a horseman should happen to be entangled therewith he would sooner be pulled off his horse than freed from the stem," as Aristobulus tells us. Here, too, were found the roots of spikenard so precious to the greedy Phœnician followers. These same products formed part of the coast trade in the days when the Periplus was written, 400 years later, though there is little demand for them now. It was somewhere near the Hingol river that Alexander made a considerable halt to collect food and supplies for his fleet. His exertions and his want of success are all fully described by Arrian, as well as the rude class of fishing villages inhabited by Ichthyophagi, all the latter of which might well be cut out of the pages of Greek history and entered in a survey report as modern narrative. After this we have but slight indications in Arrian's history of Alexander's route to Pura, the capital of Gadrosia. Three chapters are full of most graphic and lively descriptions of the difficulties and horrors of that march. We only hear that he reached Pura sixty days after leaving the country of the Oritæ, and there is no record of the number of troops that survived. Luckily, however, the log kept by the admiral of the fleet, Nearkhos, comes into our assistance here, and though it is still Arrian's history, it is Nearkhos who speaks. We must now turn back to follow the ships. I cannot now enter in detail into the reasons given by General Haig in his interesting pamphlet on the Indus delta country for selecting the Gharo creek as the particular arm of the Indus which was finally selected for the passage of the fleet seaward. I can only remark that whilst the nature of the half-formed delta of that period is still open to conjecture, so that I see no reason why the island of Krokala, for instance, should not have been represented by a district which bears a very similar name nowadays, I fully agree that the description of the coast as given by Nearkhos can only possibly apply to that section of it which is embraced between the Gharo creek and Karachi. It is only within very recent times that the Gharo has ceased to be an arm of the Indus. For the present, at any rate, we cannot do better than follow so careful an observer as General Haig in his conclusions. There can be little doubt that Alexander's haven, into which the fleet put till the monsoon should moderate, and where it was detained for twenty days, was *somewhere near* Karachi. That it was the modern Karachi harbour seems improbable. Of all parts of the western coast of India, that about Karachi has probably changed its configuration most rapidly, and there is ample room for conjecture as to where that haven of refuge of 2,000 years ago might actually have been. Let us accept the fleet of river-built galleys, manned with oars, and open to every phase of wind and weather, as having emerged from it about the beginning of October, and as having reached the island of Domai, which I am inclined to identify with Manora. Much difficulty has been found in making the estimate of each day's run, as given in stadia, tally with the actual length of coast. I think the difficulty disappears a good deal if we consider what means there were of making such estimates. Short runs in the river between known landmarks are very fairly consistent in the Greek accounts. On the basis of such short runs, and with a very vague idea of the effect of wind and tide, the length of each day's run at sea was probably reckoned at so much per hour. There could hardly have been any other way of reckoning open to the Greeks. They recognised no landmarks after leaving Karachi. Even had they been able to use a log line it would have told them but little. Wind and current (for the currents on this part of the sea mostly follow the monsoon wind) were either against them or on their beam all the way to the Hingol, and they encountered more than one severe storm which must have broken on them with the full force of a monsoon head wind. From the point where the fleet rounded Cape Monze and followed the windings of the coast to the harbour of Morontobara the estimates, though excessive, are fairly consistent still; but from this point westward, when the full force of monsoon wind and current set against them, the estimates of distance are very largely in excess of the truth, and continue so till the pilot was shipped at Mosarna, who guided them up the coast of Persia. Thenceforward there is much more consistency in

Qatar National Library

their log. It must not be supposed that Nearkhos was making a voyage of discovery. He was probably following a track that had often been followed before. It was clear that Alexander knew the way by sea to the coasts of Persia before he started his fleet, and it is a matter of surprise rather than otherwise that he did not find a pilot amongst the Malli who, if they are to be identified with the Meds, were one of the foremost sea-going peoples of Asia. His Phœnician and Greek sailors evidently were strangers to the coast, and some of his mixed crew of soldiers and sailors had subsequently to be changed for drafts from the land forces.

We cannot now follow the voyage in detail, nor could we, even if we would, indicate the precise position of those islands of which Arrian writes between Cape Monze and Sonmiani; some of them may now be represented by shoals known to the coasting vessels, whilst others may be connected with the main land. I have no doubt myself that Morontobara (the "woman's haven") is represented by the great depression of the Sirondha lake, to which I have already alluded. Between Morontobara and Kokala (which about answers to Ras Kachari) they touched at the mouth of the Purali, or Arabius, not far from Liari, having an island which sheltered them from the sea, to windward, which is now part of the mainland. Near by the mouth of the Arabius was another island "high and bare" with a channel between it and the mainland. This, too, has been linked up with the shore formation, and the channel no longer exists, but there is ample evidence of the ancient character of this corner of the coast. Between the Arabius and Kokala (three days' sail) very bad weather was made, and two galleys and a transport were lost. It was at Kokala that they joined hands with the army again. Here Nearkhos formed a camp, and it was "in this part of the country" that Leonatus defeated the Oritæ and their allies in a great battle wherein 6,000 were slain. Arrian adds that a full account of the action and its sequel, the crowning of Leonatus with a golden crown by Alexander, is given in his other work, but as a matter of fact the other account is so entirely different (representing the Oritæ as submitting quietly) that we can only suppose this to have been a separate and distinct action from the cavalry skirmish mentioned before.

It must be noted that the coast hereabouts has probably largely changed. A little further west it is changing rapidly even now, and it is idle to look for the names given by the Greeks as marking any positive locality known at present. Hereabouts at any rate was the spot where Alexander with such difficulty had collected ten days' supplies for the fleet. This was now put on board, and the bad or indifferent sailors exchanged for better seaman. From Kokala, a course of 500 stadia (largely over estimated) brought them to the estuary of the Hingol river (which is described as a winter torrent under the name of Tomeros), and from this point all connection between the fleet and the army appears to have been lost. It was at the mouth of the Hingol that a skirmish took place with the natives which is so vividly described by Nearkhos, when the Greeks leapt into the sea and charged home through the surf. Of all the little episodes described in the progress of the voyage this is one of the most interesting; for there is a very close description given of certain barbarians clothed in the skins of fish or animals, covered with long hair, and using their nails as we use fish knives, armed with wooden pikes hardened in the fire, and fighting more like monkeys than men. Here we have the real aboriginal inhabitants of India. Not so very many years ago, in the woods of Western India, a specimen answering to the description of Nearkhos almost literally was caught whilst we were in the process of surveying those jungles, and he furnished a useful contribution to ethnographical science at the time. Probably these barbarians of Nearkhos were incomparably older even than the Turanian races which we can recognise, and which succeeded them, and which, like them, have been gradually driven south into the fastnesses of Central and Southern India. Makran is full of Turanian relics connecting it with the Dravidian races of the south; but there is no time to follow these interesting glimpses into prehistoric ethnography opened up by the log of Nearkhos. Nor indeed can we follow the voyage in detail much further, for we have to take up the route of Alexander, about which very much less has hitherto been known than can be told about the voyage of Nearkhos. We may, however, trace the track of Nearkhos past the great rocky headland of Malan, still bearing the same name that the Greeks gave it, to the commodious harbour of Bagisara, which is likely enough the Damizar, or eastern bay, of the Urmara headland. The Padizar, or western bay, corresponds more nearly with the name Bagisara, but as they doubled a headland next day it is clear they were on the eastern

BRITISH LIBRARY

side of the Isthmus. The Pasiris whom he mentions have left frequent traces of their existence along the coast. Kalama, reached on the second day from Bagisara, is easily recognisable in the Khor Khalmat of modern surveys, and it is here again that we can trace a very considerable extension of the land seawards that would completely have altered the course of the fleet from the coasting track of modern days. The island of Karabine, from which they procured sheep, may very well have been the projecting headland of Giaban, now connected by a low sandy waste with the mainland. It could never have been the island of Astola as conjectured by McCrindle and others. From Kalama to Kissa (now disappeared) and Mosarna, along the coast called Karbis (now Gazban), the course would again be longer than at present, for there is much recent sand formation here; and when we come to Mosarna itself, after doubling the headland of Jebel Zarain, we find the harbour completely silted up. It may be noted that this western bay of Pasni was probably exactly similar to the Padizar of Urmara or of Gwadur, and that there is a general (but not universal) tendency to shallowing on the western sides of all the Makran headlands. Here they took the pilot on board, and after this there was little difficulty.

In three more days they made Barna (or Badara), which answers to Gwadur, where were palm trees and myrtles, and we need follow them for the present no further. Colonel Mockler who was well acquainted with the Makran coast, but hardly, perhaps, appreciated all the changes which the coast line has undergone (neither indeed did I till the surveys were complete) has traced the course of that historic fleet with great care. He has pointed out correctly that two islands (Pola and Karabia) have disappeared from the eastern neighbourhood of the Gwadur headland and one (Derenbrosa) from its western extremity; and he might have added that yet another is breaking up, and rapidly disappearing off the headland of Passabandar, near Gwadur. He has identified Kyiza (or Knidza), the small town built on an eminence not far from the shore, which was captured by stratagem, beyond doubt, and has traced the fleet from point to point with a careful analysis of all existing records that I cannot pretend to imitate. We cannot, however, leave Nearkhos without a passing reference to that island on the coast of the Ichthyophagi, which was sacred to the sun, and which was, even in those days, enveloped in such a halo of mystery and tradition that even Arrian holds Nearkhos up to contempt for expending "time and ingenuity in the not very difficult task of proving the falsehood" of these "antiquated fables." I have been to that island, the island of Astola, and the tales that were told to Nearkhos are told of it still. There off the southern face of it, is the "sail rock," the legendary relic of a lost ship which may well have been the transport which Nearkhos did undoubtedly lose off its rocky shores. There, indeed, I did not find the Nereid of such fascinating manners and questionable customs as Nearkhos describes on the authority of the inhabitants of the coast, but sea urchins and sea snakes abounded in such numbers as to make the process of exploration quite sufficiently exciting; and there were not wanting indications of those later days when the Meds (now an insignificant fish-eating people scattered in the coast hamlets) were the dreaded pirates of the Arabian sea, and used to convey the crews of the ships they captured to that island, where they were murdered wholesale. It is curious that the name given by Nearkhos is Nosala, or Nuhsala. In these days it is Astola, or more properly Hashtala, sometimes even called Haftala. I am unable to determine the meaning of the termination to which the numerals are prefixed. Another name for it is Sangadip, which is also the mediæval name for Ceylon. There can be no doubt about the identity of this island of sun worship and historic fable.

We must now turn to Alexander. We left him near the mouth of the Hingol, then probably four or five miles north of its present position, and nearer the modern telegraph line. So far he had almost step by step followed out the subsequent line of the Indo-Persian telegraph, and at the Hingol he was not very far south of it. Near here Leonatus had had his fight with the Oritæ, and Alexander had spent much time (for it must be remembered that he started a month before his fleet, and that the fleet and Leonatus at least joined hands at this point) in collecting supplies of grain from the more cultivated districts north, and was prepared to resume his march along the coast, true to his general tactical principle of keeping touch with his ships. But an obstacle presented itself that possibly he had not reckoned on. The huge barrier of the Malan range, abutting direct on the sea, stopped his way. There was no "Buzi" pass (or goat track) in those days, such as finally and after infinite difficulty helped the telegraph line over, though there

Qatar National Library

was indeed an ancient stronghold at the top, which must have been in existence before his time, and was likely enough the original city of Malan. He was consequently forced into the interior, and here his difficulties began.

We should be at a loss to follow him here, but for the fact that there is only one possible route. He followed up the Hingol till he could turn the Malan by an available pass westward. Nothing here has altered since his days. Those magnificent peaks and mountains which surround the sacred shrine of Hinglaz are, indeed, "everlasting hills," and it was through them that he proceeded to make his way. It would be a matter of immense interest could one trace any record of the Hinglaz shrine in classical writings, but there is none that I know of. And yet I believe that shrine which next possibly to Juggernath, draws the largest crowds of pilgrims (Hindu and Mussulman alike) of any in India, was in existence before the days of Alexander. For the shrine is sacred to the goddess Nana (now identified with Siva by Hindus) and the Assyrian or Persian goddess Nana is of such immense antiquity that she has furnished to us the key to an older chronology even than that of Egypt. The famous cylinder of Assurbanipal, king of Assyria, tells us that in the year 645 B.C., he destroyed Susa, the capital of Elam, and from its temple he carried back the Chaldean goddess Nana, and by the express command of the goddess herself, took her from whence she had dwelt in Elam, "a place not appointed her," and reinstated her in her own sanctuary at Urukh (now Warka in Mesopotamia) whence she had originally been taken 1635 years before by a conquering king of Elam, who had invaded Accad territory. Thus she was clearly a well established deity in Mesopotamia 2280 years B.C. Alexander, however, would have left that Ziarat hidden away in the folds of the Hinglaz mountain on his left, and followed the windings of the Hingol river some forty miles to its junction with a stream from the west, which would again give him the chance of striking out parallel to the coast.

We should be in some doubt at what particular point Alexander left the Hingol, but for the survival of names given in history as those of a people with whom he had to contend, viz., the Parikanoi, the Sagittæ, and the Sakæ, names not mentioned by Arrian. Now, Herodotus gives the Parikanoi and Asiatic Ethiopians as being the inhabitants of the seventeenth satrapy of the Persian Empire, and Bellew suggests that the Greek Parikanoi is a Greek transcript of the Persian form of Parikan, the plural of the Sanskrit Parvá-ka—or in other words the *Ba-rohi*—or men of the hills. However this may be, there is the bed of the stream called Parkán skirting the north of the Taloi range and leading westwards from the Hingol and we need look no further for the Parkanoi. In support of Bellew's theory it may be stated that it is not only in the heart of the Brahui country, but the Sajidi are still a tribe of Jalawan Brahuis, of which the chief family is called Sakæ, and that they occupy territory in Makran a little to the north of the Parkan. There is every reason why Alexander should have selected this route. It was his first chance of turning the Malan block, and it led most directly westwards with a trend towards the sea. But at the time of the year that he was pushing his way through this low valley flanked by the Taloi hills, which rose to a height of 2,000 feet above him on his left, there would not be a drop of water to be had, and the surrounding wilderness of sandy hillocks and scanty grass-covered waste would afford his troops no supplies and no shelter from the fierce autumn heat. All the miseries of his retreat were concentrated into the distance (about 200 miles) between the Hingol and the coast.

The story of that march is well told by Arrian. It was here that occurred that gallant episode when Alexander proudly refused to drink the small amount of water that was offered him in a helmet, because his army was perishing with thirst. It must have been near the harbour of Pasni, once again almost on the line of the present telegraph, that Alexander emerged from the sand storm with but four horsemen on to the sea coast at last, and instantly set to work to dig wells for his perishing troops. Thenceforward Arrian tells us only that he marched for seven days along the coast till he reached the well known highway to Karmania, when he turned inland, and his difficulties were at an end. Now, that well known highway was almost better known then than it is now. He could only leave the coast near the Dasht river and strike into the valley of the Bahu, which would lead him through a country subsequently great in Arabic history, over the yet unsuspected sites of many famous cities, to Bampur, the capital of Gadrosia. From leaving the coast to Bampur the duration of his march with an exhausted

BRITISH LIBRARY

force would be little less than a month. Working backward again from that same point (which may be regarded as an obligatory one in his route) the seven days' weary drag through the sand of the coast would carry him no further than from the neighbourhood of Pasni, and that is why I have selected that point for the historic episode of his guiding his army by chance and emerging on to the shore unexpectedly, rather than the neighbourhood of the Basol river, to which the Parkan route should naturally have led him. He clearly lost his way, as Arrian says he did, or else the estimated number of marches is wrong. We are told by Arrian that he reached Pura, the capital of Gadrosia, on the sixtieth day after leaving the country of the Oritæ. This is a little indefinite, as he may be considered to have left the country of the Oritæ when he started to collect supplies from the northern district, and we do not know how long he was on this reconnaissance. Probably, however, the date of leaving the coast and striking inland up the Hingol river is the date referred to by Arrian, in which case we may estimate that he spent about twenty-four days negotiating the fearfnl country opened up to him on the Parkan route ere he touched the sea shore again. This is by no means an exaggerated estimate if we consider the distance (something short of 200 miles) and the nature of his army. A half-armed mob, which included women and children, and of which the transport consisted of horses and mules and wooden carts dragged by men, cannot move with the facilities of a modern brigade. Nor would a modern brigade move along that line with the rapidity that has distinguished some of our late manœuvres in South Africa. On the whole, I think the estimate a probable one, and it brings us to a consideration of Bampur as the ancient capital of Gadrosia.

I am well aware that another place, Fahraj, halfway between Bampur and Kirman and on the edge of the Kirman desert, has been accepted by scholars as the ancient capital of Gadrosia ever since the late Sir O. St. John discovered it during the progress of the Sistan Commission. The name Fahraj is indifferently Fahraj, Purag, or Pura, and the ruins of it are extensive and undeniably most ancient. St. John points out that it is the probable place of junction between the forces of Alexander and of Krateros, who joined before reaching Kirman, and could only have joined about this point; and that it is about 60 days' march from the country of the Oritæ as then understood. Against this I have to urge that it is improbable that the country of Gadrosia extended so far to the north-west. Fahraj is well within the natural Kirman division of Khorasan now, and probably was always so. Although I agree that it was by the caravan. route across the desert from the great bend of the Helmund to this point that Krateros with his elephants and heavy baggage must have joined Alexander, I do not find it stated anywhere that he joined at Pura—but that he joined when Alexander was on his way from Pura to Kirman. Again I cannot agree that St. John's estimate allows sufficiently for the slow progress of the Greek force in face of such difficulties as we know of, and there is finally this great objection to Fahraj which I think is conclusive. In order to reach Fahraj Alexander must have passed Bampur. There is no other way consistent with Arrian's account. Bampur is, however, a city as ancient as Fahraj, and not far to the east of Bampur is the site of a still more ancient, though now reoccupied, city called by the very names that Fahraj is known by—viz., Purag or Pura; and Pura is the modern appellation. Thus there are two places with identically the same name, Fahraj and Pura, and as no mention is made of Alexander's passing the latter, and as the latter is within the limits of what we believe to be Gadrosia, I have, myself, no hesitation in assigning that position to the acient capital of the Gadrosians. We have now followed Alexander out of India into Persia. Thenceforward there are no great geographical questions to decipher, or knots to be untied. His progress was a progress of triumph, and the story of his retreat well ends with the thrilling tale of his meeting again with Nearkhos, after the latter had harboured his fleet at the mouth of the Minab river and set out on the search for Alexander, guided by a Greek who had strayed from Alexander's army. Blackened by exposure and clothed in rags, Nearkhos was unrecognised till he announced himself to the messenger sent to look for him. Even Alexander himself at first failed to recognise his admiral in the extraordinary apparition that was presented to him in his camp, and could only at first believe that his fleet must have perished and Nearkhos and Arkias were sole survivors. We can imagine what followed. Those were days of ready recognition of service, and no dispatches, and all Persia was open to the conquerors to choose their reward. But all history has its moral, and the moral of the story of Alexander's retreat might easily be

mistaken, if indeed it has not been so mistaken through all time. Arrian is not a good-natured biographer. Whilst giving to his hero all credit for his gallantry and his determination, he never forgets to sneer at his ostentation and an occasional display of what in modern slang would be termed "bad form." Other writers than Arrian have told the story of Alexander's retreat, and of the disasters that attended it, and have inferred, if not actually stated their conviction, that where so great a general as Alexander failed it would be hopeless for others to attempt to succeed. Arrian, however, very clearly points out that which is most undoubtedly true, that it was only Alexander's obstinate determination to do that which had proved so fatal to Semiramis and Cyrus that led him to select the worst possible route through Makran. It is impossible to suppose that he did not know that there were better and more open ways, even though we may credit him with the wish to support his fleet by adopting a route as near the coast as possible. The high road between west and east that lies through Makran must have been known before Alexander's time, just, indeed, as we may be certain from the course which was steered by the Mosarna pilot as soon as he took charge of the fleet that the sea route to Persia was well known. After Alexander's time many centuries elapsed before we get another clear historic view into Makran, and then what do we find? A country of great and flourishing cities, of high roads connecting them with well-known and well-marked stages; armies passing and repassing, and a trade which represented to those that held it the dominant commercial power in the world, flowing steadily century after century through that country which was fatal to Alexander, and which we are rather apt now to consider the fag-end of the Baluchistan wilderness. The history of Makran is bound up with the history of India from time immemorial. Not all the passes of all the frontiers of India put together have seen such traffic into the broad plains of Hindustan as for certainly three, and possibly for eight centuries passed through the gateways of Makran. As one by one we can now lay our finger on the sites of those historic cities, and first begin faintly to measure the importance of Makran to India ere Vasco da Gama first claimed the honour of doubling the Cape and opened up the ocean highway, we can only be astonished that for four centuries more Makran has remained a blank on the map of the world.

DISCUSSION.

Sir GEORGE BIRDWOOD, K.C.S.I., C.I.E., said the story of the *anabasis* of "striding Alexander" was as familiar to Englishmen as that of the wrath of Achilles, and of the wanderings of Ulysses. They were never tired of books on the subject, and they never would be; and it was naturally of the deepest interest to an English audience to listen to an exposition of the land routes and the sea route along which he returned from India to Susa and Babylon by a geographer of the high scientific ability and reputation of Sir Thomas Holdich, who had been able to compare many sections of those routes with the accounts of them by the surveyors, and annalists who accompanied "the youth of Pella" on his high emprise, as these have been so simply, and briefly, and lucidly, and with such honesty of purpose, compiled for us from their surviving fragments by Arrian. Sir Thomas Holdich had, indeed, afforded them a great intellectual pleasure, in which he (the speaker) had himself participated with especial zest; for during the war of 1856-7 he had twice sailed past the tranced seaboard of Persia, and had sketched the opalescent loom line of the coast the whole way from opposite Ras Mesandum to the delta of the Tigris and Euphrates; and the detailed landscape from Bushire and Karak to the delta, and above the delta, to Mohammera and Bussroah, and about Ahwaz on the Karun, the Ulai of "the Book of Daniel." It was a region of the highest natural enchantment, where on every side sense is at once spiritualised in vision, and history in its actual making becomes mythology; and to have all that rapt dreamland, trodden by Ibn Batuta and Ser Marco Polo, and the Rabi Benjamin of Tudela, and Edrisi, and traversed by Nearchus and Alexander, the scene of the tragic glories of the Achæmenian Persian Babylonian, and Assyrian Empires, and the actual site of Paradise,—to have all this shore of the oldest romance and human history conjured up before you again, was indeed delightful; and the heartiest thanks would be accorded by the meeting to Sir Thomas Holdich for a paper which was a solid and most attractive contribution to our knowledge of the historical geography of the Persian Gulf. He had only one adverse criticism to offer on the paper, and he pressed it merely to promote discussion. It was an objection to the title. He denied that there was anything like a "retreat," *i.e.* a retirement on his lines of communication, in Alexander's return expedition from India. He did not conquer in either the Asiatic sense of devastating countries and exacting tribute from them; or in the Roman sense of subjugating and annexing them, and rigidly reorganising their administration; but in the Greek sense of advancing the cause of liberty and civilisation, in a word, the Hellenisation of the world. Alexander's great personal ambition was to weld the Persians and Indians and Greeks into a united *élite* people, of one scientific, literary, artistic and religious culture, if not of one actual race; and to

do this chiefly through promoting commerce between them. At every step of his so-called "conquests" the Greek language and Greek art were planted out, and took firm root and flourished; and the Greek or rather Hellenised kingdoms founded by him in every part of Anterior Asia continued to exist for centuries after his death. Before Alexander nothing was known of India but what was to be found in Herodotus and Ctesias, but after his *anabasis* the knowledge of India and intercourse with India were thrown open to the whole world of the West, and an immense extension was given to the trade of West in the productions of the East; and such an impulse to the study of geography, natural history, and other sciences, that within 500 years the Schools of Philosophy at Athens, and of Science at Alexandria were on the threshold of anticipating the great economic developments and scientific discoveries of the 17th, 18th, and 19th centuries:—when there came the cataclysm of the irruption of the barbarians, and the advance of European prosperity and civilisation was checked for more than a thousand years. The very title of Arrian's history of Alexander is a contradiction of the suggestion that he retreated from India. Even when the home-sick Greeks of the army protested against marching farther eastward into Hindustan he did not draw back, but continued his course of exploration southward, down the Indus to the Sea, undertaking some successful military campaigns by the way. In a word, *anabasis* means "ascent," "an advance from victory to victory" [compare Psalm lxviii, 18]. It is a common medical term, meaning the "aggressive" stage of a disease. The fact is that Alexander, having accomplished all that he could with the means at his command in India, deliberately returned by a new overland and a new sea route to Susa and Babylon,—there to celebrate, in flagrant view of the whole world of his time, his marvellously successful Hellenisation of all the Asiatic countries between the Mediterranean Sea and the River Indus; and he celebrated his "triumph" [the very word is derived from the *thriamboi*, or Bacchic hymns sung before him on these occasions] in such a manner as to emphatically demonstrate that his great object was to fuse European and Asiatics together, and to make the whole civilised world of antiquity drink of the same "Loving Cup," "spiced" to the brink with the toast:—Glory to God in the highest, and on earth peace, good will toward men. This tinctured all his thoughts, this was the elixir of his immortality. The Journal of Nearchus, which is almost literally reproduced by Arrian, proves that the so-called "Retreat" was a scientifically devised geographical and commercial exploration. In chapter xx., Nearchus expressly states that Alexander designed the navigation of the whole circuit of the coast from Alexander's Haven [Karachi] to Susa, to determine whether the sea that way was navigable or not. In ch. xxiv., he states that on the fleet arriving at the mouth of the Tomeros [Hingal River] the natives were astonished at the apparition of it, and assembled with long sticks to oppose the landing of the Greeks. In ch. xxvii., he states that on arriving at Mosarna [now Gazdan] he took a native pilot on board, who consented to conduct the fleet so far as the Carmanian coast; and that from that day he was able to weigh anchor at night, and so take advantage of the land breeze, and to better understand the names of harbours he entered. In ch. xxx., he states that when bearing away from Kuisa [now called Ras Gunse] his sailors were greatly alarmed by the blowing of whales about the ships, and that, even when the native pilot explained that the beasts were but disporting themselves in the sunshine, the sailors would not be quieted, but went on shouting *alala*, *alale*, to frighten them off. In ch. xxxii., we read that the fleet having reached Ras-Mesandum, [*i.e.* "the Anvil," from the incessant thundering of the surges against the base of this basaltic headland*], the gate of the Persian Gulf, Onesicritus proposed that they should double it, and follow its lead, on the westward side, into, as he hoped, the Red Sea, and so escape what remained of the distressing passage up the Persian Gulf to Susa; but Nearchus rebuked him, asking him if he did not know with what design Alexander had sent the fleet on its adventurous voyage, and that it was not because he could not have taken his whole army to Susa safely by land, but to obtain a knowledge of the coasts and of the harbours and islets—and particularly whether they were habitable or not—between India and Persia. In ch. xxv. Nearchus states that Alexander, to whom he had gone a five days' journey inland, on hearing that the fleet was safely beached at the mouth of the Anamis [now Minbar River], on the beautiful coast of Carmania, rejoiced greatly, and swore by Zeus and Ammon that he felt far happier in receiving the auspicious news than in being the conqueror of Asia. In ch. xxxvi. he states that at Organa [now Ormuz], the chief of the island consented to pilot the fleet for the remainder of the voyage to Susa. Then, after Nearchus is received, as related in ch. xlii. by Alexander at Susa, Arrian himself, in ch. xliii., adds comments on the difficulties of the navigation of the Erythræan Sea generally, and implies that the voyage from India along the shores of Gadrosia and Carmania had never been made before Nearchus, unless by some wandering phantom of the seas.† All

* Called also Salamah, "Safety," a propitiatory euphemism, employed in the hope of averting the "danger" of the headland to navigators. Compare "Euxinus" for "Axenus pontus." It is also called *Ras el Khebir Huidi*, "the Cape of the Indian's Grave." See McCrindle's "Periplus of the Erythrean Sea and Voyage of Nearchus," and Moore's "Lala Rookh"

† This is rather remarkable considering the widespread tradition of Phœnician trade and navigation in the Indian Ocean. But the great commercial route of antiquity to India was the Babylonian, through Ecbatana, the "Caspian

this is conclusive against the suggestion that Nearchus was but following a track known to Alexander before, and that it was followed merely to lighten the march of the army returning through Gadrosia and Carmania to Susa and Babylon. Neither return expedition was of a strictly military character—the one on foot, indeed, was for the greater part of its way but a military triumph—and both expeditions kept the scientific and commercial objects they had in view clearly before them. On this point Humboldt, as quoted by McCrindle, says:—"The Macedonian campaign which opened so large and beautiful a portion of the earth to the influence of one sole highly-gifted race, may, therefore, certainly be regarded in the strictest sense as a scientific expedition, and, moreover, as the first in which a conqueror had surrounded himself with men learned in all departments of science as naturalists, geometricians, historians, philosophers, and artists." The scientific staff of Alexander's expedition included, among those individually named, an itinerographer, who measured and recorded the distance of his marches; a stathmographer, who located and described his halting places; a journalist, who edited the *Ephemerides* of the expedition; a diarist, who recorded anecdotes of Alexander's private life; three geographers; three hydrographers; at least six general historians; and besides these there were the commercial travellers. Except journalists—who are freelances—we have no specialists of the sort with our armed levies in South Africa, or with our military force in China; but we are sending out a scientific voyage of remote discovery to the South Pole! Sir Thomas Holdich had referred to some of the geographical folk-lore of the Persian Gulf, and in this connection he (Sir George Birdwood) regretted that his paper made no mention of the island placed by Nearchus about 1,000 stadia beyond Kishm, and named by him Kataia. It is usually identified with the modern Kish or Kais, which, between the decline of Siraf and the rise of Ormuz, was the great emporium of the trade through Anterior Asia between the West and East. The Persian tradition, according to Sir William Ouseley, is that the island derived its name from one Kais, the son of a poor widow of Siraf, who going on a voyage in the 10th century to India, made a fortune there by selling his favourite cat to a raja whose palace was so overrun with rats that they snatched the food from him before he could carry it to his mouth. [See Asher's "Itinerary of Rabbi Benjamin of Tudela," vol. ii., pp. 175–8; also Lyson's "Story of Whittington and his Cat."] If this is an authentic 10th century legend, it is the original story of "Dick Whittington and his Cat," and many here present would be interested to know whether Sir Thomas Holdich heard anything of it locally, and whether he identifies Kaish, Keish, Kyes, Qas—however it should be spelt or pronounced—with Kataia. In conclusion, he would only beg to repeat the expression of his grateful sense of the deep obligation they were all under to Sir Thomas Holdich for his valuable and most interesting paper, which as a weighty piece of scientific geographical criticism was as appropriate and fine a tribute as could possibly have been offered to "the noble dust of Alexander."

Gates," Herat ["Alexandria in Aria"], and the Cabul Valley to Taxila on the Indus; and thence either across into the valley of the Ganges, and by Patna ["Palimbethra"] to the Bay of Bengal, or down the Indus to the sea. The special Phœnician route, was from Petra, across the Arabian desert to Gherra, at the back of the bay which shelters the pearl fisheries of the palm-tufted islands of Bahrein.

Mr. B. T. Ffinch, C.I.E., referred to the telegraph line along the Makran coast. In 1863, when that line was built, the officers, finding, as they approached the Hara range of mountains, that it was impossible to continue inland, approached the sea nearer and nearer until they came to that part where the mountain dipped into the sea, with cliffs 2,000 feet high. There being no way of crossing the mountain from the east, it was decided to lay a cable round the mountain. That was done, but the cable was very quickly destroyed through rubbing on the rocks. It was then found that there was a goat path from the west which led to the top of the mountain, and the telegraph material was carried up, and eventually the line was constructed across the mountain. The cliff on the east side being 2,000 feet high, a post was placed horizontally on the top of the mountain, and a wire dropped to a post at the base. A guard was stationed at the foot of the mountain, and another guard at the top, and the only way in which they could communicate with each other, whether the line was in order or not, was by the firing of their guns. It took a clever Beluch-man seven days to go from the post at the bottom to the post at the top, because they had to traverse a roundabout route in order to get there. After passing the mountain, the posts were erected on the sea beach, and during the monsoon months especially, the line worked very unsatisfactorily, as it was extremely damp. In addition to this, it was constantly being interrupted by the falling rock. The result was that some other way had to be found for the telegraph line. He said to the assistant that he believed there was a way inland up the bed of a river, but, of course, that was useless for a telegraph line. He had also been informed that there was another pass—the Asses Pass, there being a legend that an ass had been ass enough to go that way. Eventually, however, the line was carried through that pass. A camel track was cut on the side of the mountain, and, after three years, they were able to move the line. He wished to correct what Sir Thomas Holdich had said by stating that the track along which the telegraph now went was really the route of the country. It was universally used for going to Ormara from Sonnaiani and other parts of the coast. Sir Thomas Holdich had not mentioned in his paper the mud volcano which existed near Ras Kachari. It was quite possible that that was not in existence 3,000

years ago, but, at the prescnt time, it was a very high and noticeable hill, and pilgrims going to the Hinglaj shrine invariably visited that active mud volcano on their way there.

Sir HENRY MANCE, C.I.E., said it would be very interesting to know whether Alexander and Nearchus were in touch with one another during the retreat from India. He had seen it stated in an old record that Alexander signalled from the hills to Nearchus by means of steel mirrors. It was somewhat remarkable that 2,000 years afterwards the very first experiments which led to the development of the heliograph, and its introduction into the armies of the world, were conducted on the same ground.

The CHAIRMAN moved a hearty vote of thanks to Sir Thomas Holdich for his exceedingly interesting paper, which was carried unanimously.

Sir THOMAS HOLDICH, in reply, said that with regard to Sir George Birdwood's criticism of the title of the paper, in calling it "A Retreat from India" he was under the impression that Alexander had to go. He believed the army mutinied and declined to go further. As far as he knew, Alexander's idea was not to halt where he did in India, but extend his conquests as far as the Ganges. The line of the Indus gave him a most acceptable route for further exploration. That Alexander originally contemplated when he went to India to return by the Indus and the Persian coast he certainly was not aware of. He thought it was beyond doubt that Alexander knew his way, that the country had been explored beforehand, and that the sea coast was known, because the Phœnicians must have sailed in the Persian Gulf, certainly as far east as India, before Alexander's time. The very fact of Alexander taking a pilot on board proved that conclusion. He had never heard of the legend attaching to the Island of Kais. He had heard innumerable legends in his journeys up and down the Persian coast, but he had never heard that particular one of the original story of Dick Whittington. He believed his friend, Mr. Ffinch, would bear him out that it was the rats which were the nuisance of the Persian Gulf.

SIXTEENTH ORDINARY MEETING.

Wednesday, April 24th, 1901; the Right Honourable the LORD CHIEF JUSTICE, G.C.M.G., Vice-President of the Society, in the chair.

The following candidates were proposed for election as members of the Society:—

Andrew, George Edward, H.M.S. *Resolution*, Channel Squadron.
Dobbing, Frederic C., J.P., Calderwood, Chislehurst, Kent.
Donkin, D., Albemarle, Wimbledon-common, S.W.
Harrowby, Earl of, 9, Grosvenor-gardens, S.W.
Miles, William, 114, Melody-road, Wandsworth-common, S.W.
Roe, Captain B. O., Kulu, Punjab, India.
Snell, Charles Scott, 51, Victoria-street, S.W.
Swarup, Bishan, Jenapur, Orissa, India.
Williams, Rose Lilian, 2, Royal York-villas, Clifton, Bristol.

The following candidates were balloted for and duly elected members of the Society:—

Biddulph, Mrs. John, 20, Onslow-square, S.W.
Downes, James Rathbone, East Surrey Water Company, Redhill.
Duncan, J. H., 39, Coleman-street, E.C.
Holland, Commander G. E., R.I.M., D.S.O., Port Officer, Rangoon, Burma.
Johnson, Wallace C., M.Amer.S.C.E., Niagara Falls, New York, U.S.A.
Nicoll, John, Adderley, Monifieth, Scotland, and Calcutta, India.
Oliver, James William, Dehra Dun, N.W.P., India.
Savill, Howard S., Northumberland and Northern Counties Club, Whitehall-court, S.W.
Wray, P. Remus, 42, Tollington-road, Holloway, N.

The paper read was

PATENT-LAW REFORM.

By ALEX. SIEMENS.

During the last few years a growing dissatisfaction has manifested itself with the working of the Patent-laws in this country, and various suggestions have been made as to how they could be improved, most of which advocate a strict preliminary examination.

As the Society of Arts initiated the agitation which led to the "Patents Act, 1883," it may not be out of place to raise the question again before its members, and this paper is intended to start a discussion on the subject by making suggestions how alterations of the present law might be made to the advantage of the public as well as of the inventor.

In order fully to appreciate the present position of the Patent-laws, it will be useful to give a brief outline of their historical development, and also to indicate a few of the characteristic points of foreign Patent-laws by way of comparison.

The earliest grant of a monopoly appears to have been made by Edward III. in 1331 when he granted letters of protection to John Kempe, a native of Flanders, to enable him to set up the industry of cloth-making in England;* but this Royal prerogative was not often exercised until the reigns of Henry VIII. and

* Wallace and Williamson, the Law of Letters Patent for Inventions, page 3.

of Elizabeth. During the latter's reign serious complaints were raised in the House of Commons in reference to abuses of this privilege.*

It is significant that the Queen did not pretend that she could create monopolies at her pleasure, but the preambles to the instruments conveying the grants always set forth some public benefit to be derived from their action. Towards the end of her reign the incidents of a valid monopoly patent were stated by Fuller, one of the counsel for the defendant in the case of Darcy v. Allin, in the following passage, which has been frequently quoted as a correct exposition of the law:—†

"Now therefore, I will shew you how the Judges have heretofore allowed of monopoly patents, which is that where any man of his own charge and industry or of his own wit and invention doth bring any trade into the Realm, or any engine tending to the furtherance of trade that never was used before, and that for the good of the Realm: that in such cases the King may grant him a monopoly patent for some reasonable time until the subjects may learn the same, in consideration of the good that he does bring by his invention to the commonwealth; otherwise not."

In spite of promises to the contrary, the abuses in granting monopolies continued, until, during the first Parliament of James I., a "Committee of Grievances" was appointed to investigate the whole subject.‡

As a result, after a protracted struggle with the King, the "Statute of Monopolies (1623)" was passed, by which all monopolies were abolished with a few exceptions of a temporary character, and the most important exception set out in Section 6:—§

"Provided also . . . . . that any declaration before mentioned shall not extend to any letters patent and grants of privilege for the term of 14 years or under, hereafter to be made, of the sole working or making of any manner of new manufactures within this Realm to the true and first inventor and inventors of such manufactures, which others at the time of making such letters patent and grants shall not use, so as also they be not contrary to the law nor mischievous to the State by raising prices of commodities at home, or hurt of trade, or generally inconvenient . . . . . ."

On the limiting words, "within this Realm," the interpretation has been based, which Lord Brougham expressed in the following terms:—‖

"The Patent-law is framed in a way to include two species of public benefactors; they are those who benefit the public by their ingenuity, industry, and science and invention and personal capability; the other those who benefit the public without any ingenuity or invention of their own, by the importation of the results of foreign inventions. Now the latter is a benefit to the public incontestably, and therefore they render themselves entitled to be put upon somewhat, if not entirely the same footing as inventors."

On these principles the whole patent legislation of the United Kingdom has been founded, but as Sections 10, 11, and 12 of the "Statute of Monopolies (1623)" and all subsequent Acts or sections of Acts referring to patents were revoked* by the "Patents Act (1883)" and its amending Acts (1885-88), it would be superfluous to enter into the details of the various stages of its development, and it is sufficient to give a succinct statement of the law as it now stands.

Monopolies for a limited period are granted to such persons who invent or import useful novelties, provided they describe in their specification the invention or importation in such a manner that a skilled person can carry out the manufacture after the patent has expired.

Every application for provisional protection and every complete specification is submitted to the Examiner, who has to consider and report to the Comptroller on the following points:—†

1. Whether the applicant has fairly described the nature of the invention.

2. Whether the specifications and drawings (if any) have been prepared in the prescribed manner.

3. Whether the title sufficiently indicates the subject matter.

4. Whether the invention particularly described in the complete specification is substantially the same as that described in the provisional specification.

Where the Comptroller, after receiving the report of the examiner, refuses to accept a specification, or requires an amendment, the applicant may appeal from him to the law officer, whose decision is final.

The acceptance of the complete specification is advertised, and any person may give notice of opposition, within two months, to the grant of the patent on certain very limited grounds; if there is no opposition, or if it fails, the patent is sealed.

Simple as this procedure is, the Patent-law

BRITISH LIBRARY

of France, passed 5th July, 1844, is still less exacting. An inventor or his assignee may obtain a patent for 15 years for a useful and novel invention provided the application is made before the filing of the complete specification in foreign countries with certain exceptions, and provided that the invention is worked in France within two years of the date of the grant, and the working does not cease for any two consecutive years afterwards. In addition, the importation of the patented article invalidates the grant, except from a country belonging to the Union for the Protection of Industrial Property.

The French law stipulates further, that all articles labelled "patented" must bear in addition the letters "S.G.D.G." signifying "not guaranteed by Government," and the questions, whether a patented invention is really useful and novel, are only investigated in case of litigation.

In strong contrast to Great Britain and France, there is a very strict preliminary examination in the United States and also in Germany.

A highly-trained staff of experts examine into the novelty of each application, calling the attention of the inventor to any prior publication that they may discover in any country.

In the United States the practice is to put the application in interference with any other application or patent already granted relating, in the opinion of the examiner, to the same subject, and a regular lawsuit follows to deter- the priority of the inventions.

After one interference has been disposed of another may be discovered by the examiner and the whole procedure of hearing evidence of both sides has to be repeated, so that it happens not infrequently that a patent application is kept for years before the examiners.

In Germany the specifications and drawings, after they have passed the official examiner, are open to public inspection, and any objection raised by a member of the public will be considered by the examiners.

The object in both these countries is to give the inventor an opportunity of eliminating from his specification anything that may clash with prior rights, and to make his patent, after it has passed through the ordeal of severe examination, practically unassailable.

As already stated, this system has many admirers in this country, and lately the grievances of inventors relating to the preliminary examination of applications for patents have been exhaustively treated by Mr. Lloyd Wise in a paper read before the London Section of the Society of Chemical Industry. The remedies suggested by him were summarised in *Engineering* of the 23rd November, 1900, as follows:

"The scheme is based upon the lines that:—

"1. It is desirable as far as practicable to afford to applicants for patents and to the public full information concerning the novelty of inventions in respect of which patents are sought.

"2. As, however, patents have sometimes been ultimately supported in respect of inventions which even eminent judges have regarded as non-patentable, it is not advisable in any unopposed case that a patent should be refused on the ground that the invention or alleged invention is obviously old or has been previously patented in this country, provided the applicant (if required) so amends his specification as to indicate what was previously known, thus protecting the public against being misled.

"3. Furthermore (provided that, if necessary, the applicant suitably amends his specification), it is not advisable either to make it publicly known that the specification has been amended at the instance of the Patent-office authorities or to give publicity to any official communication of any kind (whether by endorsement on the specification or otherwise), implying doubt as to the novelty of the subject matter in respect of which the patent is granted; because such publicity would obviously create prejudice against the patent, and where based upon erroneous opinion, would operate unjustly."

For the present purpose it is not necessary to enter upon the considerations which led Mr. Lloyd Wise to propound this scheme, as the summary clearly shows that he is in favour of making the examination for novelty much more exhaustive than it is at present in this country.

Before discussing this view further, it is very instructive to observe the trend of public opinion in a country where the examination is as strict as it can be made, viz., in Germany.

The position of affairs is very clearly explained in a paper read by M. von Hefner Alteneck before the Elektr. Techn. Verein, in Berlin, on the 27th March, 1900, in which he made certain proposals to alter the German Patent-law.*

In his opinion the examination system has serious drawbacks, which he summarises as follows:—

1. Important patents are not secured thereby against litigation.

2. Very heavy cost has to be incurred before the true value of an application is ascertained.

3. After a long examination the invention

may become valueless through something better being found out in the meantime.

As M. von Hefner Alteneck expresses it: "At the time of application the invention is at such a tender age that it is unable to sustain the burden of a severe examination. All the same the inventor is forced to apply for a patent to secure his rights against other people whom he has to employ to work out the details of his invention."

As a remedy for these evils M. von Hefner Alteneck recommends that the inventor should have the option at the time of making his application, either to demand a patent in accordance with the present (German) practice, viz., strictly examined for novelty and utility, or to have the invention merely registered, in which case it would be examined somewhat in the same way as English patents are.

A registered patent should be convertible into an examined patent at any subsequent time whenever the inventor desires it. Should the registered patent fail to pass the examination, or if the examination is stopped before it is concluded, the patent becomes void altogether. It should also be competent for anybody to petition the Patent Office to annul a registered patent for specified reasons, but even if such a petition were successfully resisted the patent would remain a registered one. Any attempt to pass off a registered patent as an examined patent should be punishable.

M. von Hefner Alteneck mentioned in the paper that he had for a long time considered the American system greatly superior to the German system of examination until his faith was shaken by hearing an American inventor of great experience in patent matters express the fervent conviction that the German system was ever so much better than the American one.

During the discussion of that paper,* Mr. West defended the strict examination on the plea that a patent should be considered to be of the nature of a contract by which the Government for the valuable consideration of the invention, granted a monopoly which the Government should guarantee by establishing the novelty and utility of the invention at the time of granting the patent, and to meet M. von Hefner Alteneck's objection, Mr. West suggested the introduction of the American system of "caveat," to give the inventor time to develop his invention.

He further approved of the system of placing an application "in interference" with an existing patent for a similar invention, as this tended to diminish the necessity for large firms to have their own patent staff looking out for applications that might interfere with their rights.

Lastly, he suggested that no patent or publication more than 15 years old at the time of application should be available for proving want of novelty, as he considered that an invention which has failed to find favour for 15 years should not stand in the way of an inventor who may have hit upon an old idea which has become practicable through the general progress since it was abandoned. It may be added that the present practice in Germany is to preclude publications more than 100 years old from being used as anticipations.

On the other hand, Mr. Stort considered the existing patent system of Germany as inherently faulty, pointing out that none of the most important inventions had been successful in passing the ordeal, *e.g.*, in electrical engineering, no general patents had been granted for telephones, glow lamps, arc lamps, differential regulations of arc lamps, core carbons and wireless telegraphy; and that the master patent for three-phrase currents had been declared void on account of not being worked.

He, therefore, supported M. von Hefner Alteneck's proposal, with the modification that anybody might ask the Patent Office to examine strictly a registered patent. He felt sure that by the system of merely registering patents in the first instance the work of the Patent Office would be greatly reduced, and, therefore, much improved.

The Chairman of the German Society for the Legal Protection of Industrial Property also spoke in the dicussion and invited the Elektr. Techn. Verein to take part in a Congress of his society at Frankfurt, where the subject would be further discussed, intimating that their proposal would include the recommendation to divide the examination, so that an application should at once be tested for novelty and only later on for utility and ingenuity.

The proposals of M. von Hefner Alteneck were laid before the Frankfurt Congress by the delegation of the Elektr. Techn. Verein with the additional recommendation that the rule of the German Patent-law, limiting the right of the public to demand the revocation of a patent to five years from the date of the grant, should be abolished.

In the report* at the Kiel meeting of the

Verband Deutscher Elektrotechniker, on the 18th June, 1900, it was stated that these proposals had not been accepted by the Frankfurt Congress, and in the discussion the fact was mentioned that at the end of five years three-quarters of the number of patents granted in Germany are void or have been dropped. As a result another Committee was appointed to report on the advisability of advocating the establishment of registered patents in the sense explained in M. von Hefner Alteneck's paper. All these proceedings clearly demonstrate that the strict preliminary examination does not fulfil its object; nor is this to be wondered at, for no staff of examiners can possess the latest information in every branch of invention; moreover, such an enquiry is really an attempt at proving a negative. In addition, the improved means of communication place all civilised countries on such a footing of equality, that each phrase of development in technical matters is known and studied in many countries at the same time. Hence it frequently happens that patents are applied for in several countries for similar inventions about the same time by different inventors. To minimise the difficulty arising therefrom a Union for the Protection of Industrial Property was founded in Paris in 1883* between the Governments of a number of countries, which Great Britain joined in 1884, as foreshadowed in Section 103 of the Patent Act (1883),† and the International Convention for the Protection of Industrial Property lays down the principles on which inventors are to be treated in the States belonging to the Union.

The most important articles of this Convention‡ are :—

"Art. IV. Any person who has duly applied for a patent, industrial design or model, or trade mark in one of the contracting States shall enjoy, as regards registration in the other States, and reserving the rights of third parties, a right of priority during the periods hereinafter stated.

"Consequently, subsequent registration in any of the other States of the Union before expiry of these periods shall not be invalidated through any acts accomplished in the interval, either, for instance, by another registration, by publication of the invention, or by the working of it by a third party, by the sale of copies of the design or model, or by use of the trade mark.

"The above-mentioned terms of priority shall be six months for patents, and three months for industrial designs and models, and trade marks. A month longer is allowed for countries beyond sea."

"Art. V. The introduction by the patentee into the country where the patent has been granted of objects manufactured in any of the States of the Union shall not entail forfeiture. Nevertheless, the patentee shall remain bound to work his patent in conformity with the laws of the country into which he introduces the patented objects."

"Art. XII. Each of the high contracting parties agrees to establish a special Government department for industrial property, and a central office for communication to the public of patents, industrial designs or models, and trade marks."

Since this paper was first drafted the report of the Committee has been published which was appointed on the 24th May, 1900, by the Board of Trade to enquire—

1. Whether any additional powers should be given to the Patent-office to prevent the issue of patents for inventions either obviously old or previously protected by Letters Patent in this country.

2. Whether any amendments are necessary respecting the granting of compulsory licenses (Section 22 of the Patents Act, 1883).

3. Whether the period of seven months allowed by Section 103 of the Patents Act, 1883, may properly be extended.

This last period refers really to the International Convention, and the Committee recommends the extension of the time to twelve months, subject to certain conditions, which do not concern this paper.

The subject of "strict preliminary examination" was very fully treated in the Presidential Address of Mr. J. D. Abel which he delivered to the Chartered Institute of Patent Agents on the 15th December, 1897.

Among other objections he more particularly proved by the actual outcome of patent lawsuits in the various countries, that examined patents are by no means more secure against being declared invalid on litigation, than registered patents.

All this evidence clearly shows that a strict preliminary examination is not the final solution of the problem, and the dissatisfaction which exists at the same time regarding the mere registration of patents leads to the conviction that the modern efforts at legislation in patent matters must be based on faulty principles.

From the short historical summary given above it would appear that under both systems reformers and legislators have endeavoured to secure for the inventor a valuable monopoly as

a reward for his ingenuity, and have lost sight of the considerations for which originally monopolies were to be allowed, in accordance with the wording of the Statute of Monopolies which permits "grants of privilege . . . . of the sole working or making of any manner of new manufactures . . . . . which others at the time . . . . . shall not use . . . . . ." In other words, the privilege may be granted to inventors who "work" and "make," and it is made invalid only by prior "user." This view has been the keynote underlying the interpretation of the English law by the Judges, who have held that the merit, which is rewarded by a monopoly, lies not in the invention of a new manufacture, but in the introduction of such a new manufacture to the public, so that the public derive a benefit from it.

In addition to the quotations given above, the words of Bacon may be cited in further support of this view, who says: * "All prerogatives must be for the advantage and good of the people, otherwise they ought not to be allowed by law." Rewarding the inventor is, in short, a means to attain this end, but it should not be the ultimate object of the law. Mr. Abel expresses the same idea in a different way by the following words:—

"The patent should be granted to him (the inventor), first, as an incentive to him to use his best endeavours to practically carry out his invention, and to get it taken up by the industrial world; and secondly, as a reward, not for his ingenuity, but for having produced something that will advance manufactures or otherwise benefit the community."

A reformed Patent-law should, therefore, have for its principal object the introduction of new inventions to the general use of the public, and while the interest of the inventor should not be entirely neglected, it should be subordinate to the "advantage and good of the people." To carry out this object, information about new inventions should be made readily accessible to the public, and every facility should be given to persons desiring to utilise an invention to obtain licenses from the patentee, and to overcome vexatious obstruction of any kind. As a matter of fact, a good deal has already been done to make information about novelties easily accessible to the public.

In accordance with Article XII. of the International Convention, the Governments belonging to the Union are exchanging their published patents, and exhibit them in their Patent-offices. Moreover, of late years, careful indexes have been drawn up at the Patent offices, divided into classes, according to the subject-matter of patents, and abstracts of the patents are published, greatly facilitating research.

In addition to these official steps, an International Society has been founded for the Protection of Industrial Property, with a central office in Berne and an official organ, "La Propriété Industrielle." The aims and the work of this society were explained to the members of the Society of Arts, by Mr. J. F. Iselin, in a paper read on the 18th February, 1898.

Last, but not least, the technical press describes every novelty at the earliest possible moment, so that there is ample material for the searcher after novelties, in the "patent" sense. All the same, great improvements can still be effected by collecting all these sources of information at the Patent-office, and indexing the contents, in a systematic way, according to their subject-matter. A manufacturer could then send, from time to time, to this office and ascertain what the latest discoveries in his particular branch were, and where he could communicate with the patentee, if a novelty is announced that appears useful to him. It is quite clear that for this part of the subject the provisions of Section 101 of the Patents Act, 1883, are sufficient, and that the actual steps already taken indicate that the demand for quick and complete information about useful novelties has made itself felt, and has been acknowledged to be a just one.

In reporting on the first point submitted to them, the Board of Trade Committee recommends that the staff of the Patent-office be considerably increased so as to be capable of examining every application whether it had been anticipated by any claims or descriptions in specifications of Letters Patent granted not more than fifty years before the date of the application under examination. If any such specifications are found, the inventor has to amend his specification, or a list is appended to it of prior patents which in the opinion of the examiner anticipate the claims. This recommendation agrees to a certain extent with the view expressed above, but the suggestion of Col. Harding, supported by Mr. Spring-Rice, would exactly carry out the idea of making the Patent-office really useful for imparting information. This is practically that an inventor should not have the right of requiring the officials to make a search for him, but they should assist him, as they are in the habit of doing now, by

* W. and W., page 2.

BRITISH LIBRARY

pointing out to him how and where he can find information about the particular branch of industry to which his invention refers. A search among complete specifications only, as contemplated by the Minute of the Board of Trade appointing the Committee, is not satisfactory, as a negative result would tend to mislead the public and the inventor by inspiring a sense of security as to the validity of the patent; and the experience of other countries has abundantly shown that even the strictest preliminary examination fails to make a patent secure.

Instead of making a search, after the application for a patent has been drawn up, an inventor should be induced to study what has been done before at the time when he first thinks of a new device, and every assistance should be given him to make himself thoroughly acquainted with his subject. In most cases he is sure to find anticipations, which will modify his views, shorten the experiments necessary for developing his ideas, or possibly induce him to abandon his intention of filing an application. Making information accessible to the public would therefore contribute to the desirable result of lessening the number of invalid patents.

To a certain extent the other requirements, to give facilities for obtaining licenses and for overcoming obstruction, are not neglected in the existing procedure, but they have not the consideration they deserve, nor is sufficient stress laid on introducing a new manufacture as distinguished from inventing the same.

Some alterations of the law would have to be effected to give these considerations their due weight, and the following suggestions will explain what changes might be introduced. The procedure for obtaining patents would remain exactly as it is now according to the English law, so that both the public and the patentee fully understand that the validity of a patent is not established by the mere fact of its having been granted. In this way the inventor would be saved the immense worry and expense inseparable from a strict examination, while the preliminary examination would secure a moderate restriction in the number of applications as it does at present.

For the purpose of further diminishing the number of patents and of preventing patentees delaying the introduction of the patented manufacture, it should not be possible to keep up a patent for more than four years, unless it can be shewn to the satisfaction of the examiner that the invention, as set out in the claims, has been worked for more than one year on a commercial scale before the fifth year's tax becomes payable. Such a rule would be beneficial in many ways, and among other things, give effect to the opinion expressed by Chief Baron Pollock* "... a patent, the object of which is not to benefit the world by its communication, but to obstruct by the very general character of its claims, made for conferring peculiar priviliges on the patentee; such a patent as that, in my judgment, cannot be supported." If several methods of carrying out the same manufacture are described in one patent, the satisfactory working of one modification should be sufficient to keep up the whole patent; for it would not be fair to the inventor, either to expect him to work all possible modifications of his invention on a commercial scale, or to allow the public the free use of the modifications described in the specification, but not worked by the inventor or his licensees.

The examiner should, however, be careful to distinguish between the cases referred to by Chief Baron Pollock in which the claims are too wide, and the cases in which various means are set forth for obtaining the same result. The procedure would be similar to that of the examination when the patent is first applied for, the examiner reporting to the Comptroller, from whom an appeal would be allowed to the law officer, whose decision would be final.

With the object of facilitating the introduction of new manufactures, the system of compulsory licenses should be extended so that anybody who is prepared to carry out an invention or adopt a novel device, but has been refused a license by the patentee, should be able to obtain one from the Patent-office.

This is the second point on which the Committee reports, and they are of opinion† that "the machinery as to the actual grant of the license is needlessly complicated."

They therefore recommend‡ that the jurisdiction be transferred to the High Court, "subject to the same rights of appeal and to the same regulation as to general orders as are in force in respect of its existing business, except that no appeal to the House of Lords shall be brought without the leave of the Court of Appeal or of the House of Lords."

Further, "that the respondents in any proceedings under this jurisdiction shall include (1) the patentee and (2) any person claiming

an interest in the patent as exclusive licensee or otherwise. In addition, the Attorney-General in England or Ireland, or the Lord Advocate in Scotland, or any person authorised by them respectively, shall have the right of appearing."

The leading article of *The Times* of the 18th March last observes on this proposal to transfer the granting of compulsory licenses from the Board of Trade to the High Court:—"Is the procedure there all that parties interested could desire? For a wealthy patentee or a wealthy infringer it is; for anybody else it is not."

As the law at present stands an interested person has to prove to the Board of Trade (1) "that by reason of the default of a patentee to grant licences on reasonable terms, (*a*) the patent is not being worked in the United Kingdom, or (*b*) the reasonable requirements of the public with respect to the invention cannot be supplied, or (*c*) any person is prevented from working or using to the best advantage an invention of which he is possessed." The Board of Trade may then order the patentee to grant a license.

It will be noticed that the alternatives *a* and *b*, which have to be proved by the interested persons, are really incapable of being proved, and even the third reason is extremely difficult to establish, and in case the patentee lives abroad the Board of Trade cannot grant a license at all.

Altogether the Section as it stands and also the recommendation of the Committee are drawn to protect the interest of the inventor and of the patentee respectively, which, as explained above, appears to be the wrong principle to follow.

If, however, the patent legislation is to carry out the original object for which it was established, viz., to facilitate the introduction of new maufactures, the procedure for obtaining compulsory licences should be made simple and expeditious.

It should be sufficient for the applicant for a compulsory license to show to the satisfaction of the Comptroller:—(*a*) That he is prepared to carry out the invention on a commercial scale; (*b*) that the patentee has refused him a license on reasonable terms, or has taken no notice of his request. On receiving such an application the Comptroller would send an official enquiry to patentee at his registered address, asking for an explanation within a reasonable time, say a fortnight, if the registered address be in the United Kingdom.

If the patentee does not answer within the prescribed time, or still persists in refusing a license on reasonable terms to the particular applicant, the Comptroller would be empowered to grant the license asked for, on such conditions as he may deem just, sending a copy of the license to the patentee.

As all licenses have to be filed at the Patent-office, the Comptroller would in most cases be able to ascertain for his guidance in settling the compulsory licenses on what terms licenses to use the patent in question have been granted to other parties by the patentee, and in other cases a royalty of 5 per cent. on the selling price, or of 10 per cent. on the saving effected by the adoption of the invention might be considered to be fair and reasonable.

All royalties under compulsory licenses should be paid into the Patent-office in the same way as the fees are now paid, and the Patent-office would hand them over to the patentee, less a sum equal to 10 per cent. of the gross receipts to cover expenses, if applied for within 10 years of the date of payment to the Patent-office. After that time unclaimed royalties would become the property of the Patent-office.

The essence of this suggestion is that the applicant must prove his ability and his willingness to work or make the invention on a commercial scale, and this should entitle him to a license on the most favoured nation clause, whether the patentee consents or not.

It is not to be anticipated that many compulsory licenses would have to be granted under such provisions, as inventors would soon realise that it was more to their interest to grant licenses on reasonable terms when asked for by *bonâ-fide* manufacturers, than to refuse them.

A further rule should be established that any licensee who has been using a patented invention on a commercial scale, for more than one year, should have the right to bring a suit for infringement, as long as he himself continues to work his license.

If the patentee does not carry out the invention himself on a commercial scale, he should not be entitled to prosecute for infringement, unless the invention has not yet been worked by any of his licensees, or unless one of his licensees, who is carrying on the manufacture on a commercial scale, is made a party to the suit. In no case should an action for infringement be allowed to proceed, where the defendant can prove that the plaintiff knew of the infringement for six months before he commenced the action.

BRITISH LIBRARY

These rules are to prevent men of straw or speculators, who buy up patents, from black-mailing the public, and to enable licensees to protect their interests in cases where they cannot induce the patentee to prosecute third parties for infringement.

On the other hand, it should not be possible to invalidate a patent which has been worked for more than two years on a commercial scale by the patentee or his licensees, except by proving that the invention was in use on a commercial scale for a reasonable time before the first application for the patent was made. It is a matter for discussion whether such prior user ought to have taken place in the country where the patent in question has been granted, or in any country belonging to the International Union. In the latter case the inventor would have the advantage of the earliest date of application in any one of the countries.

What is a "reasonable time" depends so much on the nature of the invention that it seems preferable to leave its determination entirely to the Court before whom each individual case is tried, and not to attempt to define precisely for what length of time a process should have been worked to become a valid anticipation.

The effect of this provision would be to make a patent almost indefeasible during the remainder of its term after the invention has been worked or made on a commercial scale for two years. Until that time the patent would fall under the provisions of the present law. It stands to reason that each patentee would use his best efforts to obtain the powerful protection of this provision for his invention; and this would place him in a position to make extortionate demands for the use of his invention were it not for the system of easily obtained compulsory licenses.

It is very essential that "use on a commercial scale" be proved to avoid the failure that has invariably attended the "working" clauses of some Patent-laws, where it is sufficient to manufacture once every year or once in every two years in the presence of a public notary.

As alluded to in the discussion of M. von Hefner Alteneck's paper, most of the large firms have a special department for watching the progress of their particular branch of industry and for investigating all the complaints about technical deficiences, which the customers of the firm may make from time to time.

If necessary, this department conducts a series of experiments on the lines indicated by the wishes of customers, and the usual practice is to patent all modifications that may suggest themselves to the trained staff working in the department.

It is also undeniable that the introduction of a modification depends only on its commercial value, so that it may easily happen that a firm, after taking out a patent for a modification, does not find it advantageous to adopt the same for its own use, or some unexpected difficulties present themselves, which, for the time, make the modification impracticable. Under modern conditions it is quite possible that another firm might discover the same modification, or a very similar one, and succeed in overcoming the difficulties which deterred the first firm from proceeding with the modification.

In such cases, the second patent should not be invalidated by the publication of the first patent, unless the first patent was valid when the second patent was applied for, or unless it can be proved that the second inventor was acquainted with the first patent before he applied for a patent himself. A similar rule should apply to other publications, so that they should not be available as proof of anticipation, when they are more than fifteen years old at the time the patent is applied for.

By the adoption of these rules actions for infringement would be considerably simplified both for the plaintiff and for the defendant, as it would not be necessary as at present to search far back for publications, which might be interpreted as being anticipations; but the commercial use of the invention would have to be proved, which is more a question of fact than one of opinion. The questions of ingenuity or of usefulness would not be raised at all in such a suit, so that the difficulty of exactly defining what really constitutes an invention would be altogether eliminated. This view is endorsed by Mr. Abel, who in discussing what is a patentable invention, says, "that it is the result that one should look to before all else, and that an advantageous result should be held to infer an exercise of ingenuity worthy of being rewarded by a patent."

An ideal state of affairs would be reached if the Patent-laws of all civilised countries were made identical, on the lines sketched out in this paper, so that a patent taken out in one country could be registered, at the option of the inventor, in all the others, without any further examination of any kind, and in the case of litigation the commercial use in one

country would be recognised by all the Courts.

In considering these suggestions the following points should not be lost sight of:—

1. Patents, taken out under the present English law, have as often been upheld in Courts of Law as patents granted after a strict examination in other countries.

2. Inventions are not so much matters of sudden inspiration as the result of patient investigation of what has been done before in the same subject, and of careful experimenting based on a sound knowledge of natural laws, combined with a common sense imagination.

3. Improvements very rarely imply radical alterations in existing methods or apparatus; they generally proceed by small steps, most of which are soon superseded.

4. The real value of an invention can only be ascertained by its practical commercial application; and it is for this that the Crown originally exercised the prerogative of granting monopolies by Letters Patent.

DISCUSSION.

Mr. JOHN IMRAY said that one point connected with the preliminary examination for the granting of patents had never been put properly before the public, viz., the abuse of the system as practised by the examiners in Germany, the United States, and other countries. If the examinations were confined to a simple question of novelty no great harm might be done and good might result, but, unfortunately, nine-tenths of the objections were not of that character. Not a week passed but twelve or twenty such objections came before him from America, Germany, Sweden, Norway, Denmark, and Austria. In all these countries the examiners, instead of confining themselves to questions of novelty or anticipation, looked almost entirely to the question of invention to settle in their own minds whether the subject involved invention or not. In his mind, a judgment as to an invention was the same thing as a judgment on the flavour of a wine or anything else. Perhaps the greatest abuse of all was that the examiners, when they could not find any direct anticipation, searched through possibly a dozen patents, taking out one feature from one and another from another, and saying that the invention was not a combination, but a mere aggregation of all the things, and on that ground refused it. Although there might be many old things, the man that put them together in such a way as to make them useful was certainly entitled to be considered an inventor. Another serious difficulty was that out of all the prior specifications which were quoted as anticipations, more than three-fourths were utterly useless, and had never been worked. Many patents were refused on the ground of prior specifications, which described utterly useless things. He had several such instances before him at the present moment. If a set of examiners could be obtained who were free from the inclination to form their own judgment as to questions of invention or non-invention, free from the tendency to pile together things picked out from different sources, and free also to judge of the merit of the prior anticipations brought forward, some such sort of examination would be of great use not only to inventors, but to the public at large, but until a scheme could be formed by which examiners could be prevented from launching out into devious paths examination was of no use.

Mr. LLOYD WISE said Mr. Siemens had referred to his (Mr. Wise's) scheme for preliminary examination of applications for patents. He first mentioned that scheme 30 years ago to that most distinguished patent lawyer, the father of the Chairman, by whom he was invited to co-operate in promoting changes in the Patent-law, the result being seen in the Select Committee's Reports of 1871-2 and in the Act of 1883. If he did not misunderstand the recommendations of the Departmental Committee, that committee approved of his scheme. He had discussed it with many men who were qualified to form an opinion, and where the scheme had been objected to, he had generally found that the objections had arisen from some misapprehension. Mr. Imray had pointed out the difficulties which arose under examination systems, owing to the examiners citing things which were practically unworkable. No objection could arise under that head in the proposed scheme, because the examiner would not have the power of refusing the patent, and if the applicant, after considering what was cited, thought fit to ignore it, the worst that could happen would be an endorsement on the specification. He was afraid the reader of the paper viewed the question of Patent-law reform from a manufacturer's point of view. A man of small means who went with a patent specification in his hands, bearing an official endorsement, as distinguished from an embodiment in the specification itself of a statement in his own language of the state of the art, to a capitalist or a manufacturer would have a very poor chance of coming to satisfactory terms. An official endorsement would be liable to be regarded as a blot. What did Mr. Siemens do when he took out a patent under the advice of Messrs. Abel and Imray? He, in his specification stated generally, according to his knowledge at the time, what had been proposed more or less in the same direction, aud then he set forth wherein what he sought to claim differed from what had been proposed. Even when that was done, occasionally he found that there was something more previously known which involved a further disclaiming statement in order to to obtain a clear patent. That was exactly the practice he suggested—that a man, having applied for a patent more or less in the dark, should be informed by the Patent-office of anything that was found, and should then be allowed

702

to put his specification into shape so as not to cover too much; if he were unwilling to do that then he should suffer an endorsement. That scheme was very favourably spoken of by the late Sir William Siemens, and had lately been recommended to the Departmental Committee by many very eminent men. He took very strong exception to the suggestion that a patent should not be renewable unless it had been practically worked during the first four years. Many excellent and useful inventions were brought out by men which it was not in their power to introduce commercially.

Mr. P. M. JUSTICE thought the reader of the paper had not considered the entire effect of his proposition in regard to the compulsory working clause. Did he suggest that he was willing that every one of his many inventions, as specified in each particular specification at the present time, which was not in full work, might be cancelled? There was always a series of steps in building up a new industry, but Mr. Siemens went outside those steps, and suggested that each thing must be worked which was patented. The original Edison telephone was a huge instrument which one had to grind like a coffee mill when speaking and listening. Did Mr. Siemens suggest that the patent was not valid, on the ground that the particular instrument was not in use after the improvement came into force? A large German aniline dye factory employed over 30 chemists, who did nothing toward practical manufacture, and he had been informed that out of over 100 products made in the works there was not more than two products in which the process by which they were produced was more than three years' old, every process having been improved. Were all the early patents to be annulled, on the ground that they were not commercially worked? If it were so the field of invention would be thrown open so that no capitalist would be prepared to risk his money in any enterprise under patents.

Mr. EDWARD CARPMAEL agreed with Mr. Siemens that the object of Patent-law was to encourage the starting of new industries in the country, but he entirely disagreed with him in thinking that the means he proposed would succeed in attaining that end. He thought the advocates of compulsory working laboured under two delusions. First, they appeared to think that everybody in the trade was most anxious to take up and work untried inventions, and that it was the patentee who was the dog-in-the-manger, who would not work himself or allow other people to do so; and, secondly, that an unpatented invention was more likely to be worked than a patented one. In his experience, extending over more than 30 years, he had always found that patentees and inventors were most anxious and willing to carry out their inventions, that being the only way in which they could make money out of them. In 99 cases out of 100 the reason why a valuable invention was not carried out was not the unwillingness of the inventor, but the obstinacy and resistance of the trade. A very striking illustration of the fact that manufacturers were not very willing to take up untried inventions was that for 12 years after the passing of the Act of 1883 not a single application was made for a compulsory license. He was quite aware that at present, owing to the regulations of the Board of Trade, there were great difficulties and expenses involved in obtaining a compulsory license; but when the Act was passed no one could have foreseen this; on paper nothing could be more simple and inexpensive. Even up to the present time he believed he was right in saying that no *bonâ-fide* application had been made for a compulsory license under a patent which had not been worked. In all cases the patent had been worked to a very large extent, and it was because it was profitable that the compulsory license was wanted. He thought a few examples would show the difficulties meritorious inventors experienced in getting their patents taken up. Messrs. Thomas and Gilchrist had to assign one-third of their patent and grant a free license before a manufacturer could be found to undertake their process, and although that was done immediately the patent was granted it was not commercially worked till more than three years had elapsed from the date of the patent. In the case of Watt's steam engine and Lister's (Lord Masham) inventions of wool and silk combing and velvet weaving fortunes had to be spent and years wasted before the inventions were commercially adopted. In more recent times, it was eight years after the date of the patent before Hopkinson's three-wire system was adopted at all, and years before Parsons's turbine was used commercially. Did Mr. Siemens seriously contend that all those inventors should be deprived of the profits of their inventions, or did he contend that England would have been benefited if these industries had been stifled at their birth? Were either Siemens's regenerative furnace or the Siemens-Martin process for the production of steel, worked within three years of the date of the patents? If they were, it was only because they belonged to a rich and powerful company, and not to a poor inventor. In his opinion, Mr. Siemens's proposition, so far from encouraging the introduction of new manufactures, would have an entirely opposite effect, in many cases stifling them altogether.

Mr. JOHN I. THORNYCROFT, F.R.S., thought there was more difficulty in getting an invention worked than was generally supposed. If compulsory working within a limited time was necessary he thought Mr. Siemens should extend the time he had mentioned. Legislation, so far as it had been altered in recent years, had been improved, but the main intention of patents by the Crown, that they should be a benefit to the community at large, must be kept in view. A preliminary examination, which would help the inventor by giving him detailed information of

what had been done before, would be of great benefit, and the suggestion that patents should be limited to those of a more valuable character was also worthy of consideration.

Mr. GEORGE B. ELLIS said that in America and Germany persons practising in the Patent-office were under control, an entirely different state of affairs to those existing in England, where there was absolutely no control, which led to a great deal of cheating. If a test was to be imposed on the novelty of the invention, at the same time the various people practising in the Patent-office should be controlled.

Prof. AYRTON, F.R.S., said the reader of the paper, in his proposed improvements, had suggested that unless a patent had been worked on a commercial scale before the end of the fourth year it should be void. No doubt such a recommendation would be of value if patentees were obstructionists. In his opinion there was a class of patents which were not utilised because the world was not ready to take advantage of them. It would be very hard that although in such a case a patentee was quite willing to enter into any arrangement to enable his patent to be utilised he should lose it. It was even harder still that he should be called upon to pay, year after year, an increasing sum to maintain a patent which returned him absolutely nothing. In such a case it was worth while considering whether a steadily increasing fee was desirable. He had not been able to discover the advantage of the regulation which said, "The acceptance of the complete specification is advertised, and any person may give notice of opposition, within two months, to the grant of the patent on certain very limited grounds." What was the advantage of objecting to anybody's patent? He was told that the granting of the patent gave no particular advantage, and by objecting one was placed at a disadvantage because one had to bear the expenses. No advantage was gained if one won, and the granting of a patent could not be objected to unless the objector was in possession of a prior patent for the same thing. In his opinion, the American system of interference was a very disadvantageous arrangement. If a patent was taken out, the patentee was called upon to defend it, not because he was claiming any royalty, but simply because, unless he did so, as somebody else had lodged an interference, he would lose it altogether. He was thoroughly in accord with Mr. Imray, that the examination of patents in Germany and the States was very unsatisfactory and of comparatively little use. Not very long ago an objection was raised to a patent of his own for a transparent varnish which, unlike ordinary transparent varnishes, was conductive, on the ground that he had not given a drawing. He pointed out to the American Patent-office that it was impossible to draw a varnish, but they said that they must have a diagram. Eventually he drew three vertical lines, which he said represented a coating of varnish on a plate of glass, and got his patent.

Mr. FLETCHER MOULTON, K.C., M.P., said he wished to deal with Mr. Siemens's views on the rights of a patentee *versus* the manufacturer. Mr. Siemens, in his plan for the protection of inventors, said that anybody who was willing to make an invention should have a right at once, after the courtesy of writing to the inventor, of applying to the Patent-office for a license to make it as much as he like for, say, 10 per cent. of the saving—nay, on the most favoured nation clause, if he was only willing to manufacture it. A man gave his time, thought, and brains to make a saving for the world, and the manufacturer, who did not spend a penny, stood by watching with grim satisfaction the 99 failures out of 100 inventions, but when one did emerge successfully, he said, "Thank you; I will take 9-10ths of the saving, and you may have as your reward 1-10th." But it was worse than that. The patent would be invalidated unless it was worked promptly. In order to get it worked promptly the inventor might have to go to some powerful manufacturers and say that if they would work it he would grant them a license on very favourable terms. The poor inventor was then lost, because although in this way he got his patent worked and saved it from extinction, if it proved successful any other manufacturer who was willing to undertake to manufacture the patent on a commercial scale was (on the proposals in Mr. Siemens's paper) entitled to a license on the very same terms that the patentee had to make in order to keep his patent from dying out. He had been brought very much in contact with the real inventor, and usually he was by no means a rich man. Their ancestors were very wise in saying that if advance in arts and science was desired, it was not the capitalist who should be favoured, but the man who brought invention and thought to work. They further realised that it was no use devising a system of rewards which would depend on the appreciation which some body of men might have of the value of his invention, but that the right way was to make the reward automatic—to say, If you have struck a new thing you shall be undisturbed in the working of it for a certain number of years, and thus if it is valuable you will have rich reward; if it is not you will have a poor reward. They realised that the only way adequately to reward invention in proportion to its merit was the patent monopoly, and he had never yet heard anything proposed which could take its place. That right ought never to be invaded unless the patentee abused the patent rights by refusing either to work himself or to allow other people to work.

The CHAIRMAN, in proposing a vote of thanks to Mr. Siemens, said he entirely agreed with Mr. Moulton that the only proper reward for invention

was to give the inventor a proper enjoyment of his own invention, and that any question of compulsory license should only arise when it was shown that the monopoly had not been wisely and properly exercised. He did not think any Patent-law reformers ought to work, as far as the British Patent-law was concerned, for a guarantee from the Government as to the validity of their patents. Such a step was in the wrong direction, whether there was examination or no examination. It would tend to a number of good and useful patents being stopped from mere nervousness. He was strongly of opinion, that anything like an examination for subject-matter or novelty would be a retrograde step. He wished to enter a protest against the idea that an anticipation 15 years old should not be allowed to invalidate. If 50 or 60 years were given different considerations would arise, but the fact that even in the term of 14 years good inventions frequently were not brought into effective operation showed that it would be unwise to limit a real anticipation by such a measure of time as 15 years. It would be far too much in the interests of people who would endeavour to pick up patents, repatent them in 15 years, and attempt to prevent people engaged in commerce using them. In regard to the kind of examination which the inventor and the public were entitled to have, he thought that when in the Patent-office there was a mass of information, carefully digested and indexed, it was very hard indeed upon inventors if the Patent-office knew that they had been travelling along a road which had been already traversed not to tell them so, especially when they were paying a large revenue to the country, there being a surplus at the present time of about £100,000 a year from patent fees. He thought the public in the same way were entitled to information. He thought Mr. Wise hit the right nail on the head when he said that no real harm would be done by endorsement, because it was only when an inventor obstinately refused to alter his specification that the Patent-office exercised any compulsion. A great deal had been said in the Press about an endorsement upon specifications being a great hardship to inventors. After considerable experience he could say deliberately that in 99 cases out of 100 it was a bugbear, and an honest inventor was only too glad to have his attention called to possible anticipations. In sitting as law officer, some hundreds of *bonâ-fide* oppositions, by persons having an interest in a previous patent had been brought before him, and these were met by the applicant abandoning any claim to the points described in the previous specifications. It was only people who wished to use patents in a way they should not be used who raised such objections. He joined in the chorus of disapprobation of Mr. Siemens' suggestion that a patent should be invalid if it was not worked in four years. That was introducing in the most aggravated form some of the abuses of the foreign system. He thoroughly agreed with what Mr. Carpmael had said. He could produce to Mr. Siemens more than one specification of his distinguished uncle, who came to England because of the protection afforded to invention by the British Patent-laws, which was never worked for anything like three years from the date when it was taken out. The same remark applied to the patents of Lord Kelvin and Prof. Hughes, and was the common feature of some of the most meritorious inventions; so meritorious that they had been extended by the favour of the Crown, because they had not been placed before the public until the last two or three years of the term. He hoped the Report of the Committee upon which he served with Mr. Moulton and Mr. Carpmael, would be found to embody, at any rate, improvements in the Patent-law founded upon experience, properly regarding the interests both of inventors and patentees, and he hoped the Government would be able to give practical effect to the recommendation.

Mr. SIEMENS, in reply, after acknowledging the vote of thanks, said that it was his intention all through to speak from the point of view of the manufacturer. On looking into the historical portion of the subject it was seen that the object of the first granting of monopolies was to encourage manufacturers and not inventors. Useful inventions had only in most exceptional cases been made by outsiders; they were usually discovered by people who had studied the subject in all its branches and made careful experiments. He thought that if a patent was not commercially taken up it should be dropped; only those patents were of value which were taken up. Professor Ayrton had said that it was a great hardship if an inventor was before his time, but he could not see why that should prevent people from reaping the benefit who came at the right moment. It was quite possible that four years was not sufficient for compulsory working, and that some modification would have to be made by which the examiner had the right to grant extension. The general idea he wished to bring forward was that the man who worked, the manufacturer, was a worthy person who ought to be supported, and not the man who went about with stray ideas without knowing what he was really offering.

Mr. SIEMENS writes:—

Owing to the lateness of the hour I could not reply very fully to the various points discussed, and I should like, therefore, to add the following observations:—

1. *Search for Novelty.*—There was a general concurrence that such a search should be made as complete as possible; and my contention is, that this search should be made at the time, when the invention is first thought of, so as to save the inventor the time, trouble, and expense of drawing up a useless specification.

I also think that the self-reliance of the inventor

مكتبة قطر الوطنية
Qatar National Library

should be encouraged by letting him make the search himself, but assisting him by providing indexes and all other information.

2. *Compulsory Working*, or as I prefer calling it, "introducing an invention on a commercial scale," is the turning point of my system, as experience has amply proved that only such inventions can be introduced as have real value. The fact of an invention not being taken up is in itself sufficient proof of its want of merit. On the other hand, if an inventor succeeds in introducing his invention, he receives under the proposed rules automatically a valid monopoly, which under the present systems he can only obtain through costly litigation.

3. *Compulsory Licenses* are necessary to keep the inventor in check, and the proposition was strongly objected to by Mr. Moulton, who declares that the inventor is injured thereby.

Mr. Moulton ignored in his remarks the provision that an applicant for a compulsory license must prove to the satisfaction of the Comptroller that he has the means of carrying out the invention on a commercial scale, and the inventor suffers no great hardship in case such licenses are granted.

Another function of the compulsory license is to prevent foreign inventors from refusing licenses to British manufacturers, and importing the patented article into the United Kingdom to the detriment of the industries of the country.

MEETINGS OF THE SOCIETY.

ORDINARY MEETINGS.

Wednesday evening, at Eight o'clock :—

MAY 1.—"Thames Steamboat Service." By ARNOLD F. HILLS. SIR FREDERICK BRAMWELL, Bart., D.C.L., F.R.S., President of the Society, will preside.

COLONIAL SECTION.

Tuesday afternoon, at 4.30 o'clock :—

APRIL 30.—"The British West Indies." By SIR NEVILE LUBBOCK, K.C.M.G., Chairman West India Committee. GENERAL SIR HENRY WYLIE NORMAN, G.C.B., G.C.M.G., will preside.

CANTOR LECTURES.

Monday evening, at 8 o'clock :—

SIR WILLIAM CHANDLER ROBERTS-AUSTEN, K.C.B., F.R.S., and T. KIRKE ROSE, D.Sc., "Alloys." Lecture 2, April 22.

HOWARD LECTURES.

Friday evening, at 8 o'clock :—

ALFRED C. EBORALL, M.I.E.E., "Polyphase Electric Working." Lecture 2, May 3.

MEETINGS FOR THE ENSUING WEEK.

MONDAY, APRIL 22...SOCIETY OF ARTS, John-street, Adelphi, W.C., 8 p.m. (Cantor Lectures.) Sir W. C. Roberts-Austen, "Alloys." (Lecture II.)
Farmers' Club, Salisbury-square Hotel, Fleet-street, E.C., 4 p.m. Mr. A. E. Mansele, "Sheep and Sheep Breeding."
Surveyors, 12, Great George-street, S.W., 8 p.m. Mr. A. C. Salter, "Ownership of the Highways."
Geographical, University of London, Burlington-gardens, W., 8½ p.m.
Actuaries, Staples-inn Hall, Holborn, 5½ p.m.
Camera Club, Charing-cross-road, W.C., 8¼ p.m. Rev. F. C. Lambert, "The Fixing Bath."
Zoological, 3, Hanover-square, W., 4 p.m. Annual meeting.

TUESDAY, APRIL 30...SOCIETY OF ARTS, John-street, Adelphi, W.C., 4½ p.m. (Colonial Section.) Sir Nevile Lubbock, "The British West Indies."
Royal Institution, Albemarle-street, W., 3 p.m. Dr. Allan Macfadyen, "Cellular Physiology, with Special Reference to the Enzymes and Ferments." (Lecture III.)
Central Chamber of Agriculture (at the HOUSE OF THE SOCIETY OF ARTS), 11 a.m.
Civil Engineers, 25, Great George-street, S.W., 8 p.m. Annual General Meeting.

WEDNESDAY, MAY 1...SOCIETY OF ARTS, John-street, Adelphi, W.C., 8 p.m. Mr. Arnold F. Hills, "Thames Steamboat Service."
Archæological Assoc., 32, Sackville-street, W, 8 p.m.
Obstetrical, 20, Hanover-square, W., 8 p.m.
British Astronomical, Sion College, Victoria-embankment, E.C., 5 p.m.
Royal Institution, Albemarle-street, W., 5 p.m. Annual Meeting.
Archæological Institution, Oxford Mansion, Oxford-street, W., 4 p.m.

THURSDAY, MAY 2...Royal, Burlington-house, W., 4½ p.m.
Antiquaries, Burlington-house, W., 8½ p.m.
Linnean, Burlington-house, W., 8 p.m. Professor H. C. Bastian, "Studies in Heterogenesi."
Chemical, Burlington-house, W., 8 p.m. Professor W. H. Perkin, jun., and Dr. J. F. Thorpe, "The Synthetical Formation of Bridged-Rings. (Part I.) "Some Derivatives of Bicyclopentane."
Society for the Encouragement of Fine Arts, 9, Conduit-street, 8 p.m. Mrs. Ernest Hart, "Stencil Painting as an Art."
Royal Institution, Albemarle-street, W., 3 p.m. Sir Alexander C. Mackenzie, "Arthur Sullivan." (Lecture II.)
Electrical Engineers, 25, Great George-street, S.W., 8 p.m. 1. Messrs. C. G. Lamb and Miles Walker, "An Instrument for Measuring the Permeability of Iron and Steel." 2. Mr. Frank Holden, "A Watt-Hour Meter."
Camera Club, Charing-cross-road, W.C., 8¼ p.m. Dr. T. Anderson, "The Grand Canyon."
Civil and Mechanical Engineers, Hotel Victoria, Northumberland-avenue, S.W., 8 p.m. Mr. A. H. Allen, "The Storage of Electricity."

FRIDAY, MAY 3...SOCIETY OF ARTS, John-street, Adelphi, W.C., 8 p.m. (Howard Lectures.) Mr. Alfred C. Eborall, "Polyphase Electric Working."
Royal Institution, Albemarle-street, W., 8 p.m. Weekly Meeting. Mr. C. Mercier, "Memory."
Geologists' Association, University College, W.C., 8 p.m.
Junior Engineers, Westminster Palace Hotel, S.W., 8 p.m. Mr. William Powrie, "Employers and Employed."
Philological, University College, W.C., 8 p.m. Annual Meeting.
Quekett Microscopical Club, 20, Hanover-square, W.C., 8 p.m.

SATURDAY, MAY 4...Botanic, Inner Circle, Regent's-park, N.W., 3½ p.m.
Royal Institution, Albemarle-street, W., 3 p.m. Mr. J. Y. Buchanan, "Climate: its Causes and Effects." (Lecture III.)

THE
CUSACK INSTITUTE
White St., Finsbury St., and Ropemaker St.,
Finsbury-pavement, London, E.C.

The most successful, commodious, and convenient Commercial College in London. Close to Moorgate-street, Broad-street, and Liverpool-street Stations. Over 3,000 successes annually at all public examinations. Painstaking individual tuition in all subjects by specialists. A unique system of training for commercial life.

During the last four years, 97 per cent. of pupils have passed at Commercial and Civil Service Examinations, including —

FIRST PLACE.—London Chamber of Commerce Examination (with Prize) 1896

FIRST PLACE.—London Chamber of Commerce Examination (with Prize) 1897

FIRST PLACE.—In all England—Society of Arts Examination (with Medal)..... 1897

FIRST PLACE.—In all England—Society of Arts Examination (with Medal)..... 1899

MEDAL AND DISTINCTION.—College of Preceptors 1899

Situations readily obtained for all Proficient Students.
EMPLOYERS PROMPTLY SUITED WITH COMPETENT CLERKS.
No charge is made to either Employer or Employed.

All communications to be addressed to—
THE PRINCIPAL, PROFESSOR CUSACK.

SOCIETY FOR THE ENCOURAGEMENT OF ARTS, MANUFACTURES, AND COMMERCE.

CANTOR LECTURES.

The following Cantor Lectures, delivered before the Society of Arts, have been published separately, and may be obtained at the Society's House, John-street, Adelphi, W.C.

Distribution of Electricity. Three Lectures. By Prof. GEORGE FORBES, F.R.S., M.A. (1885.) Price 1s.

Science Teaching. Three Lectures. By Professor FREDERICK GUTHRIE, F.R.S. (1886.) Price 1s.

Art of Tapestry-making and Embroidery. Three Lectures. By ALAN S. COLE. (1886.) Price 1s.

Friction. Four Lectures. By Professor H. S. HELE SHAW. (1886.) Price 1s.

Disease of Plants. Six Lectures. By J. L. W. THUDICHUM, M.D. (1887.) Price 1s.

Machines for Testing Materials, especially Iron and Steel Three Lectures. By Prof. W. C. UNWIN, F.R.S. (1887.) Price 1s.

Chemistry of Substances taking part in Putrefaction. and Antisepsis. Four Lectures. By JOHN M. THOMSON, F.R.S.E. (1887.) Price 1s

Alloys. Three Lectures. By Prof. W. CHANDLER ROBERTS-AUSTEN, F.R.S. (1888.) Price 1s.

Our Milk, Butter, and Cheese Supply. Three Lectures. By RICHARD BANNISTER, F.I.C., F.C.S. (1888.) Price 1s.

Elements of Architectural Design. Four Lectures. By H. H. STATHAM. (1888.) Price 1s.

Bacterial Purification of Sewage. Four Lectures. By Dr. SAMUEL RIDEAL, F.I.C. (1889.) Price 1s.

Cycle Construction and Design. Four Lectures. By ARCHIBALD SHARP, M.Inst.C.E. (1899.) Price 1s

Leather Manufacture. Four Lectures. By Prof. HENRY R. PROCTER, F.I.C. (1890.) Price 1s.

Heat Engines other than Steam. Four Lectures. By H. GRAHAM HARRIS, M.Inst.C.E. and M.E. (1889.) Price 1s. 6d.

Egyptian Tapestry. Two Lectures. By ALAN S. COLE. (1889.) Price 1s.

Modern Developments of Bread-making. Three Lectures. By WILLIAM JAGO, F.C.S., F.I.C. (1890.) Price 1s.

Colour and Colouring. Three Lectures. By Prof. A. H. CHURCH, M.A., F.R.S. (1890.) Price 1s.

Design applied to Wood-carving. Three Lectures. By LEWIS FOREMAN DAY. (1890.) Price 1s.

Stereotyping. Three Lectures. By THOMAS BOLAS, F.R.S., F.I.C. (1890.) Price 1s.

Gaseous Illuminants. Three Lectures. By Professor VIVIAN B. LEWES. (1891.) Price 1s.

Electric Transmission of Power. Three Lectures. By GISBERT KAPP, C.E. (1891.) Price 1s.

Photographic Chemistry. Three Lectures. By Professor R. MELDOLA, F.R.S. (1891.) Price 1s.

Pigments and Vehicles of the Old Masters. Three Lectures. By A. P. LAURIE, M.A. (1891.) Price 1s.

Mine Surveying. Three Lectures. By B. H. BROUGH, F.G.S. (1892.) Price 1s.

Developments of Electrical Distribution. Four Lectures. By Prof. GEORGE FORBES, F.R.S. (1892.) Price 1s.

Recent Contributions to the Chemistry and Bacteriology of the Fermentation Industries. Four Lectures. By Prof. PERCY F. FRANKLAND, Ph.D., F.R.S. (1892.) Price 1s.

The Practical Measurement of Alternating Currents. Four Lectures. By Prof. A. J. FLEMING, M.A., D.Sc., F.R.S. (1893.) Price 1s.

Generation of Light from Coal Gas. Four Lectures. By Prof. VIVIAN B. LEWES. (1893.) Price 1s.

Mosaic: its History and Practice. Two Lectures. By C. HARRISON TOWNSEND, F.R.I.B.A. (1893.) Price 1s.

Detection and Estimation of Small Quantities of Inflammable Gas or Vapour in the Air. Four Lectures. By FRANK CLOWES, D.Sc., F.I.C. (1894.) Price 1s.

Photometry. Three Lectures. By Captain W. DE W. ABNEY, C.B., F.R.S. (1894.) Price 1s.

Type-writing Machines. Two Lectures. By HENRY C. JENKINS, A.M.Inst.C.E. (1894.) Price 1s.

Explosives and their Modern Development. Four Lectures. By Professor VIVIAN B. LEWES. (1894.) Price 1s.

Means for Verifying Ancient Embroideries and Laces. Three Lectures. By ALAN S. COLE. (1895.) Price 1s.

Recent American Methods and Appliances Employed in the Metallurgy of Copper, Lead, Gold, and Silver. Four Lectures. By JAMES DOUGLAS. (1895.) Price 1s.

The Arc Light. Three Lectures. By Prof. SILVANUS P. THOMPSON, D.Sc., F.R.S. (1895.) Price 1s.

Mechanical Road Carriages. Three Lectures. By W. WORBY BEAUMONT, M.Inst.C.E. (1895.) Price 1s.

Japanese Art Industries. Two Lectures. By ERNEST HART, D.C.L. (1895.) Price 1s.

The Alternate Current Transformer. Four Lectures. By Dr. J. A. FLEMING, F.R.S. (1896.) Price 1s

Precious Stones. Two Lectures. By HENRY A. MIERS, M.A., F.R.S. (1896.) Price 1s.

Applied Electro-Chemistry. Four Lectures. By JAMES SWINBURNE. (1896.) Price 1s.

Chemistry of Metals and Alloys Employed for Building and Decorative Purposes. Three Lectures. By Prof. J. M. THOMSON, F.R.S., F.C.S. (1896.) Price 1s.

Use of Gas for Domestic Lighting. Three Lectures. By Prof. VIVIAN B. LEWES. (1897.) Price 1s.

Industrial Uses of Cellulose. Three Lectures. By C. F. CROSS, F.C.S. (1897.) Price 1s.

Material and Design in Pottery. Four Lectures. By WM. BURTON, F.C.S. (1897.) Price 1s.

Alloys. Four Lectures. By Prof. W. C. ROBERTS-AUSTEN, C.B., F.R.S. Four Lectures. (1897.) Price 1s.

Design in Lettering. Four Lectures. By LEWIS F. DAY. (1897.) Price 1s.

Gutta Percha. Three Lectures, with Appendixes. By Dr. E. F. A. OBACH. (1898.) Price 2s. 6d.

Decorative Bookbinding. Three Lectures. By CYRIL DAVENPORT. (1898.) Price 1s.

The Principles of Design in Form. Four Lectures. By HUGH STANNUS. (1898.) Price 1s.

The Thermo-Chemistry of the Bessemer Process. Three Lectures. By Prof. W. NOEL HARTLEY, F.R.S. (1898.) Price 1s

Electric Traction. Four Lectures. By Prof. C. A. CARUS WILSON. (1898.) Price 1s.

Acetylene. Four Lectures. By PROF. VIVIAN B. LEWES. (1899.) Price 1s.

Wednesday, March 4, 8 p.m. (Ordinary Meeting.) J. C. Medd, "Education in Holland."

Further details of the Society's meetings will be found at the end of this number.

FIRE PREVENTION PRIZES.

The Council of the Society of Arts, at the request of the Executive Committee of the International Fire Prevention Exhibition, have decided to offer, out of the funds of the Fothergill Trust, the following prizes at the Exhibition which is to be held at Earl's Court during the current year:—

For the best chemical fire engines for town use shown at the Exhibition:—One gold medal, two silver medals, and two bronze medals.

For the most easily worked long ladders, to reach the sill of a window 80 feet above the level of the pavement, which shall also be capable of being rapidly transported over roads of not more than 25 feet wide, shown at the Exhibition:—One gold medal, two silver medals, and two bronze medals.

The medals will be awarded by the Council on the report of the judges appointed by the Executive of the Exhibition.

The Council reserve the right of withholding any of the medals, or of awarding medals of lesser value, if in their opinion the exhibits should not be deserving of any, or all, of the medals offered.

CANTOR LECTURES.

On Monday evening, 23rd inst., Mr. Julius Hübner delivered the fourth and concluding lecture of his course on "Paper Manufacture."

A vote of thanks to the lecturer for his course of lectures was passed on the motion of the Chairman.

The Lectures will be printed in the *Journal* during the summer recess.

INDIAN SECTION.

Thursday afternoon, February 26, 1903; Sir Robert J. C. Mowbray, Bart., M.P., in the chair. The paper read was "Gleanings from the Indian Census." By Jervoise Athelstane Baines, C.S.I.

The paper and report of the discussion will be published in next week's number of the *Journal*.

Proceedings of the Society.

APPLIED ART SECTION.

On Tuesday evening, February 17, 1903; Lewis Foreman Day, Vice-President of the Society, in the chair.

The paper read was—

HERALDRY IN DECORATION.

By George W. Eve.

The choice of heraldry in decoration as a subject on which to offer suggestions to the Applied Art Section of the Society of Arts is influenced (apart from the necessity of limiting in some measure the scope of heraldic art in general) by the consideration that, as it was in decoration that heraldry found admirable expression from a very early period, its decorative use in the past is now worth study with a view to the satisfactory execution of modern work.

Primarily heraldry, no doubt, consisted of the devices which distinguished leaders in the field, but its close connection with the personality of its bearer, whom it represented in a very intimate way, also led to its use in every conceivable form of decoration. In costume, ornament, and furniture, as well as in the hangings of tapestry and in other mural adornments, it became a striking and universal feature of the art work of its time. Owing to this strong personal and allusive quality, the employment of heraldic motives in the decoration of buildings has continued, even down to our own time, to show a more marked degree of excellence than was for a long period present in other forms of heraldic expression.

Decorative work was also the direction in which the revival of heraldry, which accompanied the Gothic revival, first showed itself. Perhaps the inherent difficulties of the materials may have suggested the sincerity of the effort to properly employ them.

It will not be necessary (even if time allowed) to go very far into the origin of heraldry. For our purpose it began about the 11th century—that is to say, it began to be used and systematised, more or less, as we know it, but in its essence it must always have existed.

The desire to distinguish himself by some visible means seems to have characterised man ever since we know anything about him. Badges are mentioned as the ornaments of kings and chiefs from the earliest historic times, from that of the Chaldean King, 4000 B.C., onwards. Some of these early personal devices were strangely similar to those with which we are familiar in later times. The figures on the sculptures at Persepolis, for example, have veritable crests on their heads, and these also occur on the heads of the king and his heir apparent in contemporary coins. There may even have been some sort of regulations controlling the use of the various devices, but we may at least be sure that the powers that were took good care that others did not use their badges if they could help it.

Artistically, our heraldry from its rise in the 11th century quickly developed a high standard of decorative excellence, flourishing exceedingly, with certain changes of style and method, for three hundred years until the middle of the 16th century, when its period of greatest strength and beauty ended, and its decadence began. As a system it seems to have developed in a natural way on the lines of its own necessities, as did its artistic expression in a great measure, but the latter owed much to previous design, and, mainly through the influence of the textiles and other importations (sometimes brought by returning crusaders), helped to perpetuate in the Western world the lions, eagles, and strange and characteristic composite animals of the East. These ancient prototypes of heraldic forms are singularly interesting, and concern us here because they sometimes possess in a marked degree qualities which teach valuable lessons that are applicable to present use. This will be discussed presently.

Although at first the mediæval draughtsman followed the drawing of his imported or traditional motives with considerable closeness (as in the lions of one of the 13th century MSS. in the British Museum), he soon began to treat them in the way that came to be considered peculiarly heraldic. In thus handling his motives he was entirely himself, and the outcome was the natural result of that splendid sense of design which distinguished him. The style is rightly considered purely heraldic, because it arose from its own heraldic conditions, and was the result of the very sane intention that the thing done should be suited to the use to which it was to be put, viz., to serve as a distinctive badge, which could be seen and easily read at a distance, and, in many cases, when in motion. To this end the object was drawn as large as the containing space would fairly admit, and its form was attenuated so as to allow the ground colour to show through in due proportion, and so effect clearness of definition. Vigorous draughtsmanship also contributed to the splendidly decorative effect that was due to good distribution, and the fine balance of colour that results from it. Thus the treatment which was suggested by reasons of practical convenience, resulted in an effect of great decorative value which also afforded opportunity for the use of expressive line. It is interesting to contrast this treatment with that of the later renaissance, such as the naturalistic lion by Della Robbia, which would have become an undistinguishable blob at a distance at which the attenuated form would have been quite effective. In a similar way an eagle drawn in the ancient way, with the wing-feathers strongly divided, was at once more distinct and more decorative than its renaissance successor.

Another practical consideration, the need of readily repairing the damage caused in action to the actual shield, dictated the flat and simple treatment of much of the painted decoration. A similar simplicity occurs in

BRITISH LIBRARY

710

some of the MSS., especially in such as are of large extent or of frequent repetition when economy of time and labour was desired. When, however, circumstances allowed, time and skill were not spared in the elaboration of the work. It is of course for this reason that the heraldry in architectural decoration is generally found to be among the best work of its period.

In the ceremonial shields, this elaboration is very great. They were made of layers of various materials, such as canvas, stretched on wooden frames, and the changes were then modelled in gesso, and afterwards gilt and painted, or were fashioned in stamped leather and pinned down to the surface. The spaces were diversified with the beautiful tracery known as diapering, and the whole result was rich and beautiful in the extreme. Large numbers of these shields were made in Italy down to a late period. A most admirable English example is the shield at Canterbury Cathedral, said to be that of the Black Prince. Here the lions are admirably distributed, full of power and life, and less extravagantly drawn than those of John of Eltham at Westminster Abbey, but they lack something of leonine character. The *fleur de lis* of France are beautifully free and graceful, and though so dissimilar in shape to the lions, are equally well designed to occupy their spaces and equally well proportioned to them. The whole work, which is so excellent an example now of some of the best qualities of heraldic design, has suffered from the wear of the centuries, but when it was uninjured must have been superb. The lack of leonine character in the lions might naturally be expected when it is remembered that they were the descendants of generations of copies and, therefore, were not consciously generalised from objects seen by the artist. Even when he did see a lion his acquired ideas were too strong for him, so that one in a 13th century book of sketches, though noted in the margin as "drawn from the quick," is very like its patternlike fellows.

Whether the treatment was simple or elaborate, however, its breadth of effect and decorative quality were nearly always conspicuous. These various methods, both satisfactory in their way, are of special interest to those who require historic sanction to a choice of treatment, in opposition to the opinion that, as certain methods of work, or works of a certain period are good, they are, in addition, perfect and everything else is wrong. So, when a flat treatment, in harmony or contrast with surrounding decoration seems desirable, the armorials may be done flatly, and when on the other hand a more elaborate treatment seems fit, modelling in relief or any other suitable means of decorative effect may be employed. The old work itself, full of variety and freedom, teaches us how to look at the subject without pedantry, but not without knowledge. It teaches the right of individual treatment combined with selection, and illustrates in a measure the essentially artistic principles taught to Kipling's primæval ballad-maker by his totem,

> "There are nine and sixty ways of composing tribal lays,
> And every single one of them is right."

It is not meant, however, that ignorant and reckless scribbling is right. Order as well as freedom is necessary, and this can only be secured by a study of the subject from all points of view.

The early treatment of the crest, helm, and mantling will also amply repay study. Being made of light material, and having its weight, which was still considerable, supported by the shoulders on which the helm rested, the crest was of conspicuous size and is so represented. In early times it is said to have been one of the privileges of knighthood, and this would additionally explain its emphasis. The helm was usually that known as the great helm, to distinguish it from the helmet, basinet or other form of head armour. The latter, having a visor or front which opened, and a movable neck, came into use in the 15th century to meet the desire for lightness and mobility in actual battle, and thenceforward crests and the great helms that bore them were reserved for the tournament and other military solemnities. There was another especially practical reason for this disuse. It had been found that a crest was a dangerous ornament in actual battle, for at close quarters it served as an excellent handle by which to pull down the wearer's head. King Stephen is said to have been taken prisoner in this manner. The mantling, which was at first quite simple, soon became of the greatest value as an element of composition, and the importance of its free possibilities of line was quickly recognised. From a mere representation of the helm drapery, it thenceforth developed through various forms until it became in many instances similar to the contemporary architectural tracery, when, as in the 15th century carvings, it surrounded the shield and ornamented the surface of the panel in a very complete and beautiful way.

By the Tudor time heraldry had ceased to be

used in war in the old way, with such exceptions as banners and the decorative and emblematic shields on ships of war, and it, of course, remained an essential part of the tournaments, while they continued to exist, but heraldry in the main became merely decorative thenceforward, retaining, of course, its allusive and symbolic qualities. In this way it greatly increased, thus sharing in the impetus given to the arts by the end of the Wars of the Roses. At this time a remarkable number of simple flowers came into heraldic use, columbine, gilly-flowers, marigolds, honeysuckle, and many more appearing not only as arms but in garlands as decorative accessories.

By this time also the shield shapes had become less simple, following in their cuspings the fluted armour of which they formed part, and others of which large numbers were designed by the little masters were frank applications of the decorative scrolls of the time. The concave shield whose raised edges took the light and helped to define the form, while assisting, together with the shadow within it, the distribution of light and shade, became much in use.

Some of the early renaissance heraldry retained much of the excellence of the preceding Gothic as regards the pose of the figures and the general composition, and it attempted, in addition, the characterisation that was wanting in the earlier work. In many respects it was very admirable, and seems, in its individual thought working on some of the suggestions or traditions of the older style, to suggest the lines on which modern heraldry might develop. At the same time there was a more naturalistic school, of which the heraldry in Della Robbia's work may be taken as the expression, and this also is interesting, *but as a warning*. It most unfortunately overpowered the more decorative style, and ultimately developed into the feebleness which characterised the heraldry that preceded the revival in the last century.

A well-known example of the better renaissance is the plate by Albert Dürer, of a shield bearing a rampant lion. In this plate there is also evident a desire to render the mantling more cloth-like, though still complicated. Mantling afterwards followed the influence of the conventional leaf forms of the renaissance.

I have ventured to give you this slight sketch of the development of the artistic side of heraldry, not as a mere historic retrospect, but because it is in the study of old work that guidance is to be found for present requirements. But in this connection, a word of warning may perhaps be permitted against making a fetish of the work of any period, however good. Another is against mere copying of old examples however excellent, except, of course, for purposes of study. Merely to copy bits of heraldic precedent and to piece them together is not the way to make an artistic thing at all. A copy has no vitality of its own, and cannot even reproduce that of its original, for it is more than doubtful if it is possible to reproduce the spirit of work done under other conditions and modes of thought. Even Pugin, to whom the revival of decorative heraldry owes so much, with all his sympathy, and with all his powers of draughtsmanship, cannot be said to have altogether caught the intense vigour of his originals.

Again, hardly anything possesses, at the same time, all the good qualities that it might have, and we sometimes excuse the absence of one because of the supreme way in which another is expressed. In doing new work a broader view is necessary if it is to result in anything but a shadow of a former style. Heraldry should be expressive, interesting, and decorative. Original in treatment, and exhibiting the qualities that the best of the old work teaches us to desire, rather than being a copy of it. The term "original" here does not mean expression by means of wild arrangements of weird lines, which are perhaps original in the sense that there is nothing like them on earth, but rather the originality, or, perhaps I should say, individuality, which comes from serious attempts to express qualities rather than to copy styles.

The artistic expression of heraldry may be regarded in two ways; as a representation of an actual shield, crest, helm, and so forth, as they would be represented in a picture, of a tournament for instance, or as a presentation of the essential heraldic facts, in the way that is thought most expressive but without too much regard to preceding styles. The former seems more suitable to ancient and historic arms, and the latter to be more likely to harmonise with modern decorative surroundings, as well as to possess more vitality and variety in itself.

This harmony with surrounding decoration, is one of the essentials of design that should be continually kept in mind. Another condition, equally important, is suitability to the materials and methods by which the design is expressed. The two very obvious points cannot be too often insisted on, however wearisome the reiteration, for they are even now frequently ignored. One hears of shields

Qatar National Library

painted on vellum (with all the detail and finish to which that beautiful material lends itself), sent as a substitute for a working drawing for large embroidery or carving, and accompanied by instructions that they must be *strictly* followed. Or of friezes and panels, of which the different parts, heraldic and ornamental, have been done by different designers working in ignorance of each other's design. The general design is made, perhaps of well drawn and graceful lines, with spaces where it is thought, probably correctly, that the shields would tell. Then a sketch, perhaps a mere diagrammatic note of the arms, is procured, enlarged to the right size, and blindly copied. Of course the result is patchwork. Careless treatment of heraldry seems to pervade applied art, and so to spoil what is otherwise meritorious work. Much incongruity arises from fear lest improving the drawing or composition may violate heraldic rules, and this brings us to the necessity for acquiring such a knowledge of the subject as will enable the designer to know what points are really essential, and therefore to be carefully retained and accentuated where accent is proper, and what, on the other hand, may be modified or ignored. A knowledge of the system of heraldic description, called blazon, will be absolutely necessary to this end. Pedantry in non-essential matters is of course absurd, and artistic freedom is always to be desired, but there must first of all be a basis of knowledge on which to work.

It will be necessary to study the subject sufficiently to distinguish between the essential principles (such as underlaid the old good work) and the later amplifications of rules, full of pedantic insistence on regulating every detail however unimportant, which were made when the legal mode of thought had displaced the artistic one. The rules that are necessary to prevent confusion will be found sufficiently elastic to allow variety of treatment.

Among the qualities that it will be desired to express are just proportion, distinct definition, good distribution in filling spaces, strongly characterised and well accented forms, and vigorous pose.

The proportion of the parts of a usual form of heraldic group of shield, crest, helm and mantling, to each other remained fairly constant from the end of the 13th century to Tudor times, and may be taken (roughly) to be two-fifths of the whole height for the shield and three-fifths for the helmet and crest. This merely as a practical guide. I need hardly say that it is not to be taken as actual measurement, but only as suggesting the relative weights in the design. The character of the crest, whether broad and solid, or tall and slight, would affect this. The result of these proportions is to bring the helm a little above the actual centre of the design, where it forms a satisfactory point on which the other objects group themselves.

With regard to the proportions of ordinaries to their fields, many rules to be found in treatises may be safely ignored. In good work the ordinaries vary in size with the requirements of distinctness in respect to the other charges, and their variation in this way has no other significance. I do not, of course, deny the usefulness of points of proportion, they may be useful so long as it is recognised that they are approximate and variable guides instead of dogmatic inflexible rules. With regard to charges, it is equally impossible to say what exact proportion they should bear to the field, nor in most cases could we measure it if we did. It must be a matter of artistic perception which decides whether a space is properly filled. In any case the proportion would be an apparent rather than scientific one, and would be greatly modified by circumstances, colour for instance. I need hardly point out that the actual measurements would not be the same for a white object on black as for a black one on white. It is curious how prevalent the desire has always been to reduce to exact rules matters that are insusceptible of that kind of control. The 16th century efforts at a geometric way of drawing letters and the attempt to regulate minutely heraldic drawing are instances of a peculiarly wrongheaded way of approaching matters essentially æsthetic.

As to the animal forms, vigour is of the utmost importance, together with strong characterisation. In this connection the lions of the Assyrian reliefs are very suggestive. The expression of strong, leonine character by means of the accentuation of the muscular masses is a method that lends itself well to heraldic design. The composite figures are also well worthy of study in relation to the griffins and other monsters of later times. Gerard Leigh, writing in the middle of the 16th century, has something to say about griffins; they are, as you know, half eagle and half lion, which students of natural history may like to know, thus: "Griffins bear great enmity to man and horse; though the man be armed and on horseback, yet they take the one with the other quite from the ground and carry them clean away. I think they are of

مكتبة قطر الوطنية
Qatar National Library

great hugeness," he goes on "for I have a claw of one of their paws which should show them to be as big as two lyons." In another place Leigh refuses to believe something because "he had not seen the proof thereof."

It will be well to consider animal pose in relation to the anatomical possibilities, and the qualities of dignity, strength, or grace which are associated with certain charges should also find due expression.

The schemes of arrangement that suggest themselves as suitable to decorative purposes, are very various. Complete series of family arms and those of alliances, together with the honours conferred on individuals; arms of successive owners; shields marking the visits of distinguished guests, and so forth.

Unity of plan, such as when the arms are arranged in relation to some central object as the altar in a church or the fireplace in a room, for example, is, of course, desirable. In the latter case the central position would be appropriately occupied by the entire armorials.

The employment of Badges in decoration opens up a large and interesting field of design from their value as decoration in places where shields of arms are not so suitable. Though not subject to the same rules as the regular arms they were still regarded as of great though secondary importance, and became practically hereditary in many cases. Time, however, will not permit of their adequate treatment here. A kind of badge, more ephemeral in character, called an impress, was a fashion that came to us from Italy, as many other heraldic fashions did. They were devised from mere fancy, and consisted of a device with an explanatory motto. Henry VIII. and his knights at the Field of the Cloth of Gold bore a series of devices, of which they wore part each day until the whole was complete. Cosmo de Medici had a tortoise with a sail attached and the motto "Festina lente," and there were others innumerable. Like other heraldic matters, they sometimes led to quarrels. A knight who strutted up and down at the court of King James, had a falcon embroidered on his sleeve, and the motto, "I bear a raven, fearless in flight, who checks at him his death is dight." Then a Scottish knight saw the device, and after a while appeared with another. His was a raven with a piece of meat, and its motto said, "I bear a raven picking at a piece, who pecks at him, I'll peck at his nese." The story goes on, that in the arrangements for the consequent fight, the Scottish knight, who had but one eye, demanded that his opponent should lose one of his, in order to be on an equality.

There will not be time to do more than briefly allude to colour treatment. It will suffice to say that it is not at all desirable that heraldry should *scream* in mural decoration however necessary it may have been to do so in the field. So long as the tinctures are distinguishable with sufficient clearness any modification of tint may be used, and the colour may be broken by means of diaper or other surface treatment that may be desirable in order to make the heraldry take its appointed place. Always avoiding, however, any interference with the clear statement of the heraldric facts. The decoration may be modelled in gesso and treated with monochrome, so as to emphasize the modelling, or in many another way that practice will suggest.

The revival of the art of enamel also offers a splendid material for heraldic work. The series of works in enamel on the monuments, and above all, the early Stall Plates of the Knights of the Garter at Windsor, are too well known to need more than an allusion to the magnificent field of study they afford; but it may perhaps be permitted to hope that the beautiful art of enamelling which (though its revival is less than 20 years old) is fully capable of worthily following its long ago predecessors, may have, some day, an opportunity of doing so.

The value of heraldry in domestic decoration is also obvious. One can hardly imagine anything to excel the gemlike effect of armorial enamels on the dark panels of a library, for example.

Whatever be the material in which heraldry finds its means of expression, it is permitted confidently to hope that the wide and increasing interest that is being extended to the subject may result in the production of work that is not unworthy to follow the best of its predecessors.

DISCUSSION.

Mr. Charles Chadwyck-Healey, K.C., said that he had listened with great interest to Mr. Eve's remarks, and he wished to express his appreciation of the work that Mr. Eve had been doing for some time in developing the art of heraldry in this country. There was very great need for such work, for the country had been in a lamentable condition in this

BRITISH LIBRARY

matter for a great number of years, and it was so still, in spite of everything that had been done to bring about improvement. One need only to look, for instance, at the miserable way in which heraldry was impressed upon silver plate by the silversmith, by means of engraving. An instance came under his personal observation a year or two ago. It was desired to put a shield of arms upon a piece of old plate, and one of the leading silversmiths in London was invited to engrave it. A preliminary sketch was made, but a more pitiable thing was never turned out. The charges were reduced to the very smallest possible dimensions, so that they could hardly be recognised. The artist seemed to desire to display as much as possible the colour of the shield. The ordinary was also of the smallest dimensions. He hoped that the time was not very far distant when heraldry as a means of decoration might be developed, and that the practice of it would permeate through every class of artificer. But that could only be brought about by conscientious work, and by the example of men who had made the subject their study. He believed that a great deal was being done on the Continent in developing heraldry in design. Probably continental design would prove to be in the end rather more florid than English people cared to see, but, as an illustration of continental work he might refer to the Munich almanack, which was published every year, and which could be bought for a shilling. It was full of heraldic designs. The publication of a work of similar character was one of the ways in which heraldic design might be popularised in this country.

Mr. R. Garraway Rice agreed that the subject was of great interest. It was noticeable how much better the earlier heraldry was than the later. If he understood Mr. Eve's work aright, it had gone on the principle of trying to bring back that simplicity which was true decoration, and to avoid excessive ornament. In the 18th century, when classical forms prevailed in architecture, heraldry, which was essentially mediæval, was out of place, and it was very difficult to introduce it, hence architecture and heraldry seemed to have fallen apart. At the present day one had the advantage of being able to study the various periods, but it seemed to him that the difficulty which a modern designer had to contend with was that having at his finger-ends practically everything that had gone before, it was extremely difficult to avoid a kind of mixture. The difficulty of modern artists was to give something pure and to avoid introducing features which were out of place.

Mr. R. Phillips said that heraldry was a great aid in ornament, but no doubt those interested in the subject would agree that it had not retained the dignity and importance which properly belonged to it. He remembered in his wanderings in the New Forest coming upon a perfect mine of heraldry in the old Abbey Church at Christchurch. One point which had occurred to him, was the greater beauty of heraldic designs on buildings than in other things. He thought that the chief reason of this was, that in buildings, heraldic designs were always executed in higher relief.

Mr. George Clulow said that Mr. Eve had put before them, in a very interesting way, examples of the decorative use of heraldic design in England and other countries, but had omitted Germany. He regretted this, because there were, in Germany, numerous examples of the 16th century which abounded in the vigorous and decorative character on which Mr. Eve had properly laid much stress. As to the way in which heraldry is often expressed on plate, they must look at the subject from the point of view of the ability of the person called in to do the work. The incident of which Mr. Chadwyck-Healey had told them, displayed, of course, great ignorance on the part of the designer and engraver. It seemed to him that attention ought to be called to the fact that there were among them gentlemen who were capable of supplying heraldry in scientific form, and according to the proper heraldic use. The value of a paper, such as had been read, was that it would call attention to that fact.

Mr. Frank Frederick, in reply to the Chairman, said that the whole subject was absolutely new to him, as he came from a country where heraldry was not regarded, and where it was only seen in decoration and design. Only that day, in walking in the South Kensington Museum, he was struck with the fact that there was such a mine of wealth of design there.

Mr. Alexander Millar said that he had derived extreme pleasure from Mr. Eve's book. That was a work which everyone interested in the subject ought to possess. But, like another speaker, he had been a little disappointed not to find more reference to German heraldry. He possessed a book of which an English edition was about to be published, which appeared to him to be the fullest and finest work on German heraldic design, so far as ancient examples were concerned. In that book, the crest appeared to be composed, in many cases, of enormous horns, taking a sort of lyre shape, and ending in a kind of trumpet mouth. He did not think that he had seen anything like it in English heraldry, though it was extremely common in Germany. He should like very much to ask whether Mr. Eve could explain what the purport of that design was. Reference had been made to a German almanack, which had been published for seven or eight years; something of the same kind appeared in this country this year and last year, and he had copies of it. This book gave the English coats of arms in precisely the same style that coats of arms were given in the German almanack, but the design was less extravagant, and had a more chastened method of expression. Mr. Eve referred in his book to the origin of the

مكتبة قطر الوطنية
Qatar National Library

fleur-de-lis, and he spoke of it as probably derived from the iris or the flag. He had the strongest possible belief that it was so derived, and he did not think that it could have been adopted from the lily, however much the lily might have been conventionalised.

The CHAIRMAN regretted that he was not so entirely in sympathy with heraldry as a chairman ought to be. He looked upon it rather as an art of the past, chiefly of antiquarian interest. The shield of arms borne by a man's ancestors in battle interested him; but not the arms granted in recent years to a civilian—what had he to do with a shield at all? He (the Chairman) was interested in heraldry mainly because it was decorative. He regarded it as the type of what symbolic design should be, and of treatment of such design. But symbolism itself might become tiresome; the "rathe primrose" had not gained in poetry since it became a badge of party politics. The decorator had much to learn from heraldry—especially as to readable expression, and as to the logical use of colour—a mercy to those who had not very acute colour sense. Another lesson to be learnt from heraldry was as to the treatment of animal form in decoration, and especially in ornament, by no means an easy matter. As to the Sicilian silks to which the reader of the paper had alluded, possibly the weavers learnt from the heralds, or each might have learnt from the other. What Mr. Eve had said about proportion in heraldry would be helpful to designers and practical decorators; and it would be encouraging to them to be told that they might treat heraldry very freely, so long as they used their common sense. The pedantry connected with heraldry was one reason why artists "fought shy" of it. And the persons who hampered the artist did not always know. He had himself been called to order for introducing a diaper of grass as a background to the crest of a mower—that was not his crest said the worthy gentleman. In the decoration of a façade of a railway station not a hundred miles from Snow-hill the arms of the counties through which the line passed were on shields of all shapes and periods, according to the notepaper heading or other such "authority" from which the sculptor worked—plainly, he was of opinion that the shape of the shield was a matter with which he had no right to tamper. The result was hopeless incongruity. Apropos of silversmith's work, he agreed with Mr. Chadwyck-Healey. Presumably it was on account of cheapness that silversmiths resorted so enormously to engraving as a means of heraldic expression. But if heraldry was worth introducing at all, it was worth treating in a more dignified manner, and should not be introduced in the shamefaced manner which was usual. The "Münchener Kalendar," he might mention, were designed by Otto Hupp, an artist imbued with the mediæval spirit. Mr. Eve had mentioned Pugin. He might have mentioned also Clement Heaton, who in his day did most vigorous heraldic work. Referring to an illustration shown by the author, the Chairman protested against angel shield-bearers—there was authority for it in old work; but we knew better, or ought to. To make an angel hold the shield even of a great "swell," seemed to him playing it rather "low down" on the angel. Why did not we have heraldry on our stamps? It would at least prevent the necessity of changing them with each new reign. After referring to Mr. Eve's own excellent work in heraldic design, the Chairman concluded by proposing a hearty vote of thanks to him for his excellent paper.

The proposal was carried unanimously.

Mr. EVE, in reply, thanked the meeting for the attention which had been given to him, and also thanked the various speakers for their interesting remarks. The reason that he had not dwelt on German heraldry, was that it was a large subject, and he could not include it within the limits alloted to him. He was a great admirer of German heraldry, and he regarded it as extremely fine and vigorous. As to the Munich almanac, of course they all knew it. He should have dwelt upon heraldic ornament in iron work, but through an accident, he was unable to have the slides ready. They would have been useful as showing how heraldic design should be adapted to the material used. He could not give any information as to the German horns, about which a question had been asked. He had always understood that the horns were due to early decoration of the helmet, and that the crest was a perpetuation and a derivation of them. He had referred to Pugin, as a representative name in the gothic revival. His son-in-law Powell, Burges, and West, among others, had also done admirable work. The Chairman had objected that heraldry was a thing of the past, and he assumed that all heraldry was of a battle origin. But that was not the case. In mediæval times, many people who never fought if they could help it used heraldic arms; and even if such arms were of battle origin, he did not see why civilians should dispense with the opportunity of using a personal emblem because they did not use it for fighting purposes. The silks which he had referred to were the early textiles which came from the East through Sicily, or were those copied from oriental examples. If the animals in those early silks were compared with the earliest illuminated manuscripts the resemblance would be found to be most marked. With regard to the mower, he sympathised with the Chairman in the circumstances he had described. He agreed that correctness of expression should be insisted upon. If a thing was written in heraldry it ought to be written in such a way that its meaning should not be misunderstood. The accuracy of the heraldic statement being thus safe-guarded, ts decorative treatment could then take the course that seemed fit.

TWELFTH ORDINARY MEETING.

Wednesday, February 25, 1903; Sir STEUART COLVIN BAYLEY, K.C.S.I., C.I.E., Vice-President of the Society, in the chair.

The following candidates were proposed for election as members of the Society:—

Anderson, Sir R. Rowand, LL.D., F.R.S.E., 16, Rutland-square, Edinburgh.

Baker, Charles Edmund, 54, Parliament-street, S.W., and Park Hill-lodge, Shortlands, Kent.

Calderwood, James Macdonald, M.Am.I.M.E., M.Inst.M.M., Messrs. Symons and Moses, P O. Box 469, Johannesburg, Transvaal, South Africa.

Fraser, A. Brodie, Roddach Bow, Denton-road, Canton, Cardiff.

Grenfell, General Lord, G.C.B., G.C.M.G., The Palace, Valetta, Malta.

McLaughlin, Miss M. Louise, 2558, Eden-avenue, Mount Auburn, Cincinnati, Ohio, U.S.A.

Matland, George Read, 1, Finsbury-pavement, E.C.

Oelsner, Isidor, 31, Holland-villas-road, Kensington, W.

Quin, William James, J.P., Bishops Glen (P.O. Box 58), Bloemfontein, Orange River Colony, South Africa.

Rank, Joseph, Willersley-house, The Park, Hull.

The following candidates were balloted for and duly elected members of the Society: —

Ferguson, James, 4, Warltersville-road, Crouch-hill, N., and 91, Fore-street, E.C.

Hamilton, W. L. H., 16, St. Helens-place, E.C.

Hume, John, 18, Chapter-road, Willesden-green, N.W.

Lowry, George A., Board of Trade-buildings, Boston, Massachusetts, U.S.A.

Mackinlay, James W., Chumleigh, Finchley, N., and 85, London-wall, E.C.

Mossop, T., Bond-street-chambers, Bradford, Yorks.

Moysey, Frank Lindsey, 78, Wellmeadow-road, Catford, S.E.

Pyper, William James Stanton, Hollywood, St. Lawrence-road, Clontarf, Dublin.

Riley, Henry Lindon, LL.B., Court-chambers, St. Helens, Lancashire.

Scarborough, Prof. W. S., LL.D., Ph.D., Wilberforce University, Wilberforce, Ohio, U.S.A.

The paper read was—

TONKIN, YUNNAN, AND BURMA.

BY FRED. W. CAREY, F.R.G.S.
(Late H.B.M.'s Acting-Consul at Szemao, China.)

The title of my paper is somewhat of a misnomer. I could not hope to give you, in the time at my disposal this evening, a comprehensive description of Tonkin, Yunnan, and Burma. What I want to do is to treat, in a brief fashion, of these three countries in their relation to each other commercially; to describe two of the ways of penetration into South-West China; and to illustrate a journey from Haiphong up the Red River, through Yunnan and the Shan States into Burma. I trust that my illustrations will make up for any deficiency of matter in the paper itself.

Tonkin is the northern half of the kingdom, or empire of Annam, and was for many hundreds of years a tributary state of the Chinese empire. Little need be said of its history previous to the appearance of the French on the scene, towards the end of the 18th century. In 1799 they assisted their *protégé*, Ghia Lung, to the throne of Annam, but it was not until 50 years later that they began to take an interest in the government of that kingdom, an interest which did not cease until in 1885, as a result of the Franco-Chinese difficulty, Tonkin became a French colony.

Tonkin is divided naturally into two parts, the Delta, which is the low-lying and fertile southern portion, and the hilly country, commencing a little to the north of Hanoi, and extending north and east in both directions to the Chinese frontier. The mountainous portion is densely wooded, and very sparsely populated: minerals are said to exist in places. The Delta is simply one huge rice-plain, watered by the Red River and its numerous affluents. Generally speaking the climate of Tonkin is hot and unhealthy.

Haiphong, the principal port of Tonkin, is situated on the right bank of the CuaCam, one of the numerous mouths of the Red River, 12 miles from the sea. It is 48 hours from Hongkong by mail steamer. On account of the double bar at the entrance, the CuaCam is only navigable to steamers drawing less than 19 feet of water: and approach to the port of Haiphong is rendered still more difficul. from the fact that the tides in the Gulf of Tonkin are diurnal, *i.e.*, there is only one rise and fall during 24 hours, instead of every 12 as on our own coasts.

مكتبة قطر الوطنية
Qatar National Library

The CuaCam at Haiphong is connected with the Red River by the "Canal des Bambous," a narrow waterway lying right through the middle of rice-fields. Communication with Hanoi is kept up by steamers of some 180 tons burden. Passage through the canal is very uninteresting, only one elevation, known as "Elephant Mountain," because that is the animal it least resembles, breaks the monotony of the plain. Around this hill the steamer seems to be constantly circling owing to the windings of the canal. There are a few villages near the banks and as the steamer passes bands of naked little boys—regular pirates in embryo—issue, and solicit alms as they run along, after the manner of the "have-a-dive" boys at Aden. Six hours passage through the canal brings the steamer out into the rapid waters of the Red River, and ten hours later the boat generally announces its arrival at Hanoi by running on a sand-bank. The Red River is of a most treacherous nature as regards the rapid formation of sand-shoals. During the rainy season (corresponding to the Indian monsoons) it is subject to rapid changes, rising from 16 to 18 feet in as many hours: so that what one day is a broad tract of dry sand covered with traffic becomes the next a wide expanse of clay-coloured water, on which float hundreds of bamboo houses; for the Annamese fisherfolk prepare themselves for such emergencies by constructing their dwellings on a raft-like principle, so that they buoy up as the river rises.

Hanoi lies on the right bank of the Red River, a fine bridge, completed only last year, connecting it with the opposite bank. It is now recognised as the official capital of Tonkin, although until a year or two ago Hué, the residence of the Emperor of Annam, bore that title. History records that Hanoi was founded in the 8th century by a Chinese Mandarin. Its original Chinese appellation (Tungking—"Capital of the East") is now perpetuated in the name of the country itself.

The European portion of the town of Hanoi is splendidly laid out. The public buildings and the Cathedral are very fine, and the lakes and open spaces about the town admirably kept. Altogether Hanoi is one of the brightest and most picturesque cities of the Far East.

At Hanoi we came into closer touch with the natives of the country, who belong to the common Indo-Chinese stock. The Annamese, both morally and physically, are one of the inferior races. The men are undersized, but active, good-tempered, and tractable. They have not the commercial instinct of their neighbours, and, as in Penang and Singapore, all trade is practically in the hands of Chinese merchants. The women have rather nice figures, and they would be considered good-looking but for their mouths, which are spoilt by the custom of covering the teeth with a layer of black lacquer. Their beauty is not enhanced, either, by the unpleasant habit of chewing betel. Equality of the sexes, so far as hard work is concerned, applies in Tonkin. We noticed many women employed in gangs, carrying timber for building, &c.

Hanoi is connected by railway with Langson, on the Kwangsi frontier. This line was a most costly one to the colony, and although it is intended to carry it on to Lungohow, and eventually to Nanning Fu on the West River, it is highly improbable that it will ever pay its working expenses. A railway to Viétri is also under construction, and will be carried on to Laokay in time. This is the line which is eventually to enter Yunnan, and I shall refer to it again in the course of my paper.

The steamer into which we changed at Hanoi, to continue our way up the Red River, belongs to the "Compagnie des Correspondances fluviales," who enjoy a monopoly of the river navigation in Tonkin. Our boat was a stern-wheeler, drawing five feet of water, yet able to run up as far as Yenbay, *only when the river is in flood*. We left Hanoi at noon. During the evening we passed Sontay (scene of a sanguinary battle between the French and Chinese in '85) on our left, and anchored soon afterwards for the night at Viétri, a small military post at the junction of the Clear and Red Rivers. The Clear River rises near Kaihua Fu in Yunnan, and has been suggested as an alternative route for a railway into that province. It is navigable for small steamers to Tu Yen-kwang, 40 miles or so up from Viétri.

During the forenoon of the next day we passed, on our left, the Black River, by far the most important tributary of the Red River. Steamers run regularly up to Chobo, but beyond that navigation is difficult and even dangerous at all times of the year, the river being very swift and rocky. Small narrow boats of half-ton capacity, carry goods during the dry season up to Laichow, near the Yunnan frontier; but when the river is in flood communication is impossible, and nothing is more dreary than life in some of the military posts on the Black River of Tonkin.

Three days out from Hanoi we reached Yenbay, a growing garrison town on the left

bank. There we changed into a small stern-wheel steamer of a newer type—the *Baoha* This boat runs between Yenbay and Laokay during the rainy season. Although only of light draught, and 40 tons burden, it cannot get up so far during the dry season. In fact the Red River is only navigable to small steamers, *all the year*, to Viétri. Native craft, on the contrary, are busiest when the river is low, and the current not quite so strong.

inch of space outside the cabin was occupied by soldiers of the Foreign Legion. Most of these men were Alsatians or Norwegians; but at different posts on the way up I met three Englishmen, who gave me plausible reasons to account for their enlistment in the Legion,—the real one being, I suspect, a desire to keep as far away as possible from the Scotland Yard authorities.

The great feature, and at the same time the

MAP OF TONKIN, YUNNAN, AND BURMA.

Accommodation for passengers on board the *Baoha* was limited. There were twelve of us, and only one small cabin; and in this we had to eat, amuse ourselves during the day, and sleep—the settees being hooked up in sleeping-car fashion at night. Those who occupied the upper berths were comfortable enough; but those underneath suffered from the heat, and from fear of the dreadful consequences should the bars holding up the berth and the 200 lb. gentleman above give way.

The company is subsidized for military purposes by the Government, and every square

drawback, of the Red River are its numerous rapids, which add an element of danger to the difficulties of navigation. There are no less than sixteen of these places between Yenbay and Laokay, where the current rushes down over rocks with great velocity. The worst rapid is the "Ta Kai," just below the post of Traihut. As the little steamer forged its way slowly up against the strong current, the Annamese crew threw "joss-paper" overboard in handfuls to propitiate the river gods, and they attributed our safe passage to this sacrifice. We were at all events luckier than

the Commercial Mission sent out in 1896 by the French Chambers of Commerce to study the trade of Tonkin and China. They came to grief at the "Ta Kai," and had to continue their journey in junks. Perhaps the supply of "joss-paper" had given out!

The journey from Yenbay to Laokay usually occupies three days. Laokay is only a small place, but it is important as being the steamer terminus, and a frontier post. On the left bank the Tonkin-Yunnan frontier is marked by the NanHsi, a small stream which here joins the Red River, and Laokay is situated just at the junction. Chinese and French forts, perched on exactly opposite hills, stare defiance at each other across the little stream.

On the Chinese side of the NanHsi is the village of Hokow, where there is a branch of the Imperial Chinese Customs. Here we obtained the junks necessary for the continuance of our journey. The largest of these boats are 60 to 70 feet long by 9 wide, and have a carrying capacity of 12 tons; but those employed on the upper reaches can only take five tons weight of cargo. They all have the triangular mast peculiar to junks of the Red River. This mast is made of two long bamboos, attached one on each side of the boat, and fastened together at the top ends. It can be raised or lowered at will, and carries a big square sail.

We engaged three of the smaller kind, and having transferred our baggage into them, set sail in company with several other boats that were proceeding up river. There was a crew of five men to each boat. They did nothing but whistle whilst the wind lasted; when it slackened they would either jump ashore and tow us, or bring out long poles and push us along. When we arrived at a rapid (and these places are numerous between Laokay and Manhao) the crews of all the boats would combine to help each other over, and these were times of much hard work and fearful gesticulation. At critical moments recourse was had to the river gods, whose effigies are stuck up in rocky niches near the most dangerous rapids.

Proceeding up river from Laokay, we had Chinese territory on our right and French on our left, for the right bank is French up to the Lungpo stream, where the frontier turns at right angles and runs west.

About half-way up between Laokay and Manhao, on the left bank, is the small village of Hsinkai, from which place there is a road that runs by fairly easy gradients up to the Mengtsz plain and so on to the Yunnan plateau. Up this road the French intend to carry their railway, and a lot of levelling work has already been done on this portion of the line.

When the river is low, and with a favourable wind, junks accomplish the journey up to Manhao in four or five days, but under adverse circumstances they sometimes take a month. Rather a funny thing happened during the delimitation of the Tonkin-Yunnan frontier a few years ago. Two French officers, attached to the Boundary Commission, having occasion to go down from Mengtsz to Laokay, were asked by their comrades to bring back with them a fresh supply of wines and provisions. By the time they were ready to return the river was in flood, and the journey up to Manhao alone took them 35 days. Moreover, a party of missionaries bound for Yunnan accompanied them up; and, before they reached Mengtsz, they had finished the entire stock of stores, much to the disgust of the other members of the Commission.

Manhao is called the port of Mengtsz. It is the terminus of the larger junks, though the smaller ones can go up as far as Yuanchiang. Manhao is really merely a landing-place for goods on their way to the Yunnan plateau. It is looked upon by the Yunnanese as a most unhealthy spot, and the muleteers of caravans from Mengtsz will never spend the night there. They sleep up in the hills, descend early in the morning, leave their cargo at Manhao, and get away as soon as they have loaded their animals with the goods awaiting them. The mule of Yunnan is a wonderful little animal. It will carry a load of 150 lbs. day after day over the steepest roads of the province in all kinds of weather.

We left Mahano the day following our arrival, and proceeded to make acquaintance with the mountains of Yunnan. The road in most places was simply a series of stone steps, and one's first experience of riding up these, though amusing to the onlooker, is unpleasant, the stones are so very, very hard. After crossing the first range above the Red River, we felt that we had earned a good night's rest. This, however, we did not get, as the inns between Manhao and Mengtsz are mere hovels, meant as shelter more for passing pack-animals than travellers. The noise made by the mules, and the chattering of their drivers disturbed us; but the worst enemy to slumber in all Chinese inns is the "chamois"—Mark Twain's variety.

Next day, after crossing a second range of mountains, 6,000 to 7,000 feet above sea-level,

BRITISH LIBRARY

we followed a spur down into the plain of Mengtsz. This place, opened by the French to frontier trade in 1889, is the principal port of entry for foreign goods into south and eastern Yunnan. I note, in passing, that 72 per cent. of the whole Import trade into Yunnan, *viâ* Mengtsz, is indisputably British, and 79 per cent. of the total Export trade.

Yunnan has been aptly described as a mountainous desert, with here and there an oasis in the shape of a fertile plain. Most of these plains lie at elevation of from 4,500 to 6,000 feet above the level of the sea, and enjoy a warm, equable climate. The Chinese congregate in these healthy spots, and in the course of years have pushed the original inhabitants, *e.g.*, the Sians and Lolos, into the hills or down into the fever-stricken valleys where they themselves cannot live.

The area of Yunnan is 110,000 square miles, about twice the size of England. Its population is only 8,000,000. Most of the inhabitants dwell in the big centres of the eastern portion of the province—Yunnan Fu, Cheng Chiang, Chao Tung, Linan, &c. It follows, therefore, that large tracts of the province are very sparsely peopled, and almost entirely uncultivated. The poverty of the inhabitants is very apparent, and the traveller wonders why the wealth of Yunnan is so often referred to. The reason, no doubt, is to be found in its position on the map. It is the hinterland of both British Burma and French Tonkin, and the highway from these countries to the richest province of China—Szechwan. That Yunnan is also a part of the Chinese Empire is often forgotten, China being considered, I suppose, a negligible quantity.

The mineral resources of Yunnan are no doubt large, though the mines were worked to a greater extent formerly than now. The copper mines to the north-east have been exploited for centuries: deposits of silver and lead occur in places. Near Mengtsz there are important tin mines; and iron and coal exist in large quantities in the neighbourhood of Tunghai. Zinc and mercury have been found, I believe, by French prospectors. Gold is worked at Talang, and one or two other places; but Yunnan includes no Klondyke within its borders. The situation of most of these mines, however, is unfavourable from a commercial point of view. Heavy cost of transport and distance from the world's markets are factors that have to be reckoned with. I know that the Mengtsz merchants make very little profit on the *tin* they export to Hongkong, but it happens to be for them the most convenient way of paying for some of the goods they import.

As the most valuable article of commercial exchange, however, *opium* has superseded everything for the last 30 years. The cultivation of the poppy in Yunnan can be traced back to the year 1760—eighty years before our so-called Opium War with China—and the Yunnanese are further credited with having discovered the way of smoking the drug. The production of opium in any quantity dates from the time of the Mahommedan Rebellion, which killed the silk industry, and closed half the mines in the province. The want of some product, easily transportable, with which they could pay for their needs, led the Yunnanese to turn their attention more and more to the cultivation of the poppy. The annual output is now not far short of 5,500 tons, whils in the neighbouring province of Szechwan it is considerably more. Indian opium, which the sophist accuses us of forcing on the Chinese, is, on entry into China, handicapped by an exceedingly heavy import duty. In a few years' time it is bound to be ousted from the Chinese market by the native article, and the great "Opium Question" will then no longer concern us. Opium smoking is, no doubt, a terrible vice, but it is preferable, in some respects, to what is known as *our* "national sin." The opium smoker never wants to go "mafficking," or paint the town red, to the great discomfort of respectable citizens!

Salt for local consumption is all obtained from mines and brine wells within the province, and carried by pack-animals to the various markets. When the brine is drawn from the wells, it is poured into large iron pans, under which a fire is set, and the salt obtained by evaporation.

With the exception of the minerals referred to, Yunnan possesses no product suitable for exportation, and possible goods for carriage by projected Burma-Yunnan or Tonkin-Yunnan railways are hard to think of. The trade that might eventually arise in live stock has been made much of, and certainly many parts of the Yunnan plateau are particularly suited to the breeding of sheep, oxen and ponies.

This question of railways into Yunnan is one on which there exists considerable differences of opinion. It can be viewed from the commercial or political aspect, and may briefly be summed up as follows:—The French have obtained a concession to extend their railway

from Laokay to Yunnan Fu. The construction of this line, it is thought by some, will "interpose an insurmountable barrier of French influence between Burma and Western China" to the prejudice of British trade. The Indian Government is, therefore, urged to construct an opposition line from the Kunlung Ferry to Tali Fu. The distances as the crow flies are about equal, but it is not denied that the engineering difficulties of the British line are far greater than those to be overcome by the French.

The French are greatly favoured in two respects. Tonkin is much nearer than Burma to the richest and most populous portions of the province; and, owing to the trend of the country, the approaches to Yunnan from Tonkin run parallel with the mountain ranges. Situated thus, the French are bound to extend their influence in Yunnan, but the statistics of the trade of Mengtsz prove, I think, that commercially, we have no cause to fear their rivalry.

From Burma the railways suggested would have to traverse, or *dodge*, the chains of mountains which divide the Mekong and Salween Rivers and their numerous affluents. I am aware that, thanks to the action of the Yunnan Company, and the help accorded them by the Indian Government, a route has been found from Kunlung which avoids the steeper gradients; but the railway proposed could be built only at an immense cost, and even then as the Western portion of the province is wretchedly poor, to compete with the French railway it would have to be carried on over most difficult country to Yunnan Fu. The trade possibilities of the province, viewed ever so optimistically, do not, I think, warrant such a huge undertaking; and I see in the passive attitude of the Indian Government, not blindness to the political importance of such railway schemes, but merely a hesitation to burden themselves with the financial responsility.

A line that could be built at a comparatively small cost, and that would pay, is one from Bhamo, our trade mart on the Irrawaddy, to Tengyueh, the port of Western Yunnan.

The hostility of the population to railway schemes was shown in the riots which broke out at Mengtsz, in June, 1899. A mob attacked the foreign settlement there in the middle of the night, and burnt two houses occupied by the Commissioner and members of my own service.

For many years to come the Yunnanese will have to depend on their present means of transport. Besides the mule, there is the bullock, also used as a pack animal. The water buffalo, though strictly speaking an agricultural animal, is sometimes harnessed to a rough cart used, equally, to carry stones, or to take a party of Yunnanese ladies to some temple on the hills. In it they also visit their family graves, an act of piety that more often develops into a happy picnic.

Reference to family graves brings us to funerals. The three important occasions of a Chinaman's life are his birth, his marriage, and his death. In Yunnan the last is the event which calls for most display. On the death of a relative even the poorest family gives a feast to which all their friends are invited. The funeral car used has a paper Stork on top. It is the emblem of immortality. The Goose is, similarly, the symbol of conjugal felicity. A paper one is always stuck up on a pole outside the house of a newly-wedded couple in Yunnan. So that the rich man may have every comfort when he wakes in the Buddhist purgatory, paper images of what he will most need are made, and after being carried in his funeral procession are burnt at his graveside. There is for instance his horse, with groom in charge. Four paper bearers also carry his sedan chair, ready for him to step into when he lands on the other side of the Styx. The mourners at a Yunnanese funeral wear white, not black, another instance of their topsy-turvydom. To the principal guests at the funeral two pieces of white cloth are given, one for the head, the other for the waist.

From funerals I turn for a moment to other examples of Yunnanese customs, in which a procession forms the distinctive feature. There is the "Ying Chun" Festival or ceremony of meeting the Spring. The chief official of the place is then borne on a special car to a small temple marking the eastern boundary of his town. There he meets the plaster figure of a buffalo, supposed to represent the Spring, with which after worshipping at the temple he returns in state to his residence.

At another procession during the year, an idol (that is presumably in need of an airing) is borne round the town on the shoulders of respectable shopkeepers.

But the prettiest processions take place every spring and autumn to mark the season's changes. Then the people make what they call "Flower Cars." Little boys, dressed to represent the heroes and heroines of antiquity, are perched up aloft on iron bars, and as the cars move along, borne on men's shoulders,

BRITISH LIBRARY

they wave their fans and nod their heads. The whole effect is very picturesque and pleasing.

The Chinese are past masters in the art of irrigating their fields. Their staple food, rice, must be grown in water until it ripens, and in Yunnan they have all kinds of ingenious ways of carrying water on to their farms. One method is the wheel that is turned by a stream, and to which is attached hollow pieces of bamboo. These fill and empty themselves automatically into a wooden shoot leading into the fields.

After the rice is harvested, it has to be hulled or skinned before it can be eaten, and this labour calls for a further display of ingenuity. The apparatus used in many villages consists of a wooden log, hollowed at one end, and with a piece of hard wood fastened through the other. The log is evenly balanced, and a stream of water is directed on to the hollow end, which sinks down under the weight of water, empties itself, and rises again. The other end falls continually on to the grain, and loosens the husk.

The Yunnanese live almost entirely on rice and vegetables. When they can afford it they buy some pork, or kill a fowl, but meat to the majority of the inhabitants is a luxury. Only the Mahommedans eat beef, and where they live beef can usually be purchased daily in the market. The Mahommedans in Yunnan are probably descended from the soldiers stationed there by the Great Mongol Emperor, Ghenghis Khan, when he invaded Burma and India in the 13th century. In 1855 occurred their terrible rebellion, and the Mahommedans kept the field against the Imperialist troops till 1873. The Chinese eventually gained the ascendency, but not before the population of the province had been reduced by many millions.

The first Chinese settlers intermarried freely with the native tribes around them, and the result is that the beliefs and customs of their descendants, the Yunnanese of the present day, differ in many respects from those common to other parts of China. They are intensely superstitious, and believe in divination of all kinds. They would even have faith, I believe, in the weather forecasts of our Meteorological Department. The local diviner is usually a blind man. When a young man wishes to start a home of his own, he does not go on his knees and ask some sweet maid to be his everlasting cook and stocking darner. He obtains instead her "card of nativity" through one of the recognised match-makers of the place, and sends it with his own to a diviner. If the "stars are in conjunction" negotiations can continue, but if they don't agree all is at an end! At least he must seek elsewhere.

Phrenology is not practised, so far as I am aware, but physiognomists get a good living amongst the Yunnanese. A Chinaman is not supposed to grow a moustache until he is at least 30 years of age. He makes a virtue of necessity in this case. However, when he does want to increase his attractions, the Yunnanese applies to a physiognomist, who will discover for him a lucky day on which to start growing a moustache.

In Yunnan the "five senses of man" are said to be the ears, eyes, mouth, nose, and eyebrows. Blue or grey eyes are rarely met with amongst the Chinese, the prevailing colour being black. The consequence is that the Yunnanese attribute extraordinary powers to our eyes. According to them we can see the precious minerals in the earth. I have even been asked by some country people to aid them to find the silver supposed to have been hidden by their parents in their garden during the Mahommedan rebellion.

The Yunnanese lady is fond of dressing herself and her children in bright colours. The most favoured material is Szechwan flowered silk; but for ordinary wear coloured cotton cloth, made and dyed locally, is in general use. Woollen cloth is much appreciated, but is very dear, all on the market being of British or German manufacture. As jewellery—earrings, bracelets, rings, necklaces, and hair ornaments are worn. These are generally made of silver, but the very poor classes manage with brass or pewter.

In India the would-be beauty must imitate the waddle of an elephant. In China the "waving willow" walk is held up as the acme of perfect progression for women. To obtain this walk mothers bind the feet of their girl-babies in rather a cruel fashion, so as to make them small and pointed. In Yunnan it is only the girls of the richer classes whose feet are permanently deformed. It is a silly custom, of course; but one thing may be said in its favour, and it is probably why the women have so long permitted themselves to be the victims of such a fashion. On account of their bound feet the Chinese women are not compelled to slave in the fields like the women of every other Eastern race, whilst their husbands loaf at home. To be in the fashion, the Yunnanese women of the poorer classes bind their feet

with cotton bandages, so as to make them appear smaller, but beyond giving them the necessary willowy step, it does not seem to hurt them in any way.

To turn once more from frivolous to serious consideration of our subject. It is 18 days journey by mule caravan from Mengtsz to Szemao. The main road leads through Linan, Shihping, noted for its lovely lake, Yuanchiang, a small, fever-stricken, walled city, on the Red River, Talang, and Pu-Erh. The road lies over mountain ranges, down the beds of streams, and up wooded valleys, never monotonous, but often difficult. Just east of Yuanchiang the road crosses a range 8,000 feet high, descending immediately after the Red River, only 1,500 feet above the sea at that place. The climb on the opposite side is a very stiff one, and the best way is to cling on to your pony's tail and let him pull you up.

The roads in Yunnan, generally, are in a deplorable condition. The bridges, however, are a noticeable feature of the province. The curve of the ordinary stone ones is unnecessarily high in proportion to the width of the streams they span. Between Yuanchiang and Talang, there are two rather fine chain suspension bridges. They span the Papien and the Homa rivers, which unite further south, and enter Tonkin as the Black River. The planking in the centre of these bridges is purposely left loose, and is, in fact, very unsafe. This is to prevent caravans of pack animals from passing over in a body, and causing too great a strain on the structure. At preseut only two or three can cross at a time, and they have to pick their steps most carefully.

The scenery on the road was most superb, and the vegetation most varied, the flowers at different elevations corresponding to those of the Tropics, and the Temperate and Frigid zones respectively. In fact Yunnan is the botanist's paradise.

Szemao is a busy town of 10,000 inhabitants, healthily situated on a little rising in the centre of a typical Yunnan plain. It was opened to frontier trade in 1896, and Consuls for both Great Britain and France appointed there. It was found, however, that the commercial importance of the place had been over-estimated and both Consulates have lately been suppressed. In return, a Consulate General has been established at Yunnan Fu, the capital of the province.

The trade of Szemao is principally in the famous Pu-Erh tea, that is held in such great esteem by the Chinese of other provinces. Raw cotton is imported from the British Shan States; but other necessaries of life, *e.g.*, matches, woollen cloth, lamps, &c., are supplied from Mengtsz.

The architecture of Yunnan has characteristics of its own, notably so in the pointed gables that adorn the houses and temples. The walls, though built of sun-dried and burnt bricks, form no part of the structure of a house, and might fall down without causing a general collapse. The woodwork in all cases supports the roof, and is the solid portion of their buildings. The "guardian" figures outside their temples are rather quaint, their conception of a "lion" being particularly funny.

The animals best known to the Yunnanese are the elephant, tiger, panther, bear, wild boar, sambhur, or big deer, several varieties of small deer—including the musk deer, the fox, wolf, monkey, and wild cat. There are others, but this will suffice to show the variety existing in the province. The panthers at Szemao are rather a nuisance. On three occasions whilst I was out riding on the hills my dog was attacked by a panther. Young bears are sometimes brought into the market for sale. Elephants are found in a wild state in the Chinese Shan States. Some of the Shan chiefs own tame ones, and at rare intervals these are sent into Szemao, as a mark of respect to the Chinese officials.

In the neighbourhood of Szemao live many of the aboriginal tribes, whom the Chinese, in their gradual march westwards, have ousted from their former homes in the plains. The Lolos, so often referred to by travellers, are scattered all over Yunnan. Only in one place, in the north of the province, do they exist as a separate and independent community. They possess a language and literature of their own, though very few of them can now write and read their own characters. Their religion is a form of spirit worship, and consists chiefly in propitiating the evil spirits, so that no harm may come to the inmates of the house. The religion of all these native tribes is a simple one, based on old legends, and arising in the first instance from an attempt to account for the three inexplicable mysteries — Dreams, Disease, and Death.

The Lolos are fond of music and dancing, amusements they indulge in on moonlight nights. Their dancing is not quite like ours. Although both sexes take part in it, they evince no desire to hug each other. They simply move around in a circle, and stamp their feet in time with the music.

The Woni race are supposed to be the oldest inhabitants of Yunnan. They are divided into numerous clans, each wearing different dresses, with as much variety of colour and detail as in the tartans of the Scottish clans. The men, as a rule, wear the blue cotton jacket and trousers common to the poorer classes throughout China; but the women retain the picturesque costume of their tribe. The Akka of the Shan States belong to the Woni race, as do also the Putu and the Mahê. The Mahê lead a wretched existence. They dwell in tiny little bamboo and mud hovels on the outskirts of Szemao and Pu Erh, and act as "hewers of wood and drawers of water" to the Chinese. Every day they go out, young and old, to the neighbouring hills in search of firewood, which they bring into the town toward evening. They sell as much as they can carry for 75 cash, equivalent to 2d. in our money. They never grow rich!

I shall not have time this evening to describe any more of these hill tribes, but I should like to mention, in passing, the interesting "Wa" tribes, wild and tame, of the Meng Lem district.

My homeward journey led me through the Shan States and Burma. The healthy portion of the Yunnan plateau terminates in most abrupt fashion a few miles beyond Szemao, and one literally tumbles off the edge, down into the lower plains and valleys inhabited by the Shans. Szemao is the last town, and I may add the last centre of civilisation in this direction, until British territory is reached; for south or west beyond Szemao there doesn't exist a single inn for the convenience of travellers. The only way is to camp out, or sleep in the Shan temples *en route*. Except in bad weather, a tent is preferable, and even the muleteers either sleep under a piece of stout cloth held off the ground by sticks, or erect a shelter of branches, roofed with grass. I have stayed in Shan temples, and slept very comfortably under the shadow of the great gilt Buddha, but the awakening was always somewhat of a shock, as it is the practice for the priests and the boy novices to kneel down every day at dawn, and yell their morning orisons.

The capital of the Chinese Shan States is Kenghung, on the Mekong, the residence of the Saw Bwa, or Hereditary Chieftain, who is the nominal ruler of the "Sip Song Panna," *i.e.*, the "Twelve States." From Szemao to this place it is six days' journey. Though the plain of Kenghung lies at an elevation of 2,100 feet above the sea, it is considered by the Chinese to be a most unhealthy spot. Through it runs the Mekong, here nearly 200 yards wide, and crossed by a rude ferry.

The houses of the Shans are usually constructed on piles, their living apartments being thus well off the ground. They do not copy the architecture of the Chinese, and the few bridges that one meets with are of wood or bamboo, and very frail.

One custom of the Chinese Shans is worth noting. At the New Year the young girls provide themselves with balls, like a small pincushion in shape, filled with cotton seed, and covered with pieces of coloured cloth. To one side is attached a long string with streamers. These are thrown by the girls from a certain distance to the young men. By catching or missing them the youths show their preference, and marriage engagements are the result. To obtain some photographs I joined in the game, but I was careful to show no preference.

From Kenghung to Kengtung it is another ten days by caravan. There is nothing to be said in connection with our journey thither, except that the roads were worse if anything than any I have yet seen. Plains give way to mountains, mountains to valleys, and valleys to plains; rarely did we get any level road. Occasionally we came to a river, which the animals had to swim, whilst the baggage was carried across in clumsy boats.

Twelve days out from Szemao we crossed the Burma frontier, marked by a wooden post and a heap of stones. As we neared Kengtung we found evidence of British influence in the roads; they were wider and better kept than those we had been traversing. The country around produces cotton, tea, and a little opium.

Four days later, after negotiating the usual mountain barrier, we descended into the fine plain of Kengtung. This place is one of the outposts of our Empire. It is the residence of a political officer, who, whilst subordinate to the Superintendent of the Southern Shan States, is in charge of the Kengtung State, extending from the Chinese frontier on the north, to Siam on the south. Kengtung is garrisoned by Indian troops, and possesses a post and telegraph office.

Big forests of teak exist in Kengtung territory, near the Siamese frontier, and are worked by the Sawbwa under British supervision.

The Bazaar at Kengtung is one of the sights of British Burma. On market day it is thronged

Qatar National Library

with people dressed in every conceivable colour, and the scene is most animated. Lightly clad Siamese, natives of Laos, swarthy Indians, stolid Cantonese pedlars, Burmese, Shans, and numerous hill tribes jostle each other, and the babel of languages once heard is not easily forgotten.

The Shan, or "Tai" race is divided into many clans. The inhabitants of Kengtung are known as "Kuns," those of the Chinese Shan States, as "Lü," of Meng Lem as "Lem," &c.

There is a good mule-track between Kengtung and the Salween. Two very high mountain ranges have nevertheless to be negotiated, but a new route has lately been surveyed that avoids the steeper hills, and a big cart road will shortly be ready for caravans. After leaving Kengtung one travels in comparative comfort. At most of the stages along the road bungalows have been built for the traveller. Seven days' travelling brought us to the Salween, at a place called Takaw. We crossed the river by a ferry boat similar to the one at Kenghung. The ferry system in the Shan States certainly needs amelioration.

Two days later we reached the pretty Namkham River, one of the tributaries of the Salween, and the following day arrived at Hsai-Kao, where there is a post and telegraph office. From Hsai-Kao, a good, wide road led us across undulating plains, resembling the downs of Wiltshire. Water in many places is rather scarce; but with this defect remedied no country would be better suited for colonisation. Like Yunnan, the Shan States could well support a larger population. Amongst the present inhabitants are the "Red Yang" tribe whose dress is very curious. I was glad to add a photo of them to my collection.

Seventeen days out from the Kengtung we arrived at Taunggyi, the capital of the Southern Shan States. It is a prosperous, and growing British settlement, situated in a splendidly chosen spot in a plain 4,600 feet above the sea. This place was only a tiny hamlet twelve years ago. About that time, Mr. Hildebrand, until last year Superintendent of the Southern Shan States, happily selected Taunggyi as his official residence, and it now bids fair to rival that well-known sanatorium of Burma—Maymyo. Trade is thriving, thanks to the construction of good cart roads, and we are bound to hear more of Taunggyi as a commercial centre in the future.

From Taunggyi we turned south to the older military settlement, Fort Stedman, distant one day's march only. Fort Stedman is situated on the eastern shore of Lake Yawng Hwe. The place is much lower and hotter than Taunggyi. Proximity to water could have been the only reason for choosing it as a residence for troops.

Sending my caravan round the lake, I crossed myself in a small dug-out. The shores and islands of the lake are inhabited by the Inthas—a hybrid tribe of Burmese origin. Their method of paddling with their legs is, I believe, absolutely unique. Standing on the gunwale of the boat, they balance themselves on one leg, and twisting the other round the long paddle force the blade back through the water. In this way they send the boat along at a great speed.

The third morning after quitting Lake Yawng Hwe, we finally left the hills behind us, and descended into the hot plains of Lower Burma. For the next two days the roads, though wide and level, were horribly dusty, and the heat and glare intense. We struck the Rangoon-Mandalay railway at Thazi, a small junction town, where I paid off my caravan. We had taken 48 days in coming from Szemao, and in spite of the different altitudes traversed, none of us were ill on the way, a result, I expect, of the quinine that I occasionally dispensed to all.

From Thazi I went down to Rangoon; then wishing to see a little more of Burma, I took the night mail up to Mandalay. A large proportion of the Chinese population of Mandalay are natives of Yunnan, who have, in most cases, taken Chinese wives, and settled there. Continuing my railway journey I went right up to the northern terminus, Myitkina, a settlement on the upper reaches of the Irrawaddy, quite close to the Chinese frontier. Some speculators are dredging for gold in that river, just above Myitkina.

From Myitkina, I went down on a Government launch, kindly placed at my disposal by Sir Frederic Fryer, through the wonderful gorges of the Irrawaddy, rarely visited by travellers, though well worth seeing. At Sinbo, just above the first defile, the river, at the commencement of the rains, rises sometimes as much as 84 feet, owing to the narrowness of the passage lower down. We went down with the current, at a good pace, to Bhamo, a trade-mart and military station—also the terminus of the Irrawaddy steamers. Bhamo is growing wonderfully, and trade with Yunnan across the frontier steadily increasing.

From Bhamo, I continued my way down the river on one of the Irrawaddy Flotilla Com-

BRITISH LIBRARY

pany's well-appointed steamers. I enjoyed this part of my trip immensely, and am only surprised that the lovely scenery of the Upper Irrawaddy, with its pagoda-lined banks, does not attract more travellers.

It is getting late, however, so with a passing reference to the "Shwe Dagon," or Golden Pagoda of Rangoon, I bring my paper to a conclusion.

DISCUSSION.

The CHAIRMAN, in thanking Mr. Carey, said that that gentleman had served in China, first under the Imperial Customs Department, with Sir Robert Hart, and had spent seven years of his life in Yunnan. So that no man was able to give a better account of the countries with which his paper dealt, than he. During the last two years he had served in the British Consular service in Yunnan, and while there, being a most expert photographer, he had taken the large number of excellent pictures which he had shown on the screen that evening. He, himself, saw enough to recognise how exceedingly good the pictures were. It had been the hope of the authorities of the Society of Arts to have had as chairman that evening Sir Hugh Barnes, the Lieutenant-Governor designate of Burma. Unfortunately, however, Sir Hugh had to be in the country. To him (the Chairman) the paper was particularly interesting, for, although he had never set foot in the actual territories which Mr. Carey had traversed, he recognised so many traits in regard to scenery, custom, and the appearance of the people, like those with which he had been familiar among the Indo-Chinese tribes all along our Eastern frontier. For instance, one picture showed the use of the solid wheel, another the mode of irrigation, while yet another exhibited huts built upon piles. Still further he recognised the similarity in the native dances, and the plaids which designated the different tribes. All that kind of thing one met among the tribes to the east of Assam, Manipur, and right down to the frontier. The only point in the paper upon which he had anything serious to say, was with regard to the railway from Burma to Yunnan. Upon that he entirely agreed with Mr. Carey. Lord Curzon, when at Rangoon a year or so ago, expressed his opinion in very plain terms, saying that if there was any money to spend, the communications in Burma had the first call upon it. But there was a great deal to do in the interior, said Lord Curzon, before it would be just to spend any of the Indian taxpayers' money upon what was a doubtful thing, commercially and politically, in regard to Yunnan. He (the Chairman) concluded that Lord Curzon was right in saying that he would hold his hand.

Obituary.

THOMAS WARD, J.P.—Mr. Ward, of Wadebrook-house, Northwich, whose death occurred on Wednesday evening, 18th inst., at the age of 68, had been for some years a member of the Society of Arts. He was Managing Director of the Salt Union and Chairman of the British Salt Association. In December, 1894, he read a paper before the Society on "The Manufacture of Salt," for which he received a silver medal. At the general election of 1895 Mr. Ward contested the Northwich Division in the Unionist interest, but was defeated by Sir John Brunner.

MEETINGS OF THE SOCIETY.

ORDINARY MEETINGS.

Wednesday evenings, at Eight o'clock :—

MARCH 4.—"Education in Holland." By J. C. MEDD. The HON. LYULPH STANLEY, M.A., will preside.

MARCH 11.—"Existing Laws, By-laws, and Regulations relating to Protection from Fire, with Criticisms and Suggestions." By T. BRICE PHILLIPS. (Fothergill Prize Essay.) SIR WILLIAM H. PREECE, K.C.B., F.R.S., will preside.

MARCH 18.—"New Aspects of Life Assurance." By WILLIAM SCHOOLING.

MARCH 25.—"Oil Lighting by Incandescence." By ARTHUR KITSON.

INDIAN SECTION.

Thursday Afternoons, at 4.30 o'clock :—

MARCH 12.—"The Currency Policy of India." By J. BARR ROBERTSON. SIR EDWARD A. SASSOON, Bart., M.P., will preside.

APRIL 23.—"The Province of Sind." By HERBERT MILLS BIRDWOOD, C.S.I., M.A., LL.D. The EARL OF LYTTON will preside.

MAY 14.—"The Province of Assam." By SIR CHARLES JAMES LYALL, K.C.S.I., M.A., LL.D.

COLONIAL SECTION.

Tuesday Afternoons, at 4.30 or 5 o'clock :—

MARCH 3, at 4.30 p.m.—"The Uganda of To-day." By HERBERT SAMUEL, M.P. Sir HARRY H. JOHNSTON, G.C.M.G., K.C.B., will preside.

MARCH 31, at 4.30 p.m.—"British North Borneo." By HENRY WALKER, Commissioner of Lands, British North Borneo. The RIGHT HON. SIR GEORGE TAUBMAN GOLDIE, K.C.M.G., will preside.

MAY 5, at 4.30 p.m.—"The Lagos Hinterland: its People and its Products." By MAJOR J. H. EWART.

APPLIED ART SECTION.

Tuesdays, at 4.30 or 8 o'clock.

MARCH 17. 4.30 p.m.—"Artistic Fans." By MISS HANNAH FALCKE. SIR GEORGE BIRDWOOD, K.C.I.E., C.S.I., will preside.

CANTOR LECTURES.

Monday Evenings, at Eight o'clock:—

PROF. J. A. FLEMING, M.A., D.Sc., F.R.S., "Hertzian Wave Telegraphy in Theory and Practice." Four Lectures.

LECTURE I.—MARCH 2.—*General Principles. The Theory of the Radiator or Aerial.*—Introductory remarks—The production of an electric wave—The theory of the aerial or radiator—Comparison between organ pipes and Hertzian wave radiators—The propagation of an electric wave over earth or water surface—Fundamental and harmonic electrical oscillations in radiators—The Marconi radiator—The Braun radiator—The Slaby radiator—Oscillation transformers and multiplicators.

MEETINGS FOR THE ENSUING WEEK.

MONDAY, MARCH 2...SOCIETY OF ARTS, John-street, Adelphi, W.C., 8 p.m. (Cantor Lectures.) Prof. J. A. Fleming, "Hertzian Wave Telegraphy in Theory and Practice." (Lecture I.)

Farmers' Club, Salisbury-square Hotel, Fleet-street, E.C., 4 p.m. Mr. Edwin Clements, "Railway Rates for the Carriage of Agricultural Produce."

Royal Institution, Albemarle-street, W., 5 p.m. General Monthly Meeting.

Engineers, in the Theatre of the United Service Institution, Whitehall, S.W., 7½ p.m. Mr. W. Worby Beaumont, "Road Traffic in and near Large Cities."

Chemical Industry (London Section), Burlington-house, W., 8 p.m. Mr. Thomas Tyrer, "The need of a Duty-Free Alcohol for Industrial Purposes."

Camera Club, Charing-cross-road, W.C., 8¼ p.m. Mr. E. W. Pulling, "A Tour round the World. No. II.: The Malay States, China, and Japan."

Medical, 11, Chandos-street, W., 8½ p.m.

Victoria Institute, 8, Adelphi-terrace, W.C., 4½ p.m. Paper by Cavaliere W. P. Jervis.

Medical and Chirurgical, 20, Hanover-square, W., 5 p.m. Annual Meeting.

TUESDAY, MARCH 3...SOCIETY OF ARTS, John-street, Adelphi, W.C., 4½ p.m. (Colonial Section.) Mr. Herbert Samuel, M.P., "The Uganda of To-day."

Alpine Club, Savile-row, W., 3½ p.m. Mr. H. Woolley, "The Canadian Rockies."

Royal Institution, Albemarle-street, W., 5 p.m. Sir William Abney, "Recent Advances in Photographic Science." (Lecture II.)

Central Chamber of Agriculture (at the HOUSE OF THE SOCIETY OF ARTS), 11 a.m.

Civil Engineers, 25, Great George-street, S.W., 8 p.m. Mr. George Frederick Zimmer, "Mechanical Handling of Material."

Pathological, 20, Hanover-square, W., 8½ p.m.

Anglo-Russian Literary Society, Imperial Institute, South Kensington, S.W., 3 p.m. Mr. F. H. Skrine, "Some Phases of Russian History."

Zoological, 3, Hanover-square, W., 8½ p.m. 1. Mr. J. T. Cunningham, "Observations and Experiments on Japanese Long-tailed Fowls." 2. Mr. E. R. Sykes, "The Land Operculate Mollusca collected during the 'Skeat Expedition' to the Malay Peninsula." 3. Mr. R. Lydekker, "The Significance of the Callosities on the Limbs of the *Equidæ*."

WEDNESDAY, MARCH 4...SOCIETY OF ARTS, John-street, Adelphi, W.C., 8 p.m. Mr. J. C. Medd, "Education in Holland."

United Service Institution, Whitehall, S.W., 3 p.m. Major-General C. E. Webber, "An Organisation of the Nation for Defence."

Entomological, 11, Chandos-street, W., 8 p.m. 1. Mr. G. A. James Rothney, "The Aculeate Hymenoptera of Barrackpore, Bengal." 2. Mr. Charles Owen Waterhouse, "Notes on the Nests of Bees of the Genus 'Trigona.'" 3. Colonel Charles Swinhoe, "The Aganiidæ in the British Museum, with descriptions of some New Species."

Archæological Association, 32, Sackville-street, W. 8 p.m.

Obstetrical, 20, Hanover-square, W., 8 p.m.

Royal Archæological Institution, 20, Hanover-square, W., 4 p.m. Viscount Dillon, "Armour Notes."

THURSDAY, MARCH 5...Royal, Burlington-house, W., 4½ p.m.

Antiquaries, Burlington-house, W., 8½ p.m.

Linnean, Burlington-house, W., 8 p.m. 1. Mr. W. S. Rowntree, "Some Points in the Visceral Anatomy of the Characinidæ." 2. Mr. F. G. Parsons, "The Anatomy of the Pig-footed Bandicoot *Chæropus Castanotis*." 3. Dr. Elliot-Smith, "Furthur Notes on Lemurs."

Chemical, Burlington-house, W., 8 p.m. 1. Mr. H. Bassett, "The mechanism of the reduction of potassium bichromate by sulphurous acid." 2. Mr. H. A. D. Jowett, "The constitution of pilocarpine, Part IV." 3. Messrs. H. A. D. Jowett and C. E. Potter, "Preparation and properties of 1,4 (or 1,5) dimethyl glyoxaline and 1,3 dimethyl pyrazole." 4. Mr. R. G. Hill, "Some analyses of 'Reh,' or the alkaline salts in Indian Usar land." 5. Messrs. W. H. Perkin and J. F. Thorpe, "Experiments on the synthesis of camphoric acid. Part III. Synthesis of isolauronolic acid." 6. Messrs. T. M. Lowry and G. C. Dorrington, "Camphor-β-thiol." 7. Mr. F. D. Chattaway, "Isomeric change of dibenzanilide into benzoylorthoamino- and benzoylparaamino-benzophenone." 8. Messrs. J. C. Cain and F. Nicoll, "The rate of decomposition of diazo-compounds. Part. III.: The temperature co-efficient."

Royal Institution, Albemarle-street, W., 5 p.m. Prof. L. C. Miall, "Insect Contrivances." (Lecture II.)

National Indian Association, Jehanghir Hall, Imperial Institute-road, S.W. Mr. R. Masujima, "The Japanese Code regarding Family Law."

Junior Art Workers' Guild, Clifford's-inn, Fleet-street, E.C., 8 p.m. Mr. Cyril Davenport, "Bookbinding."

Civil and Mechanical Engineers, Caxton-hall, Westminster, S.W., 8 p.m. Mr. R. W. A. Brewer, "The Production of Power by means of Gas Producers and Engines."

FRIDAY, MARCH 6...Art Workers' Guild, Clifford's-inn, Fleet-street, E.C., 8 p.m. Lecture on "Carpaccio."

Royal Institution, Albemarle-street, W., 8 p.m. Weekly Meeting. 9 p.m. Dr. J. G. McKendrick, "Studies in Experimental Phonetics."

Geologists' Association, University College, W.C., 8 p.m.

Philological, University College, W.C., 8 p.m.

Quekett Microscopical Club, 20, Hanover-square, W.C., 8 p.m.

SATURDAY, MARCH 7...Royal Institution, Albemarle-street, W., 3 p.m. Lord Rayleigh, "Light: its Origin and Nature." (Lecture III.)

Miscellaneous.

Society of Arts Examinations, 1903.

MONDAY, MARCH 30th, to THURSDAY, APRIL 2nd.

Grade I. Preliminary or Junior. Grade II. General or Intermediate.

In Grade II. First, Second, and Third-class Certificates will be granted in each subject.
In Grade I. Certificates will be given in each of the subjects enumerated. These will be of one class only.
In Rudiments of Music Higher and Elementary Certificates are given. In Harmony Higher, Intermediate, and Elementary Certificates will be granted.

A Fee of 2s. 6d. will be required by the Society from each Candidate in each subject in Grade II., and in Grade I. a fee of 2s. for one subject, and 1s. for each additional subject taken up by the same Candidate. The fees for Harmony and Rudiments of Music are the same as for Grade II.

MEDALS AND MONEY PRIZES are awarded in all the subjects of Examination. Full Particulars of these will be found in the Programme.
There will be no Prizes or Medals in Grade I.

The Examinations are under the control of Local Committees. No application can be recognised unless sent through a Committee.

The last day for receiving applications is WEDNESDAY, the 4th March, 1903, and after that date none will be received under any circumstances whatever. Application forms from the Provinces should therefore be posted not later than TUESDAY, the 3rd MARCH. Committees may, however, close their entry lists at an earlier date, if found desirable.

Copies of the Programme for 1903, with full details, together with the questions for 1902, and reports by the Examiners, can be had, Price 3d., on application to the Secretary, SIR HENRY TRUEMAN WOOD, Society of Arts, Adelphi, London, W.C.

The questions for the years 1896 to 1902 inclusive can also be obtained (price 3d. each year), on application as above.

6d. Monthly.

The ILLUSTRATED

SCIENTIFIC NEWS,

A New Journal of Popular Science,

Containing Original Articles and Up-to-Date Intelligence in all branches of Science, contributed by many of the leading Scientific Authorities of the day.

The March Number contains:

Coherers: Some Experiments on Loose Contacts.
The Barmen-Elberfeld Suspended Railway. Higher Education & Research.
Nernst and the Cooper-Hewitt Electric Lamps.
The Pendulum Propeller.
The Splash of a Projectile. The "Piano Player Parodox."
Constituents of the Atom. The Fate of the Oyster, &c., &c.

FIRE PREVENTION PRIZES.

The Council of the Society of Arts, at the request of the Executive Committee of the International Fire Prevention Exhibition, have decided to offer, out of the funds of the Fothergill Trust, the following prizes at the Exhibition which is to be held at Earl's Court during the current year:—

For the best chemical fire engines for town use shown at the Exhibition:—One gold medal, two silver medals, and two bronze medals.

For the most easily worked long ladders, to reach the sill of a window 80 feet above the level of the pavement, which shall also be capable of being rapidly transported over roads of not more than 25 feet wide, shown at the Exhibition:—One gold medal, two silver medals, and two bronze medals.

The medals will be awarded by the Council on the report of the judges appointed by the Executive of the Exhibition.

The Council reserve the right of withholding any of the medals, or of awarding medals of lesser value, if in their opinion the exhibits should not be deserving of any, or all, of the medals offered.

CANTOR LECTURES.

On Monday evening, 23rd inst., Mr. JULIUS HÜBNER delivered the fourth and concluding lecture of his course on "Paper Manufacture."

A vote of thanks to the lecturer for his course of lectures was passed on the motion of the CHAIRMAN.

The Lectures will be printed in the *Journal* during the summer recess.

INDIAN SECTION.

Thursday afternoon, February 26, 1903; SIR ROBERT J. C. MOWBRAY, Bart., M.P., in the chair. The paper read was "Gleanings from the Indian Census." By JERVOISE ATHELSTANE BAINES, C.S.I.

The paper and report of the discussion will be published in next week's number of the *Journal*.

Proceedings of the Society.

APPLIED ART SECTION.

On Tuesday evening, February 17, 1903; LEWIS FOREMAN DAY, Vice-President of the Society, in the chair.

The paper read was—

HERALDRY IN DECORATION.

By GEORGE W. EVE.

The choice of heraldry in decoration as a subject on which to offer suggestions to the Applied Art Section of the Society of Arts is influenced (apart from the necessity of limiting in some measure the scope of heraldic art in general) by the consideration that, as it was in decoration that heraldry found admirable expression from a very early period, its decorative use in the past is now worth study with a view to the satisfactory execution of modern work.

BRITISH LIBRARY

Primarily heraldry, no doubt, consisted of the devices which distinguished leaders in the field, but its close connection with the personality of its bearer, whom it represented in a very intimate way, also led to its use in every conceivable form of decoration. In costume, ornament, and furniture, as well as in the hangings of tapestry and in other mural adornments, it became a striking and universal feature of the art work of its time. Owing to this strong personal and allusive quality, the employment of heraldic motives in the decoration of buildings has continued, even down to our own time, to show a more marked degree of excellence than was for a long period present in other forms of heraldic expression.

Decorative work was also the direction in which the revival of heraldry, which accompanied the Gothic revival, first showed itself. Perhaps the inherent difficulties of the materials may have suggested the sincerity of the effort to properly employ them.

It will not be necessary (even if time allowed) to go very far into the origin of heraldry. For our purpose it began about the 11th century—that is to say, it began to be used and systematised, more or less, as we know it, but in its essence it must always have existed.

The desire to distinguish himself by some visible means seems to have characterised man ever since we know anything about him. Badges are mentioned as the ornaments of kings and chiefs from the earliest historic times, from that of the Chaldean King, 4000 B.C., onwards. Some of these early personal devices were strangely similar to those with which we are familiar in later times. The figures on the sculptures at Persepolis, for example, have veritable crests on their heads, and these also occur on the heads of the king and his heir apparent in contemporary coins. There may even have been some sort of regulations controlling the use of the various devices, but we may at least be sure that the powers that were took good care that others did not use their badges if they could help it.

Artistically, our heraldry from its rise in the 11th century quickly developed a high standard of decorative excellence, flourishing exceedingly, with certain changes of style and method, for three hundred years until the middle of the 16th century, when its period of greatest strength and beauty ended, and its decadence began. As a system it seems to have developed in a natural way on the lines of its own necessities, as did its artistic expression in a great measure, but the latter owed much to previous design, and, mainly through the influence of the textiles and other importations (sometimes brought by returning crusaders), helped to perpetuate in the Western world the lions, eagles, and strange and characteristic composite animals of the East. These ancient prototypes of heraldic forms are singularly interesting, and concern us here because they sometimes possess in a marked degree qualities which teach valuable lessons that are applicable to present use. This will be discussed presently.

Although at first the mediæval draughtsman followed the drawing of his imported or traditional motives with considerable closeness (as in the lions of one of the 13th century MSS. in the British Museum), he soon began to treat them in the way that came to be considered peculiarly heraldic. In thus handling his motives he was entirely himself, and the outcome was the natural result of that splendid sense of design which distinguished him. The style is rightly considered purely heraldic, because it arose from its own heraldic conditions, and was the result of the very sane intention that the thing done should be suited to the use to which it was to be put, viz., to serve as a distinctive badge, which could be seen and easily read at a distance, and, in many cases, when in motion. To this end the object was drawn as large as the containing space would fairly admit, and its form was attenuated so as to allow the ground colour to show through in due proportion, and so effect clearness of definition. Vigorous draughtsmanship also contributed to the splendidly decorative effect that was due to good distribution, and the fine balance of colour that results from it. Thus the treatment which was suggested by reasons of practical convenience, resulted in an effect of great decorative value which also afforded opportunity for the use of expressive line. It is interesting to contrast this treatment with that of the later renaissance, such as the naturalistic lion by Della Robbia, which would have become an undistinguishable blob at a distance at which the attenuated form would have been quite effective. In a similar way an eagle drawn in the ancient way, with the wing-feathers strongly divided, was at once more distinct and more decorative than its renaissance successor.

Another practical consideration, the need of readily repairing the damage caused in action to the actual shield, dictated the flat and simple treatment of much of the painted decoration. A similar simplicity occurs in

BRITISH LIBRARY

some of the MSS., especially in such as are of large extent or of frequent repetition when economy of time and labour was desired. When, however, circumstances allowed, time and skill were not spared in the elaboration of the work. It is of course for this reason that the heraldry in architectural decoration is generally found to be among the best work of its period.

In the ceremonial shields, this elaboration is very great. They were made of layers of various materials, such as canvas, stretched on wooden frames, and the changes were then modelled in gesso, and afterwards gilt and painted, or were fashioned in stamped leather and pinned down to the surface. The spaces were diversified with the beautiful tracery known as diapering, and the whole result was rich and beautiful in the extreme. Large numbers of these shields were made in Italy down to a late period. A most admirable English example is the shield at Canterbury Cathedral, said to be that of the Black Prince. Here the lions are admirably distributed, full of power and life, and less extravagantly drawn than those of John of Eltham at Westminster Abbey, but they lack something of leonine character. The *fleur de lis* of France are beautifully free and graceful, and though so dissimilar in shape to the lions, are equally well designed to occupy their spaces and equally well proportioned to them. The whole work, which is so excellent an example now of some of the best qualities of heraldic design, has suffered from the wear of the centuries, but when it was uninjured must have been superb. The lack of leonine character in the lions might naturally be expected when it is remembered that they were the descendants of generations of copies and, therefore, were not consciously generalised from objects seen by the artist. Even when he did see a lion his acquired ideas were too strong for him, so that one in a 13th century book of sketches, though noted in the margin as "drawn from the quick," is very like its patternlike fellows.

Whether the treatment was simple or elaborate, however, its breadth of effect and decorative quality were nearly always conspicuous. These various methods, both satisfactory in their way, are of special interest to those who require historic sanction to a choice of treatment, in opposition to the opinion that, as certain methods of work, or works of a certain period are good, they are, in addition, perfect and everything else is wrong. So, when a flat treatment, in harmony or contrast with surrounding decoration seems desirable, the armorials may be done flatly, and when on the other hand a more elaborate treatment seems fit, modelling in relief or any other suitable means of decorative effect may be employed. The old work itself, full of variety and freedom, teaches us how to look at the subject without pedantry, but not without knowledge. It teaches the right of individual treatment combined with selection, and illustrates in a measure the essentially artistic principles taught to Kipling's primæval ballad-maker by his totem,

> "There are nine and sixty ways of composing tribal lays,
> And every single one of them is right."

It is not meant, however, that ignorant and reckless scribbling is right. Order as well as freedom is necessary, and this can only be secured by a study of the subject from all points of view.

The early treatment of the crest, helm, and mantling will also amply repay study. Being made of light material, and having its weight, which was still considerable, supported by the shoulders on which the helm rested, the crest was of conspicuous size and is so represented. In early times it is said to have been one of the privileges of knighthood, and this would additionally explain its emphasis. The helm was usually that known as the great helm, to distinguish it from the helmet, basinet or other form of head armour. The latter, having a visor or front which opened, and a movable neck, came into use in the 15th century to meet the desire for lightness and mobility in actual battle, and thenceforward crests and the great helms that bore them were reserved for the tournament and other military solemnities. There was another especially practical reason for this disuse. It had been found that a crest was a dangerous ornament in actual battle, for at close quarters it served as an excellent handle by which to pull down the wearer's head. King Stephen is said to have been taken prisoner in this manner. The mantling, which was at first quite simple, soon became of the greatest value as an element of composition, and the importance of its free possibilities of line was quickly recognised. From a mere representation of the helm drapery, it thenceforth developed through various forms until it became in many instances similar to the contemporary architectural tracery, when, as in the 15th century carvings, it surrounded the shield and ornamented the surface of the panel in a very complete and beautiful way.

By the Tudor time heraldry had ceased to be

مكتبة قطر الوطنية
Qatar National Library

used in war in the old way, with such exceptions as banners and the decorative and emblematic shields on ships of war, and it, of course, remained an essential part of the tournaments, while they continued to exist, but heraldry in the main became merely decorative thenceforward, retaining, of course, its allusive and symbolic qualities. In this way it greatly increased, thus sharing in the impetus given to the arts by the end of the Wars of the Roses. At this time a remarkable number of simple flowers came into heraldic use, columbine, gilly-flowers, marigolds, honeysuckle, and many more appearing not only as arms but in garlands as decorative accessories.

By this time also the shield shapes had become less simple, following in their cuspings the fluted armour of which they formed part, and others of which large numbers were designed by the little masters were frank applications of the decorative scrolls of the time. The concave shield whose raised edges took the light and helped to define the form, while assisting, together with the shadow within it, the distribution of light and shade, became much in use.

Some of the early renaissance heraldry retained much of the excellence of the preceding Gothic as regards the pose of the figures and the general composition, and it attempted, in addition, the characterisation that was wanting in the earlier work. In many respects it was very admirable, and seems, in its individual thought working on some of the suggestions or traditions of the older style, to suggest the lines on which modern heraldry might develop. At the same time there was a more naturalistic school, of which the heraldry in Della Robbia's work may be taken as the expression, and this also is interesting, *but as a warning*. It most unfortunately overpowered the more decorative style, and ultimately developed into the feebleness which characterised the heraldry that preceded the revival in the last century.

A well-known example of the better renaissance is the plate by Albert Dürer, of a shield bearing a rampant lion. In this plate there is also evident a desire to render the mantling more cloth-like, though still complicated. Mantling afterwards followed the influence of the conventional leaf forms of the renaissance.

I have ventured to give you this slight sketch of the development of the artistic side of heraldry, not as a mere historic retrospect, but because it is in the study of old work that guidance is to be found for present requirements. But in this connection, a word of warning may perhaps be permitted against making a fetish of the work of any period, however good. Another is against mere copying of old examples however excellent, except, of course, for purposes of study. Merely to copy bits of heraldic precedent and to piece them together is not the way to make an artistic thing at all. A copy has no vitality of its own, and cannot even reproduce that of its original, for it is more than doubtful if it is possible to reproduce the spirit of work done under other conditions and modes of thought. Even Pugin, to whom the revival of decorative heraldry owes so much, with all his sympathy, and with all his powers of draughtsmanship, cannot be said to have altogether caught the intense vigour of his originals.

Again, hardly anything possesses, at the same time, all the good qualities that it might have, and we sometimes excuse the absence of one because of the supreme way in which another is expressed. In doing new work a broader view is necessary if it is to result in anything but a shadow of a former style. Heraldry should be expressive, interesting, and decorative. Original in treatment, and exhibiting the qualities that the best of the old work teaches us to desire, rather than being a copy of it. The term "original" here does not mean expression by means of wild arrangements of weird lines, which are perhaps original in the sense that there is nothing like them on earth, but rather the originality, or, perhaps I should say, individuality, which comes from serious attempts to express qualities rather than to copy styles.

The artistic expression of heraldry may be regarded in two ways; as a representation of an actual shield, crest, helm, and so forth, as they would be represented in a picture, of a tournament for instance, or as a presentation of the essential heraldic facts, in the way that is thought most expressive but without too much regard to preceding styles. The former seems more suitable to ancient and historic arms, and the latter to be more likely to harmonise with modern decorative surroundings, as well as to possess more vitality and variety in itself.

This harmony with surrounding decoration, is one of the essentials of design that should be continually kept in mind. Another condition, equally important, is suitability to the materials and methods by which the design is expressed. The two very obvious points cannot be too often insisted on, however wearisome the reiteration, for they are even now frequently ignored. One hears of shields

BRITISH LIBRARY

painted on vellum (with all the detail and finish to which that beautiful material lends itself), sent as a substitute for a working drawing for large embroidery or carving, and accompanied by instructions that they must be *strictly* followed. Or of friezes and panels, of which the different parts, heraldic and ornamental, have been done by different designers working in ignorance of each other's design. The general design is made, perhaps of well drawn and graceful lines, with spaces where it is thought, probably correctly, that the shields would tell. Then a sketch, perhaps a mere diagrammatic note of the arms, is procured, enlarged to the right size, and blindly copied. Of course the result is patchwork. Careless treatment of heraldry seems to pervade applied art, and so to spoil what is otherwise meritorious work. Much incongruity arises from fear lest improving the drawing or composition may violate heraldic rules, and this brings us to the necessity for acquiring such a knowledge of the subject as will enable the designer to know what points are really essential, and therefore to be carefully retained and accentuated where accent is proper, and what, on the other hand, may be modified or ignored. A knowledge of the system of heraldic description, called blazon, will be absolutely necessary to this end. Pedantry in non-essential matters is of course absurd, and artistic freedom is always to be desired, but there must first of all be a basis of knowledge on which to work.

It will be necessary to study the subject sufficiently to distinguish between the essential principles (such as underlaid the old good work) and the later amplifications of rules, full of pedantic insistence on regulating every detail however unimportant, which were made when the legal mode of thought had displaced the artistic one. The rules that are necessary to prevent confusion will be found sufficiently elastic to allow variety of treatment.

Among the qualities that it will be desired to express are just proportion, distinct definition, good distribution in filling spaces, strongly characterised and well accented forms, and vigorous pose.

The proportion of the parts of a usual form of heraldic group of shield, crest, helm and mantling, to each other remained fairly constant from the end of the 13th century to Tudor times, and may be taken (roughly) to be two-fifths of the whole height for the shield and three-fifths for the helmet and crest. This merely as a practical guide. I need hardly say that it is not to be taken as actual measurement, but only as suggesting the relative weights in the design. The character of the crest, whether broad and solid, or tall and slight, would affect this. The result of these proportions is to bring the helm a little above the actual centre of the design, where it forms a satisfactory point on which the other objects group themselves.

With regard to the proportions of ordinaries to their fields, many rules to be found in treatises may be safely ignored. In good work the ordinaries vary in size with the requirements of distinctness in respect to the other charges, and their variation in this way has no other significance. I do not, of course, deny the usefulness of points of proportion, they may be useful so long as it is recognised that they are approximate and variable guides instead of dogmatic inflexible rules. With regard to charges, it is equally impossible to say what exact proportion they should bear to the field, nor in most cases could we measure it if we did. It must be a matter of artistic perception which decides whether a space is properly filled. In any case the proportion would be an apparent rather than scientific one, and would be greatly modified by circumstances, colour for instance. I need hardly point out that the actual measurements would not be the same for a white object on black as for a black one on white. It is curious how prevalent the desire has always been to reduce to exact rules matters that are insusceptible of that kind of control. The 16th century efforts at a geometric way of drawing letters and the attempt to regulate minutely heraldic drawing are instances of a peculiarly wrongheaded way of approaching matters essentially æsthetic.

As to the animal forms, vigour is of the utmost importance, together with strong characterisation. In this connection the lions of the Assyrian reliefs are very suggestive. The expression of strong, leonine character by means of the accentuation of the muscular masses is a method that lends itself well to heraldic design. The composite figures are also well worthy of study in relation to the griffins and other monsters of later times. Gerard Leigh, writing in the middle of the 16th century, has something to say about griffins; they are, as you know, half eagle and half lion, which students of natural history may like to know, thus: "Griffins bear great enmity to man and horse; though the man be armed and on horseback, yet they take the one with the other quite from the ground and carry them clean away. I think they are of

مكتبة قطر الوطنية
Qatar National Library

great hugeness," he goes on "for I have a claw of one of their paws which should show them to be as big as two lyons." In another place Leigh refuses to believe something because "he had not seen the proof thereof."

It will be well to consider animal pose in relation to the anatomical possibilities, and the qualities of dignity, strength, or grace which are associated with certain charges should also find due expression.

The schemes of arrangement that suggest themselves as suitable to decorative purposes, are very various. Complete series of family arms and those of alliances, together with the honours conferred on individuals; arms of successive owners; shields marking the visits of distinguished guests, and so forth.

Unity of plan, such as when the arms are arranged in relation to some central object as the altar in a church or the fireplace in a room, for example, is, of course, desirable. In the latter case the central position would be appropriately occupied by the entire armorials.

The employment of Badges in decoration opens up a large and interesting field of design from their value as decoration in places where shields of arms are not so suitable. Though not subject to the same rules as the regular arms they were still regarded as of great though secondary importance, and became practically hereditary in many cases. Time, however, will not permit of their adequate treatment here. A kind of badge, more ephemeral in character, called an impress, was a fashion that came to us from Italy, as many other heraldric fashions did. They were devised from mere fancy, and consisted of a device with an explanatory motto. Henry VIII. and his knights at the Field of the Cloth of Gold bore a series of devices, of which they wore part each day until the whole was complete. Cosmo de Medici had a tortoise with a sail attached and the motto "Festina lente," and there were others innumerable. Like other heraldic matters, they sometimes led to quarrels. A knight who strutted up and down at the court of King James, had a falcon embroidered on his sleeve, and the motto, "I bear a raven, fearless in flight, who checks at him his death is dight." Then a Scottish knight saw the device, and after a while appeared with another. His was a raven with a piece of meat, and its motto said, "I bear a raven picking at a piece; who pecks at him, I'll peck at his nese." The story goes on, that in the arrangements for the consequent fight, the Scottish knight, who had but one eye, demanded that his opponent should lose one of his, in order to be on an equality.

There will not be time to do more than briefly allude to colour treatment. It will suffice to say that it is not at all desirable that heraldry should *scream* in mural decoration however necessary it may have been to do so in the field. So long as the tinctures are distinguishable with sufficient clearness any modification of tint may be used, and the colour may be broken by means of diaper or other surface treatment that may be desirable in order to make the heraldry take its appointed place. Always avoiding, however, any interference with the clear statement of the heraldric facts. The decoration may be modelled in gesso and treated with monochrome, so as to emphasize the modelling, or in many another way that practice will suggest.

The revival of the art of enamel also offers a splendid material for heraldic work. The series of works in enamel on the monuments, and above all, the early Stall Plates of the Knights of the Garter at Windsor, are too well known to need more than an allusion to the magnificent field of study they afford; but it may perhaps be permitted to hope that the beautiful art of enamelling which (though its revival is less than 20 years old) is fully capable of worthily following its long ago predecessors, may have, some day, an opportunity of doing so.

The value of heraldry in domestic decoration is also obvious. One can hardly imagine anything to excel the gemlike effect of armorial enamels on the dark panels of a library, for example.

Whatever be the material in which heraldry finds its means of expression, it is permitted confidently to hope that the wide and increasing interest that is being extended to the subject may result in the production of work that is not unworthy to follow the best of its predecessors.

DISCUSSION.

Mr. CHARLES CHADWYCK-HEALEY, K.C., said that he had listened with great interest to Mr. Eve's remarks, and he wished to express his appreciation of the work that Mr. Eve had been doing for some time in developing the art of heraldry in this country. There was very great need for such work, for the country had been in a lamentable condition in this

BRITISH LIBRARY

matter for a great number of years, and it was so still, in spite of everything that had been done to bring about improvement. One need only to look, for instance, at the miserable way in which heraldry was impressed upon silver plate by the silversmith, by means of engraving. An instance came under his personal observation a year or two ago. It was desired to put a shield of arms upon a piece of old plate, and one of the leading silversmiths in London was invited to engrave it. A preliminary sketch was made, but a more pitiable thing was never turned out. The charges were reduced to the very smallest possible dimensions, so that they could hardly be recognised. The artist seemed to desire to display as much as possible the colour of the shield. The ordinary was also of the smallest dimensions. He hoped that the time was not very far distant when heraldry as a means of decoration might be developed, and that the practice of it would permeate through every class of artificer. But that could only be brought about by conscientious work, and by the example of men who had made the subject their study. He believed that a great deal was being done on the Continent in developing heraldry in design. Probably continental design would prove to be in the end rather more florid than English people cared to see, but, as an illustration of continental work he might refer to the Munich almanack, which was published every year, and which could be bought for a shilling. It was full of heraldic designs. The publication of a work of similar character was one of the ways in which heraldic design might be popularised in this country.

Mr. R. Garraway Rice agreed that the subject was of great interest. It was noticeable how much better the earlier heraldry was than the later. If he understood Mr. Eve's work aright, it had gone on the principle of trying to bring back that simplicity which was true decoration, and to avoid excessive ornament. In the 18th century, when classical forms prevailed in architecture, heraldry, which was essentially mediæval, was out of place, and it was very difficult to introduce it, hence architecture and heraldry seemed to have fallen apart. At the present day one had the advantage of being able to study the various periods, but it seemed to him that the difficulty which a modern designer had to contend with was that having at his finger-ends practically everything that had gone before, it was extremely difficult to avoid a kind of mixture. The difficulty of modern artists was to give something pure and to avoid introducing features which were out of place.

Mr. R. Phillips said that heraldry was a great aid in ornament, but no doubt those interested in the subject would agree that it had not retained the dignity and importance which properly belonged to it. He remembered in his wanderings in the New Forest coming upon a perfect mine of heraldry in the old Abbey Church at Christchurch. One point which had occurred to him, was the greater beauty of heraldic designs on buildings than in other things. He thought that the chief reason of this was, that in buildings, heraldic designs were always executed in higher relief.

Mr. George Clulow said that Mr. Eve had put before them, in a very interesting way, examples of the decorative use of heraldic design in England and other countries, but had omitted Germany. He regretted this, because there were, in Germany, numerous examples of the 16th century which abounded in the vigorous and decorative character on which Mr. Eve had properly laid much stress. As to the way in which heraldry is often expressed on plate, they must look at the subject from the point of view of the ability of the person called in to do the work. The incident of which Mr. Chadwyck-Healey had told them, displayed, of course, great ignorance on the part of the designer and engraver. It seemed to him that attention ought to be called to the fact that there were among them gentlemen who were capable of supplying heraldry in scientific form, and according to the proper heraldic use. The value of a paper, such as had been read, was that it would call attention to that fact.

Mr. Frank Frederick, in reply to the Chairman, said that the whole subject was absolutely new to him, as he came from a country where heraldry was not regarded, and where it was only seen in decoration and design. Only that day, in walking in the South Kensington Museum, he was struck with the fact that there was such a mine of wealth of design there.

Mr. Alexander Millar said that he had derived extreme pleasure from Mr. Eve's book. That was a work which everyone interested in the subject ought to possess. But, like another speaker, he had been a little disappointed not to find more reference to German heraldry. He possessed a book of which an English edition was about to be published, which appeared to him to be the fullest and finest work on German heraldic design, so far as ancient examples were concerned. In that book, the crest appeared to be composed, in many cases, of enormous horns, taking a sort of lyre shape, and ending in a kind of trumpet mouth. He did not think that he had seen anything like it in English heraldry, though it was extremely common in Germany. He should like very much to ask whether Mr. Eve could explain what the purport of that design was. Reference had been made to a German almanack, which had been published for seven or eight years; something of the same kind appeared in this country this year and last year, and he had copies of it. This book gave the English coats of arms in precisely the same style that coats of arms were given in the German almanack, but the design was less extravagant, and had a more chastened method of expression. Mr. Eve referred in his book to the origin of the

مكتبة قطر الوطنية
Qatar National Library

fleur-de-lis, and he spoke of it as probably derived from the iris or the flag. He had the strongest possible belief that it was so derived, and he did not think that it could have been adopted from the lily, however much the lily might have been conventionalised.

The CHAIRMAN regretted that he was not so entirely in sympathy with heraldry as a chairman ought to be. He looked upon it rather as an art of the past, chiefly of antiquarian interest. The shield of arms borne by a man's ancestors in battle interested him; but not the arms granted in recent years to a civilian—what had he to do with a shield at all? He (the Chairman) was interested in heraldry mainly because it was decorative. He regarded it as the type of what symbolic design should be, and of treatment of such design. But symbolism itself might become tiresome; the "rathe primrose" had not gained in poetry since it became a badge of party politics. The decorator had much to learn from heraldry—especially as to readable expression, and as to the logical use of colour—a mercy to those who had not very acute colour sense. Another lesson to be learnt from heraldry was as to the treatment of animal form in decoration, and especially in ornament, by no means an easy matter. As to the Sicilian silks to which the reader of the paper had alluded, possibly the weavers learnt from the heralds, or each might have learnt from the other. What Mr. Eve had said about proportion in heraldry would be helpful to designers and practical decorators; and it would be encouraging to them to be told that they might treat heraldry very freely, so long as they used their common sense. The pedantry connected with heraldry was one reason why artists "fought shy" of it. And the persons who hampered the artist did not always know. He had himself been called to order for introducing a diaper of grass as a background to the crest of a mower—that was not his crest said the worthy gentleman. In the decoration of a façade of a railway station not a hundred miles from Snow-hill the arms of the counties through which the line passed were on shields of all shapes and periods, according to the notepaper heading or other such "authority" from which the sculptor worked—plainly, he was of opinion that the shape of the shield was a matter with which he had no right to tamper. The result was hopeless incongruity. Apropos of silversmith's work, he agreed with Mr. Chadwyck-Healey. Presumably it was on account of cheapness that silversmiths resorted so enormously to engraving as a means of heraldic expression. But if heraldry was worth introducing at all, it was worth treating in a more dignified manner, and should not be introduced in the shamefaced manner which was usual. The "Münchener Kalendar," he might mention, were designed by Otto Hupp, an artist imbued with the mediæval spirit. Mr. Eve had mentioned Pugin. He might have mentioned also Clement Heaton, who in his day did most vigorous heraldic work. Referring to an illustration shown by the author, the Chairman protested against angel shield-bearers—there was authority for it in old work; but we knew better, or ought to. To make an angel hold the shield even of a great "swell," seemed to him playing it rather "low down" on the angel. Why did not we have heraldry on our stamps? It would at least prevent the necessity of changing them with each new reign. After referring to Mr. Eve's own excellent work in heraldic design, the Chairman concluded by proposing a hearty vote of thanks to him for his excellent paper.

The proposal was carried unanimously.

Mr. EVE, in reply, thanked the meeting for the attention which had been given to him, and also thanked the various speakers for their interesting remarks. The reason that he had not dwelt on German heraldry, was that it was a large subject, and he could not include it within the limits alloted to him. He was a great admirer of German heraldry, and he regarded it as extremely fine and vigorous. As to the Munich almanac, of course they all knew it. He should have dwelt upon heraldic ornament in iron work, but through an accident, he was unable to have the slides ready. They would have been useful as showing how heraldic design should be adapted to the material used. He could not give any information as to the German horns, about which a question had been asked. He had always understood that the horns were due to early decoration of the helmet, and that the crest was a perpetuation and a derivation of them. He had referred to Pugin, as a representative name in the gothic revival. His son-in-law Powell, Burges, and West, among others, had also done admirable work. The Chairman had objected that heraldry was a thing of the past, and he assumed that all heraldry was of a battle origin. But that was not the case. In mediæval times, many people who never fought if they could help it used heraldic arms; and even if such arms were of battle origin, he did not see why civilians should dispense with the opportunity of using a personal emblem because they did not use it for fighting purposes. The silks which he had referred to were the early textiles which came from the East through Sicily, or were those copied from oriental examples. If the animals in those early silks were compared with the earliest illuminated manuscripts the resemblance would be found to be most marked. With regard to the mower, he sympathised with the Chairman in the circumstances he had described. He agreed that correctness of expression should be insisted upon. If a thing was written in heraldry it ought to be written in such a way that its meaning should not be misunderstood. The accuracy of the heraldic statement being thus safe-guarded, ts decorative treatment could then take the course that seemed fit.

TWELFTH ORDINARY MEETING.

Wednesday, February 25, 1903; Sir STEUART COLVIN BAYLEY, K.C.S.I., C.I.E., Vice-President of the Society, in the chair.

The following candidates were proposed for election as members of the Society:—

Anderson, Sir R. Rowand, LL.D., F.R.S.E., 16, Rutland-square, Edinburgh.

Baker, Charles Edmund, 54, Parliament-street, S.W., and Park Hill-lodge, Shortlands, Kent.

Calderwood, James Macdonald, M.Am.I.M.E., M.Inst.M.M., Messrs. Symons and Moses, P.O. Box 469, Johannesburg, Transvaal, South Africa.

Fraser, A. Brodie, Roddach Bow, Denton-road, Canton, Cardiff.

Grenfell, General Lord, G.C.B., G.C.M.G., The Palace, Valetta, Malta.

McLaughlin, Miss M. Louise, 2558, Eden-avenue, Mount Auburn, Cincinnati, Ohio, U.S.A.

Matland, George Read, 1, Finsbury-pavement, E.C.

Oelsner, Isidor, 31, Holland-villas-road, Kensington, W.

Quin, William James, J.P., Bishops Glen (P.O. Box 58), Bloemfontein, Orange River Colony, South Africa.

Rank, Joseph, Willersley-house, The Park, Hull.

The following candidates were balloted for and duly elected members of the Society: —

Ferguson, James, 4, Warltersville-road, Crouch-hill, N., and 91, Fore-street, E.C.

Hamilton, W. L. H., 16, St. Helens-place, E.C.

Hume, John, 18, Chapter-road, Willesden-green, N.W.

Lowry, George A., Board of Trade-buildings, Boston, Massachusetts, U.S.A.

Mackinlay, James W., Chumleigh, Finchley, N., and 85, London-wall, E.C.

Mossop, T., Bond-street-chambers, Bradford, Yorks.

Moysey, Frank Lindsey, 78, Wellmeadow-road, Catford, S.E.

Pyper, William James Stanton, Hollywood, St. Lawrence-road, Clontarf, Dublin.

Riley, Henry Lindon, LL.B., Court-chambers, St. Helens, Lancashire.

Scarborough, Prof. W. S., LL.D., Ph.D., Wilberforce University, Wilberforce, Ohio, U.S.A.

The paper read was—

TONKIN, YUNNAN, AND BURMA.

BY FRED. W. CAREY, F.R.G.S.
(Late H.B.M.'s Acting-Consul at Szemao, China.)

The title of my paper is somewhat of a misnomer. I could not hope to give you, in the time at my disposal this evening, a comprehensive description of Tonkin, Yunnan, and Burma. What I want to do is to treat, in a brief fashion, of these three countries in their relation to each other commercially; to describe two of the ways of penetration into South-West China; and to illustrate a journey from Haiphong up the Red River, through Yunnan and the Shan States into Burma. I trust that my illustrations will make up for any deficiency of matter in the paper itself.

Tonkin is the northern half of the kingdom, or empire of Annam, and was for many hundreds of years a tributary state of the Chinese empire. Little need be said of its history previous to the appearance of the French on the scene, towards the end of the 18th century. In 1799 they assisted their *protégé*, Ghia Lung, to the throne of Annam, but it was not until 50 years later that they began to take an interest in the government of that kingdom, an interest which did not cease until in 1885, as a result of the Franco-Chinese difficulty, Tonkin became a French colony.

Tonkin is divided naturally into two parts, the Delta, which is the low-lying and fertile southern portion, and the hilly country, commencing a little to the north of Hanoi, and extending north and east in both directions to the Chinese frontier. The mountainous portion is densely wooded, and very sparsely populated: minerals are said to exist in places. The Delta is simply one huge rice-plain, watered by the Red River and its numerous affluents. Generally speaking the climate of Tonkin is hot and unhealthy.

Haiphong, the principal port of Tonkin, is situated on the right bank of the CuaCam, one of the numerous mouths of the Red River, 12 miles from the sea. It is 48 hours from Hongkong by mail steamer. On account of the double bar at the entrance, the CuaCam is only navigable to steamers drawing less than 19 feet of water: and approach to the port of Haiphong is rendered still more difficul. from the fact that the tides in the Gulf of Tonkin are diurnal, *i.e.*, there is only one rise and fall during 24 hours, instead of every 12 as on our own coasts.

BRITISH LIBRARY

The CuaCam at Haiphong is connected with the Red River by the "Canal des Bambous," a narrow waterway lying right through the middle of rice-fields. Communication with Hanoi is kept up by steamers of some 180 tons burden. Passage through the canal is very uninteresting, only one elevation, known as "Elephant Mountain," because that is the animal it least resembles, breaks the monotony of the plain. Around this hill the steamer seems to be constantly circling owing to the windings of the canal. There are a few villages near the banks and as the steamer passes bands of naked little boys—regular pirates in embryo—issue, and solicit alms as they run along, after the manner of the "have-a-dive" boys at Aden. Six hours passage through the canal brings the steamer out into the rapid waters of the Red River, and ten hours later the boat generally announces its arrival at Hanoi by running on a sand-bank. The Red River is of a most treacherous nature as regards the rapid formation of sand-shoals. During the rainy season (corresponding to the Indian monsoons) it is subject to rapid changes, rising from 16 to 18 feet in as many hours: so that what one day is a broad tract of dry sand covered with traffic becomes the next a wide expanse of clay-coloured water, on which float hundreds of bamboo houses; for the Annamese fisherfolk prepare themselves for such emergencies by constructing their dwellings on a raft-like principle, so that they buoy up as the river rises.

Hanoi lies on the right bank of the Red River, a fine bridge, completed only last year, connecting it with the opposite bank. It is now recognised as the official capital of Tonkin, although until a year or two ago Hué, the residence of the Emperor of Annam, bore that title. History records that Hanoi was founded in the 8th century by a Chinese Mandarin. Its original Chinese appellation (Tungking—"Capital of the East") is now perpetuated in the name of the country itself.

The European portion of the town of Hanoi is splendidly laid out. The public buildings and the Cathedral are very fine, and the lakes and open spaces about the town admirably kept. Altogether Hanoi is one of the brightest and most picturesque cities of the Far East.

At Hanoi we came into closer touch with the natives of the country, who belong to the common Indo-Chinese stock. The Annamese, both morally and physically, are one of the inferior races. The men are undersized, but active, good-tempered, and tractable. They have not the commercial instinct of their neighbours, and, as in Penang and Singapore, all trade is practically in the hands of Chinese merchants. The women have rather nice figures, and they would be considered good-looking but for their mouths, which are spoilt by the custom of covering the teeth with a layer of black lacquer. Their beauty is not enhanced, either, by the unpleasant habit of chewing betel. Equality of the sexes, so far as hard work is concerned, applies in Tonkin. We noticed many women employed in gangs, carrying timber for building, &c.

Hanoi is connected by railway with Langson, on the Kwangsi frontier. This line was a most costly one to the colony, and although it is intended to carry it on to Lungohow, and eventually to Nanning Fu on the West River, it is highly improbable that it will ever pay its working expenses. A railway to Viétri is also under construction, and will be carried on to Laokay in time. This is the line which is eventually to enter Yunnan, and I shall refer to it again in the course of my paper.

The steamer into which we changed at Hanoi, to continue our way up the Red River, belongs to the "Compagnie des Correspondances fluviales," who enjoy a monopoly of the river navigation in Tonkin. Our boat was a stern-wheeler, drawing five feet of water, yet able to run up as far as Yenbay, *only when the river is in flood*. We left Hanoi at noon. During the evening we passed Sontay (scene of a sanguinary battle between the French and Chinese in '85) on our left, and anchored soon afterwards for the night at Viétri, a small military post at the junction of the Clear and Red Rivers. The Clear River rises near Kaihua Fu in Yunnan, and has been suggested as an alternative route for a railway into that province. It is navigable for small steamers to Tu Yen-kwang, 40 miles or so up from Viétri.

During the forenoon of the next day we passed, on our left, the Black River, by far the most important tributary of the Red River. Steamers run regularly up to Chobo, but beyond that navigation is difficult and even dangerous at all times of the year, the river being very swift and rocky. Small narrow boats of half-ton capacity, carry goods during the dry season up to Laichow, near the Yunnan frontier; but when the river is in flood communication is impossible, and nothing is more dreary than life in some of the military posts on the Black River of Tonkin.

Three days out from Hanoi we reached Yenbay, a growing garrison town on the left

Qatar National Library

bank. There we changed into a small stern-wheel steamer of a newer type—the *Baoha* This boat runs between Yenbay and Laokay during the rainy season. Although only of light draught, and 40 tons burden, it cannot get up so far during the dry season. In fact the Red River is only navigable to small steamers, *all the year*, to Viétri. Native craft, on the contrary, are busiest when the river is low, and the current not quite so strong.

inch of space outside the cabin was occupied by soldiers of the Foreign Legion. Most of these men were Alsatians or Norwegians; but at different posts on the way up I met three Englishmen, who gave me plausible reasons to account for their enlistment in the Legion,—the real one being, I suspect, a desire to keep as far away as possible from the Scotland Yard authorities.

The great feature, and at the same time the

MAP OF TONKIN, YUNNAN, AND BURMA.

Accommodation for passengers on board the *Baoha* was limited. There were twelve of us, and only one small cabin; and in this we had to eat, amuse ourselves during the day, and sleep—the settees being hooked up in sleeping-car fashion at night. Those who occupied the upper berths were comfortable enough; but those underneath suffered from the heat, and from fear of the dreadful consequences should the bars holding up the berth and the 200 lb. gentleman above give way.

The company is subsidized for military purposes by the Government, and every square

drawback, of the Red River are its numerous rapids, which add an element of danger to the difficulties of navigation. There are no less than sixteen of these places between Yenbay and Laokay, where the current rushes down over rocks with great velocity. The worst rapid is the "Ta Kai," just below the post of Traihut. As the little steamer forged its way slowly up against the strong current, the Annamese crew threw "joss-paper" overboard in handfuls to propitiate the river gods, and they attributed our safe passage to this sacrifice. We were at all events luckier than

مكتبة قطر الوطنية
Qatar National Library

the Commercial Mission sent out in 1896 by the French Chambers of Commerce to study the trade of Tonkin and China. They came to grief at the "Ta Kai," and had to continue their journey in junks. Perhaps the supply of "joss-paper" had given out!

The journey from Yenbay to Laokay usually occupies three days. Laokay is only a small place, but it is important as being the steamer terminus, and a frontier post. On the left bank the Tonkin-Yunnan frontier is marked by the NanHsi, a small stream which here joins the Red River, and Laokay is situated just at the junction. Chinese and French forts, perched on exactly opposite hills, stare defiance at each other across the little stream.

On the Chinese side of the NanHsi is the village of Hokow, where there is a branch of the Imperial Chinese Customs. Here we obtained the junks necessary for the continuance of our journey. The largest of these boats are 60 to 70 feet long by 9 wide, and have a carrying capacity of 12 tons; but those employed on the upper reaches can only take five tons weight of cargo. They all have the triangular mast peculiar to junks of the Red River. This mast is made of two long bamboos, attached one on each side of the boat, and fastened together at the top ends. It can be raised or lowered at will, and carries a big square sail.

We engaged three of the smaller kind, and having transferred our baggage into them, set sail in company with several other boats that were proceeding up river. There was a crew of five men to each boat. They did nothing but whistle whilst the wind lasted; when it slackened they would either jump ashore and tow us, or bring out long poles and push us along. When we arrived at a rapid (and these places are numerous between Laokay and Manhao) the crews of all the boats would combine to help each other over, and these were times of much hard work and fearful gesticulation. At critical moments recourse was had to the river gods, whose effigies are stuck up in rocky niches near the most dangerous rapids.

Proceeding up river from Laokay, we had Chinese territory on our right and French on our left, for the right bank is French up to the Lungpo stream, where the frontier turns at right angles and runs west.

About half-way up between Laokay and Manhao, on the left bank, is the small village of Hsinkai, from which place there is a road that runs by fairly easy gradients up to the Mengtsz plain and so on to the Yunnan plateau. Up this road the French intend to carry their railway, and a lot of levelling work has already been done on this portion of the line.

When the river is low, and with a favourable wind, junks accomplish the journey up to Manhao in four or five days, but under adverse circumstances they sometimes take a month. Rather a funny thing happened during the delimitation of the Tonkin-Yunnan frontier a few years ago. Two French officers, attached to the Boundary Commission, having occasion to go down from Mengtsz to Laokay, were asked by their comrades to bring back with them a fresh supply of wines and provisions. By the time they were ready to return the river was in flood, and the journey up to Manhao alone took them 35 days. Moreover, a party of missionaries bound for Yunnan accompanied them up; and, before they reached Mengtsz, they had finished the entire stock of stores, much to the disgust of the other members of the Commission.

Manhao is called the port of Mengtsz. It is the terminus of the larger junks, though the smaller ones can go up as far as Yuanchiang. Manhao is really merely a landing-place for goods on their way to the Yunnan plateau. It is looked upon by the Yunnanese as a most unhealthy spot, and the muleteers of caravans from Mengtsz will never spend the night there. They sleep up in the hills, descend early in the morning, leave their cargo at Manhao, and get away as soon as they have loaded their animals with the goods awaiting them. The mule of Yunnan is a wonderful little animal. It will carry a load of 150 lbs. day after day over the steepest roads of the province in all kinds of weather.

We left Mahano the day following our arrival, and proceeded to make acquaintance with the mountains of Yunnan. The road in most places was simply a series of stone steps, and one's first experience of riding up these, though amusing to the onlooker, is unpleasant, the stones are so very, very hard. After crossing the first range above the Red River, we felt that we had earned a good night's rest. This, however, we did not get, as the inns between Manhao and Mengtsz are mere hovels, meant as shelter more for passing pack-animals than travellers. The noise made by the mules, and the chattering of their drivers disturbed us; but the worst enemy to slumber in all Chinese inns is the "chamois"—Mark Twain's variety.

Next day, after crossing a second range of mountains, 6,000 to 7,000 feet above sea-level,

BRITISH LIBRARY

we followed a spur down into the plain of Mengtsz. This place, opened by the French to frontier trade in 1889, is the principal port of entry for foreign goods into south and eastern Yunnan. I note, in passing, that 72 per cent. of the whole Import trade into Yunnan, *viâ* Mengtsz, is indisputably British, and 79 per cent. of the total Export trade.

Yunnan has been aptly described as a mountainous desert, with here and there an oasis in the shape of a fertile plain. Most of these plains lie at elevation of from 4,500 to 6,000 feet above the level of the sea, and enjoy a warm, equable climate. The Chinese congregate in these healthy spots, and in the course of years have pushed the original inhabitants, *e.g.*, the Sians and Lolos, into the hills or down into the fever-stricken valleys where they themselves cannot live.

The area of Yunnan is 110,000 square miles, about twice the size of England. Its population is only 8,000,000. Most of the inhabitants dwell in the big centres of the eastern portion of the province—Yunnan Fu, Cheng Chiang, Chao Tung, Linan, &c. It follows, therefore, that large tracts of the province are very sparsely peopled, and almost entirely uncultivated. The poverty of the inhabitants is very apparent, and the traveller wonders why the wealth of Yunnan is so often referred to. The reason, no doubt, is to be found in its position on the map. It is the hinterland of both British Burma and French Tonkin, and the highway from these countries to the richest province of China—Szechwan. That Yunnan is also a part of the Chinese Empire is often forgotten, China being considered, I suppose, a negligible quantity.

The mineral resources of Yunnan are no doubt large, though the mines were worked to a greater extent formerly than now. The copper mines to the north-east have been exploited for centuries: deposits of silver and lead occur in places. Near Mengtsz there are important tin mines; and iron and coal exist in large quantities in the neighbourhood of Tunghai. Zinc and mercury have been found, I believe, by French prospectors. Gold is worked at Talang, and one or two other places; but Yunnan includes no Klondyke within its borders. The situation of most of these mines, however, is unfavourable from a commercial point of view. Heavy cost of transport and distance from the world's markets are factors that have to be reckoned with. I know that the Mengtsz merchants make very little profit on the *tin* they export to Hongkong, but it happens to be for them the most convenient way of paying for some of the goods they import.

As the most valuable article of commercial exchange, however, *opium* has superseded everything for the last 30 years. The cultivation of the poppy in Yunnan can be traced back to the year 1760—eighty years before our so-called Opium War with China—and the Yunnanese are further credited with having discovered the way of smoking the drug. The production of opium in any quantity dates from the time of the Mahommedan Rebellion, which killed the silk industry, and closed half the mines in the province. The want of some product, easily transportable, with which they could pay for their needs, led the Yunnanese to turn their attention more and more to the cultivation of the poppy. The annual output is now not far short of 5,500 tons, whils in the neighbouring province of Szechwan it is considerably more. Indian opium, which the sophist accuses us of forcing on the Chinese, is, on entry into China, handicapped by an exceedingly heavy import duty. In a few years' time it is bound to be ousted from the Chinese market by the native article, and the great "Opium Question" will then no longer concern us. Opium smoking is, no doubt, a terrible vice, but it is preferable, in some respects, to what is known as *our* "national sin." The opium smoker never wants to go "mafficking," or paint the town red, to the great discomfort of respectable citizens!

Salt for local consumption is all obtained from mines and brine wells within the province, and carried by pack-animals to the various markets. When the brine is drawn from the wells, it is poured into large iron pans, under which a fire is set, and the salt obtained by evaporation.

With the exception of the minerals referred to, Yunnan possesses no product suitable for exportation, and possible goods for carriage by projected Burma-Yunnan or Tonkin-Yunnan railways are hard to think of. The trade that might eventually arise in live stock has been made much of, and certainly many parts of the Yunnan plateau are particularly suited to the breeding of sheep, oxen and ponies.

This question of railways into Yunnan is one on which there exists considerable differences of opinion. It can be viewed from the commercial or political aspect, and may briefly be summed up as follows:—The French have obtained a concession to extend their railway

from Laokay to Yunnan Fu. The construction of this line, it is thought by some, will "interpose an insurmountable barrier of French influence between Burma and Western China" to the prejudice of British trade. The Indian Government is, therefore, urged to construct an opposition line from the Kunlung Ferry to Tali Fu. The distances as the crow flies are about equal, but it is not denied that the engineering difficulties of the British line are far greater than those to be overcome by the French.

The French are greatly favoured in two respects. Tonkin is much nearer than Burma to the richest and most populous portions of the province; and, owing to the trend of the country, the approaches to Yunnan from Tonkin run parallel with the mountain ranges. Situated thus, the French are bound to extend their influence in Yunnan, but the statistics of the trade of Mengtsz prove, I think, that commercially, we have no cause to fear their rivalry.

From Burma the railways suggested would have to traverse, or *dodge*, the chains of mountains which divide the Mekong and Salween Rivers and their numerous affluents. I am aware that, thanks to the action of the Yunnan Company, and the help accorded them by the Indian Government, a route has been found from Kunlung which avoids the steeper gradients; but the railway proposed could be built only at an immense cost, and even then as the Western portion of the province is wretchedly poor, to compete with the French railway it would have to be carried on over most difficult country to Yunnan Fu. The trade possibilities of the province, viewed ever so optimistically, do not, I think, warrant such a huge undertaking; and I see in the passive attitude of the Indian Government, not blindness to the political importance of such railway schemes, but merely a hesitation to burden themselves with the financial responsility.

A line that could be built at a comparatively small cost, and that would pay, is one from Bhamo, our trade mart on the Irrawaddy, to Tengyueh, the port of Western Yunnan.

The hostility of the population to railway schemes was shown in the riots which broke out at Mengtsz, in June, 1899. A mob attacked the foreign settlement there in the middle of the night, and burnt two houses occupied by the Commissioner and members of my own service.

For many years to come the Yunnanese will have to depend on their present means of transport. Besides the mule, there is the bullock, also used as a pack animal. The water buffalo, though strictly speaking an agricultural animal, is sometimes harnessed to a rough cart used, equally, to carry stones, or to take a party of Yunnanese ladies to some temple on the hills. In it they also visit their family graves, an act of piety that more often develops into a happy picnic.

Reference to family graves brings us to funerals. The three important occasions of a Chinaman's life are his birth, his marriage, and his death. In Yunnan the last is the event which calls for most display. On the death of a relative even the poorest family gives a feast to which all their friends are invited. The funeral car used has a paper Stork on top. It is the emblem of immortality. The Goose is, similarly, the symbol of conjugal felicity. A paper one is always stuck up on a pole outside the house of a newly-wedded couple in Yunnan. So that the rich man may have every comfort when he wakes in the Buddhist purgatory, paper images of what he will most need are made, and after being carried in his funeral procession are burnt at his graveside. There is for instance his horse, with groom in charge. Four paper bearers also carry his sedan chair, ready for him to step into when he lands on the other side of the Styx. The mourners at a Yunnanese funeral wear white, not black, another instance of their topsy-turvydom. To the principal guests at the funeral two pieces of white cloth are given, one for the head, the other for the waist.

From funerals I turn for a moment to other examples of Yunnanese customs, in which a procession forms the distinctive feature. There is the "Ying Chun" Festival or ceremony of meeting the Spring. The chief official of the place is then borne on a special car to a small temple marking the eastern boundary of his town. There he meets the plaster figure of a buffalo, supposed to represent the Spring, with which after worshipping at the temple he returns in state to his residence.

At another procession during the year, an idol (that is presumably in need of an airing) is borne round the town on the shoulders of respectable shopkeepers.

But the prettiest processions take place every spring and autumn to mark the season's changes. Then the people make what they call "Flower Cars." Little boys, dressed to represent the heroes and heroines of antiquity, are perched up aloft on iron bars, and as the cars move along, borne on men's shoulders,

they wave their fans and nod their heads. The whole effect is very picturesque and pleasing.

The Chinese are past masters in the art of irrigating their fields. Their staple food, rice, must be grown in water until it ripens, and in Yunnan they have all kinds of ingenious ways of carrying water on to their farms. One method is the wheel that is turned by a stream, and to which is attached hollow pieces of bamboo. These fill and empty themselves automatically into a wooden shoot leading into the fields.

After the rice is harvested, it has to be hulled or skinned before it can be eaten, and this labour calls for a further display of ingenuity. The apparatus used in many villages consists of a wooden log, hollowed at one end, and with a piece of hard wood fastened through the other. The log is evenly balanced, and a stream of water is directed on to the hollow end, which sinks down under the weight of water, empties itself, and rises again. The other end falls continually on to the grain, and loosens the husk.

The Yunnanese live almost entirely on rice and vegetables. When they can afford it they buy some pork, or kill a fowl, but meat to the majority of the inhabitants is a luxury. Only the Mahommedans eat beef, and where they live beef can usually be purchased daily in the market. The Mahommedans in Yunnan are probably descended from the soldiers stationed there by the Great Mongol Emperor, Ghenghis Khan, when he invaded Burma and India in the 13th century. In 1855 occurred their terrible rebellion, and the Mahommedans kept the field against the Imperialist troops till 1873. The Chinese eventually gained the ascendency, but not before the population of the province had been reduced by many millions.

The first Chinese settlers intermarried freely with the native tribes around them, and the result is that the beliefs and customs of their descendants, the Yunnanese of the present day, differ in many respects from those common to other parts of China. They are intensely superstitious, and believe in divination of all kinds. They would even have faith, I believe, in the weather forecasts of our Meteorological Department. The local diviner is usually a blind man. When a young man wishes to start a home of his own, he does not go on his knees and ask some sweet maid to be his everlasting cook and stocking darner. He obtains instead her "card of nativity" through one of the recognised match-makers of the place, and sends it with his own to a diviner. If the "stars are in conjunction" negotiations can continue, but if they don't agree all is at an end! At least he must seek elsewhere.

Phrenology is not practised, so far as I am aware, but physiognomists get a good living amongst the Yunnanese. A Chinaman is not supposed to grow a moustache until he is at least 30 years of age. He makes a virtue of necessity in this case. However, when he does want to increase his attractions, the Yunnanese applies to a physiognomist, who will discover for him a lucky day on which to start growing a moustache.

In Yunnan the "five senses of man" are said to be the ears, eyes, mouth, nose, and eyebrows. Blue or grey eyes are rarely met with amongst the Chinese, the prevailing colour being black. The consequence is that the Yunnanese attribute extraordinary powers to our eyes. According to them we can see the precious minerals in the earth. I have even been asked by some country people to aid them to find the silver supposed to have been hidden by their parents in their garden during the Mahommedan rebellion.

The Yunnanese lady is fond of dressing herself and her children in bright colours. The most favoured material is Szechwan flowered silk; but for ordinary wear coloured cotton cloth, made and dyed locally, is in general use. Woollen cloth is much appreciated, but is very dear, all on the market being of British or German manufacture. As jewellery—earrings, bracelets, rings, necklaces, and hair ornaments are worn. These are generally made of silver, but the very poor classes manage with brass or pewter.

In India the would-be beauty must imitate the waddle of an elephant. In China the "waving willow" walk is held up as the acme of perfect progression for women. To obtain this walk mothers bind the feet of their girl-babies in rather a cruel fashion, so as to make them small and pointed. In Yunnan it is only the girls of the richer classes whose feet are permanently deformed. It is a silly custom, of course; but one thing may be said in its favour, and it is probably why the women have so long permitted themselves to be the victims of such a fashion. On account of their bound feet the Chinese women are not compelled to slave in the fields like the women of every other Eastern race, whilst their husbands loaf at home. To be in the fashion, the Yunnanese women of the poorer classes bind their feet

with cotton bandages, so as to make them appear smaller, but beyond giving them the necessary willowy step, it does not seem to hurt them in any way.

To turn once more from frivolous to serious consideration of our subject. It is 18 days journey by mule caravan from Mengtsz to Szemao. The main road leads through Linan, Shihping, noted for its lovely lake, Yuanchiang, a small, fever-stricken, walled city, on the Red River, Talang, and Pu-Erh. The road lies over mountain ranges, down the beds of streams, and up wooded valleys, never monotonous, but often difficult. Just east of Yuanchiang the road crosses a range 8,000 feet high, descending immediately after the Red River, only 1,500 feet above the sea at that place. The climb on the opposite side is a very stiff one, and the best way is to cling on to your pony's tail and let him pull you up.

The roads in Yunnan, generally, are in a deplorable condition. The bridges, however, are a noticeable feature of the province. The curve of the ordinary stone ones is unnecessarily high in proportion to the width of the streams they span. Between Yuanchiang and Talang, there are two rather fine chain suspension bridges. They span the Papien and the Homa rivers, which unite further south, and enter Tonkin as the Black River. The planking in the centre of these bridges is purposely left loose, and is, in fact, very unsafe. This is to prevent caravans of pack animals from passing over in a body, and causing too great a strain on the structure. At present only two or three can cross at a time, and they have to pick their steps most carefully.

The scenery on the road was most superb, and the vegetation most varied, the flowers at different elevations corresponding to those of the Tropics, and the Temperate and Frigid zones respectively. In fact Yunnan is the botanist's paradise.

Szemao is a busy town of 10,000 inhabitants, healthily situated on a little rising in the centre of a typical Yunnan plain. It was opened to frontier trade in 1896, and Consuls for both Great Britain and France appointed there. It was found, however, that the commercial importance of the place had been over-estimated and both Consulates have lately been suppressed. In return, a Consulate General has been established at Yunnan Fu, the capital of the province.

The trade of Szemao is principally in the famous Pu-Erh tea, that is held in such great esteem by the Chinese of other provinces. Raw cotton is imported from the British Shan States; but other necessaries of life, *e.g.*, matches, woollen cloth, lamps, &c., are supplied from Mengtsz.

The architecture of Yunnan has characteristics of its own, notably so in the pointed gables that adorn the houses and temples. The walls, though built of sun-dried and burnt bricks, form no part of the structure of a house, and might fall down without causing a general collapse. The woodwork in all cases supports the roof, and is the solid portion of their buildings. The "guardian" figures outside their temples are rather quaint, their conception of a "lion" being particularly funny.

The animals best known to the Yunnanese are the elephant, tiger, panther, bear, wild boar, sambhur, or big deer, several varieties of small deer—including the musk deer, the fox, wolf, monkey, and wild cat. There are others, but this will suffice to show the variety existing in the province. The panthers at Szemao are rather a nuisance. On three occasions whilst I was out riding on the hills my dog was attacked by a panther. Young bears are sometimes brought into the market for sale. Elephants are found in a wild state in the Chinese Shan States. Some of the Shan chiefs own tame ones, and at rare intervals these are sent into Szemao, as a mark of respect to the Chinese officials.

In the neighbourhood of Szemao live many of the aboriginal tribes, whom the Chinese, in their gradual march westwards, have ousted from their former homes in the plains. The Lolos, so often referred to by travellers, are scattered all over Yunnan. Only in one place, in the north of the province, do they exist as a separate and independent community. They possess a language and literature of their own, though very few of them can now write and read their own characters. Their religion is a form of spirit worship, and consists chiefly in propitiating the evil spirits, so that no harm may come to the inmates of the house. The religion of all these native tribes is a simple one, based on old legends, and arising in the first instance from an attempt to account for the three inexplicable mysteries — Dreams, Disease, and Death.

The Lolos are fond of music and dancing, amusements they indulge in on moonlight nights. Their dancing is not quite like ours. Although both sexes take part in it, they evince no desire to hug each other. They simply move around in a circle, and stamp their feet in time with the music.

The Woni race are supposed to be the oldest inhabitants of Yunnan. They are divided into numerous clans, each wearing different dresses, with as much variety of colour and detail as in the tartans of the Scottish clans. The men, as a rule, wear the blue cotton jacket and trousers common to the poorer classes throughout China; but the women retain the picturesque costume of their tribe. The Akka of the Shan States belong to the Woni race, as do also the Putu and the Mahê. The Mahê lead a wretched existence. They dwell in tiny little bamboo and mud hovels on the outskirts of Szemao and Pu Erh, and act as "hewers of wood and drawers of water" to the Chinese. Every day they go out, young and old, to the neighbouring hills in search of firewood, which they bring into the town toward evening. They sell as much as they can carry for 75 cash, equivalent to 2d. in our money. They never grow rich!

I shall not have time this evening to describe any more of these hill tribes, but I should like to mention, in passing, the interesting "Wa" tribes, wild and tame, of the Meng Lem district.

My homeward journey led me through the Shan States and Burma. The healthy portion of the Yunnan plateau terminates in most abrupt fashion a few miles beyond Szemao, and one literally tumbles off the edge, down into the lower plains and valleys inhabited by the Shans. Szemao is the last town, and I may add the last centre of civilisation in this direction, until British territory is reached; for south or west beyond Szemao there doesn't exist a single inn for the convenience of travellers. The only way is to camp out, or sleep in the Shan temples *en route*. Except in bad weather, a tent is preferable, and even the muleteers either sleep under a piece of stout cloth held off the ground by sticks, or erect a shelter of branches, roofed with grass. I have stayed in Shan temples, and slept very comfortably under the shadow of the great gilt Buddha, but the awakening was always somewhat of a shock, as it is the practice for the priests and the boy novices to kneel down every day at dawn, and yell their morning orisons.

The capital of the Chinese Shan States is Kenghung, on the Mekong, the residence of the Saw Bwa, or Hereditary Chieftain, who is the nominal ruler of the "Sip Song Panna," *i.e.*, the "Twelve States." From Szemao to this place it is six days' journey. Though the plain of Kenghung lies at an elevation of 2,100 feet above the sea, it is considered by the Chinese to be a most unhealthy spot. Through it runs the Mekong, here nearly 200 yards wide, and crossed by a rude ferry.

The houses of the Shans are usually constructed on piles, their living apartments being thus well off the ground. They do not copy the architecture of the Chinese, and the few bridges that one meets with are of wood or bamboo, and very frail.

One custom of the Chinese Shans is worth noting. At the New Year the young girls provide themselves with balls, like a small pincushion in shape, filled with cotton seed, and covered with pieces of coloured cloth. To one side is attached a long string with streamers. These are thrown by the girls from a certain distance to the young men. By catching or missing them the youths show their preference, and marriage engagements are the result. To obtain some photographs I joined in the game, but I was careful to show no preference.

From Kenghung to Kengtung it is another ten days by caravan. There is nothing to be said in connection with our journey thither, except that the roads were worse if anything than any I have yet seen. Plains give way to mountains, mountains to valleys, and valleys to plains; rarely did we get any level road. Occasionally we came to a river, which the animals had to swim, whilst the baggage was carried across in clumsy boats.

Twelve days out from Szemao we crossed the Burma frontier, marked by a wooden post and a heap of stones. As we neared Kengtung we found evidence of British influence in the roads; they were wider and better kept than those we had been traversing. The country around produces cotton, tea, and a little opium.

Four days later, after negotiating the usual mountain barrier, we descended into the fine plain of Kengtung. This place is one of the outposts of our Empire. It is the residence of a political officer, who, whilst subordinate to the Superintendent of the Southern Shan States, is in charge of the Kengtung State, extending from the Chinese frontier on the north, to Siam on the south. Kengtung is garrisoned by Indian troops, and possesses a post and telegraph office.

Big forests of teak exist in Kengtung territory, near the Siamese frontier, and are worked by the Sawbwa under British supervision.

The Bazaar at Kengtung is one of the sights of British Burma. On market day it is thronged

مكتبة قطر الوطنية
Qatar National Library

with people dressed in every conceivable colour, and the scene is most animated. Lightly clad Siamese, natives of Laos, swarthy Indians, stolid Cantonese pedlars, Burmese, Shans, and numerous hill tribes jostle each other, and the babel of languages once heard is not easily forgotten.

The Shan, or "Tai" race is divided into many clans. The inhabitants of Kengtung are known as "Kuns," those of the Chinese Shan States, as "Lü," of Meng Lem as "Lem," &c.

There is a good mule-track between Kengtung and the Salween. Two very high mountain ranges have nevertheless to be negotiated, but a new route has lately been surveyed that avoids the steeper hills, and a big cart road will shortly be ready for caravans. After leaving Kengtung one travels in comparative comfort. At most of the stages along the road bungalows have been built for the traveller. Seven days' travelling brought us to the Salween, at a place called Takaw. We crossed the river by a ferry boat similar to the one at Kenghung. The ferry system in the Shan States certainly needs amelioration.

Two days later we reached the pretty Namkham River, one of the tributaries of the Salween, and the following day arrived at Hsai-Kao, where there is a post and telegraph office. From Hsai-Kao, a good, wide road led us across undulating plains, resembling the downs of Wiltshire. Water in many places is rather scarce; but with this defect remedied no country would be better suited for colonisation. Like Yunnan, the Shan States could well support a larger population. Amongst the present inhabitants are the "Red Yang" tribe whose dress is very curious. I was glad to add a photo of them to my collection.

Seventeen days out from the Kengtung we arrived at Taunggyi, the capital of the Southern Shan States. It is a prosperous, and growing British settlement, situated in a splendidly chosen spot in a plain 4,600 feet above the sea. This place was only a tiny hamlet twelve years ago. About that time, Mr. Hildebrand, until last year Superintendent of the Southern Shan States, happily selected Taunggyi as his official residence, and it now bids fair to rival that well-known sanatorium of Burma—Maymyo. Trade is thriving, thanks to the construction of good cart roads, and we are bound to hear more of Taunggyi as a commercial centre in the future.

From Taunggyi we turned south to the older military settlement, Fort Stedman, distant one day's march only. Fort Stedman is situated on the eastern shore of Lake Yawng Hwe. The place is much lower and hotter than Taunggyi. Proximity to water could have been the only reason for choosing it as a residence for troops.

Sending my caravan round the lake, I crossed myself in a small dug-out. The shores and islands of the lake are inhabited by the Inthas—a hybrid tribe of Burmese origin. Their method of paddling with their legs is, I believe, absolutely unique. Standing on the gunwale of the boat, they balance themselves on one leg, and twisting the other round the long paddle force the blade back through the water. In this way they send the boat along at a great speed.

The third morning after quitting Lake Yawng Hwe, we finally left the hills behind us, and descended into the hot plains of Lower Burma. For the next two days the roads, though wide and level, were horribly dusty, and the heat and glare intense. We struck the Rangoon-Mandalay railway at Thazi, a small junction town, where I paid off my caravan. We had taken 48 days in coming from Szemao, and in spite of the different altitudes traversed, none of us were ill on the way, a result, I expect, of the quinine that I occasionally dispensed to all.

From Thazi I went down to Rangoon; then wishing to see a little more of Burma, I took the night mail up to Mandalay. A large proportion of the Chinese population of Mandalay are natives of Yunnan, who have, in most cases, taken Chinese wives, and settled there. Continuing my railway journey I went right up to the northern terminus, Myitkina, a settlement on the upper reaches of the Irrawaddy, quite close to the Chinese frontier. Some speculators are dredging for gold in that river, just above Myitkina.

From Myitkina, I went down on a Government launch, kindly placed at my disposal by Sir Frederic Fryer, through the wonderful gorges of the Irrawaddy, rarely visited by travellers, though well worth seeing. At Sinbo, just above the first defile, the river, at the commencement of the rains, rises sometimes as much as 84 feet, owing to the narrowness of the passage lower down. We went down with the current, at a good pace, to Bhamo, a trade-mart and military station—also the terminus of the Irrawaddy steamers. Bhamo is growing wonderfully, and trade with Yunnan across the frontier steadily increasing.

From Bhamo, I continued my way down the river on one of the Irrawaddy Flotilla Com-

734

pany's well-appointed steamers. I enjoyed this part of my trip immensely, and am only surprised that the lovely scenery of the Upper Irrawaddy, with its pagoda-lined banks, does not attract more travellers.

It is getting late, however, so with a passing reference to the "Shwe Dagon," or Golden Pagoda of Rangoon, I bring my paper to a conclusion.

DISCUSSION.

The CHAIRMAN, in thanking Mr. Carey, said that that gentleman had served in China, first under the Imperial Customs Department, with Sir Robert Hart, and had spent seven years of his life in Yunnan. So that no man was able to give a better account of the countries with which his paper dealt, than he. During the last two years he had served in the British Consular service in Yunnan, and while there, being a most expert photographer, he had taken the large number of excellent pictures which he had shown on the screen that evening. He, himself, saw enough to recognise how exceedingly good the pictures were. It had been the hope of the authorities of the Society of Arts to have had as chairman that evening Sir Hugh Barnes, the Lieutenant-Governor designate of Burma. Unfortunately, however, Sir Hugh had to be in the country. To him (the Chairman) the paper was particularly interesting, for, although he had never set foot in the actual territories which Mr. Carey had traversed, he recognised so many traits in regard to scenery, custom, and the appearance of the people, like those with which he had been familiar among the Indo-Chinese tribes all along our Eastern frontier. For instance, one picture showed the use of the solid wheel, another the mode of irrigation, while yet another exhibited huts built upon piles. Still further he recognised the similarity in the native dances, and the plaids which designated the different tribes. All that kind of thing one met among the tribes to the east of Assam, Manipur, and right down to the frontier. The only point in the paper upon which he had anything serious to say, was with regard to the railway from Burma to Yunnan. Upon that he entirely agreed with Mr. Carey. Lord Curzon, when at Rangoon a year or so ago, expressed his opinion in very plain terms, saying that if there was any money to spend, the communications in Burma had the first call upon it. But there was a great deal to do in the interior, said Lord Curzon, before it would be just to spend any of the Indian taxpayers' money upon what was a doubtful thing, commercially and politically, in regard to Yunnan. He (the Chairman) concluded that Lord Curzon was right in saying that he would hold his hand.

Obituary.

THOMAS WARD, J.P.—Mr. Ward, of Wadebrook-house, Northwich, whose death occurred on Wednesday evening, 18th inst., at the age of 68, had been for some years a member of the Society of Arts. He was Managing Director of the Salt Union and Chairman of the British Salt Association. In December, 1894, he read a paper before the Society on "The Manufacture of Salt," for which he received a silver medal. At the general election of 1895 Mr. Ward contested the Northwich Division in the Unionist interest, but was defeated by Sir John Brunner.

MEETINGS OF THE SOCIETY.

ORDINARY MEETINGS.

Wednesday evenings, at Eight o'clock :—

MARCH 4.—"Education in Holland." By J. C. MEDD. The HON. LYULPH STANLEY, M.A., will preside.

MARCH 11.—"Existing Laws, By-laws, and Regulations relating to Protection from Fire, with Criticisms and Suggestions." By T. BRICE PHILLIPS. (Fothergill Prize Essay.) SIR WILLIAM H. PREECE, K.C.B., F.R.S., will preside.

MARCH 18.—"New Aspects of Life Assurance." By WILLIAM SCHOOLING.

MARCH 25.—"Oil Lighting by Incandescence." By ARTHUR KITSON.

INDIAN SECTION.

Thursday Afternoons, at 4.30 o'clock :—

MARCH 12.—"The Currency Policy of India." By J. BARR ROBERTSON. SIR EDWARD A. SASSOON, Bart., M P., will preside.

APRIL 23.—"The Province of Sind." By HERBERT MILLS BIRDWOOD, C.S.I., M.A., LL.D. The EARL OF LYTTON will preside.

MAY 14.—"The Province of Assam." By SIR CHARLES JAMES LYALL, K.C.S.I., M.A., LL.D.

COLONIAL SECTION.

Tuesday Afternoons, at 4.30 or 5 o'clock :—

MARCH 3, at 4.30 p.m.—"The Uganda of To-day." By HERBERT SAMUEL, M.P. Sir HARRY H. JOHNSTON, G.C.M.G., K.C.B., will preside.

MARCH 31, at 4.30 p.m.—"British North Borneo." By HENRY WALKER, Commissioner of Lands, British North Borneo. The RIGHT HON. SIR GEORGE TAUBMAN GOLDIE, K.C.M.G., will preside.

MAY 5, at 4.30 p.m.—"The Lagos Hinterland: its People and its Products." By MAJOR J. H. EWART.

APPLIED ART SECTION.

Tuesdays, at 4.30 or 8 o'clock.

MARCH 17. 4.30 p.m.—"Artistic Fans." By MISS HANNAH FALCKE. SIR GEORGE BIRDWOOD, K.C.I.E., C.S.I., will preside.

Miscellaneous.

Society of Arts Examinations, 1903.

MONDAY, MARCH 30th, to THURSDAY, APRIL 2nd.

Grade I. Preliminary or Junior. Grade II. General or Intermediate.

In Grade II. First, Second, and Third-class Certificates will be granted in each subject.
In Grade I. Certificates will be given in each of the subjects enumerated. These will be of one class only.
In Rudiments of Music Higher and Elementary Certificates are given. In Harmony Higher, Intermediate, and Elementary Certificates will be granted.

A Fee of 2s. 6d. will be required by the Society from each Candidate in each subject in Grade II., and in Grade I. a fee of 2s. for one subject, and 1s. for each additional subject taken up by the same Candidate. The fees for Harmony and Rudiments of Music are the same as for Grade II.

MEDALS AND MONEY PRIZES are awarded in all the subjects of Examination. Full Particulars of these will be found in the Programme.
There will be no Prizes or Medals in Grade I.

The Examinations are under the control of Local Committees. No application can be recognised unless sent through a Committee.

The last day for receiving applications is WEDNESDAY, the 4th March, 1903, and after that date none will be received under any circumstances whatever. Application forms from the Provinces should therefore be posted not later than TUESDAY, the 3rd MARCH. Committees may, however, close their entry lists at an earlier date, if found desirable.

Copies of the Programme for 1903, with full details, together with the questions for 1902, and reports by the Examiners, can be had, Price 3d., on application to the Secretary, SIR HENRY TRUEMAN WOOD, Society of Arts, Adelphi, London, W.C.

The questions for the years 1896 to 1902 inclusive can also be obtained (price 3d. each year), on application as above.

6d. Monthly.

The ILLUSTRATED

SCIENTIFIC NEWS,

A New Journal of Popular Science,

Containing Original Articles and Up-to-Date Intelligence in all branches of Science, contributed by many of the leading Scientific Authorities of the day.

The March Number contains:

Coherers: Some Experiments on Loose Contacts.
The Barmen-Elberfeld Suspended Railway. Higher Education & Research.
Nernst and the Cooper-Hewitt Electric Lamps.
The Pendulum Propeller.
The Splash of a Projectile. The "Piano Player Parodox."
Constituents of the Atom. The Fate of the Oyster, &c., &c.
