Photographic 'Tabloids' (B. W. & Co.)

TRADE TABLOID MARK

Of all Chemists and Dealers.

PHOTOGRAPHIC 'TABLOIDS' have been used with signal success by travellers and explorers in all parts of the globe. They keep equally well and produce the same excellent results in every climate from that of the Arctic Regions to that of the Tropics. Their compactness has enabled explorers to develop and fix important plates on the spot, so that the risk of keeping undeveloped negatives is avoided. In short, the advantages of Photographic 'Tabloids' are, that they are always ready for instant use, they save trouble and space and prevent disappointment and failure.

List of Photographic 'Tabloids.'

DEVELOPING 'TABLOIDS':—			
Eikonogen	in bottles of	15 & 40	
,, with Quinol	,,	15 & 40	
Paramidophenol ...	,,	12 & 25	
Pyro-Developer ...	,,	20 & 55	
Pure Pyrogallic Acid, 1 gr.	,,	42 & 100	
,, ,, 2 gr.	,,	24 & 55	
,, ,, 4 gr.	,,	15 & 36	
Pyrogallic Acid with Eikonogen ...	,,	15 & 40	
Quinol	in bottles of	20 & 55	
Quinol with Pyro.	,,	18 & 45	
ACCELERATOR 'TABLOIDS'	,,	30 & 100	
RESTRAINER 'TABLOIDS':—			
Potassium Bromide, 1 gr.	,,	30 & 100	
Ammonium Bromide, 1 gr.	,,	30 & 100	
TONING 'TABLOIDS':—			
Toning Gold Compound, in tubes containing 3 'Tabloids.'			

Burroughs, Wellcome & Co., Snow Hill Buildings, LONDON.

NO TRAVELLER SHOULD BE WITHOUT

CALVERT'S CARBOLIC OINTMENT,

A CHEAP AND EFFECTIVE REMEDY FOR

Chafed Skin, Piles, Insect Bites or Stings, Sunburn, Sore Eyes, Chilblains, Chapped Hands, Scalds, Neuralgic and Rheumatic Pains, Ear-ache, Cuts, Throat Colds, and Skin Ailments.

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that,

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his admission fee, and "£2 as his first annual subscription, or he may compound, either at his entrance by one payment of "£35, or at any subsequent period on the following basis:—

Fellows of 20 years' standing and over			...	£12 10s.
" 15 " "	and under 20		...	£16
" 10 " "	"	15	...	£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the Society so long as "he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's Periodical Publications.

Copies of the Regulations and Candidates' Certificates may be had on application at the Society's Office, 1, Savile Row, London, W.

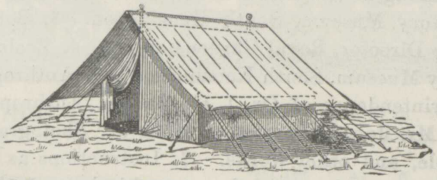
GABARDINE COMBINATION SPORTING OUTFITS

OUTSIDE GABARDINE, INSIDE RAIN-PROOFED TWEEDS (Burberry's Patent).

PROOF AGAINST WAIT-A-BIT THORNS AND SPEAR-GRASS, RAIN, SLEET, OR SNOW. HOT AND COLD WINDS. ANTS AND TROPICAL INSECTS.

(The latter points are of special importance for India and Africa.)

Yet perfectly VENTILATING, very DURABLE, and as COMFORTABLE as ordinary Tweed Garments.



"For lightness combined with strength, nothing has been found to equal the material known as GABARDINE, manufactured by Burberry, of Basingstoke. This substance deserves special recommendation, as one suit will generally outlast three or four made of other and perhaps more expensive cloth."—*The Sportsman in South Africa.*

Write to **T. BURBERRY & SONS,** 30, Haymarket, LONDON, and BASINGSTOKE,

Stating climate required for, and Estimates, Information, and suitable Patterns will be sent free.

THE BEST TENT FOR AFRICA IS BENJAMIN EDGINGTON'S DOUBLE-ROOF RIDGE TENT,

MADE FROM GREEN ROT-PROOF CANVAS,

As Supplied to

MR. H. M. STANLEY.
MR. H. H. JOHNSTON.
SIR F. DE WINTON.
CAPT. STAIRS, R.E.
LIEUT. WISSMANN.
BISHOP HANNINGTON.
REV. MR. ASHE.
REV. MR. COMBER.
THE CONGO STATE GOVERNMENT.
THE IMPERIAL BRITISH EAST AFRICA COMPANY, &c.

PRICE LISTS ON APPLICATION.

STRONG CAMP BEDSTEADS, CHAIRS, AND CAMP FURNITURE OF ALL KINDS.

The above Tent can be seen erected at

BENJAMIN EDGINGTON, Limited,
2, DUKE STREET, LONDON BRIDGE, LONDON, S.E.
(Opposite the Railway Station).

THE No. 4 YŌST TYPEWRITER

Is the Latest and Most Marvellous Writing Machine Extant.

To the African Explorer or the Arctic Navigator a Yōst Typewriter would prove AN ADMIRABLE PRESENT.

The No. 4 Yōst is built entirely of best metals, and it is thoroughly suitable for *all climates.* SEND FOR PARTICULARS.
The Yōst is used and recommended by Missionaries, Travellers, and Explorers in all parts of the World.

BRITISH LIBRARY

ROYAL GEOGRAPHICAL SOCIETY.

NOTICES.

Hints to Travellers.—The Seventh, revised, Edition, edited, under a Committee of the Council, by Capt. W. J. L. WHARTON, R.N., F.R.S. (Hydrographer to the Admiralty), and Mr. DOUGLAS W. FRESHFIELD, Sec. R.G.S.

Price Eight Shillings; to Fellows at the Office of the Society, Five Shillings.

Instructions for Intending Travellers, under the authority of the Council of the Royal Geographical Society.—Arrangements have been made for the instruction of intending Travellers in the following subjects:—

1. Surveying and Mapping, including the fixing of positions by Astronomical Observations. By Mr. John Coles, Map Curator of the Society. 2. Geology, including practical training in the field. Under the superintendence of Dr. J. W. Gregory, Natural History Museum, South Kensington. 3. Botany. Under the superintendence of the Director, Royal Gardens, Kew. 4. Zoology. Dr. Bowdler Sharpe, Natural History Museum, South Kensington. 5. Anthropological Measurements. Under the superintendence of Dr. J. G. Garson, Anthropological Institute. 6. Photography. By Mr. John Thomson, Author of 'Photographic Illustrations of China and its People,' and other works. 7. Instructions as to What and How to Observe in the Field, from the general geographical standpoint. By Dr. H. R. Mill, Librarian to the Society.

The Lessons are given on days and at hours arranged between the Instructor and the pupil.

Tickets for the lessons must be previously procured at the Offices of the Society, where information as to fees, etc., may be obtained.

Evening Meetings.—Papers to be read at the Evening Meetings in November:—**Tuesday, November 10.** Address by the President. The Jackson-Harmsworth Arctic Expedition, and the Story of the Last Year's Work. By Arthur Montefiore Brice. **Monday, November 23.** Two Years in Uganda, Unyoro and the Upper Nile Regions. By Seymour Vandeleur, Lieut. Scots Guards.

Educational Lectures.—Under the joint auspices of the Society and the London University Extension, Mr. H. J. Mackinder, M.A., is giving a course of twenty-five lectures on the Geography of Europe, Asia, and Northern Africa, in illustration of the Methods and Principles of Modern Geography, at Gresham College, Basinghall Street, E.C., on successive Mondays at 6 p.m. The first lecture was given on October 5. There will be two series of ten lectures each and one of five. To these lectures Fellows are admitted free on showing their tickets.

Any Fellow resident in this country, desiring to have notice of the subjects of papers to be read at the Society's Meetings forwarded to him, can receive such notices by post on payment in advance to the Chief Clerk, at 1, Savile Row, of 2s. per session.

The Society's House will remain open for the Convenience of Fellows on the evenings of the Society's ordinary meetings till 8.15.

NOTICE.

PHOTOGRAPHS.

ROYAL GEOGRAPHICAL SOCIETY.

It would greatly add to the value of the Collection of Photographs which has been established in the Map Room of the Royal Geographical Society, if all the Fellows who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they would be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

As a rule, Cameras have either to be slung over the shoulder, or carried in the hand.

THE
POCKET KODAK

Slips into the Pocket,

and is hardly felt, as it weighs only 5½ ounces.

The POCKET KODAK holds 12 exposures of Film at one time, and is unloaded and reloaded in daylight.

It has a large finder, and a red window at the back, which shows just how far to turn the key, and how many exposures have been made.

It contains the simplest shutter ever constructed, one button sets and releases it, and makes either instantaneous or time exposures.

It is covered with either red or black leather. Perfect in workmanship. Rich and dainty in finish.

Pictures made with the POCKET KODAK are so sharp and distinct that they are capable of being enlarged up to 8½ × 6½ inches, and sometimes larger.

PRICE, loaded with Film for 12 exposures, £1 1s.

EASTMAN Photographic Materials Co., Ltd.,
115-117, Oxford St., London, W.
PARIS: 4, Place Vendôme.

S. DAVIES,

NOTICE.

The "PROCEEDINGS OF THE ROYAL GEOGRAPHICAL SOCIETY," new series, consists of 14 volumes, extending from 1879 to 1892.

Each volume covers on an average 840 pages, the selling price being 18s. per volume.

These volumes not only contain full reports of the papers read at the Royal Geographical Society, by all the great travellers and geographers of the period, but constitute a record of exploration and geographical work in all parts of the world.

Each volume contains numerous maps, all of them original, embodying the results of exploration, and executed in the best style. In the 14 volumes there are some 350 maps, besides numerous illustrations of characteristic scenery in the least-known parts of the world.

It is believed that a complete set of the *Proceedings* would be a valuable addition to public libraries and other institutions, while many private individuals might wish to have the volumes. As it is desired to reduce the stock in hand, the series is now offered, bound in cloth, at £6 per set. Application to be made to the Chief Clerk, Royal Geographical Society, 1, Savile Row, London, W.

In addition to the *Proceedings*, the Society has issued four volumes of "Supplementary Papers," containing a large number of Memoirs and Narratives of considerable length, besides several valuable Bibliographies. These will be sold for half price, £2 for the four volumes. These contain over 30 Maps and numerous Illustrations.

S. SMITH & SON'S Non-Magnetisable Watches.

THE TESTING OF OUR WATCHES BY THE
ADMIRALTY.

Hydrographic Department, Admiralty,
London, S.W., 19th May, 1894.

Sir,—I have much pleasure in returning you the two Non-Magnetisable Watches which you were good enough to send for my inspection. They have successfully passed through a severe test in close proximity to a powerful dynamo, and I believe the Astronomer Royal is in correspondence with you on the subject.

I am, Sir, your obedient Servant,
W. H. WHARTON, Hydrographer.

Messrs. S. Smith & Son, 9, Strand, W.C.

Prize Medal, Electrical Exhibition, 1892, for Non-Magnetisable Chronographs.

Certificate and Warranty with every Watch. Postage Free at our own risk. Old Watches and Jewellery taken in exchange. Send for our Treatise on Watches, Just Issued, 141 pp., 320 Illustrations. Finest Work yet Published.

West Strand Observatory,

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

READY ON DECEMBER 1st.

THE STRUGGLE OF THE NATIONS.

(EGYPT, SYRIA, AND ASSYRIA.)

By PROFESSOR MASPERO.

Edited by the Rev. Professor SAYCE. Translated by M. L. MCCLURE. With General and Special Maps, three Coloured Plates, and over 400 Illustrations. Demy 4to (approximately), cloth boards, 25*s.*

This is a companion volume to "The Dawn of Civilization," and carries the history of the ancient peoples of the East from the twenty-fourth to the ninth century before our era. It embraces in its scope the period of the sojourn of the Children of Israel in Egypt, and the historic connexion between Egypt and Syria during the centuries immediately following the Exodus. As its title, "The Struggle of the Nations," implies, the period covered was one in which the Great Empires of the East were in perpetual conflict—each striving for supremacy. Syria, owing to its position on the highway of the nations, became their principal battle-field. The recent discovery of a Stele of Minephtah, in which the Israelites are mentioned for the first time on any Egyptian monument, has infused a new interest into the Bible account of the Exodus. Prof. Maspero has brought to bear upon this question his unrivalled learning. It is clear that the part played by Semitic peoples in Egypt was much more important than was previously suspected, and that from the time of the Hyksos onwards, Asiatics exercised a considerable influence on the Nile.

THE DAWN OF CIVILIZATION (EGYPT AND CHALDÆA). New and Revised Edition. By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. MCCLURE. With Map and over 470 Illustrations, including three Coloured Plates. Demy 4to (approximately), cloth, bevelled boards, 24*s.*

Professor Maspero, by using the results of the most recent researches in Egypt and Mesopotamia, has brought this new Edition up to the latest date.

LONDON: NORTHUMBERLAND AVENUE, W.C.; 43, QUEEN VICTORIA STREET, E.C.
BRIGHTON: 129, NORTH STREET.

GEORGE PHILIP & SON'S LIST.

JUST PUBLISHED.

THE BOUNDARY QUESTION BETWEEN BRITISH GUYANA AND VENEZUELA. Consisting of Diagrams and Maps from the Capuchian Archives in Rome, with a brief summary of the question. By the Rev. JOSEPH STRICKLAND, S.J., Litt. Doc., Phil. Doc. Imperial 8vo, cloth, 10*s.* 6*d.*

FOUR NEW LIBRARY MAPS.

LONDON AND ENVIRONS. Philips' Library Map of London and its Environs. Founded upon the Ordnance Survey Plans, and corrected to date from private information, etc.

Scale—3 inches to 1 mile. Mounted on cloth in case, 21*s.*
Size—64 by 52 inches. Mounted on roller and varnished, 21*s.*
4 sheets, coloured, 16*s.* Mounted on patent spring roller, 63*s.*

The *Morning Post*:—"Philips' New Library Map of London is one of the most complete works of its kind. The engraving has been executed with care and delicacy."

ARGENTINE REPUBLIC. Topographical Map of the Argentine Republic. By H. D. HOSKOLD, C.E. This is an entirely new large-scale Map of the Argentine Republic, based on the most recent information, coloured to show the political divisions, with hills printed in brown, and insets showing tables of distance, heights, and sections of the principal mountain regions, etc., and plan of the Town of Buenos Aires. The original, from which this map has been prepared, was drawn by Señor H. D. HOSKOLD, C.E., of Buenos Aires.

Scale—31½ miles to 1 inch. Mounted to fold in leather case, 63*s.*
Size complete—54 by 86 inches. Mounted on roller and varnished, 63*s.*
10 sheets, coloured, 50*s.* Mounted on best spring roller, 126*s.*

WESTERN AUSTRALIA. Philips' Large Map of Western Australia. The topographical information has been reduced from larger Government Survey Maps, special surveys and plans, and other material supplied by the Agent-General. The coast line from Admiralty Charts.

Scale—24 miles to 1 inch. Mounted to fold in case, 30*s.*
Size—52 by 74 inches. Mounted on roller and varnished, 31*s.* 6*d.*
4 sheets, coloured, 21*s.* Mounted on patent spring roller, 73*s.* 6*d.*
Mounted on best spring roller, 105*s.*

WESTERN AUSTRALIA—GOLD FIELDS. Philips' New Map of the Western Australian Gold Fields. (Central Coolgardie Gold Fields, *now ready.*)
Compiled from official Maps of the Department of Mines, W.A., and other information supplied by the Agent-General of Western Australia. This map, when completed, will be the most accurate and reliable published.

Scale—1 inch to 1 mile. Mounted to fold in case, 63*s.*
Size of 4 sheets—60 by 80 inches. Mounted on roller and varnished, 70*s.*
4 sheets, coloured, 42*s.* Mounted on self-acting spring roller, 74*s.* 6*d.*

CLOTHED WITH AIR

CELLULAR UNDERWEAR AND SHIRTS.

THE HEALTHIEST AND MOST ECONOMICAL FOR TRAVELLERS.

Extract from C.T.C. HANDBOOK AND GUIDE, 1896–97, p. 52.

"From the peculiar manner in which CELLULAR CLOTH is woven (forming a network of minute air-cells next the skin), it allows, even more fully than wool, the free evaporation of perspiration on the side next the skin. . . . It is less bulky, and is lighter to carry; it dries much more quickly; it is more easily washed, and its prime cost is much smaller. Last, but not least, it is quite free from that bane of all woollen goods, the liability to shrinkage."

BEST FOR ALL SEASONS AND CLIMATES.
ESTIMATES FOR OUTFITS SUPPLIED ON APPLICATION.

To be obtained in all the principal cities and towns in the United Kingdom, the Colonies, and India.

Illustrated Price List of full range of Cellular goods for Men, Women, and Children, sent Post Free on application.

Full assortment of goods at the following retail houses:—

ROBERT SCOTT, Ltd., 14 and 15, Poultry, London, E.C.

TENTS

FOR THE

TRAVELLER

AND

EXPLORER.

Write for our "Red Bound Catalogue" of Tents and Camp Equipment, post free.

THE MOST PERFECT TENT is PIGGOTT BROS. & CO.'S "PROSPECTING TENT." Made double. The inner roof being suspended 12 inches below the ridge, allows of a free circulation of air between the outer and inner roofs. The inner roof has ventilators, protected by mosquito net. *Made from Green Waterproof and Rot-Proof Canvas.*

PIGGOTT BROS. & CO., MANUFACTURERS,
57, 58, 59, Bishopsgate Street Without, LONDON.

"Woollen goods are to be preferred for all countries and for all climates."—HINTS TO TRAVELLERS (published by Royal Geographical Society), 6th edition, p. 12.

No. 5. NOVEMBER, 1896. Vol. VIII.

JOURNEY ROUND SIAM.*

By J. S. Black, First Assistant of Her Majesty's Consular Service in Siam.

Within recent times the importance and magnitude of British interests in Siam have been, by the course of events in that country, brought prominently before the public. These interests arise from the presence of large numbers of British subjects and the investment of British capital in the various industries of the country. Our subjects are not only English people, but Indians, Malays, Burmese, and Chinese; in fact, every species of Asiatic who can lay claim to have been born in British possessions, and they are to be found not only at Bangkok, the capital of Siam, but are scattered in thousands throughout the most distant parts of the kingdom. The great proportion of this foreign population is composed of Burmese or Shans, who migrate from their homes into the adjoining Siamese territory as traders or gem-diggers. By virtue of the existing treaties with Siam, all her Majesty's Asiatic subjects are entitled to Consular protection and assistance, and the object of the journey which forms the subject-matter of the paper to-night was to hold district courts, settle a number of long-pending disputes between British subjects and Siamese in the provinces, and generally acquire information regarding the nature of British interests in these little-known regions.

I shall not in this paper allude to the details of my official business, but I may be permitted here to remark that I was occasionally extremely busy, and, after a hard day's work as Consular Court Judge (the Court sometimes consisting of a tent and the bench of a small camp table), I did not feel much inclined to worry the natives in search of that precise and scientific information which one ought to be able to

BRITISH LIBRARY

present to such a learned body as the Royal Geographical Society. My journey was official, and naturally the greatest part of my attention was devoted to my official business, and, being versed neither in geology, zoology, nor any other "ology," I must crave the indulgence of this Society for venturing to lay before them such facts as would come under the observation of an ordinary traveller. The course of my journey, however, lay through some districts which have not to my knowledge yet been described, at least from the point of view from which I propose to treat them to-night, and geographical, as well as public, curiosity about these districts has been considerably heightened within the last few months. I might add that, having resided seven years in Bangkok, and devoted a large share of that time to the study of the Siamese language, I was in a position to communicate freely with the natives and obtain information at first hand; and thus I might say, with all modesty, I possessed an advantage, emphasized as it was by my official position, that is given to few travellers in a strange country.

Siam, as will be observed from the map, is, geographically speaking, roughly divided into two great basins—the basin of the Menam, and the basin of the Mekong. The course of my journey struck eastwards from Bangkok to the Talesap Lake, northwards through the western side of the Mekong basin, and, crossing the watershed south of Luang Prabang, I cut across the rough and hilly country of Northern Siam to Chiengmai, whence I descended the rivers Meping and Menam, a distance of nearly 600 miles, to Bangkok again. It is not possible, within the brief limits of such a lecture as this, to enter into the details of a journey which lasted six months, and during which I traversed over 2000 miles. I can, therefore, endeavour merely to describe new districts as concisely as possible, and treat generally of a few salient features such as might be imagined to be of interest to those who desire to add to their knowledge of this country.

Chantabun, which is situated 14 miles from the mouth of a stream of the same name, and lies 188 miles from Bangkok, was my first stopping-place—a place which has of late years been honoured with an amount of public attention which its intrinsic merits would not by any means have attracted to itself. It is generally spoken of as the second port of Siam, but it is a port in which only a few miserable canoes can be seen at any time, except on the one day of the week when a small Siamese steamer calls from Bangkok. Nor is its population considerable, for, on the authority of the Governor, that amounts to four thousand only, of whom at least one quarter are the descendants of Annamites who some generations ago migrated from their homes in Cochin-China. The whole province does not contain a population of more than thirty thousand, and this is concentrated on the Chantabun stream and near the coast. The Annamites, as well as many Chinamen, who are numerous in the province, are converts to the Roman Catholic faith, and their spiritual wants are

BRITISH LIBRARY

ministered to by a French missionary, assisted by several native pastors. The exports are insignificant in value, with the exception of pepper, which amounts to about £60,000 per annum. The pepper plant, the sight of which reminds one of the hop gardens of Kent, flourishes at the base of the Sabap hills, and is cultivated exclusively by Chinese. These industrious individuals have, as usual, the monopoly of all lucrative business in their hands, keep the best shops, and control the liquor and opium trade.

Chantabun is on the way to the sapphire and ruby mines, which are situated in the adjoining provinces of Battambong and Krat, and a

CHANTABUN.

number of Burmese reside here for the purpose of buying the precious stones from the diggers, and of trading in the necessaries of food and clothing required at the mines. These mines contain a population of over two thousand Burmese-British subjects, and here lay the chief scene of my official labours in this part of the country.

I might add, by the way, before leaving Chantabun, that the presence of the few French troops just outside the town have not produced any noticeable difference in the place, except that the price of chickens and eggs has been slightly enhanced—a fact which the old Burman in whose house I lodged was careful to communicate to me. The civil government is entirely in the hands of the Siamese authorities, and trade and business go on as usual.

The province of Chantabun is separated from the province of Battambong by a range of hills from 2000 to 3000 feet high, and one

BRITISH LIBRARY

peak—Sai Dao—is passed on the route which, judging roughly, must be 5000 feet high. It will thus be observed that Chantabun is not, as has sometimes been erroneously supposed, the port and outlet of the provinces of Battambong and Siamrap. These provinces drain into the Talesap Lake, and finally into the Mekong, whilst the province of Chantabun drains into the Gulf of Siam. Indeed, there would be little or no communication between the two places were it not for the fact that the sapphire mines are situated near the frontier of Chantabun.

Pailin is the name given to that place, and the journey thither, which is done by pack-bullock or elephant, occupies about four days. The narrow footpath—impassable for bullock-carts—winds its way through dense forest, and rises to a height of about 1000 feet. Though the scenery is rugged and varied, it is not nearly so impressive and picturesque as what I was yet to see amongst the wild and solitary grandeur of the Mekong gorges or the rapids on the Menam. At Pailin my duties detained me twelve days, and then I passed on to Battambong.

Battambong and Siamrap are provinces which have somehow gained the reputation of being extremely rich, fertile, and populous. In recent times these provinces have hardly ever been referred to except in euphuistic language describing their wealth, population, and magnificence. As no Consular official had ever been in this direction before, I was naturally anxious to explore this unusual land flowing with milk and honey, and scrutinize, if necessary, these vague and glowing accounts in the light of cold and relentless statistics. I must confess that any sanguine expectations I possessed were considerably shattered after I had traversed the province, seen Battambong the capital, and succeeded in getting a few figures about trade and population. It does not strike one at all as the richest and most populous province of Siam. In fact, in its present condition, it by no means comes up to the general standard of wealth of the Menam valley.

I do not speak of the potentialities of the place—far from it—as almost every part of Indo-China is capable of enormous development under proper European management, but I take things as they now stand. And what do we find? The population of the combined provinces of Battambong and Siamrap I estimate at about eighty thousand, and the import and export trades combined may be valued at about £80,000 per annum. I must state that these figures are only approximations, as *boná fide* statistics are not to be obtained in any part of Indo-China, and the data upon which even the most painstaking inquirer bases his results are necessarily very imperfect. My figures of trade were obtained from individual merchants and from calculations based on the amount of taxes, and population from rough guesses at the number of able-bodied men in the different subdivisions. In any case, the statistics are accurate enough to show that the terms of "rich, fertile, and populous" are hardly applicable to this part of Siam.

The town of Battambong itself is a scattered village of about four thousand inhabitants lying on both sides of the Sangkai stream, which, when I was there during the dry season, did not contain enough water to float an ordinary boat. Three miles beyond the town the cultivation of rice ceases, and nothing is to be seen but a vast expanse of treeless, grassy plain stretching out to the jungle which fringes the distant horizon.

The imports are chiefly cotton cloth for the clothing of the population, and small quantities of other articles, such as lamps, slippers, silks, looking-glasses, brass dishes, etc. The principal export is rice, and this

ON THE WAY TO THE GREAT LAKE, EAST SIAM.

amounts to about £20,000 per annum, and fish to about £15,000. The other exports are hides and horns, cardamums, mats, etc. The Siamese share of the fisheries of the lake is quite insignificant compared with that of Cambodia.

It is gratifying to learn that, in spite of the close connection which exists geographically between Battambong and Saigon, the cloth trade here is almost exclusively British, and is in the hands of two wholesale British Indian dealers. It is an extraordinary fact that British goods can be conveyed to Battambong overland from Bangkok, a long and toilsome journey of two days by steamer and about twenty days by bullock-cart, and yet undersell French goods in Battambong, though the latter can in the rainy season be brought up by steamer from Saigon in two days. In this season the Indian traders often get their cloth through Saigon by paying a heavy transit duty. The bulk of the exports naturally find their way to Saigon, but French imports are insignificant, and consist chiefly of liqueurs and brandy, silk goods, and knickknacks.

A rich spot, however, in this province is at the sapphire mines situated up amongst the hills at the sources of the Khonburi stream. It is a curious geological circumstance that a range of hills forms a distinct line of demarcation between the sapphire mines at Pailin and the ruby mines at Nawong, in the province of Krat. Sapphires are found on the northern slope of these hills, and rubies on the southern. The mines are of two kinds, surface and deep. The former are 2 or 3 feet deep, or, in fact, sometimes the surface of the ground is merely scraped with a piece of iron or stick, carefully powdered to bits with the hand, and stones picked out. The other mines are from 15 to 20 feet deep, and have generally an aperture of 4½ feet square. The upper stratum of earth is loam, then loamy and clayey, and finally the ruby or sapphire layer is reached with a thickness varying from 4 to 18 inches. This layer is hoisted up with a rude crane and basket, and carried down to the nearest stream, where it is washed and carefully examined in little flat baskets with closely woven meshes. From the waterworn appearance of the fragments of rocks embedded in the layer, it would seem that the precious stones are not found in the original matrix, but have been washed down from the hills. A British company was formed some years ago to work the ruby mines, but, as the Burmese miners resented the right of the company of insisting upon all the stones being handed over at a price fixed by the company's expert, they left the mines in large numbers. No other class of men can be found to work in these pestilential and malarious jungles, and thus the production of stones and the existence of the company gradually came to an end. In 1895 another British company, the Siam Exploring Co., Ltd., received from the King of Siam the exclusive right of working the sapphire mines at Pailin, and they also bought up the rights of the former company at the ruby mines. The entire mining-field is thus in their hands, and there is no doubt but that it is a most valuable concession, as the annual output of stones from this region is very large. The mining district at Pailin covers an area of 6 miles long by 1½ miles in breadth, and large portions of this are still untouched, and are doubtless gem-bearing. Immense quantities of cheap stones are found, but some of the Siam sapphires are as good as any that are brought into the market. The rubies do not bear so good a reputation. They are nearly all tinged with a dark "clarety" colour instead of that clear pigeon-blood hue so prized in this valuable stone. The difficulty that the company has to overcome—and it is by no means a small difficulty—is to get hold of the stones. In such an extensive area supervision of the miners is almost impossible, and, besides, the Shans, who up to the present have been working each man for himself, will not labour for wages, nor will they naturally give up good stones when they find them.

While at Battambong, the governor, who is a frank, genial young

man, and whose acquaintance I had already made in Bangkok, planned a deer-hunt for my distraction. Deer are hunted here in an extraordinary and, I should think, quite a unique fashion. They are, in fact, run down by ponies, and that in a remarkably short space of time. The ponies are small, hardy, and very active animals, as one may judge from their success in this hunt. The entertainment was got up in grand style, with twenty elephants and thirty ponies, and the ponies were ranged across the plain outside Battambong in a line extending about a quarter of a mile, whilst the elephants followed up behind with spectators. The deer, which are by no means small animals, but the ordinary *sambur* of these tropical countries, swarm in

A CAMBODIAN GIRL WEAVING CLOTH.

great numbers amongst the thick deep grass, and as soon as the head and horns of one was seen bobbing up and down as it bounded away like an arrow, the nearest half-dozen ponies started off after it at a break-neck pace. The natives ride barebacked, and, as the ground is full of depressions and empty water-holes, it is marvellous how well they retain their seats.

In three or four minutes' time we saw from our elevated perch the foremost rider stop and jump off. When the elephants came up, the deer was already nearly skinned, and a few moments afterwards it was cut in two, tied together with its own skin, and slung across the back of an elephant, there in readiness to carry home the spoil. The deer, it seems, drop down breathless, and the rider gives it the *coup de grâce* with his hunting-knife. I calculated the course of two of these runs, and put it down at three-quarters of a mile for the one and three miles

for the other. The spirited little ponies appear to enjoy the fun with as much zest as the men themselves, and one animal, whose rider was sent flying headlong into the grass, enthusiastically galloped riderless in to the death. The hunt lasted from nine in the morning till three in the afternoon, and in that time we caught four deer, and seven or eight escaped, either by superior speed or due to the fact that the ponies did not get the sight of them in time.

Battambong and Siamrap are provinces of the ancient kingdom of Cambodia, which, after centuries of struggle with Siam, varied with internal dissension, finally came under the suzerainty of the latter power towards the end of the seventeenth century. In 1867 France assumed a protectorate over the lower half of this tributary kingdom, and the possession of the remaining portion, Battambong and Siamrap, was by a Franco-Siamese treaty assured to Siam. The current speech of the country is Cambodian—a language which differs radically from Siamese—but Siamese is the official language, and all the officials, who are, one might say, both the aristocracy and the plutocracy of these Asiatic countries, speak both languages with equal facility. The present descendants of the once powerful Kmer race have, in their customs, religion, and general characteristics, much in common with the Siamese; but they are inferior to them both in physique, intellect, and morals. They are, indeed, notorious both for mendacity and petty pilfering.

From Battambong I descended the river Sangkai, crossed the Talesap Lake in three and a half hours, and proceeded to Siamrap, which lies about 10 miles from the shore. This great sea of fresh water, which measures nearly 100 miles in length and 20 at its greatest breadth, rises no less than 21 feet during the rainy season, and floods all the adjoining country for miles. In the dry season it is not more than 4 or 5 feet deep, and it is at this time, during the months of March, April, and May, that the surrounding population flock to its shores to catch the numerous fish.

Siamrap is itself a stagnant little place of about two thousand inhabitants; but the pretty rivulet here of pure sparkling water, with its old-fashioned water-wheels and its banks shaded by the wavy palm and cocoanut tree, forms a refreshing scene after passing through the low and swampy country that fringes the Talesap Lake.

I only stayed a day and a half in Siamrap, as my time was exceedingly limited, and as the only case I had to investigate was a trifling one of bullock theft, which I settled with the governor in about three minutes. The celebrated ruins of Angkor Wat and Angkor Thom lie about 4 miles from the village, but I do not intend to launch out into any disquisition on a subject which is now well worn. I might remark, however, that though I am not an enthusiast by any means about ruins, and particularly ruins of Indo-Chinese temples, of which we get rather

BRITISH LIBRARY

tired out there, even the most casual spectator cannot fail to be overwhelmed with admiration and amazement as he gazes upon these wonderful galleries, pretty side buildings, and lofty sculptured towers rising up before him in silent grandeur and magnificence. It is a solitary and desolate spot, and nothing is to be heard but the gentle sighing of the wind as it rustles the leaves of the melancholy palm trees, or whistles along the deserted corridors, now damp with age and infested with swarms of ghost-like bats. All round and in the centre of the ruined city itself grows dense and lofty jungle, and one can well imagine the beasts of the field holding high carnival amongst the fallen and broken pillars when the clear moon looks down upon these ancient monuments of human greatness. The imagination pictures to itself, too, the time when Angkor Thom, the city, was the capital of a powerful empire, and Angkor Wat the holy shrine and temple of the dense and busy population that once trod these jungle-covered plains; and now, though empire and race have long since disappeared almost without leaving a trace of their history, the immense blocks of stone which the hands of these people dragged here and piled high one upon another, the highways radiating from the capital, the stone bridges and distant scattered monuments, still remain to attest the former might and opulence of the country.

Before hurrying onwards, however, I inquired about the traditions lingering among the present inhabitants, and at my request the Governor ordered forth one of the oldest inhabitants of the place—a patriarch of seventy-five, who was represented to be the best repository of this vague traditional knowledge. As he squatted humbly on the ground before me, I regarded this curiosity with considerable interest, and enjoined him in judicial language to "tell the truth, the whole truth, and nothing but the truth." This is what he said, as I took it down word for word—

"There was once a king of Angkor Thom, Chao Pratum Suriwong by name, and he had a son Pra Ketmala. Pra In came down from heaven and saw Pra Ketmala. He asked Chao Pratum Suriwong that Pra Ketmala might be taken up to heaven. He was taken up to heaven, but the smell of the Thewada (angels) being too strong for him to bear, he returned to Earth again, and then Pra In ordered Pra Weesanukam to build Nakon Wat. Pra Weesanukam accordingly came down and told Chao Pratum Suriwong to build the temple, and Chao Pratum Suriwong impressed men to do the work. Men to seven times the number that could stand within the walls of Angkor Thom were impressed, and they completed the whole building in seven days. When the building was finished, Pra Ketmala did not stay in it himself, but placed therein Pra Putta Kosa Chan, who had been a priest in Ceylon. Then Pra Ketmala went to Beng Melia, near Pnompenh."

Mythology is not a strong point with me, and besides there is no

مكتبة قطر الوطنية
Qatar National Library

time to construct ingenious theories from this little statement, but I put it on record, and perhaps the learned in these matters may find that it forms at least a condensed version of the already received notions about the construction and object of these wonderful structures.

The next portion of my journey lay through the western side of the Mekong basin, with the town of Korat as a halfway resting-place. Bullock-cart is the method of locomotion in this district, and as these crazy vehicles are dragged along at a pace of about 1½ mile an hour, an ordinary day's march is a long and toilsome business. It was now the month of March, and the heat was becoming oppressive—so much so that I found it necessary, in order to get any progress at all out of the bullocks, to make my caravan travel during the coolness of the night, and rest, if possible, in some shady spot during the day. Our usual marching hours were from three in the morning till eight or nine, and then again from three in the afternoon till eight, and the average number of miles covered in that time was only about 15 or 16. I rode a pony myself, and a very small animal he was—so diminutive, in fact, that I could barely keep my feet off the ground; but he was a hardy little beast, and gallantly carried me all the way between Siamrap and Nongkhai, on the Mekong, a distance of nearly 500 miles. I sold him then for 30*s*., but as he only cost £2 originally, it could not be called an expensive ride, particularly as he ate nothing but burnt-up grass and a little rice.

The character of the country throughout the whole of this region is much alike, and becomes to the traveller exceedingly tiring and monotonous. The trail, as one may call it—for there is no pretence at road-making—winds through open jungle, the trees being about 30 feet high, and mostly mai rang, mai teng, and mai yang, as they are called in Siamese—resinous trees of the *Dipterocarpus* genus. The landscape is flat, with the exception of the rise up to the Korat plateau, and there the highest average level above the sea is about 800 feet, with a very gentle dip in an easterly direction towards the Mekong. The population, which is Cambodian up to and somewhat beyond Dong Rek hills and Lao north of that, is exceedingly scanty. In the neighbourhood of Dong Rek hills are found a race called Suey, who speak their own peculiar dialect in addition to Cambodian or Lao. They would appear to be the remnants of aboriginal tribes, and are, if anything, uglier, dirtier, and more primitive-looking than the surrounding Cambodians and Lao. The Korat people, who are also an ugly but sturdy race, seem to be a hybrid of Lao and the aboriginal Suey; but, from the neighbourhood of Cambodian settlements in this district, there is every probability that the limit of the ancient Kmer kingdom extended right up to Korat.

In and around the town of Korat, however, Siamese is the prevailing language, and the "panung," or Siamese loin-cloth, which is drawn

BRITISH LIBRARY

between the legs in the shape of trousers, is the usual dress of both sexes. The difference in the dress of the Lao is that the women wear a brightly striped petticoat instead of the "panung." The silk-worm is extensively cultivated, and the natives are skilful in manufacturing beautiful silks, some kinds of which bear a striking resemblance to Scotch tartans. They weave most of their own clothing, which consists only of this loin-cloth and a breast-scarf.

The whole of the Mekong region beyond 50 miles north and east of Korat is peopled by these Lao, a race who are as much akin almost to our own Shans as to the Siamese. The language differs both in character and sound from Siamese; but, as the Lao country has been under

SIAMRAP DURING THE DRY SEASON.

the domination of Siam now for a hundred and twenty years, Siamese is widely understood and spoken.

This extensive tract of country suffers from two great and serious evils—the want of inhabitants and isolation. The want of population may be exemplified by one fact, namely, that the largest town in the whole of the Mekong valley from Pnompenh to Luang Prabang is Nongkhai, and that place, as I was careful to ascertain, contains between 700 and 800 houses, or say a population—to be liberal in calculation—of about 5000. In Ubon there are 632 houses, and Korat is, I should think, somewhat larger. These three towns constitute the great centres of population in the whole of this immense territory. For days and weeks almost, even on the main routes of communication, a traveller will pass villages which number only a few squalid huts, and when I came to a place of two hundred huts it was thought a great event by all

my men, for in a metropolis of that size there was some kind of market where they might replenish the camp larder.

Why the population should be so scarce is difficult to say. In olden times war and bloodshed certainly ravaged the country; but now, from my own observation, I should think the principal check on the growth of population is pestilence. The year of 1895 may have been exceptional, but everywhere I went I saw signs of widespread epidemics of fever, small-pox, and cholera. In and around Korat and some other places this was particularly noticeable, as the people have the custom of sticking up in front of a house where there is illness, a little earthenware pot marked with blue or white bands. This was not done out of consideration, it seems, for the neighbours, but was a visible token of supplication for mercy to the demon of fever or cholera. The number of these pots in some places was perfectly alarming, and on more than one occasion we marched right into a village where cholera was rampant.

This region, too, is by nature cut off from communication with the outside world. Outlet by the Mekong on the east is barred by the precipitous rapids at Khone (or Khawn, as it is locally pronounced), and what trade there is has always tended in the direction of Korat. The route from Korat to Bangkok, again, is extremely difficult and dangerous, as it passes through a dense and dark forest, which has such a frightful reputation for fever that the name is always mentioned by the Siamese with bated breath—and with good reason too, for it is beyond doubt a most pestilential and malarious spot. The narrow and tortuous trail can only be traversed by pack-bullocks, and they take ten days to accomplish the journey to Saraburi, which is within three days of Bangkok by boat.

It is by this route that trade is carried on, and, considering the difficulties and cost of transport, it is rather surprising to find that there is any trade at all. Not that it amounts to very much, for, judging roughly in the absence of any reliable statistics, I should not be inclined to estimate the total import and export trade at more than £200,000 per annum. The imports consist, as usual, principally of cotton cloth and a few other articles of clothing, brass dishes and crockery, and the exports of cardamums, raw silk, gum benjamin, cattle, and hides. On account of this isolation, the inhabitants do not seem to possess that instinct for trade which renders a country valuable. They grow their own rice and tobacco, weave their own clothes of silk and cotton, and in many places have not even got beyond a system of barter for their few wants, and of paying their taxes in kind.

Korat is important in one sense, as being the depôt for the whole of the Hinterland, extending even across to the left bank of the Mekong, but it cannot be said that this is a region which, in its present

BRITISH LIBRARY

condition, offers much attraction to a foreign market. Easy and cheap communication by railway would doubtless create a much larger demand for foreign commodities, but that will be naturally limited by the scarcity of population. Even judging liberally from the data which I accumulated on this journey, I do not think that the total population of the whole of the Mekong basin still remaining in the possession of Siam can, at the utmost, amount to more than 1,000,000. As for the left bank of the Mekong, it is, in comparison, practically uninhabited, as all the villages are situated on the right bank.

The whole of this country swarms with wild animals, and at different places are to be found wild elephant, tiger, leopard, bear, pig, and deer. I occasionally saw the huge, circular tracks of wild elephant on the path in the forest, and once or twice the spore of tiger in the vicinity of our camp attested the presence of that uncanny nocturnal visitor. Several times my faithful "boy" told me in the morning, with a tremor in his voice, that he had heard the roaring of a tiger during the watches of the night. I never had that luck myself, I'm sorry to say, as the deep and dreamless slumber of a tired wanderer generally made me oblivious to all the nightly sounds of the forest, however strange or weird they might be. I, however, had the pleasure, such as it was, of seeing a real live leopard at home in his native jungle. Not that I had any desire to call on the gentleman, and cultivate a closer acquaintance—an unsocial disposition which, I rejoiced to see, was even more marked on the part of the leopard. It was early morning, and I was quietly trotting along on my Lilliputian charger, when a kind of exaggerated cat, so to say, slouched across the path. Without condescending to take the slightest notice of a British Consular official, he disappeared through the undergrowth at a rapid pace, and took with him, I might add, my hearty wishes for a *bon voyage*.

I heard of few fatalities of natives from attacks of tiger, but in several places I was informed of their depredations on ponies and cattle. Not only is the population scanty, but there is apparently such abundance of deer and pig that little necessity exists for beasts of prey to approach the haunts of men in search of food. At one place, however, near where we camped at the ruby mines, a native, who was sleeping out in the open with two others, was pounced upon by a tiger, and so severely mauled that he died. And in the north of Siam the sad story of an old woman who had been devoured by a hungry tiger—and a very bold and hungry beast he must have been to have tackled an old Siamese woman—kept our whole caravan in a state of excitement till the scene of the unhallowed repast was left far behind.

The journey from Siamrap to Korat occupied eighteen days, and that from Korat to Nongkhai fifteen days, and we suffered greatly from heat and want of water. Not that the temperature went up to abnormal heights, but on the close stuffy day that it reached 105° in

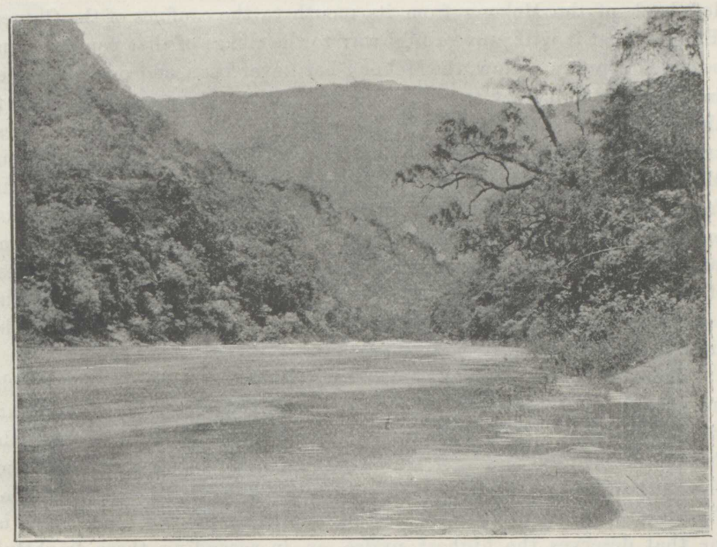
my double-roofed tent under the shade of trees, I felt it was quite as high as any human being would care to see it. This is the hottest season of the year, and the temperature, even in the substantial well-built house which I occupied in Korat, generally ranged up to nearly 100°, and remained over 90° till some time after sundown. The nights, luckily, were cool, the minimum in the early morning just before daybreak often marking 76°.

All the small streams were dried up, and the rivers reduced to mere driblets of water. We depended for drinking-water on stray pools, which marked here and there what would be the bed of a stream in the rainy season, and as cattle and buffaloes had been wallowing in these for months back, the water was not, to put it mildly, of the sweetest and most inviting description. In the neighbourhood of Korat the surface of the ground is in some places covered with an excrescence of salt like hoar-frost, and the streams are brackish. Here part of my impedimenta was a cart-load of green cocoanuts, with which I quenched my thirst; but a sickly and disagreeable drink it is when taken in any quantity. The town of Korat, like many others in this district, depends for its drinking-water on an immense marsh outside the walls. When I was there in the height of the dry season, the water was so low that the people had to wallow through the mud and carefully dip up the precious fluid with dippers, and even when it was both boiled and filtered it did not lose its marshy taste and aroma. In the rainy season, again, there is plenty of water everywhere; too much of it, in fact, as communication by bullock cart is rendered extremely difficult, if not impossible. Altogether, on account of heat, want of water, a monotonous jungly country, a toilsome and dreary method of locomotion, disease and pestilence, I was glad to reach the banks of the mighty Mekong, and turn my back on this desolate country.

At Nongkhai I received a warm and cordial welcome from H.R.H. Prince Prachak, the Siamese Chief Commissioner, who not only lodged me in a specially built house and treated myself and men in a right princely fashion, but, to my astonishment and delight, presented me on arrival with a bottle of Bass cooled in ice made in his own royal ice-machine. He also distilled the brackish water of the place, and my recollections of this pleasant spot are mostly connected with the joys of revelling in an unlimited quantity of distilled water and Bass beer in ice.



It was at Nongkhai that I first gazed upon the great river of Indo-China, the Mekong. Even at this point, more than 1000 miles from its mouth, the Mekong is a magnificent stream, and the sight of this vast volume of water nearly half a mile wide, issuing from the unknown regions of Tibet and sweeping on grandly towards the distant ocean, gives rise to feelings of the deepest admiration and awe. My feelings of admiration and awe were, however, quickly changed

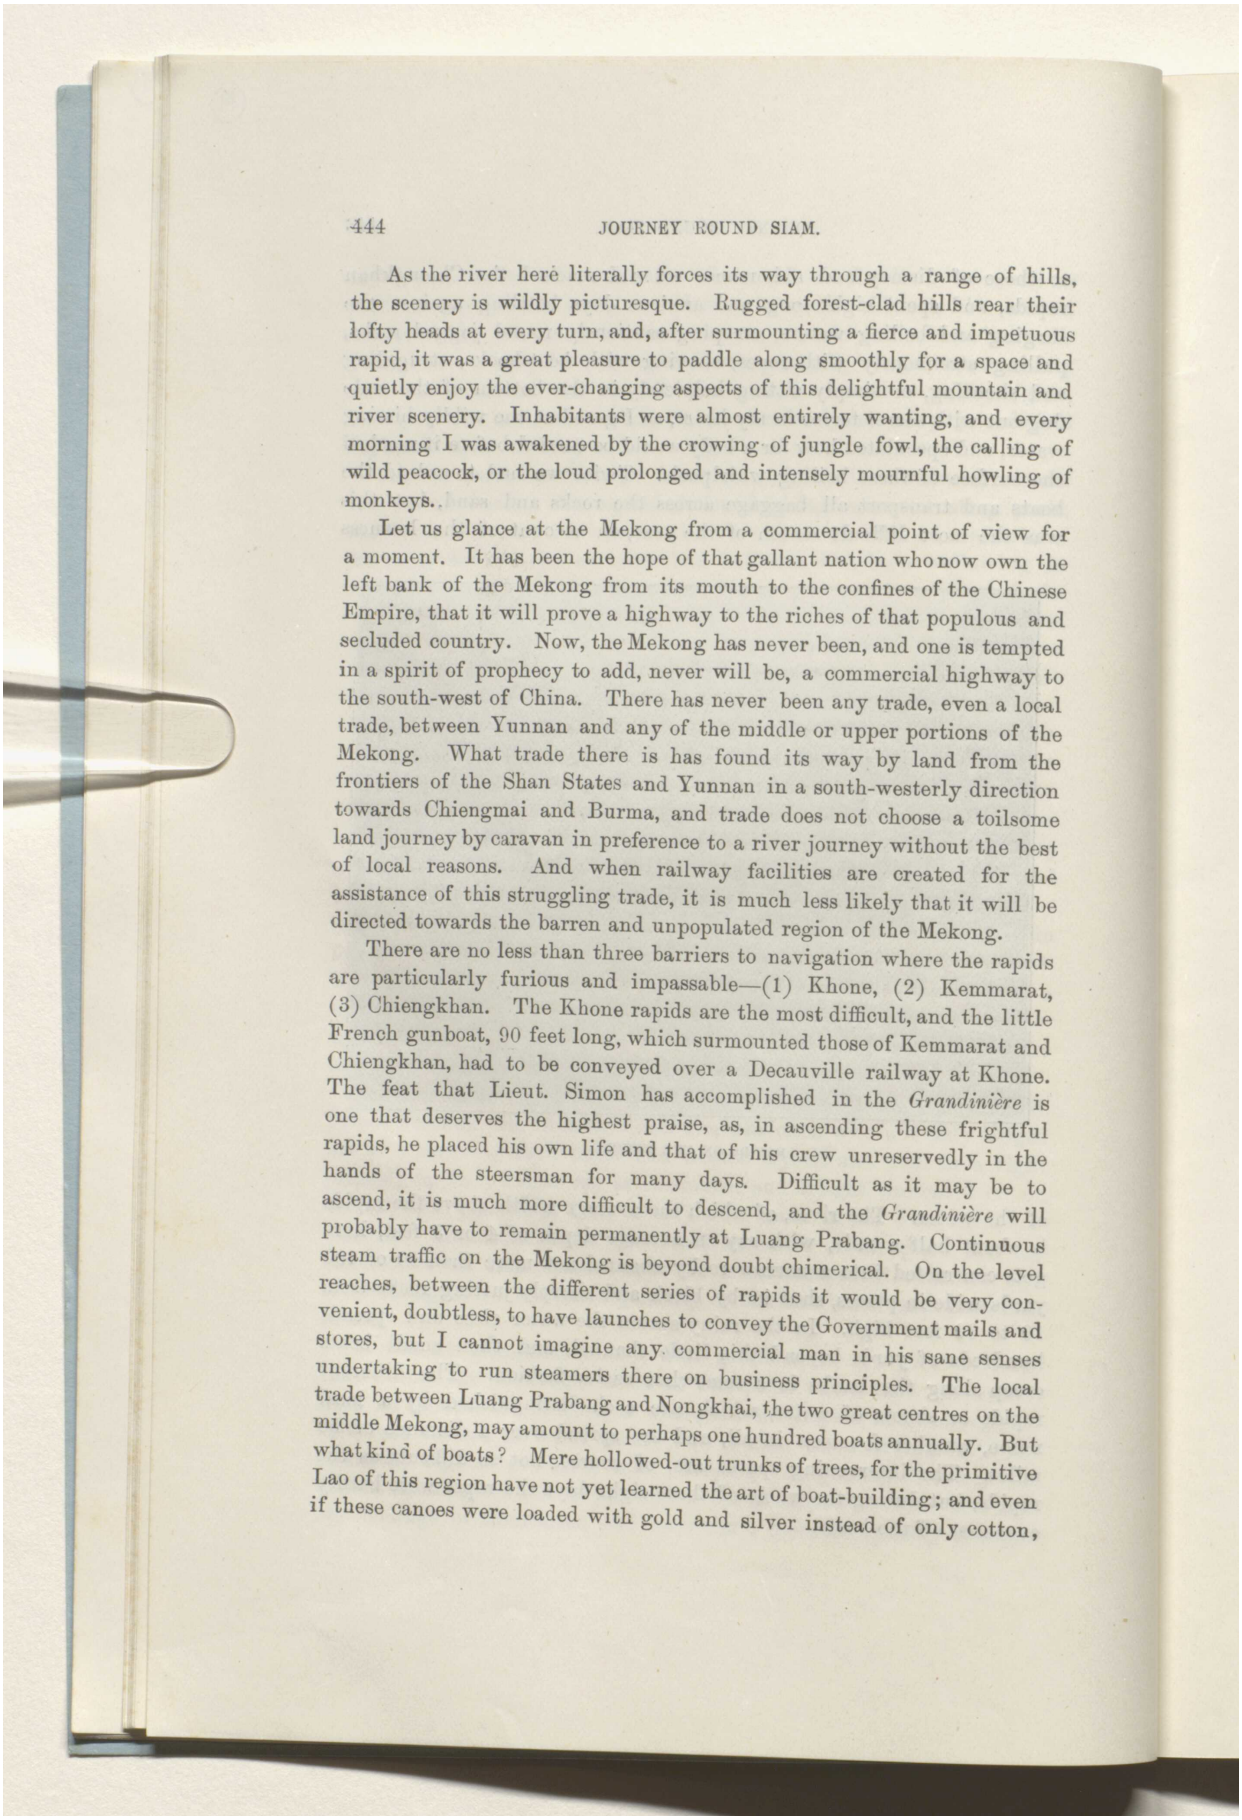
to those of dismay and abhorrence when I reached the Chiengkhan rapids, and spent eight long and anxious days battling against the surging and boiling waters, creeping cautiously round jagged rocks, pulling strenuously with ropes, shoving with boat-hooks, struggling and shouting, or simply sitting helplessly in the bottom of the rude dug-out with secret terror in my heart, as I gazed at the wildly hissing water, and speculated how far a body would be carried before it reached the surface of these boiling whirlpools. Twice we had to unload the boats and transport all baggage across the rocks and sand, but this was the most difficult season of the year, on account of the lowness



RAPIDS ON THE MEKONG.

of the water. The river, of which the average width above the rapids is about half a mile, with say an average depth of 4 or 5 feet, here gets contracted into a narrow rocky channel not more than 60 or 100 yards wide in places, shut in by black and sharply jutting rocks from 10 to 30 feet high. In the rainy season the water rises and spreads hundreds of yards beyond this little channel, and then small boats creep along the banks in a somewhat easier fashion. The different rapids or shoots of water, which are each distinguished by a local name, number fourteen in all, and are spread over a distance of 50 miles. The intervening spaces are, of course, not so difficult as the rapids, but during the whole of these eight days the ropes were hardly ever cast off the boats.

As the river here literally forces its way through a range of hills, the scenery is wildly picturesque. Rugged forest-clad hills rear their lofty heads at every turn, and, after surmounting a fierce and impetuous rapid, it was a great pleasure to paddle along smoothly for a space and quietly enjoy the ever-changing aspects of this delightful mountain and river scenery. Inhabitants were almost entirely wanting, and every morning I was awakened by the crowing of jungle fowl, the calling of wild peacock, or the loud prolonged and intensely mournful howling of monkeys.

Let us glance at the Mekong from a commercial point of view for a moment. It has been the hope of that gallant nation who now own the left bank of the Mekong from its mouth to the confines of the Chinese Empire, that it will prove a highway to the riches of that populous and secluded country. Now, the Mekong has never been, and one is tempted in a spirit of prophecy to add, never will be, a commercial highway to the south-west of China. There has never been any trade, even a local trade, between Yunnan and any of the middle or upper portions of the Mekong. What trade there is has found its way by land from the frontiers of the Shan States and Yunnan in a south-westerly direction towards Chiengmai and Burma, and trade does not choose a toilsome land journey by caravan in preference to a river journey without the best of local reasons. And when railway facilities are created for the assistance of this struggling trade, it is much less likely that it will be directed towards the barren and unpopulated region of the Mekong.

There are no less than three barriers to navigation where the rapids are particularly furious and impassable—(1) Khone, (2) Kemmarat, (3) Chiengkhan. The Khone rapids are the most difficult, and the little French gunboat, 90 feet long, which surmounted those of Kemmarat and Chiengkhan, had to be conveyed over a Decauville railway at Khone. The feat that Lieut. Simon has accomplished in the *Grandinière* is one that deserves the highest praise, as, in ascending these frightful rapids, he placed his own life and that of his crew unreservedly in the hands of the steersman for many days. Difficult as it may be to ascend, it is much more difficult to descend, and the *Grandinière* will probably have to remain permanently at Luang Prabang. Continuous steam traffic on the Mekong is beyond doubt chimerical. On the level reaches, between the different series of rapids it would be very convenient, doubtless, to have launches to convey the Government mails and stores, but I cannot imagine any commercial man in his sane senses undertaking to run steamers there on business principles. The local trade between Luang Prabang and Nongkhai, the two great centres on the middle Mekong, may amount to perhaps one hundred boats annually. But what kind of boats? Mere hollowed-out trunks of trees, for the primitive Lao of this region have not yet learned the art of boat-building; and even if these canoes were loaded with gold and silver instead of only cotton,

BRITISH LIBRARY

mats, silk, and salt, would the value of their trade be enough to justify a flotilla of steamers on the Mekong?

It was May 9, and the rainy season had begun, when I left the river at Paklai and struck across country to Nan and Chiengmai. I travelled now at the head of a train of twelve elephants, and, as the season was advancing and the streams getting full of water, we hurried on, marching generally from dawn to dusk, with frequent changes of elephants. The country is exceedingly rough and hilly between Paklai and Nan, and the roads are mere mountain paths, more often than not only the rocky beds of streams. It was marvellous with what patience and skill the

A STREET IN KORAT.

ponderous elephants carefully toiled up precipitous ravines as steep as a staircase, and slid down fearsome inclines with all the facility of trained acrobats.

What a trumpeting and bellowing of content there was from these tired and footsore elephants, as we halted for the night and unstrapped from their backs their howdahs and burdens; and what bustle, confusion, and shouting there was every morning getting them loaded again at the earliest break of dawn! Life then was reduced to a daily worry of packing and unpacking, as everything had to go into handy form to fill up the small recesses of the howdah. But once on the march, safely hoisted upon the back of my unwieldy Jumbo, I was comfortable for the day. The rain might fall in torrents, as it generally did, or the sun come out with blinding glare, but I was secure under

مكتبة قطر الوطنية
Qatar National Library

cover; and whether the elephants were slouching through a bog, or slowly zigzagging up the face of a hill, was a matter of indifference as far as my comfort was concerned. With a book, a sandwich, and a bunch of bananas for lunch, and a packet of Siamese cigarettes, I was happy for the day, and often went peacefully to slumber for an hour or two, even though it was rather a tight fit to squeeze inside the narrow limits of the howdah.

Soon after the watershed between the Mekong and Menam was passed, the character of the country and people changed for the better. Instead of passing through interminable flat jungly plains as in Eastern Siam, we traversed now a country of sparkling streams, fertile valleys, and beautiful blue hills. The people had the look of being more active and well-to-do; their houses were large and solidly built, and their temples substantially constructed of durable teak and brick. One of my men, who was a Chiengmai Lao—that is, tattooed from waist to knee in contradistinction to the Lao of the Mekong, who are only slightly tattooed on the thighs—had all along, during this journey, been sounding the praises of the Northern Lao country, and expressing his contempt for his brethren of the east. Now at every turn he was calling on his companions to admire the riches and beauties of his own country. Inwardly I assented to all he said, and felt that the change was most striking from the miserable, poverty-stricken Mekong valley to the flourishing Menam, where there was not only beauty of landscape, but the bustle and animation of business and material prosperity.

The extensive forests of teak are at present the chief source of the wealth of this country. Northern Siam divides with Burma the monopoly of supplying the world with this valuable timber, and the share that Siam annually turns out is valued at over a quarter of a million sterling. These teak forests are worked almost exclusively by Burmese British subjects, and the wood is bought and shipped by British firms to London. The amount of British capital invested in this industry alone must amount to at least a million sterling.

It is a curious fact that the zone of teak seems to stop at the limit of the Menam watershed, for on the Mekong slope teak does not appear to grow in any quantity, and what has been observed is small and stunted. The only exception to this is on the Me Ing. It has never been heard of on the left bank of the Mekong.

Nan is a pleasant little town of three or four thousand inhabitants, and is likely to be a busy centre of the teak trade in the near future, as one of the large British teak firms is anxious to extend its operations to that province.

At Pre, which is the next place of importance on the way to Chiengmai, I was delayed a few days by heavy rains and floods. I was very kindly entertained here by Dr. Briggs, a medical missionary, who employed his skill and knowledge in doctoring three of my men who

مكتبة قطر الوطنية
Qatar National Library

were prostrated with malarial fever. My cook—a Chinaman—had suffered a great deal during the journey, and I had only kept him alive, on the way from Nan to Pre, by repeated brandy cocktails and spoonfuls of bovril. I had, to my surprise, entirely escaped fever myself, and I attribute this chiefly to the strict precautions I took with water, which I never touched unless both boiled and filtered. Even at native banquets, which it was my fate to attend in ceremony in all parts of the country, I invariably smuggled in, more or less surreptitiously, a bottle or two of my own precious water. The uninterrupted use of a mosquito-net, too, even when there were no mosquitoes, probably assisted greatly in keeping off an attack of malarial fever. I also took five grains of quinine every three or four days, and in particularly malarious regions, two grains night and morning.

At Pre I remember, as one of the many curious experiences of this journey, that I attempted to join in the Lao hymns which the worthy missionary and his household sang at family worship. Dr. Briggs is a Canadian, and his favourite tune was "God save the Queen." To sing Lao hymns to the tune of the National Anthem whilst a bevy of merry brown native girls chimed in with their sweet voices is an experience, I am sure, which is given to few men.

Chiengmai, which I reached on June 20, is the capital of Northern Siam, and a very flourishing, busy, and cheerful town it is. It contains a population, I should think, of twelve thousand, and is prettily situated on the Meping 1000 feet above sea-level, with the lofty and forest-clad peak of Doi Suthep towering up behind to a height of 5500 feet. The European population here numbers about twenty, and they are all missionary or teak-timber men, with the exception of Her Britannic Majesty's Consul.

The latter part of my journey was by boat from Chiengmai to Bangkok, a distance of 537 miles, and that was accomplished with the rising floods in eighteen days, including stoppages for official purposes of four days. The rapids on the Meping, which are not nearly so dangerous or impressive as those on the Mekong, were all passed in a day and a half, and I found it much more exhilarating to shoot swiftly down such watery inclines like an arrow, than slowly fight our way up them. The gorges are quite narrow, lofty, and covered with dense masses of green vegetation, and every sweep of the river brings to view new and exquisite panoramas of rugged landscape. On the way down I called in at Lopburi, one of the ancient capitals of Siam, and there I took a photograph of the ruined palace of Constance Phaulkon, a Greek adventurer, a man apparently of great genius, who attained the post of prime minister in Siam towards the end of the seventeenth century. He was ultimately assassinated in a court intrigue, and his memory is still preserved in Lopburi.

BRITISH LIBRARY

The Menam valley is, comparatively speaking, well-known country, and I shall here only endeavour to draw your attention to one or two significant facts about it, so that you may picture to yourselves the contrast between the Mekong and the Menam valley.

Siam, as I have remarked at the opening of this paper, may be divided into the two valleys of the Menam and the Mekong, and the total average import and export trade for the kingdom of Siam, based on the returns for the past three years, amounts to four and three-quarter millions sterling per annum. As I have estimated the total export and import trade that passes to and from the Mekong region at about a quarter of a million, it follows that the balance of the remaining trade of four and a half millions sterling per annum is carried on with the Menam valley. These statistics show at a glance the relative importance, as far as the outside world is concerned, of these two regions; and, as the great proportion of this trade is carried on by British energy and British capital, you can well understand the satisfaction of the mercantile community to find that this, the important and vital portion of the kingdom of Siam, has, by the recent agreement concluded between England and France, been placed in a position of absolute security and freedom from armed interference on the part of either country.

Nor does four and a half millions sterling represent in any degree the trade that the valley of the Menam is capable of when properly developed, and when its five or six millions of inhabitants are brought within easy reach of British markets. The export of rice, the principal production of the country, which averages nearly two millions sterling per annum, is drawn to a very great extent from the delta of the Menam alone, and not many miles from Bangkok there are extensive tracts of rich alluvial soil which need only canals to bring them within the area of cultivation.

The fertile valleys of Northern Siam, too, require to be brought into closer connection both with Bangkok and Burma, and it is to the object of constructing a Trunk railway up the valley of the Menam, and throwing off branch lines to the Burmese frontier, that the Government of Siam should strenuously devote itself. Nor should the extension and repair of the canals in the Menam delta be forgotten, for in that low alluvial land canals are even a more important factor for development than railways.

In concluding this paper, I might take the opportunity of paying a brief tribute of thanks to the Siamese authorities, and particularly to H.R.H. Prince Damrong, the active and talented Minister of the Interior, by whose special orders my transport throughout the whole of this extensive journey was admirably arranged. It was to his foresight, and to the care and energy displayed by the local officials, that I was nowhere subjected to delay, and that I completed this tour round Siam without any serious mishap.

Before the papers were read, the PRESIDENT said: We are honoured this evening by the presence of the Prince of Siam, son of his Majesty the King of Siam. The papers to be read are on kindred subjects. The first by Mr. Clifford,* on some of the Malay States on the eastern side of the peninsula—about which we are almost in complete ignorance, I think, until we shall have heard his paper; and the other will be an account of a very interesting journey round Siam, by Mr. Black, of her Majesty's consular service in Siam. I will now ask Mr. Clifford to read his paper.

After the reading of the papers, the following discussion took place:—

Sir HUGH LOW: I am afraid I can add very little to what Mr. Clifford said in his admirable paper. I don't know that part of the country well, having only visited parts of it. Mr. Clifford has travelled through it, and, I suppose, knows it better than any other person who has ever been in it. He came to the country, where I was at the time, about twelve years ago, when quite a young man, and at once showed his great powers of endurance by going into the jungle in all kinds of weather; and he has told us how he forced himself to live upon the native food, which I don't think any other person could have done, and carried out the expedition he undertook with so little difficulty. He is about to go back to these countries, and, although Pahang has not been under the care of British officers long, I have not the least doubt that, when he has been there for a short time, we shall have great improvements by federation with the most prosperous states on the western side of the Peninsula; and federation will enable Pahang to be developed, a policy which has been successful—as all our policy has been lately—so successful that scarcely anything can be compared with it in recent history. It is not for us to talk about the commercial advantages of the place, but the jungles, and the country through which Mr. Clifford travelled, really contain some of the most glorious scenery, the richest botanical products, and the most beautiful zoological productions in the world. Mr. Black mentioned the peacocks. These are far more handsome than those we have in England; it is a most glorious bird. I don't think I can say anything which would add to our knowledge, but I am sure that this Society will wish Mr. Clifford every possible success in this most important post to which he has been appointed, as Resident at Pahang—that country which is said to contain minerals in abundant quantities, which are already profitably produced, though scarcely prospected at all by Europeans. They are crudely worked by the Chinese and Siamese, but could be produced in greater abundance than in any other part of the world; and I have not the least doubt that many other rich productions will soon be developed now that this federation is under the protection of officers who are going to take charge of it.

The PRESIDENT: We also, I believe, have to welcome here this evening the presence of Mr. Swettenham, who has been kind enough to bring some interesting curiosities from the Malay Peninsula, and I trust he will address you on some part of the subject Mr. Clifford has brought before us.

Mr. F. A. SWETTENHAM: There are one or two things I should like to say, not so much with reference to Mr. Clifford's paper, because he has said all there is to be said. His journey was very remarkable, and I am specially glad to be here this evening, because I think I may claim some credit for having suggested to this Society that they should ask Mr. Clifford to read this paper. I should like to say, with reference to the geographical portion of the question, that Mr. Clifford has been able to fill up a blank space on the map. Twenty years ago the map showed

* Mr. Clifford's paper will be published in a subsequent number.

BRITISH LIBRARY

only the outline; since that time we have done something to fill up all the western part of it; but until the other day—I speak of last year—the part that is now filled up was quite blank, and this Mr. Clifford and his friends have done. I hope this Society will put it in the way of being seen by the public. If the Royal Geographical Society would aid the efforts that are being made in the East by a sister society, a branch of the Royal Asiatic Society, we might in a short time get a really good map of the Malay Peninsula. As I said, twenty years ago nobody thought it worth while to try and fill in any part of the Malay Peninsula. Sir Hugh Low reminded us that we must not discuss commercial topics here, but I trust that, as we are a nation of shopkeepers, you will forgive me if I allude to matters which are, in a way, commercial. Our interest in the Peninsula has been forced upon us. The British Government for many years absolutely refused to have anything whatever to do with the Malay Peninsula. We were established in a few small places marked in bright red on the map. The British had a colony, and outside that they declined to go, until the state of things in what I may call the Hinterland became so bad that we were compelled to go in against the wishes of the British Government. The result of our going there has been that we have done a great deal of good. The places which yielded a very small revenue indeed ten years ago, $400,000, now yield $8,000,000, the colony itself only yielding $4,000,000. The colony is more than a hundred years old, and we have been in the Malay Peninsula only twenty years. There is not a railway in the colony, and we have 200 miles inside the Malay States. I ask your pardon for mentioning these commercial matters, but they are of some importance. I hope that, by means of the scheme for federation which has lately been sanctioned by the Secretary of State for the Colonies, we shall be able to so extend these railways that by-and-by the Malay Peninsula will become quite an important place, and that Malacca will become the port for the valuable mineral and agricultural products of the Peninsula. All that is due to one great fact which I think we are far too apt to forget, which is, that our presence in the Straits of Malacca is due to the foresight of one man, Sir Stamford Raffles. Everybody who knows anything about his life must recognize that he is one of the greatest Englishmen that ever lived, probably the greatest who ever got as far as he did, and I fear one whose history, character, and career have been the least recognized and least known, although whatever we are and whatever we shall be in the Straits of Malacca is really due to his great foresight and desire to advance the interests of this country.

Mr. F. Verney: I have really nothing to add to the very excellent remarks which have been made by those who have had the opportunity of serving in that distant and most interesting country. Perhaps I may be allowed to say a word with regard to the relations which have recently been established between England and France in the country of Siam. I must not trench on the question of politics, but would say this, that we must fervently hope that the arrangement may tend to the advancement and progress of the country, which we have so much at heart. I hope that no one here will think for a moment that commercial rivalry need be co-existent with a kind of commercial hostility. I think there is plenty of room for healthy commercial rivalry in this great country, and we should not in the least deny to France the rights we claim. We hope, by advancing in healthy rivalry, we may, without doing any harm to the king and country of Siam, go ahead in a way advantageous to Siam itself, and not disadvantageous, but of great gain, to the two commercial countries which have their interests so largely developed in Indo-China. We must have been immensely interested by the excellent papers we have heard. It requires splendid health, first-rate temper, a knowledge of the language of the country, and great experience, to produce such

BRITISH LIBRARY

good explorers as we have listened to to-night, and Englishmen, going into these countries, and making nothing of the toil and hardships they go through, giving such excellent representations of the journeys they have made and the countries they have visited, offer us the main chance we have of learning something of, and adding to our interest in, those distant lands. We feel heartily obliged to these two gentlemen who have been exploring these countries, and who have brought back such interesting accounts of them to us.

Mr. J. G. Scott: After the two papers which have been read to us, it seems rather invidious to call upon a person like myself, with a superficial acquaintance of the country, to make any remarks at all; but I think I shall be only representing the feeling of this meeting when I say that the little we have heard will make us look forward to the proceedings of the Society with the greatest interest. I should like to make some remarks with regard to Siam. A little earlier than Mr. Black, I travelled in Siam, and crossed his route. A few remarks which Mr. Clifford made about his hardships in Trengganu and Kelantan suggest to me that it would be as well, seeing that Siamese listeners are here to-night, that I should thank the Siamese Government for the facilities they placed at the disposal of myself and Mr. Black in travelling about the country. So far as I am concerned, I can safely say that I never had to test my capacity for putting away the rice which Mr. Clifford spoke of as the diet of which one has to take a great deal before being satisfied. There are a great many British subjects in the north of Siam, a great many Burmans and Shans. It is a curious fact that both Burmans and Shans are agriculturists in their own country. Agriculturists in this country are not in so good a position as they, for in Siam you only have to tickle the ground. Considering the number of British subjects in Siam, it is a matter of great pleasure to us that that country, which was in a dubious position owing to its two neighbours calling each other bad names, is now guaranteed on both sides. In travelling through the country, one sees an extraordinary number of ancient ruined cities, the city walls grown with trees, which shows they must have existed more than a hundred years ago, and from the ruins it would appear that the population must have been very great. We may hope, now that Siam is settled and at ease, that the population will grow to be as great as ever, and it is in this central part of the country that the population will settle. The country to the east, which some people seem to think belongs to France, is much less interesting. Mr. Black's paper, when it is published, will give you an idea of the country, but I think it is waterless, and that the population from there will most probably go to the centre of Siam, and will help to swell the amount of British trade, which is already 97 per cent. of the whole trade of Siam. The Mekong, of which I saw the upper part, and Mr. Black the middle, is a very fine river to look at, but it is not such a fine river as the British river, the Salwen. It never can become a commercial river at all. Lieutenant Simon has taken a gunboat up above the rapids to Luang Prabang, which shows it is feasible for pluck to conduct steamers up the river; but what a brave man will do a commercial man will not do, because it won't pay. Mr. Verney said that we might look upon the French rivalry with friendship. I think that if they intend to use the Mekong river, we may look upon their efforts to take the trade down with indifference.

Mr. R. L. Morant: I don't wish to keep the meeting; but, if I may, I should like for a moment to add my humble testimony to what has been said about the work done round the Peninsula. I had the honour of going to each centre of government there with H.M. the King of Siam in 1889, on which occasion I was able to look at it, not only as a Britisher, but also, of course, through Siamese spectacles —that is, looking at the methods of the British Government from the point of

Qatar National Library

view of an Eastern monarch. We went down the west and up the east coast. The contrast was striking as one came up to the more northern ports of the Peninsula, where the suzerainty is not British. I well remember the remarks his Majesty made at the time, that it was quite visible what could be done by good administration. I only wish to ask a question upon two points of some importance. On most maps there is marked a river flowing through Korat down to the Mekong; when I went to Korat in 1894 I did not see anything in the nature of a river which would be of any use. The question is of some importance politically as well as geographically. Perhaps Mr. Black, who was there at a different season, saw something of the kind. As far as I can make out, everything in the nature of commerce must come westwards, that is to say, westwards from Korat. I would also like to know whether it is yet finally decided for the railway to go as far as Korat, or to stop at the point it has now reached. In its present condition it will not largely assist trade, though it has its uses. I shall never forget with what delight we walked along the top of the embankment after toiling over heavy jungle tracks. At the same time, if rails were laid it would be probably somewhat more useful to Siam generally. One would like to know if Mr. Black has any opinion on these points.

Mr. Black: As regards Mr. Morant's first question about the river flowing eastwards from Korat to the Mekong, there is such a river called Nam Mun. It flows past Korat, about 13 miles distant. It is a very small stream there, and in the dry season it contains only a few inches of water. Where it enters the Mekong its course is obstructed by rapids, and even the native boats, which at present go down that river, are obliged to have their goods taken out and carried overland; so that in its present condition, for the purposes of commerce it is not what might be called a practicable river. In the rainy season, of course, there is a great deal of water, and launches could, and, in fact, I believe a couple of launches were run for a short time from a place near Korat called Ta Chang down to Ubon, below which the rapids begin. Trade on this river could be fostered and developed, but this would take some time. As regards the railway, I am sorry to say that I have no information to give. If it were continued to Korat, it would develop an entirely new country, and pass over a tract which is now very difficult to traverse. At present this railway has been constructed for a distance of 75 miles, or half way. There still remains a distance of from 80 to 85 miles to Korat to be constructed.

The President: It now only remains for us to thank the authors of these two papers. Mr. Clifford has opened to us countries which, I may say, were almost entirely unexplored. It is true that the coasts of these countries have been known for centuries. I remember well that the great Arctic navigator, John Davis, was becalmed for many days off that coast of Trengganu and Pahang, and in sight of these lands he lost his life through the treachery of some Japanese pirates. But with regard to the interior of these states, we know next to nothing. We must all admire the hardihood and pluck with which Mr. Clifford explored them, and I think we must also applaud the gallantry of those youngsters who, in a dark night, risked their lives down the rapids; for, although it was only to bring their master his dinner, still it was an act of heroism. His account of the country is instructive, and his narrative of the journey most interesting. I am very sorry that Mr. Black was obliged to skip a large portion of a very valuable part of his paper, because he was afraid of boring you, which I am sure he would not have done. What he has told us is certainly most instructive and interesting, and I know you will desire me to return your cordial thanks to Mr. Black and to Mr. Clifford for the papers we have listened to this evening.

A JOURNEY IN THE VALLEY OF THE UPPER EUPHRATES.

By VINCENT W. YORKE.*

Divrik at present contains about 4000 families, of which 800 are said to be Turkish, and the rest Armenian. The town, which is situated on the edge of an extensive plain, is loosely built, with many gardens, and has a fair bazar. Its name and situation would point to its identity with Tephrike, an important fortress of the Paulicians in the ninth century A.D. It was founded by Carbeas, the leader of this powerful sect, in 855, and for nearly twenty years was the cause of much trouble to the Byzantine Empire. It was eventually taken by the Byzantines during the reign of Basil I. in 873.† The place afterwards came into the hands of the Seljuks, who, according to St. Martin,‡ were driven out by the Mongols in 1243.§

After a thorough search for antiquities, we could find no remains which can be with certainty ascribed to any period older than that of the Seljuk occupation. There are two ruined castles at Divrik, the largest of which occupies a strong position on a steep rock overhanging the modern town. Round the top of this rock there exists a circuit of walls, preserved at some points to a considerable height, which may in places be as old as the time of the Paulician occupation. Within these there are also remains of what may once have been a church, though, if this was ever the case, it has been largely modified in the Seljuk style. The other castle is built on a high pinnacle of rock on the further bank of the Chalta Irmak. It is much smaller in extent, and less well preserved. The graveyards of the town did not contain a single inscription, or even any worked stones which can be assigned to the Byzantine age. Remains of the Seljuk period, on the other hand, were abundant; there are numerous small chapels and tombs, for the most part octagonal in shape with pyramidal roofs, which show Seljuk work

---

* Paper read at the Royal Geographical Society, May 13, 1895. Map, p. 428. Continued from p. 335.

† Other settlements of the Paulicians in this district mentioned by the Byzantine historians are Argaoun and Amara (or Abara), founded by Carbeas, Koptos Spathe, and Tauras. None of these have as yet been identified.

‡ *Op. cit.*, p. 188.

§ Divrik has been identified with Abrik of the Arab geographers by l'Estrange in his notes to a translation of Ibn Serapion (*Jour. Roy. Asiat. Soc.*, 1895, p. 54), but he has changed his opinion subsequently in deference to Hogarth, who would identify Abrik with the modern Arabkir (*vide J.R.A.S.*, 1895, p. 740). But his original identification is confirmed to a certain extent by the occurrence of the variant Αφρικὴ for Τεφρικὴ in two passages of the Byzantine historians (Sym., 8. 455, B.; Leon., 255.16), while the old name of Arabkir, as given in the fiscal archives, appears to have been Nareen (Taylor in *Jour. R.G.S.*, *loc. cit.*, p. 311). Abrik was visited by Ali of Herat in the twelfth century, and was then a place of pilgrimage held in veneration alike by Christians and Moslems. A curious passage from Yakut (i. 87), giving Ali's description of the place, is translated by l'Estrange (*J.R.A.S.*, *loc. cit.*).

in various parts of the town; and on an eminence below the larger of the two castles there stands a magnificent mosque, built, according to an inscription on the north door, for Kai Kosru II. (*c.* 1240), which must be one of the most splendid monuments of its style and period in existence. As it has attracted very little notice from previous travellers, it will be well briefly to describe it.

The mosque is oblong in shape, lying north and south, and measures 87 yards by 47 yards. It has three great stone portals, two on the west side, and one on the north. The north door is very richly decorated, and, except at the bottom, where it has been in part rebuilt, is in a good state of preservation. The system on which it is designed is that of a pointed arch within a rectangular frame. The sides of the frame are supported by clusters of pillars, and on each side of the arch and above it a line of very elaborate ornament, consisting of rose-medallions, crescents and stars, and lotus-buds, is worked. These are in many cases almost completely detached from the background. The south door of the west side is similar in shape and design to the north door, the chief ornament used being heavy and elaborately carved foliage. The third door is more simple in style, and is ornamented almost entirely with the honeycomb pattern. On each side of it, in panels cut in the projecting buttresses, are representations of the two-headed eagle, the badge of the Seljuk sultans; and against the main wall, close to them, another strange bird, which is probably meant for a hawk. The mosque inside has a stone vaulted roof, ornamented at the keystones with bosses, on which shells and flowers are carved. It was originally supported by sixteen hexagonal piers, which have been roughly built up in recent times. From one of the cupolas hangs a "blue stone," *i.e.* a ball of Persian porcelain, to which magical properties are ascribed. The whole building is now, unfortunately, in a very bad state of repair, and a large portion of it will probably within a short time fall into ruins.

From Divrik we made our way back to Zimarra by a longer but easier route, which skirts the base of the high mountain which we had climbed in coming. We followed the Sivas road on leaving Divrik for half an hour, and then took a path which goes off to the right and crosses the river by a stone bridge with two arches. We then followed the course of one of its tributaries, the Hornova Chai, until we reached the Armenian village of Hornova, and soon after crossed the watershed between that stream and another which flows into the river of Divrik. Our path then led us down a small and gradually deepening gully to the village of Karageban, which is six and a half hours distant from Divrik. Karageban is a village of sixty houses inhabited by a singularly handsome race of people, who spoke Turkish and claimed to be Turks. Here we spent the night, and the next day proceeded to Zimarra, which we reached in two and a half hours. From Zimarra we took the direct route by Hassan Ova to Kemakh.

At one hour beyond Zimarra we stopped at some ruins on a small stream a short distance below the village of Zinika. These ruins, to which allusion is made in 'Arch. Epigr. Oester.' (1884, p. 239), are those of a small fortress of circular shape, built round a low mound about 50 feet high and 200 yards in circumference. The walls consist of an outer line, within which, at an interval of about 20 yards, is a small enceinte; they are built of large mostly unsquared blocks of limestone laid in uneven courses, the gaps being filled up with small stones and a little mud mortar. It is difficult to determine the period to which these remains belong; the rude style of building would point perhaps to a pre-Roman date for the walls, and the mortar used in them to a Roman

THE EUPHRATES ABOVE CHERMUK (LOOKING SOUTH).

restoration of the same, but without further evidence no definite conclusion can be arrived at with respect to their age.* There is a direct path leading from these ruins to Pingan, not more than 4 or 5 miles distant.

From these ruins we proceeded by an easy path, which led us, after three hours' travelling over bare and undulating country, to the village of Dostal, situated only a short distance from the western Euphrates. The inhabitants of this village, which consists of forty houses, though they described themselves as Kurds, talked nothing but Turkish. At Dostal we were told of the existence of a "written stone" a short distance from the village and close to the road which we were following

* It is quite possible that the remains may be those of the fortress of Hisn-al-Minshar mentioned by Ibn Serapion, as Hogarth suggests (*vide J.R.A.S.*, 1895, p. 746).

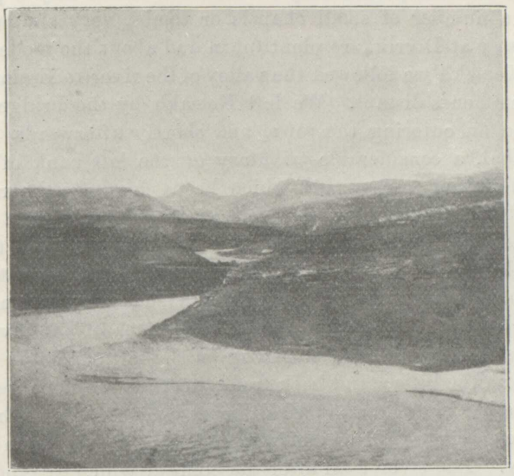
to Hassan Ova. This stone we found to be a Latin inscription bearing the name of the Emperor Decius on a panel cut in the living rock on the further or left bank of the Kara Budak, a tributary of the Euphrates at a point situated about 4 miles from Dostal, and about the same distance from the junction of the tributary with the river. On the right bank of the Kara Budak, opposite the inscription, there are remains of an abutment of a bridge, and on the left bank the rock is cut away for a short distance to carry a road.

As is often the case, the name of the river over which the bridge was built is given in the inscription, and, curiously enough, it appears to be the same as that by which the Romans called our own Severn, *i.e.* Sabrina. Its discovery gives certain indication that a Roman road passed the stream at this point.

From the spot where we found the remains Hassan Ova is reached in one and a half hour, and a road to Kuru Chai goes off to the left fifteen minutes after leaving the bridge. At Hassan Ova, which is situated close to the Armidan Chai,* another considerable tributary of the Euphrates, and one which has as yet found no place in Kiepert's maps of Asia Minor, we saw some signs of an ancient site in some columns and capitals, probably of Byzantine date, lying in a ruined hut by the side of our path. Unfortunately, we were prevented from searching the village for further evidence of antiquity by the fear of being detained in quarantine. Hassan Ova lies on the frontier between the vilayets of Sivas and Erzingan, and eleven days' quarantine had been imposed on all travellers coming from the former province. Any delay might have led to our detention in the wretched village, which is notorious in this part of Asia Minor for its bad water, for eleven days, so we hastened on, fortunately without being perceived by the official to whom the supervision of this part of the frontier had been entrusted.

A short distance above Hassan Ova the country through which the western Euphrates flows becomes mountainous on the right bank, and our path struck up into the hills, and, after a long and easy ascent, reached the height of 6458 feet.

We then crossed a well-cultivated upland plain until we came to the valley of the Nezgieb Chai, which we followed down to Nezgieb, a Turkish village of fifty houses, distant three hours forty minutes from Hassan Ova. After leaving Nezgieb, we travelled for rather more than an hour down the bed of the same stream; the path then mounts from the left bank, and crosses the heads of numerous *derés* formed by small tributaries of the Euphrates. In this manner we gradually ascended to the edge of a high cliff, from which we had a view of the



* It is also called the Kuru Chai Su. Its course was followed by Taylor in 1866 (*loc. cit.*, pp. 308 ff.).

Euphrates and Kemakh on the further bank. At this point a severe thunderstorm, which had been brewing all day in the Dersim mountains behind Kemakh, broke over us, with the result that a small stream which lay between us and the town was turned into an almost unfordable torrent. By making a considerable détour we succeeded in passing this obstacle, and so reached the Euphrates. The river, which flows at this point through a high and precipitous ravine, is here spanned by a wooden bridge, which we crossed to ride down a ladder-like staircase into the town of Kemakh. We rode the whole distance from Hassan Ova to Kemakh in nine hours twenty minutes, but we travelled very slowly for the last two hours, and the journey could easily be accom-

THE WESTERN EUPHRATES ABOVE AGHIN (LOOKING NORTH).

plished in eight and a half hours. It is quite possible that the road which was so often traversed by Byzantine armies (Sebastea—Tephrike—Kamacha *) may have coincided with the route along which we travelled from Hassan Ova to Kemakh, but we saw no sign of any ancient road along our path.

Kemakh is a small town of about fifteen hundred houses, of which only thirty-five are Armenian. The town is clustered round a precipitous rock, which rises close to the left bank of the river, and on which there are remains of what must once have been an impregnable fortress. It most probably occupies the site of one of the several towns called Theodosiopolis, which existed in this part of the Byzantine Empire.† In

مكتبة قطر الوطنية
Qatar National Library

later times it was one of the so-called Mesopotamian fortresses which the Arabs held along the line of the Byzantine frontier.* We stayed two nights in Kemakh, but were unsuccessful in our search for remains of the Byzantine period. Portions of the walls of the castle, which are in places still preserved to a considerable height, may be as old as those times; but it is more probable that the greater part of them are later in date, and the work of the Mohammedan conquerors. Within the walls of the castle there are ruins of many houses which may possibly be the remains of the Byzantine town, but we found no inscriptions or other evidence to support such an hypothesis. The churches which are reported to have been seen by other travellers who have visited Kemakh, do not exist at the present day.† Remains of the Seljuk period, consisting of a number of small chapels or tombs, very similar to those which we saw at Divrik, are plentiful in and about the modern town.

From Kemakh we followed the valley of the river to Erzingan, which is about ten hours distant. We left Kemakh by the bridge which we had crossed on entering the town, and shortly afterwards forded the Kiumur Chai, a considerable tributary of the left bank of the river. We then followed an easy path which keeps closely to the right bank. The river between Erzingan and Kemakh is generally from 80 to 100 yards broad; the stream is yellow in colour, and flows at the rate of about 6 miles an hour. We found the temperature of the water on June 6, at 4.30 p.m., to be 59° Fahr. The Dersim mountains descend abruptly to the left bank all along this part of the course of the river, but for seven hours of our journey the country on the left bank was fairly easy in character; the hills stand back from the river or slope gently down towards the bank. Three and a half hours before reaching Erzingan we came to the carriage-road which is in course of construction along the river-valley. The river, soon after the point at which we got on to this road, is hemmed in on both sides by hills, which continued until we reached the plain of Erzingan, when the road leaves the river. A ride of one and a half hour along the road over the plain then brought us to Erzingan. We met with few human habitations, except *khans*, in the river-valley between Erzingan and Kemakh, and we saw no sign of any old road or other antiquities along our route.

The following table is a list of distances and heights between Egin and Erzingan:—

Miles.		Feet.
—.	Egin	3342
14.	Top of ridge ...	5913
11.	Pingan	3331
14.	Kesmé	4874
8.	Summit	7922
7½.	Divrik	3642

Miles.		Feet.
23.	Karageban	4695
23.	Dostal	—
9.	Hassan Ova	—
13.	Nezgieb	5807
17.	Kemakh	3877
35.	Erzingan	4267

BRITISH LIBRARY

Erzingan is situated in a large plain, which is surrounded on every side by high mountains. It is at the present day the principal military outpost against Russia on this part of the Turkish frontier, and the head-quarters of the 4th Army Corps. The town, which is badly built, is said to contain from 30,000 to 35,000 inhabitants. We could find no ancient buildings or other antiquities in Erzingan, which does not seem to represent any ancient site. The chief monument of the place is a modern mosque built in classical style.

At Erzingan we finally left the Euphrates, and made our way northwards to Sadagh, about ten hours distant on the other side of the high mountain range which bounds the plain of Erzingan to the north, and forms part of the watershed between the Black Sea and the Persian

GORGE OF THE WESTERN EUPHRATES BELOW EGIN.

Gulf. Sadagh, where ruins and antiquities have been reported by several travellers, lies close to the route which is travelled by the postal service between Erzingan and Trebizond. Following this route, an ascent of nearly four hours, by a path which nowhere presents any great difficulties, brought us from the plain of Erzingan to the top of the pass (8805 feet) over the Sipikor Dagh. The carriage-road, which is in course of construction between Erzingan and a point on the Erzerum-Trebizond *chaussée* near Giumush Khané, begins a short distance before the top of the pass is reached, and, though it is not yet metalled in many places, it is probable that before long the whole road will be completed, and it will be possible to drive all the way from Erzingan to Trebizond. After reaching the top of the pass, we rode down a green and pleasant valley to Sipikor, a Turkish village of one hundred houses.

مكتبة قطر الوطنية
Qatar National Library

From here we followed the carriage-road, which keeps to the left bank of a small stream flowing into the Kelkid Irmak (Lycus), and in five and a half hours reached Sadagh, which lies a short distance to the left of the road. Sadagh is a Turkish village of about a hundred and fifty houses, built for the most part of old squared stones. It is situated in a depression in the hills on the left bank of one of the main sources of the Kelkid Irmak, and has a fine water-supply which flows from a reservoir, which is artificially banked up above the village. The site lies close to the route up the Kelkid Irmak from Enderes *viâ* Ashkaleh to Erzerum. This route, inasmuch as it formed part of the old route by land from Constantinople to Erzerum,* was of great importance before the half-sea route *viâ* Trebizond to Erzerum was opened up, and in consequence the village has been mentioned in the writings of some of the early travellers to the East.†

In more recent years, it has been visited by Taylor in 1868, who copied a Latin inscription, and reported the existence of some Byzantine inscriptions in the village;‡ and subsequently by Biliotti, who sent in a description of the site, accompanied by a plan of the ruins, to the British Government. A Latin inscription was also copied on the site by Colonel Everett, and has been published in the Corpus.§ On the strength of the reports Sadagh was identified by Kiepert in his maps with Satala, the camp of Legio XV. Apollinaris.‖

There was nothing, however, in these reports and inscriptions to make this identification certain, and we devoted two days to an examination of the site, and a search for further epigraphical evidence. Our efforts were rewarded by the finding of several legionary titles inscribed with the words "Leg. XV. Apol.," the discovery of which must remove all doubt as to the identity of the site with Satala. Considerable remains of an ancient fortified town exist near the modern village. The walls, which consist of a rubble core faced with well-squared stones, seem to have formed a square enclosure, the sides of which faced the four points of the compass. They are best preserved on the north side, where the towers are still standing along the whole line and at the two corners. On the south and along part of the west side the ancient walls have been almost obliterated by the modern village, which is built over the south-west corner of the enclosure. As far as can be judged from the style of construction, the walls would seem to be of Byzantine rather than of Roman date, and are probably in their present form not older than the time of Justinian, who is known ¶ to have restored the fortifications of

* It is described in Ritter, vol. x. p. 751.

† Tournefort, Let. 21; Morier, 'Persia,' p. 331.

‡ Taylor, *loc. cit.*, pp. 287 ff. The inscription which he copied can be partially restored, and is undoubtedly one of the Emperor Aurelian. It has not yet found its way into the Corpus.

BRITISH LIBRARY

the town. A short distance south-east of the site there are remains of an aqueduct, of which five arches are still standing. Above the modern village, near the reservoir, there are remains of earthworks, which possibly represent the site of a small fort which guarded the water-supply. There are also some foundations of a building outside the north wall, but not enough of it is preserved to indicate its character.

In the course of our stay we succeeded in finding, besides the legionary tiles and a considerable number of unimportant Byzantine epitaphs, seven Latin inscriptions. Of these two are mere fragments, and another, a milestone, is so weather-worn as to be wholly illegible.

With regard to the famous bronze head which was found at Sadagh

MOSQUE AT DIVRIK (NORTH DOOR).

and is now in the British Museum, we could obtain but little information. We were shown the place where it was found; the spot is within the walls of the site, and the man who turned it up was at the time of our visit still alive, though at the point of death. From the accounts of the oldest inhabitants, it appears that a thorough search was made at the time when the head and hand were discovered, and they all agreed in saying that nothing else was found, so that the reports which have been in circulation to the effect that the body of the statue is still in possession of the natives of the place, are probably without any foundation. Exactly the same account was given by one of the *beys* at Kemakh, the government engineer of the district, and our *Khanji* at Erzingan.

From Sadagh we made short excursions along two of the valleys which converge on the village from the west, the valley of the Lycus,

مكتبة قطر الوطنية
Qatar National Library

and that of another smaller stream to the south. In the valley of the Lycus, on the road to Kelkid Chiflik, at a village one hour distant from Sadagh, there are two columns, which may once have been milestones, though neither is inscribed.

On leaving Sadagh we regained the post-road from Erzingan to Trebizond, and went *viâ* Keusse over a high pass (7389 feet) to strike the Erzerum-Trebizond *chaussée* at a point fifteen minutes short of Tekké. The point where the two roads join is ten hours distant from Sadagh. One hour and a half after leaving Sadagh we saw what may be a Roman fort, 2 miles to the right of our road. We did not have time to visit it, but could make out with a glass that its walls consist of a rubble core faced with squared stones.

From Tekké to Trebizond the road has been described by numberless travellers, and I will only add notes about two places on it. At seven hours twenty-five minutes from Tekké, at Ardasa Khan, there are ruins of a castle, probably Byzantine, above the village on a high rock to the right. From the existence of these remains and the similarity of names, it may be conjectured that Ardasa = Αραδάση of the Byzantine lists.* At two and three-quarter hours beyond Ardasa, and ten hours before reaching Trebizond, a small group of *khans* is passed on the south side of the pass, which are called by the collective name of Zigana Khan. The name of one of the stations on the road of the Antonine Itinerary from Trapezus to Satala is preserved in Zigana,† but there is not the faintest trace of antiquity on the spot, and if the distances given in the Itinerary are correct, the station must have been rather further south.

At Trebizond our journey came to an end, and we took ship for Constantinople.

PART II.

The Roman Roads and Defences on the Upper Euphrates.

Having thus described our journey, I shall now endeavour to show what new light can be thrown by its results on the subject of the Roman roads and defences on this part of the frontier, discussing, firstly, the course taken by the roads, and the position of some of the stations on them; and, secondly, the history of their construction.

The general system of the Roman roads leading to and along the upper Euphrates may be said to be fairly understood, and is well set out in the writings of Professor Ramsay ‡ and Hogarth § on the subject. The system has as its centre Melitene, the *caput viæ* of the great road from Ephesus and Cæsarea, which doubtless followed the same course as the old trade-route to the East, the κοινὴ ὁδός of

* Ramsay, p. 319.
† Zigana was also a station for troops ('Notit. Dignit. Orient.,' cap. xxxv.).

BRITISH LIBRARY

Artemidorus. From Melitene a road ran north to Satala, and south in two branches across the Taurus to Samosata, these three points being the *stativa* of the three legions stationed on the upper Euphrates. From Melitene another road led in a north-westerly direction to Sebastea, and from Sebastea another went eastwards to Nicopolis and Satala, from which point it was continued through Armenia Major to Artaxata. From Nicopolis another road ran south to cut into the road Satala—Melitene, according to Kiepert at Analibla, according to Ramsay at Carsagis. From Satala the road from Melitene was prolonged to Trapezus on the Black Sea, which was also a station of Roman troops.

The Roads Melitene—Samosata.

The roads given in the authorities are—

I. Antonine Itinerary: Melitene, XII.; Miasena, XXVIII.; Lacotena, XXVI.; Perre, XXIV.; Samosata.

II. Peutinger Table: Melentenis, VIII.; Corne, XIV.; Metita, XII.; Glaudia, XLVI.; Barsalium, VIII.; Heba, XXX.; Charmodara, XII.; Samosata.

Melitene is at Malatia (Eski Shehr), Samosata at Samsat. Of the sites of the other stations on these two roads very little is known, but we have one fixed point in Perre which is near Adiaman (*vide*, p. 322). Corne, Metita, Claudias * (Glaudia), Barzalo † (Barsalium), Cholmadara (Charmodara) of road II. are placed on the river by Ptolemy, and Laudias (Claudias) and Barzalo are mentioned in a passage of Ammianus Marcellinus (XVIII., 7. 11), in which it is implied that they were forts on the Euphrates. A Greek inscription exists at Gerger, and has been published in Humann and Puchstein's book, from which it appears that the place was called Arsameia in the first century B.C. But, unfortunately, this name does not occur either in the roads of the Tables or in Ptolemy. No milestones have as yet been found in the country which lies between Samosata and Melitene, and the only other piece of positive evidence pointing to the course, taken by either of the two roads which joined the camps, is the great bridge of Kiakhta.

In view of the fact that no one of the stations mentioned in two lists of the Tables is common to both, it seems highly probable that the two roads must have taken wholly divergent routes. Moreover, it appears, from the testimony of Ptolemy and the passage of Ammianus Marcellinus, that road II. kept more or less closely to the river-bank. Hence there is no reason to depart from the arrangement which has been adopted with regard to this road in all the most recent maps of the ancient world, making it follow the course of the river. The precise route taken by the road can only be laid down when further exploration has been carried out along the river above Gerger.

With regard to road I., Ramsay ‡ has suggested that it is probably represented by the modern route by Elemenjik, Khan Bunar, Viran Shehr, and Adiaman. But at the time when his work was published, the existence of a Roman bridge at Kiakhta had only just been made generally known, and if the situation of this bridge, which

* Claudias seems also to be the same as the Claudiopolis of Pliny (V. 24. 85), and Claudiana, a station of the Notitia Dignitatum. It is twice mentioned by Barhebræus ('Hist. Dynast.,' trans. Pococke, pp. 140 and 333). The name seems to have survived into the last century, as Otter ('Voyage en Turquie et Perse,' vol. ii. p. 284) speaks of Arcloudieh as an important fortress near Malatia. However, it is not to be found in the modern maps.

† Barzalo is placed by Ainsworth ('Travels in A. M.,' vol. i. p. 263) at Bersel, a village near Tokariz.

‡ 'Hist. Geogr.,' p. 280.

Qatar National Library

lies in a direct line between Perre (Adiaman) and Melitene, and the easy nature of the country between Perre and Kiakhta, are taken into consideration, the conclusion seems to be inevitable that road I. must have used the bridge. The distance, too, of the route which he selects for the road, seems to be far too great, if the distances are correctly given in the Itinerary.*

If then, as seems fairly certain, the bridge at Kiakhta belongs to road I., the question remains still to be answered: What route did road I. take over the high Taurus between Kiakhta and Malatia?†

The best authority on the roads across this part of the Taurus is undoubtedly Von Moltke. In 1838 he was stationed with the Turkish army at Malatia, and was in great degree responsible for moving the troops across the mountains from Malatia to the plain of Samsat. He crossed the mountains several times, and must naturally have spared no trouble in obtaining information as to the different passes. He says that there are only three routes practicable for troops,‡ one of these being the waterway of the river, down which he travelled on a raft. The other two are (*a*) the route by Surghu Erkenek and Pelwere, which he describes as practicable for artillery. This route follows, after leaving Malatia, the Sultan Su, a tributary of the Tokhma Su, and is the same as that thought by Ramsay to represent road I.; (*b*) a route along another tributary of the Tokhma Su by Abdul Kharab over high mountains, and practicable only for infantry and cavalry. It is improbable, as has been shown above, that route (*a*) can be the same as the road of the Itinerary, and route (*b*) keeps a long way to the west of the line which we should expect a road using the bridge of Kiakhta to take. It is possible, however, that the Roman road which crossed the Bolam Su at Kiakhta may have followed that stream to its source, which, according to the maps, is close to Abdul Kharab, and from this point to Malatia may have coincided with route (*b*). A further possibility remains that it took a line up the basin of the Gerger Chai to the east of the mountain path which we followed from Kiakhta to Malatia. We were told of the existence of such a route at Kiakhta, but were assured that it was considerably longer than the one by which we travelled—in fact, thirty-two hours as compared with eighteen and a half.

Thus, in the present state of our knowledge of the passes through this part of the Taurus, there is but little evidence to show which one was chosen for road I., and it is probable that the old road has not yet been trodden by any European traveller. It seems not unlikely that it may have kept along the valley of the Bolam Su,

* The ruins on this road at Viran Shehr (*vide* 'Ainsworth Travels in A. M.,' vol. i. p. 258) correspond well enough in position to the site of Zibatra, an important fortress in late Byzantine times. Its position is fairly accurately defined in the Arab geographers as lying between Malatia, Samsat, and Hisn Mansur (Adiaman), and close to the source of the Jihan (l'Estrange, 'Palestine under the Moslems,' pp. 554 and 562). l'Estrange, however, in his notes on Ibn Serapion, just published in *J.R.A.S.*, 1895, pp. 739 ff., is inclined to adopt a suggestion by Hogarth, that Zibatra might possibly be Derendeh.

† Very strong arguments have been brought together by Hogarth in Macan's new edition of Herodotus, to prove that the Royal Road of Persian days, and subsequently the κοινὴ ὁδὸς of Artemidorus, took a route from Malatia across the Taurus by Kiakhta to Samsat. If this theory holds good, it is highly probable that road I. followed the same route across the mountains.

‡ 'Briefe a. d. Turkei,' p. 316. The value of Moltke's statements, however, is to some slight extent discounted by the fact that in his time Kiakhta and Gerger were occupied by rebellious Kurds. This may have led him to choose routes avoiding these two places.

joining route (*b*) at Abdul Kharab, and thence have followed a tributary * of the Tokhma Su down to Malatia. More than this cannot be said until we are better informed as to the nature of the valley of the Bolam Su.

The Roads north of Melitene.

The whole of the road Melitene—Satala is given in the Antonine Itinerary. It is described as having led *per ripam*.

I*a*. Satala, XVII.; Suissa, XVIII.; Arauracos, XXI*b*.; Carsagis, XXVIII.; Sinervas, XXVIII.; Analiba, XVI.; Zimara, XVI.; Teucila, XXVIII.; Sabus, XVI.; Dascusa, XXXII.; Ciaca, XVIII.; Melitene.

A considerable portion of the same road is given in the Peutinger Table, but it starts from Draconis, the second station from Satala on the direct road Nicopolis—Satala (*vide infra*, II*a*. and II*b*.).

I*b*. Draconis, XVI.; Haris, XVII.; Eregarsina, VIII.; Bubalia, XXVII.; Zimara, XVIII.; Zenocopi, XVIII.; Vereuso, XIII.; Saba, XVIII.; Dascusa, XVIII.; Hispa, XVIII.; Arangas, VIIII.; Ciaca, XXVII.; Melitene.

A direct road, Nicopolis—Satala, is given both in the Itinerary and the Table.

II*a*. In the Antonine Itinerary: Nicopolis, XXIV.; Olotoedariza, XXVI.; Dracontes, XXIV.; Haza, XXVI.; Satala.

II*b*. In the Peutinger Table: Nicopoli, XIV.; Caltiorissa—Draconis, XIII.; Cunissa, X.; Hassis, XIII.; Ziziola, XII.; Satala.

Another road, Nicopolis—Satala, which, if Carsagis is taken to be the same as Carsat, joins road I*a*. at that point, is given in the Itinerary—

II*c*. Nicopoli, XXIV.; Olotoedariza, XXIV.; Carsat, XXIV.; Arauracos, XXIV.; Suissa, XXVI.; Satala.

A road from Nicopolis which cuts into road I*a*. at Analiba and road I*b*. at Zimara, is given in the Peutinger Table.

III. Nicopoli, XXI.; Ole Oberda, XV.; Caleorsissa, XXIII.; Analiba, XV.; Zimara.

The stations on these roads are evidently much confused; Eregarsina of I*b*. is most probably the same as Carsagis and Carsat of I*a*. and II*c*., and the stations Hispa and Arangas of I*b*. are taken from the Melitene—Sebastea road. Probably Hassis of II*b*. = Haris of I*b*., and Dracontes of II*a*. = Draconis of I*b*. and II*b*. Analiba should be changed, as Ramsay has pointed out, to Analibla, in accordance with Ptolemy and 'Acta Conciliorum.'

Melitene, as has been shown already, is at Malatia (Eski Shehr); Satala, now that we have found the legionary tiles, may with certainty be identified with Sadagh, and Nicopolis is at Purk.† In the country through which the roads must have passed, there are only two places which can confidently be considered to be ancient sites. One of these is the place opposite Pingan, from which three

* There is some evidence pointing to the fact that in late Byzantine times there was a road in use along this tributary. The stream may very probably be identified with the Az Zarnuk of the Arab geographers, as its junction with the Tokhma Su (Kubakib) is accurately defined in a passage of Ibn Serapion (translated by l'Estrange, *J.R.A.S.*, 1895, pp. 63 ff.). The Byzantine historians (Ced., 207. 4; Theoph. Cont., 167 B.) record that Basil, in A.D. 872, marched from Ceramisium on this stream (ἐπὶ τῷ Ατζάρνουκ ποταμῷ) to the Euphrates along the road to Melitene. I owe the references to de Muralt, 'Chronographie Byzantine,' p. 453.

BRITISH LIBRARY

inscriptions have been published, and where we copied another.* The site is identified by Ramsay with Dascusa on the authority of one of the inscriptions found there, in which Ala II. Ulpia Auriana, according to the Notitia Dignitatum stationed at Dascusa, is mentioned.† But Ramsay, in his map of Cappadocia, assigns a position to Dascusa 50 miles south of the position given to it in his text, and places Zimara in the map, where, according to the text, Dascusa should be. The position given by Ramsay to Zimara is confirmed by the existence of the modern village with the same name, Zimara, very near to the spot at which the inscriptions were found, and just about in the position in which we should be inclined, if working from the Tables, to look for the site. So that if, following the evidence of the inscription, we place Dascusa on the river-bank opposite Pingan, it will be at a spot only about 6 miles distant from the probable site of Zimara. But the Peutinger Table and Itinerary place Dascusa at a point from 60 to 70 miles south of Zimara, and their testimony is supported by a statement of Pliny,‡ who says that Dascusa was 75 miles lower down the river than Zimara. Hence, if the evidence of the inscription is to hold good, it seems necessary to conclude that the station of Dascusa is wrongly placed by the Table, the Itinerary, and Pliny, and has been shifted by these authorities from its real position, which is where the inscription was found opposite Pingan. A minute examination of the literary evidence bearing on these places makes, however, another explanation open to us, by the adoption of which we should do less violence to the authorities. Ptolemy mentions a Δασκοῦσα in conjunction with Zimara in Armenia Minor on the Euphrates, and another place, Δάγουσα, in conjunction with Sinis and Melitene, also on the river, in the στρατηγία of Melitene. A Dagusa is mentioned also by Orosius§ as being situated "in confinio Armeniæ et Cappadociæ," so that there is some evidence in favour of there having been two places on the Euphrates with very similar names, Dascusa and Dagusa. The position of the first of these, as defined by Ptolemy, would fit in very well with the site opposite Pingan; the name is the same as that of the station of the Ala II. Ulpia Auriana, given in the Notitia, and the coincidence of its being joined with Zimara by Ptolemy, and of the preservation of the name Zimara only 6 miles from the spot where the inscription of the Ala was found, is very striking. The position of Dagusa may, then, be found in that of the Dascusa of the Table and Itinerary, and would be, according to the distances which they give and the statement of Pliny, about 70 miles lower down the river. The confusion of two so similar names is so likely to have happened as to require no explanation. On the whole, this theory of there having been two places, Dascusa and Dagusa, on the Euphrates seems to offer the simplest way out of the difficulty, though of course it adds complication to the topography of the district. If it is adopted, the Dascusa, which is placed in Ramsay's map at a point near the junction of the two branches of the Euphrates, must be changed, on the authority of Ptolemy, into Dagusa, and Dascusa must be placed, in accordance with the evidence of the inscription, on the river-bank opposite Pingan. A point in favour of this arrangement is the fact that Zimara is one of the few stations between Melitene and Satala which has no troops assigned to it in the Notitia, and if this

* *Vide* p. 335, note.

† The evidence of the inscription, however, is not conclusive, as it is merely the tombstone of a soldier belonging to this Ala, and it is quite possible that he died while away from his post.

‡ *V.* 24. 84. He says, however, that Zimara is only 12 miles from the source of the Euphrates, so that it is possible that there were two places with this name, as Ritter (vol. x. pp. 822, 823) maintains.

§ I. 2. 23.

BRITISH LIBRARY

theory is adopted, the omission can be explained by the proximity of Dascusa, for the troops there stationed would serve to protect the two posts.

The other site is that seen by Boré* near Melik-Sherif, and identified by Kiepert with Arauraca.

With regard to the other stations on these roads, the only suggestions that we can make are that Dascusa of the Table and Itinerary may have been near Korpanik (see p. 330), that the ruins at Zinika (p. 455) may represent the old Zimara, and that Analibla may have been at Hassan Ova, where we saw some signs of a Byzantine site; but none of these identifications can be made with any degree of certainty.

Two fixed points on the main road on the right bank of the Euphrates are given (1) by the bridge at Korpanik (p. 330); (2) by the bridge over the Kara Budak (Sabrina) (p. 456). Between Malatia and Korpanik the country along the river is easy; and, though we saw no certain traces of any Roman road during this part of our journey, it is highly probable that the old road kept close to the earthy bank, and possible that it has been long ago washed away. Above Korpanik, the country through which the river passes soon becomes mountainous, and from Egin to Pingan the path along the right bank is reported to be most difficult by the natives, and all traffic goes by the route which we followed on the left bank. Hence it seems likely that the Roman road between the bridge at Korpanik and the probable site of Zimara took a line to the west of the route by which we travelled. Taylor,† on his way from Zimara to Arabkir, between Gamkeui and Arabkir, high up on the Sarichichek Dagh, saw a paved road, which he speaks of as being "solidly and ingeniously constructed," and it is not improbable that this may be a portion of the road for which we searched in vain in the river-valley. Moreover, the further west that we place this portion of the road, the more easy it is to understand how Hispa and Arangas—which belong to the Melitene—Sebastea road—were introduced among the stations of road I*b*. in the Peutinger Table.

Beyond the bridge over the Kara Budak, my personal knowledge of the country, through which the road passed in two branches to Nicopolis and Satala, ceases, and I will merely make one criticism of the views advanced by Ramsay as to the course which it took. From the lists of the Table and Itinerary, it appears to be fairly certain that in the district which lies south of Nicopolis and Satala, there was a triangle of roads of which the direct road Nicopolis—Satala was the base. The apex of this triangle is placed by Ramsay at Carsagis, by Kiepert at Analibla. Two sides of the triangle are made by the important roads Nicopolis—Satala and Melitene—Satala, and the third side by the cross-road from Nicopolis to a point in the Melitene-Satala road between Zimara and Satala. Ramsay makes several most ingenious conjectures with regard to the stations Ole-Oberda, Aladaleariza, and Caltiorissa, and makes out what is on paper a very fairly satisfactory restoration of the roads. But in deviating from the view upheld by Kiepert, that road III. struck into the road Melitene—Satala at Analibla, he leaves out of consideration the existence of a natural route which appears to answer very exactly to the requirements of a road from Nicopolis to Zimara. The object in laying out a road from Nicopolis to strike into the Satala—Melitene road would naturally be to make it join the latter at a point in as direct a line as possible between Nicopolis and Melitene; for the road in question cannot have been intended merely to join Satala and Nicopolis, between which points a direct road is given in the Peutinger Table and the Itinerary (II*a*. and II*b*.) This purpose would be best secured by a road going

* Referred to by Ritter, vol. xviii. p. 215.

BRITISH LIBRARY

direct from Nicopolis to the probable site of Zimara, near Pingan, and joining the Satala—Melitene road near the bridge over the Kara Budak, in the neighbourhood of which Ramsay and Kiepert agree in placing Analibla. A possible course for such a road is given us in the route travelled by Taylor * from Purk (Nicopolis) to Zimara. This road, which Taylor implies is practicable for wheels as far as the gorge of the upper Armidan or Kuru Chai Su, passes, soon after leaving Purk, at Ashkhar, a Roman milestone, of which he published a copy, and which has been subsequently seen by Messrs. Hogarth and Munro.† From Purk to this point, an old road was observed by him and by the other travellers. Subsequently Taylor crossed the Kara Budak at or very near the spot where we found the remains of the bridge. The milestone at Ashkhar is assigned by Mr. Munro to the road Nicopolis—Sebastea, but it is equally possible that it may have belonged to the road Nicopolis—Zimara—Melitene, which, if it followed Taylor's route, would have joined the Satala—Melitene road near the bridge over the Kara Budak. It is impossible to prove that this route represents the Roman road from Nicopolis, but it seems to be the most likely course to have been chosen for that road. It hits off the bridge over which the main road certainly passed, and there are remains on it which show that for some part of the way a Roman road once went. There is no epigraphical evidence in favour of Ramsay's restoration of this road, and if the position of the bridge over the Kara Budak as regards the line of Taylor's route and the direct and easy nature of the road from Purk to the bridge are taken into consideration, the conclusion seems to be inevitable that Kiepert's restoration of the road is the more probable.

The History of the Lines.

We cannot claim to have discovered much which throws new light on the history of the roads and fortifications of the Euphrates. Unfortunately, the evidence of milestones, which is so abundant on the Cæsarea—Melitene road, and from which the history of this section of the great highway to the East can be written with some degree of certainty, vanishes when the valley of the Euphrates is reached. Along the course of the river from Samosata to Satala only five inscriptions which bear the names of Roman emperors have as yet been found. These are at the bridge of Kiakhta,‡ on a milestone near Melitene (p. 328), at the bridge over the Kara Budak (p. 456), on a milestone near Melik Sherif,§ and at Satala (p. 460, *note*).‖

On account of this dearth of inscriptions, the history of the roads, which have been briefly discussed above, must be written mainly from the very few literary references to this part of the Roman Empire, and the records which we possess of the legions there stationed.

In the reign of Augustus Cappadocia and Commagene were both client states under native princes, and there is no evidence of any regular Roman troops having been posted then on the Euphrates.¶ Tiberius first made Cappadocia a province, and brought Commagene under direct control; but the latter state was given back

* *Loc. cit.*, pp. 301 ff.

† Munro, *loc. cit.*, p. 727; 'C.I.L.,' vol. iii. p. 6057.

‡ 'C.I.L.,' vol. iii. Suppl. 6709–6714.

§ 'C.I.L.,' vol. iii. p. 306.

‖ To these may be added the milestone of Trajan, near Purk (p. 465) ('C.I.L.,' vol. iii. 6057), and possibly one of the empress, Julia Domna, which we found at Satala.

¶ Hogarth ('Suppl. Papers of R.G.S.,' vol. iii. p. 710) makes a mistake in saying that, according to Dion Cassius (lv. 23), there were two legions stationed in Cappadocia as early as the time of Augustus. Dion Cassius, in this passage, only gives the stations of the legions in his own day.

Qatar National Library

to its former rulers under Caligula. The northern districts which lie along and above the western Euphrates as far as Trapezus, were first made Roman probably in 63 A.D.* During the wars of Corbulo it seems probable that Melitene was used as one of the bases of operations for the campaigns beyond the river (Tac., 'Ann.,' xv. 26), but whether a camp was established here as early as this is not certain.† In these wars the two legions, XII. Fulminata and XV. Apollinaris, which, at least from Hadrian's time, were both always stationed in Cappadocia, were first employed in Asia Minor; but at this time they were attached to the army of Corbulo for special duty, and did not belong in any way to Cappadocia, the legate of which had no army in times of peace.‡ Under Corbulo we learn that a fort was established at Ziata,§ near Kharput, on the further side of the Euphrates; but for the establishment of other forts on the nearer bank evidence is wanting.

In the Jewish war under Titus both the twelfth and the fifteenth legions took part, and, after the capture of Jerusalem in 70 A.D., the twelfth was sent to Melitene, but the fifteenth was ordered back to its old quarters in Pannonia. ‖

Of Vespasian we are told that he "addidit legiones" to Cappadocia, and gave a legate of consular instead of one of equestrian rank to the province. He also brought Commagene again under direct Roman administration, adding it to the province of Syria. In this province he also raised the number of legions from four to seven; one of these being the new legion, XVI. Flavia Firma, of which we found two inscriptions at Samosata (p. 322). Whether this legion was stationed from the first at Samosata—which was certainly afterwards for some time its head-quarters—is not known, but Mommsen inclines to the view that it was.¶ The milestone near Melik Sherif, and most probably on the line of the Melitene—Satala road, to which allusion has already been made, seems to prove that Vespasian laid out a portion of this road. Its date, if Mommsen's restoration of the inscription is right, is 75 A.D., in which year a Roman garrison is known to have been stationed at Harmozica (Tiflis).** It is thought probable by Mommsen †† that Satala was a station of troops as early as this reign, but, except for the milestone, there is little evidence to support his view. Legio XV. Apollinaris was sent to Pannonia after the Jewish war, and the monuments of its stay there are so abundant that, even if some of them are to be referred to an earlier period, it is most probable that it remained here for a considerable number of years after the war. ‡‡

Thus, while there are no grounds for supposing any military post or road to

* Armenia Minor rather later, but at any rate by 75 A.D. (*vide* Mommsen, 'Provinces,' vol. i. p. 324).

† It is possible that the ἔρυμα ἐν τετραγώνῳ, built by the Romans ἐν τοῖς ἄνω χρόνοις, may have dated back to this time (Procop., 'De Æd.,' iii. 5).

‡ Tacitus, 'Hist.,' ii. § 1, "Inermes legati regebant nondum additis Cappadociæ legionibus." § 'C.I.L.,' vol. iii. Suppl. 6741-6742.

‖ Josephus, 'Bell. Jud.,' vii. 1. 3; vii. 5. 3.

¶ Dion Cassius (lxviii.) implies that Samosata was not held by the Romans at the time when Trajan arrived there in 109 A.D., so that if the legion was stationed then at Samosata, it must have left its post.

** 'C.I.L.,' vol. iii. 6052. †† 'Provinces,' vol. i. p. 324, note.

‡‡ Mommsen's view, stated in the Provinces *loc. cit.*, is at variance with the conclusions at which he arrived in discussing the history of the Pannonian legions ('C.I.L.,' vol. iii. p. 550). For the inscriptions of this legion at Carnuntum, *vide* 'Arch. Epigr. Oester.,' vol. v. pp. 208 ff. (Hirschfeld); and for a review of the whole question, 'Arch. Epigr. Oester.,' vol. x. pp. 12 ff. (Domaszewski).

have existed on the right bank of the Euphrates previous to Vespasian's reign, we have one piece of positive evidence that the latter laid out a road in Armenia Minor. Seeing also that he re-made Commagene into a province, and strengthened the defences in Cappadocia and Syria, it is probable that the camps, not only at Melitene but also at Samosata, may be attributed to him. And if so, it is more than probable that he would have laid out a road to connect the two posts. Hence it is fair incidentally to suggest that he may have built the original bridge at Kiakhta, which we know, from the inscriptions found by Humann and Puchstein, to have been restored by Septimius Severus. The fact of the existence of an older bridge* tells against the attribution of the southern lines to Septimius Severus, suggested by Hogarth, and, if they are to be attributed to an earlier emperor, there is no one more likely to have laid them out than Vespasian, who first organized the two districts, which are joined by the bridge, for military purposes.

In the reign of Domitian, according to two inscriptions,† roads were constructed in Cappadocia and Armenia Minor, but the district of Armenia Minor is perhaps only mentioned in order to give the full list of the administrative districts under the governor who made the roads, and no definite inference can be drawn from the inscriptions that Domitian planned any of the roads on the frontier. In Trajan's reign a milestone was placed on some road at a point 7 miles from Nicopolis, and may perhaps, as I have tried to show, belong to a road Nicopolis-Zimara, but the evidence is so slight, as compared with that of the roads laid out by Trajan in Galatia and Pontus,‡ that not much stress can be laid on it. It is possible, however, that this road was made by him as a connection between the main system in that region and the frontier-road along the Euphrates. Trajan is also said to have made Melitene a city (Procopius, 'De Æd.,' iii. 5), but this fact does not carry much weight, as a camp most probably existed at this point, according to Procopius's own testimony (*loc. cit.*), before Trajan's time, and Legio XII. was certainly sent here after the Jewish war. Procopius's statement may very likely refer only to some honours conferred on Melitene by Trajan, who must have passed through the place on his march from Samosata to Satala. Whether Legio XV. Apollinaris was stationed at Satala at the time of Trajan's campaign is uncertain. It is supposed by Domaszewski that the legion was not moved from Carnuntum till Hadrian's reign, but no definite evidence as to the date of the change of legions at that camp has as yet come to light. At any rate, by the end of Hadrian's reign this legion had been brought back to the East,§ and seems to have remained till the end of its history at Satala.

Thus it appears that before the middle of the second century the two legions, the twelfth and the fifteenth, were both stationed on the frontier. An Ala Auriana is mentioned by Arrian as having taken part in an expedition against the Alani, and may be the same as the Ala II. Ulpia Auriana of the Notitia, which will thus have been stationed on the Euphrates as early as Hadrian's reign.

With regard to the Legio Prima Pontica, which was stationed at Trapezus,‖

---

* It is confirmed by the erased inscription which we saw on it (*vide* p. 322).

† 'C.I.L.,' vol. iii. pp. 312–318.

‡ Hogarth, *loc. cit.*, p. 711; Ramsay, 'Hist. Geogr.,' p. 258.

§ It is mentioned by Arrian (100 and 103) as taking part in the expedition against the Alani. (The only inscription which can be approximately dated at Satala is that of Aurelian, *vide* p. 460.) Legio XII. also took part in the expedition.

nothing seems to be known; it does not occur in any of the early lists of legions, and would seem not to have come into existence till the third century A.D., and to have been one of the lesser auxiliary legions.* In the reign of Septimius Severus, as Hogarth has shown, the great road Cæsarea—Melitene was improved on a magnificent scale, but the only evidence for similar improvements due to this emperor along and to the north of the valley of the Euphrates is given by the inscriptions on the great bridge at Kiakhta. Of the later emperors, Decius restored the bridge over the Kara Budak, and there is a milestone, probably the second from Melitene, of the emperors Constans and Constantius, either on the road Melitene—Sebastea or Melitene—Satala. The inscription of Aurelian at Satala need not be any evidence of his having improved that camp, and may be merely an inscription in honour of his great achievements in the East. In still later times, we know that the fortifications at Melitene† and Satala‡ were repaired by Justinian.

Of the arrangement of the posts and disposition of the troops along the frontier very little is known. Between Samosata and Melitene, Claudiana and Metita are mentioned as posts in the Notitia; Barzalo and Laudias are called *castra præsidiaria* by Ammianus Marcellinus,§ and may be the same as Barsalium, Claudia and Metita of the Peutinger Table. Between Melitene and Satala, along the road of the Antonine Itinerary, seven of the ten stations (all except Carsagis, Sinibra, and Zimara) are assigned troops by the Notitia.‖ Between Nicopolis and Satala Aladalearizа of the Notitia may be the same as the Olotoedariza of the Table and Itinerary. North of Satala, on the road to Trapezus, Domana and Zigana were both stations of troops. So that an unbroken line of posts at fairly regular intervals must have existed in later times along the river as far as Satala, and been extended northwards to Trapezus.

With regard to the strategical importance of these posts, Samosata and Melitene, two of the three great legionary camps, guarded two important crossing-places of the Euphrates. Barsalium and Claudia, as may be inferred from the passage of Ammianus Marcellinus (*loc. cit.*), probably were chosen with the same object. If Dascusa was situated opposite Pingan, it doubtless protected another crossing-place. The river is narrow at this point, and a bridge could always have been thrown over it with little trouble similar to the wooden bridge now existing there. It is probable that another station was near the crossing at Keban-Maden, but no troops are assigned to the other Dascusa (*vide*, p. 466), which should be near this point. The importance of Satala seems to lie in its position on the route to the East, which was still much used until the middle of this century,¶ and in the advantages which it

---

* The name is confirmed by 'C.I.L.,' vol. iii. 306; *vide* also vol. iii. Suppl. 6746; but I do not know that it is otherwise mentioned. In earlier times, possibly the garrison was furnished by the twelfth and fifteenth legions, as inscriptions of both these have been found at Trapezus (*vide* 'C.I.L.,' vol. iii. Suppl. 6745, 6747).

† Procop., 'De Æd.,' iii. 5. ‡ *Ibid.*, iii. 4.

§ XVIII. 7. 11.

‖ 'Notit. Dignit. Orient.,' cap. 32 and 35.

¶ This route goes from the modern Sadagh to Erzerum, and passes Ilija, usually identified with Elegeia. Trajan went from Satala to Elegeia (Dio. Cass., lxviii.). Ilija, it must be remembered, however, is a very common Turkish name for a natural hot spring, and is used in many places all over the Ottoman empire. If its identity here with Elegeia could be proved from other evidence, it would afford an interesting example of the common practice of preserving an ancient name, slightly altered so as to bear a meaning in a modern language.

thus offered as a starting-place for expeditions into Armenia from the north. The fact also that it lies on the natural road from Trapezus to the Euphrates, and was thus open to communications with the sea, may have led to the choice of the site for a legionary camp. The legion stationed here seems to have supplied some of the garrisons in Armenia, for we know that in A.D. 185, a *vexillatio* of the Legio XV., Apollinaris was stationed at Valarschapat (Caenepolis).*

Judging from our experience, it seems probable that very slight remains of the Roman defensive posts along the frontier from Samosata to the Black Sea exist at the present day, and, even though further evidence may be forthcoming in the future, it seems certain that the lines on the eastern frontier were not laid out on nearly the same scale as on the other Roman frontiers, on the Rhine and the Danube, in Britain and in Africa. This is more easily to be explained on the more southern reaches of the Euphrates above Samosata, where the great size and swiftness of the stream, and the inaccessible nature of the mountains through which it flows,† render the river, except at certain easily guarded spots, a formidable barrier to the crossing of an army. But north of Melitene, and especially at and above Keban-Maden, near which the two branches of the Euphrates meet, the river is not so serious an obstacle to an invading force,‡ and it is natural to expect to find remains of defensive works on a large scale near the river-bank. Such remains do not appear to exist at the present day, and the inference may with probability, but not with complete certainty, be made that no great defensive works were ever carried out between the camps. In the same way little care seems to have been bestowed on the connecting roads, and, with the exception of the work of Septimius Severus on the Cæsarea—Melitene road and the bridge which he built at Kiakhta, there is no evidence which points to the roads having been constructed differently to the generality of Roman roads in Asia Minor.§

If we are to seek a reason for this apparent neglect, it is doubtless to be found in the different character of this frontier to that of the other frontiers of the empire. This difference lies in the continual change of relations between Armenia and Rome during the first two centuries of our era. During this period Armenia was hardly ever regarded as a hostile country, and was often reduced nearly to the condition of a Roman province with Roman troops quartered in it. Probably, as Hogarth has pointed out, Septimius Severus was the first to depart from the traditional views of the emperors. He is known to have laid out roads to Melitene from the west and from the south; that he intended to extend these roads to the north as well is not improbable, but the negative results of our journey tend to show that, if ever conceived, this project was not carried out.‖

Before the reading of the paper, the PRESIDENT said: The paper we are to listen to this evening is an account of an expedition under Mr. Hogarth by the upper waters

BRITISH LIBRARY

of the Euphrates and in the Taurus. Unfortunately he is not at present in England, but Mr. Vincent Yorke, a member of the expedition, has kindly prepared a paper, and will read it to us, and exhibit some interesting photographs; and after his paper Mr. Myres will give a short account of his explorations in the Karian country of Asia Minor.*

After the reading of the paper, the following discussion took place :—

Mr. THEODORE BENT: At this late hour of the evening, after dining and hearing two papers, I feel that you will excuse me if my remarks are rather double, but I should like to ask one or two questions especially upon the paper we have last heard from Mr. Myres. At one time I was much interested in the history of the primitive races which migrated from this part of Asia Minor to Greece, probably by means of the islands as stepping-stones. In these islands there are to be found peculiar little marble figures found in the tombs; these are popularly believed to be Karian, and Herodotus, I believe, called them Karian, and I should like to know if Mr. Myres ever saw any of these marble figures of the female goddess in any tombs. When we were on the sister peninsula of Cnidos we heard rumours of several figures found there, and if they are found at Halicarnassus, it would be a considerable point that the peoples who inhabited the islands of Greece before the Greek period came from this part of Asia Minor, and it would make Herodotus right. With regard to Mr. Yorke's paper, I have been somewhat near the country which Mr. Hogarth and Mr. Yorke explored, and which has been so graphically described to us. The point which struck me more particularly was about the Armenians. The Armenians I have seen were at the Patriarchate of Sis, and there I must say they did not seem in a happy frame of mind. In Russian Armenia they are very far advanced in civilization, but in Turkish Armenia they are quite the reverse. I know nothing about the atrocities, and it is many years since we were there; but at the same time it seems to me that if they had the chance they would be better than the Greeks. In Russia they have had the chance, and the result in several places has proved that they are capable of becoming civilized and a credit to the world in general, which I think is more than can be said about the Armenians of Asia Minor. The country of the Euphrates is certainly one of the most interesting parts of the world, and I am sure we are extremely obliged to Mr. Yorke for giving us so much information about an almost unknown part of the world.

The PRESIDENT: I had no idea Mr. Myres was going to give us so full an account as he has done. I think the papers we have heard this evening fully justify us in having assisted the expeditions of Mr. Hogarth and Mr. Myres. They were also assisted by other societies, but for geography they have produced most valuable results. An important tributary of the Euphrates, before unknown, has now been brought to light, and several other interesting points have been brought out in connection with the positions of the legionary stations at the extreme eastern frontier of the Roman Empire, and the Hogarth expedition has actually discovered the site of one previously unknown, one of the four important frontier stations. These discoveries alone fully justify us in having given our aid to these expeditions, and I am sure that the meeting will instruct me to give its very hearty thanks to Mr. Yorke for the trouble he has taken in preparing the paper describing Mr. Hogarth's expedition, and to Mr. Myres for his most interesting account of his discoveries in Karia, especially in the Peninsula of Myndos. We must not forget to thank Lieut. Green, who accompanied Mr. Hogarth's

* The paper by Mr. Myres will appear in a subsequent number.

expedition, for the extremely valuable mapwork he executed. In your names I return thanks to Mr. Yorke, Mr. Myres, and Lieut. Green.

Mr. Yorke's Map.—The map of the valley of the Upper Euphrates has been constructed by Mr. F. W. Green. The bearings were taken by prismatic compass, distances estimated by time, and the heights above the sea-level obtained by aneroid. Some of the detail has been added from Captain Maunsell's Survey, 1892, and other sources.

DE MORGAN'S "MISSION SCIENTIFIQUE" TO PERSIA.

By Major-Gen. Sir F. GOLDSMID, C.B., K.C.S.I.

We have now before us the second volume of the 'Études Géographiques,' or results of the scientific mission to Persia, conducted by M. J. de Morgan, of which the first part was noticed in the *Journal* for August, 1895. The large amount of information which it contains, original and compiled, renders it a valuable reference to those who seek a closer acquaintance with the tracts in North-Western and Western Persia; but it can hardly be said to open out any great extent of new country. Notes of available bibliography—almost identical with those to be found in Curzon's 'Persia' *—disclose at once to us how many older travellers have helped to a due appreciation of that portion of Kurdistan which tacitly admits, if it does not openly proclaim, the sovereignty of the Shah; and it is equally evident that a like attention has been given to non-Kurdish districts.

The geographical limits of the country under exploration are shown under nine heads: (1) The Kurdistan of Mukri; (2) the Kurdistan of Sehna; (3) the Kurdistan of Kirmanshahan; (4) the Province of Hamadan; (5) Malayer and Burujird; (6) Northern Luristan; (7) the Pusht-i-Kuh; (8) Susiana; and (9) the Persian Gulf. For each of these there are subdivisions discussing respectively physical geography, climate, flora and fauna, and population; while for the greater number separate treatment is accorded to towns, villages, and monuments, mineral riches, as also commerce, agriculture, and local industries. Under the Pusht-i-Kuh, or "back of the hill," special notice is taken of ruins. On the other hand, there is no mention made of towns or villages for the Persian Gulf.

M. de Morgan's 'Kurdistan de Moukri,' with which his volume opens, is a comprehensive chapter relating to the country traversed by Mr. Walter Harris, some five years later than the French writer, and described by sketch-map and letterpress in our *Journal* for November last. The actual route taken by the two explorers was not always

---

* Twenty-two out of the twenty-three books of reference on Persian Kurdistan, for instance, are the same, and placed in precisely the same order, as those noted by Mr. Curzon.

identical, for Mr. Harris, on leaving Suj-bulak, abandoned the caravan-road for a straight cut across the mountains, so as to visit the Kurds in their summer quarters; but they seem to have been on one and the same track again at Sardasht, Bana (or Bahireh), and Sakiz. Independently of questions of hydrography, orography, and geology, separately grouped, the chapter is rich in illustrative detail, and the author has much to say on the character, language, and customs of the people, which comes under the head of light as well as instructive reading. This description of a marriage at Namashir, in the Balmik district, may be thus rendered in English:

"The bride lived with her parents in a neighbouring village; she had been purchased for the modest sum of twenty *tumáns* (say £8½ to £9½) by an inhabitant of the village in which we were encamped. About five o'clock in the afternoon—when the religious part of the ceremony had been performed—she arrived on horseback, escorted by her own country-folk, and bringing upon a beast of burden two boxes, painted in red, containing her wearing apparel. As soon as the small caravan came in sight, there was a general discharge of firearms; and directly she arrived and had alighted, the bride was conducted to the house of her lord, and the female villagers crowded around her. Much and loud talk ensued among men and women gathered together; then three large coal fires were lighted, and dancing began. The men and women danced in separate groups, holding one another by the waist, whirling round the fires, and adapting their steps to the time of the songs sung by a man placed in the foremost rank of the males, and a woman occupying a like position among the females. The song was slow, with a measured fall, in a monotonous air, often broken in upon by the bursts of laughter of the whole assembly."

Our author endeavoured to obtain some specimens of the words, as strung together for a vocal accompaniment to the dancing on these festal occasions. But, although he was able to collect a certain number, he could not find any that would bear translation. While allowing a high importance to Mukri literature, he regrets that the equivocal taste of its songs and stories is fatal to their publicity in Europe. To the above extract in reference to a wedding, let us add another which relates to a funeral—

"During our stay at the village of Passawa, among the Mamishes, a native of the place, through some unexplained visitation, ceased to show any signs of life. Instantly the air was filled with the lamentations of the whole neighbourhood; the men cried in moderation, but the women and children yelled and shrieked in despair. Although the wretched man thus mourned for was not actually dead, it was not long before he was found to be so in every respect.

"Half an hour after the news of his supposed decease was spread abroad in the village, the male inhabitants took the body to a stream, and, having stripped it of clothes, were about to wash it, when the corpse revived and began to struggle. 'He is possessed with the devil!' they exclaimed; and, struck by a vigorous blow at the back of the head, the victim fell stiff, now no more to rise again. The arrangements for his burial having been completed, the business of the hour was resumed, and the body borne to the cemetery; the whole village followed, weeping and vociferating, as if the practically murdered man had been an object of adoration

BRITISH LIBRARY

to all his fellows. When the grave was closed, the female mourners came and encircled it, continuing their cries and wailings. Then, at a given signal, they suddenly became silent, to resume shortly, in unanimity of cadence, their moan of despair, *wai, wai, wai, wai, wai, wai*, and so on for about an hour. During this time the men, who had accomplished their funeral task, were seated, smoking their *kalians* and discussing their private affairs."

M. de Morgan alludes to the practice of despatching invalids who had grown unconscious as common throughout Kurdistan, and not infrequent in Persia generally. Sometimes, he affirms, the supposed dead man only revives when he has been deposited under the earth. Should his voice at such time be heard, it is said that a great calamity has come upon the country, and every one seeks to escape from the presence, as it were, of an exorcised demon, throwing over the body the largest available stone. Stoning for adultery is mentioned as a national law, but not often put into practice, owing, on the one hand, to the few cases which present themselves, and, on the other, to the difficulty of finding four witnesses to give evidence, a lesser number being insufficient for conviction.

Among the ancient customs of Mukri may also be mentioned the festival of the "sham governor," celebrated at Suj-Bulak in the spring of every year, which is thus described:

"The townspeople appoint a governor (*Amir*), who for three days exercises control, and abandons himself to the eccentricities of the occasion. As soon as this official is installed, he selects his ministers, secretaries, and *Farrash-bashi* (head servant), chooses his body-guard, and proceeds in state, followed by the whole population, to announce to the real governor that he has been deprived of office.

"This festival has often been productive of trouble, for the inhabitants of Suj-Bulak have taken advantage of the occasion to belabour the actual Amir with blows. So that now the sham ruler is always accompanied by soldiers and a government delegate, whose duty it is to prevent the joke being carried too far. For three days the mock rule continues. The governor decides the most absurd cases, and punishes the assumed culprits; but as, in the exaction of penalty inflicted, the dinar ($\frac{1}{100}$ part of a kran) counts for the kran, a fine of one hundred *tumans* (or 10 × 100 krans) is, in reality, that of one kran only. Thus payment is readily made and amusement afforded. The whole procedure is, practically, the 'Carnival of Mukri.'"

There are some noteworthy observations on the mineral riches of the Kurdistan of Kirmanshahan which may be commended to the attention of present and future explorers. Not only do they possess a general interest for the geographical world, but they indicate the existence of a special field of investigation, to turn which to good account no serious effort seems yet to have been made. We are reminded that marble, such as utilized in the wonderful sculptures at Besitun and Tak-i-Bustan, is still abundant in the locality of these monuments. Moreover, the perfect quality of the plaster procurable from the gypsum—the presence of which in the Zohal district and neighbourhood has been certified by

Loftus and others—is cited to show how natural gifts are suffered to lie profitless by a community, whether the governors or the governed, who prefer conventional dwelling-places of bad brick which entail little labour, to solid and durable houses involving abnormal effort. Above all, the reader is enjoined to give heed to the possibilities of a vast and profitable trade in petroleum, of which the aspect of this part of the country amply warrants the anticipation. Our author is of opinion that what he designates a *bande petrolifère*, stretching out in a south-westerly direction from Kerkuk, in Turkish Arabia, to the Persian "Pusht-i-Kuh," may be found the most important source of wealth throughout the whole region. The proximity of Baghdad and the advantages which it offers as a port of embarkation are pointed out, and it is argued that while the naphthas of Baku must pass through the Suez Canal to reach India, those of Zohab might be despatched thither in a direct line that would be of inestimable value in competition. This question is discussed with much useful and careful detail.

Amid the problems treated in the Kirmanshahan chapter, M. de Morgan discusses the better means of developing traffic between the tablelands of Persia and the Persian Gulf, but he himself supports the ambitious proposal of connecting Tehran by rail with Baghdad. His opinion on the feasibility of this connection is, no doubt, worthy of attention. Moreover, Constantinople to Baghdad, and Baghdad to Tehran, are combinations not only desirable, but likely, as main lines of railway in the future. One stated objection to the fulfilment of his project, in the fact that the city of the khalifs is out of Persia, he considers unimportant, because of the good understanding (*très bonnes relations*) which exists between Shah and Sultan. But we are rather inclined to accept his view on other grounds. Throughout the length of the Turko-Persian frontier, the hostility between the Sunni and Shiah on either side is proverbial; nor is this feeling less marked between Kirmanshah and Baghdad than elsewhere. Some years ago, when the Turkish iron poles of the Indo-European telegraph were about to join the Persian wooden poles across a tract of disputed territory, so great was the international jealousy, and fear of ceding a yard of doubtful land, that proceedings were summarily stopped. Her Majesty's Resident and Consul-General at Baghdad fortunately hit upon the happy expedient of using iron and wooden poles alternately over the whole tract under litigation, or the junction of the wires might have remained a *fait non-accompli* to the present day.

Space will not admit of extracts from other than the two first chapters, but all are worth reading and remembering, in connection with the geographical study of the western side of Persia. Illustrations abound in this handsome volume: these are, for the most part, good and helpful to the due comprehension of the text; some are especially attractive and artistic. Had we to select the more excellent, we might

point to the Lake Gohar, situated in the narrow valley south of Ushtaran Kuh, in Northern Luristan, and three of the many views of the Ushtaran Kuh itself. The Tang-Azna, in the country of the Lurs of Sagwand, is a charming photograph.

SOME BOOKS ON EAST AND SOUTH AFRICA.

THE first book on our list* supplies a welcome exception to the general applicability of the statement, so often made, that the work of British explorers falls far short of that of the Germans in permanent scientific value. In this respect it may rank with the best German publications that have appeared in recent years. Although primarily a geologist, Dr. Gregory has given much attention to other branches of natural science, and his conclusions with regard to the various scientific questions touched upon are the result of long and careful study. The plan of his book is that followed by many German writers, the account of the journey itself being followed by chapters dealing with the various scientific aspects of the country.

The general results of Dr. Gregory's journey were fully given in the series of articles published in the *Journal* in 1894 (vol. iv.). The most striking features of the country dealt with are the Great Rift Valley, which gives the book its name, and Mount Kenya, on which so much new light was thrown by the journey. To non-geologists the term "rift valley" may be apt to suggest an exaggerated idea of depth and narrowness, the height of the walls being after all very slight compared with the width of the floor. It would not be easy, however, to suggest a better. Dr. Gregory followed its eastern side through two degrees of latitude, besides crossing its floor near Lake Baringo. The illustration at p. 94 gives a good idea of the level nature of the floor and the sudden rise of the bounding walls.† It may be remarked that the results of Dr. Donaldson Smith's journey hardly bear out the idea of its prolongation as a marked line of depression north-east of Lake Rudolf, while it is not quite clear, from the allusion to Lake Nyasa as in the *eastern* branch of the valley, whether the author rejects the notion that the western trough is indicated south of Tanganyika by the furrow of the Songwe and Saisi valleys.

The account of Dr. Gregory's adventures in the romantic region of snow-fields and glaciers around the central peak of Kenya is of extreme interest, and will, it is to be hoped, induce others to follow in his steps. Kenya appeals more to the imagination than Kilimanjaro, whose

* 'The Great Rift Valley.' By J. W. Gregory. London: Murray. 1896.

† The illustration (after Giraud) intended to show the steep sides of the narrow type of lakes, is accidentally referred to Tanganyika instead of Nyasa. Another slip is the statement that only one of the lakes has an outlet to the sea.

BRITISH LIBRARY

massive simplicity is more easily taken in; the various peaks and toothed pinnacles of Kenya, separated by upland valleys, show a more complicated general structure. The route followed is not marked on the sketch-map, but the names given to the chief features are an assistance in tracing it. Dr. Gregory does not appear to have named the striking rock-pinnacle, which rises above the moraines of the Lewis glacier, and which might readily be mistaken for the highest summit, though a comparison with the map and the other views shows that it is not. Though lacking the precision of photographs, the views alluded to give a vivid general idea of the features of the great mountain.

An interesting chapter deals with problems connected with the distribution of the flora and fauna, on which new light has been thrown by the discovery of moraines on Kenya at a much lower level than is reached by the present glaciers. In his division of the country into botanic zones, Dr. Gregory has introduced a slight modification since publishing his paper in the *Journal*. He defines a somewhat greater number than Mr. Scott-Elliot, but does not discriminate so minutely as Prof. Engler, whose eight floral zones, laid down for Usambara, do not include the higher mountains. The high mountain forests of Usambara correspond, according to Dr. Gregory, with the mountain forest which clothes the lower slopes of the main peaks.* We cannot do more than refer to the section dealing with the native tribes, which gives, perhaps, the best summary of our present knowledge which exists in English. Special attention is paid to the history of tribal migrations, and the main war-paths of the Masai are shown on one of the accompanying sketch-maps.

Mr Chanler's volume† takes the form of a detailed narrative of the events connected with his expedition to the north-east of Mount Kenya, in conjunction with Lieut. von Höhnel. Although the difficulties encountered caused a partial failure of the original plan, enough new ground was broken to give a considerable value to the results attained, a previously unknown area of over 100 miles in each direction being carefully mapped. The excellence of the former surveys of von Höhnel, on whom this work devolved, is a voucher for the trustworthiness of the map, which is on the large scale of 1:750,000. The colouring, according to contours of altitude—though the data available can hardly admit of great exactitude—no doubt gives a good general idea of the relief of the country. The chief geographical discovery was the tracing of the river Guaso Nyiro through the greater part of its course to the Lorian swamp, the position of which was thus for the first time defined. Much

* In the case of Kenya the forest zone is almost at the base, owing to the height of the plateau on which the mountain is placed; but on Kilimanjaro it begins only at a considerable height.

† 'Through Jungle and Desert.' By William Astor Chanler. London and New York: Macmillan. 1896.

new information was collected regarding the tribes met with, especially the Rendile, a race of doubtful affinity, but probably allied to the Gallas and Somalis, who own large herds of camels. The failure to obtain transport animals from them was largely responsible for the curtailment of the route.

On several occasions fights occurred, and in this respect the expedition compares unfavourably with Dr. Gregory's, which succeeded in maintaining friendly relations with the natives in spite of its small numbers. Mr. Chanler holds that the first intercourse of Europeans with new tribes is bound to involve bloodshed, and was, perhaps, not so determined to avoid it as some travellers have been without ill result. The difficulties encountered were, however, undoubtedly great. He apparently lacks the sympathetic feeling towards the Zanzibaris * which Dr. Gregory displays in spite of a consciousness of their many faults, and this may partly account for, without excusing, the desertion of his men after von Höhnel's departure for the coast, dangerously wounded by a rhinoceros. These animals seem to have been particularly plentiful and troublesome. The numerous and characteristic cuts are from photographs by the author, and, being evidently faithful copies, are a welcome change from the process-reproductions now almost universal in books of travel.

Before proceeding to books on South Africa, we may notice that the second volume of Dr. Paulitschke's 'Ethnographie Nordost Afrikas' has now been published. It deals in a thorough and comprehensive way with the moral culture of the Danakil, Galla, and Somal tribes, the first volume (noticed in the *Journal*, vol. iii. p. 503) having been concerned with their "material culture."

There is, perhaps, no part of the continent about which so many misconceptions prevail as German South-West Africa, the numerous works already published with reference to it having often been too scientific for popular comprehension. The connected account of the colony † which Lieut. H. von François—not to be confounded with his brother, Major C. von François—has prepared in a form suitable for general use, is therefore likely to prove serviceable in giving a clear conception of the present state and capabilities of the country. As the writer has served there for a considerable time, he has had good opportunities of becoming well acquainted with it personally. The book begins with a general description of the physical geography, plant and animal life, etc., followed by a sketch of the native inhabitants. Having thus given an idea of the material to be worked upon in the development of

* The Zanzibaris, Mr. Chanler thinks, are perfectly satisfied with their present condition of serfdom, and he doubts whether they would be benefited by a change.

† 'Nama und Damara, Deutsch-Süd-West-Afrika.' Von H. von François. Magdeburg: Baensch. [1896.]

مكتبة قطر الوطنية
Qatar National Library

the country, the author proceeds to relate the chief events connected with the German occupation (some space being devoted to the relations of the government with Hendrik Witbooi), and describes the various industries practised, concluding with a forecast for the future. Of the native population the Hill Damaras and the "Bastards" will probably prove most valuable allies in the work to be done. Political relations with the Hottentots will always be on a somewhat doubtful basis. British merchants and others still form a large proportion of the white population, and Boers are present in some numbers. Although the latter give little trouble, the author sees a danger in the possible preponderance of the Dutch element, and insists on the need of a larger number of German settlers, as well as of improved internal communications and a direct line of steamers to Germany. Want of practical experience at present puts the German immigrants at a disadvantage. The book is well and abundantly illustrated.

Prof. Wallace's book* is a valuable addition to our knowledge of the economic resources of the Cape, and must deeply interest all who are concerned in the welfare of that colony. The information it contains was acquired at first hand during journeys through the length and breadth of the country, carried out in 1895 at the request of the Cape Government, which gave constant opportunities of intercourse with the farmers themselves. Although much of the book naturally deals with more or less technical subjects, it is also most instructive from a geographical point of view, enabling the reader to grasp clearly the general surface features and their effect on the plant and animal life of the colony.

The series of maps by Bartholomew, which are excellent specimens of cartography, is a valuable feature of the work. The orographical features are shown in a two-sheet map of the scale of 1 : 2,500,000, coloured according to contours of altitude at every 1000 feet up to 4000, and at every 2000 feet above that height. Another map shows, under the title "Land surface features," the prevailing forms of vegetation, with the limited areas in which agriculture is practised.† Others give the proportions of the different kinds of stock in different localities, and a useful set of meteorological maps concludes the series. One of the most interesting chapters is that on ostrich-farming. The total number of birds now exceeds a quarter of a million. Fruit-growing, for which the climate is particularly favourable, is unaccountably neglected, and enterprise and skill are much needed to show what might be done in this direction.

* 'Farming Industries of Cape Colony.' By Robert Wallace, F.L.S., etc. London: King. 1896.

† The tints of this map do not in every case agree with those of the reference at the side. Thus the thorn-bush is green in the latter, but a light-brown in the former, apparently owing to the omission of a component tint.

GEOGRAPHY AT THE BRITISH ASSOCIATION, LIVERPOOL, 1896.

THE meeting of the British Association at Liverpool, from September 18 to 23, 1896, was the largest and most successful of recent years. The total number of tickets issued, amounting to 3180, has only twice been exceeded—at Newcastle in 1863, and at Manchester in 1887. If it were possible to distinguish the Liverpool meeting from all others by any one feature, that would be the convenient and even magnificent housing of the Association as a whole and all the sections. Section E certainly fared the best of all, for the "Small Concert Hall," in the same building with the great St. George's Hall, which served as the reception-room, was allotted to it. The hall is circular, of large dimensions, seating comfortably about a thousand people; it has just been redecorated, and was effectually darkened to admit of the use of the lantern. The attendance at the meetings of the section was very large, and much more uniform than usual. Very few papers were read to a small audience, and the number of communications sent in was so great (thirty-four) that a meeting had to be held on Saturday forenoon, in addition to the four days which usually suffice.

The Organizing Committee had arranged the papers of which intimation had been given in such a way that similar subjects were kept together; but the failure of some authors to put in an appearance, the changing of dates, which had been fixed to suit themselves, by others, and the presentation of valuable communications at short notice by gentlemen who could only attend on particular days, broke down the prepared order, and made the proceedings of each day too varied to be altogether profitable. It must, however, be recognized that the papers submitted were in themselves of great interest and value, and many of them afforded satisfactory proof of the sound study of geography as a science, and not as the mere record of explorations. But in exploration the story of some splendid successes was told, and an unexampled collection of the finest lantern-slides brought the scenery of many distant parts of the world vividly before most appreciative audiences. The large diagram maps of the Royal Geographical Society were as usual lent to the section.

The constitution of the section was as follows, the names of those nominated as vice-presidents or members of Committee who were disqualified by absence from the meeting or by not becoming *members* of the Association being omitted:—

President:—Major L. Darwin, Hon. Sec. R.G.S.; *Vice-Presidents*:—John Coles, F.R.A.S.; Admiral Sir Erasmus Ommanney, C.B., F.R.S.; Lieut.-Col. Sir Lambert Playfair, K.C.M.G.; P. L. Sclater, F.R.S.; E. G. Ravenstein; Coutts Trotter; Horace Walker. *Secretaries*:—Lieut.-Col. F. Bailey, Sec. R.S.G.S.; H. N. Dickson, F.R.S.E.; H. R. Mill, D.SC.

BRITISH LIBRARY

(*Recorder*); Commander E. Dubois Phillips, R.N. *Committee*:—J. Bolton; A. Montefiore Brice; G. G. Chisholm, M.A., B.SC.; Sir W. Martin Conway; Vaughan Cornish, M.SC.; H. T. Crook; B. V. Darbishire, M.A.; Chas. Gatehouse; E. Heawood, M.A.; A. J. Herbertson; Rev. J. F. Heyes, M.A.; J. Scott Keltie, Sec. R.G.S.; Prof. J. Milne, F.R.S.; Count Pfeil; George Philip, Jun.; Ralph Richardson; Eli Sowerbutts; Major-Gen. Sir Charles Wilson, R.E., K.C.B., F.R.S.

Thursday, September 19.—The address of the President (p. 488) was listened to with close attention by a large audience, and on its conclusion Count Pfeil proposed a vote of thanks, which was seconded by Sir Charles Wilson and heartily carried.

Mr. H. S. Cowper gave a preliminary account of his journey in March, 1896, through Northern Tripoli, a continuation of his work published in the *Geographical Journal*, vol. vii., 1896, p. 150, which it is hoped will shortly be submitted in full to the Society. The Rev. C. J. Robinson gave an account of his travels in the Hausa country.

Mr. John Coles explained the methods of photographic surveying, exhibiting two different types of camera adapted for such work, and expressing his belief that photographic methods in surveying were destined soon to take a very prominent place.

Mr. H. N. Dickson stated the present position of his research on the chemical composition and circulation of the water of the North Atlantic, specimens having been collected for him by the observers of the Meteorological Office and other sea-captains. Prof. Hjort, of Christiania, referred to the admirable oceanographical work being carried on by the Norwegian Government.

Dr. H. R. Mill explained his scheme for a geographical description of the British Islands, based on the 1-inch maps of the Ordnance Survey, and invited discussion on it. Mr. H. T. Crook criticized the Ordnance maps, complaining that they did not give as much information as they should do, and stating that if they were properly constructed no written description would be necessary. Prof. Hull pointed out that the Ordnance maps, with geological colouring superimposed, were as full as any maps could be made; and Mr. Coles paid a high tribute to the great beauty and accuracy of the British maps as compared with the state maps of any country in the world.

Friday, September 18.—The Rev. W. K. R. Bedford described the old tapestry maps of parts of England, woven during the latter part of the sixteenth century, specimens of which are preserved at York and in the Bodleian Library at Oxford. They showed several features of the topography of the counties represented which do not seem to have been shown on any of the published maps of the period.

Dr. Tempest Anderson showed photographs of the Altels avalanche of September, 1895, in which a mass, partly snow, partly glacier ice, swept for 4000 feet down the mountain-side, causing great destruction.

BRITISH LIBRARY

The fracture afforded an interesting glimpse of the internal structure of a glacier far from its termination.

Lieut. G. Vandeleur, of the Scots Guards, gave a preliminary statement of his observations in Uganda and on the Upper Nile, which will shortly be presented in full to the Royal Geographical Society.

Dr. F. P. Gulliver, of Harvard College, discussed the form of the coast-line of Romney Marsh, and described the origin of Dungeness. His paper will probably be published with diagrams in the *Journal*.

Mr. A. Montefiore Brice, secretary to the Jackson-Harmsworth Arctic Expedition, gave an address to a crowded house on the second year's work of the expedition, illustrated by slides, showing the life of the expedition and the scenery of Franz Josef Land. Sir Erasmus Ommanney, Sir Martin Conway, and Mr. Coles, expressed the feeling of the meeting as to the valuable work which had been done. It will be fully recorded in the *Journal*.

Mr. G. F. Scott Elliot communicated a paper on the influence of climate and vegetation on African civilization, an abstract of which appears in the Monthly Record. It gave rise to a brief discussion.

Mr. Vaughan Cornish contributed the results of a valuable original investigation on the forms, origin, and distribution of sand-dunes and sand-banks, which we hope to publish in full, with diagrams, at an early date.

Saturday, September 19.—Mr. A. J. Herbertson exhibited a series of monthly mean rainfall maps of the world, which, in conjunction with Dr. A. Buchan, he has prepared for the great physical atlas now being compiled by Mr. Bartholomew, on the basis of Berghaus. These maps are the first of their kind to be made, and are full of interest from the point of view of climatology.

Mr. Ravenstein presented the report of the Committee on the Climatology of Tropical Africa (Secretary, Mr. H. N. Dickson), the text of which is given in the Monthly Record.

Mr. J. Howard Reed sent in a paper describing the efforts of the Manchester Geographical Society in the popularization of geographical education.

The feature of the day was an eloquent address on Canada and its gold-resources by Sir James Grant, K.C.M.G., which was warmly received. He said that Canada contained both coal and gold, and within the last few years remarkable discoveries had been made. In Nova Scotia the coal area covered 635 square miles. In New Brunswick it was estimated that there were upwards of 150,000,000 tons of coal; while in the north-west territory Dr. Dawson had arrived, after careful investigation, at the fact that there were over 50,000 square miles of coal-bearing strata. It was a remarkable fact that the Dominion had coal on the Atlantic and Pacific seaboards and in the interior—as if nature had intended to supply it with the requisite material in the

مكتبة قطر الوطنية
Qatar National Library

event of an emergency to send its ships to any part of the world, and thus contribute materially to the strengthening of the Empire. With reference to gold, discoveries were made in Nova Scotia in 1860, and since 1885 the mines in the province had become exceedingly lucrative, owing to the utilization of appliances for the recovery of gold from low-grade ores. It was estimated that that province had produced gold to the value of $11,500,000. In the province of Quebec Prof. Hardman made some investigations. After running a tunnel 600 feet in length, he struck the bed of an old river, and in three weeks removed enough gold to pay the entire expense of his operations. The consequence was that to-day there was feverish excitement in the province, and every acre of land was being taken up. In Ontario the discoveries had been of a remarkable character. At Manatou there were numerous seams in which the gold appeared on the surface, and could be removed with the greatest ease. This district was only 100 miles distant from Winnipeg and 40 miles from the Pacific Railway. In British Columbia 400 miners in one day took from Williams Creek 200 lbs. weight of gold, and he predicted that the future output in this province would surprise not only Canadians, but the whole of the civilized world.

Monday, September 21.—Mr. W. A. L. Fletcher, who accompanied Mr. and Mrs. St. George Littledale on their great journey across Tibet from north to south, gave an account of his journey toward Lhasa; and our readers, who have already had an opportunity of knowing the facts of this journey, will be pleased to learn that Mrs. Littledale has recovered from the results of the hardships she underwent, and was present at the reading of the paper.

Iceland was the subject of two short papers, both illustrated by very fine slides of scenery. Mr. Frederick W. Howell described his journey through the glacier-region of Northern Iceland, and Dr. K. Grossman spoke of the volcanic scenery surrounding Hecla.

Mr. G. G. Chisholm treated of the Relativity of geographical advantages in an able paper, for the adequate discussion of which there was, unfortunately, no time. He considered geographical advantages: (1) as relative to the condition of the surface of a country, *e.g.* the extent of forests, marshes, etc. The former and present relative importance of Liverpool and Bristol might be explained, in part at least, by changes that had taken place under this head. Also the difference in direction by some of the great Roman roads and those of the present day, and the consequent fact that some important Roman stations in Britain were not now represented even by a hamlet. (2) As relative to the political condition of a country and of other countries. (3) As relative to the state of military science. Under these two heads the difference in the situation of the Roman wall between Tyne and Solway and the Anglo-Scottish boundary suggested some considerations. Also

View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984181.0x000097

مكتبة قطر الوطنية
Qatar National Library

the difference in the situation of some important Roman towns or stations and their modern representatives (Uriconium, Shrewsbury; Sorbiodunum, Salisbury). (4) As relative to the state of applied science—well illustrated in this country, in the history of the iron and textile industries. (5) As relative to the density of population—another important consideration in the industrial history of our own country. (6) As relative to the mental attitude of the people where the geographical advantages existed. Many Chinese travellers and students of China had recognized the excessive reverence for ancestors in that country as one great hindrance in the way of turning the advantages of the country to account.

Mr. Ralph Richardson read a paper on the boundary of British Guiana and Schomburgk's line, which called forth a very lively discussion, but did not reach any definite conclusion.

In the afternoon Sir W. Martin Conway gave a preliminary account of the expedition to Spitzbergen which he, together with Dr. J. W. Gregory, Messrs. Garwood, Trevor-Battye, and H. Conway, made in the summer of 1896. He vividly described the difficulties in the way of land travel presented by soft snow and interminable marshes which he had successfully overcome in crossing the south-western island.

Mr. J. Ferguson, in the absence of Mr. H. W. Cave, exhibited a fine series of photographs of the ancient ruined cities of Ceylon, which were taken by Mr. Cave to serve as illustrations for a forthcoming work on the subject.

Prof. J. Milne, F.R.S., discoursed on earthquakes and sea-waves. During the whole day the audience in the section had been large, and highly appreciative of the papers submitted to them.

Tuesday, September 22.—Mr. A. E. Fitz Gerald gave a short account of his mountaineering journey across the Southern Alps of New Zealand, and announced his intended departure for an expedition of some magnitude to the Chilian Andes, in the course of which it is his intention to attempt the ascent of Aconcagua.

Sir Charles W. Wilson was listened to with the deepest attention while he gave an address on the Egyptian Sudan, a report of which, it is hoped, will appear in the *Journal*, and after he concluded, a number of questions were asked as to the prospects of trade by the different routes proposed to the interior.

Mr. A. W. Andrews read a practical paper on the teaching of geography in relation to history, and his arguments will appear later in the *Journal*.

Mr. E. Odlum, of Vancouver, described the border zone between British Columbia and Alaska, referring especially to the region under consideration in the present boundary negotiations. Sir Charles Wilson, as the surveyor responsible for fixing the 49th parallel, the boundary between Western Canada and the United States, and Mr. John Coles as

مكتبة قطر الوطنية
Qatar National Library

the first settler in British Columbia, congratulated Mr. Odlum on his paper.

Mr. J. Scott Keltie, who had just returned from Christiania, gave an account of the triumphal reception of Dr. Nansen, and a sketch of the achievements of the great Arctic expedition. He read extracts from an article by Professor Mohn (see the October number of the *Journal*), who expressed the highest possible delight and admiration at the scientific results of the observations, especially those on meteorology and terrestrial magnetism. Sir Erasmus Ommanney and Mr. Coles spoke of the unique value of Nansen's work.

Mr. A. J. Herbertson demonstrated the use of a simple arrangement for explaining the principle of map-projections. It consists of a hemisphere made up of wire meridians and parallels, the shadow of which is thrown on a sheet of paper by means of a candle sliding along a graduated bar. The nature of the projection, of course, varies with the position of the candle.

Mr. B. V. Darbishire showed a new population map of the South Wales coal-district. It gave the position of all detached inhabited houses as well as the villages and towns, and having the contour-lines of elevation, it brought out the relation of population to land-form.

Mr. A. J. Herbertson read the interim-report of the Committee on Geographical Teaching, in which he stated that he had collected a large amount of material; but the Committee, having been unable to obtain access to some important returns, wished to delay the full report until next year, when it could be presented in its entirety.

Mr. Coutts-Trotter proposed, and Mr. Eli Sowerbutts seconded, a vote of thanks to the president (Major Darwin), the vice-presidents who had assisted him in the chair (Messrs. John Coles and Horace Walker), the secretaries of the Section, and the local secretaries for the admirable hall provided.

Papers of geographical interest were as usual read in many sections besides that specially devoted to geography. In Section A (Mathematics and Physics), Dr. L. A. Bauer discussed some problems in terrestrial magnetism, Mr. H. M. Taylor read a paper on great-circle sailing, and reports were submitted by the Committees on seismological observations and on meteorological photographs. In Section C (Geology), Mr. Man's presidential address abounded in allusions to results of physical geography, and much interest was aroused in a series of papers on ocean depth and deposits, introduced by Mr. E. B. Wethered, on the depths of the sea in past epochs. Mr. T. Mellard Reade discussed the oscillations in the level of the land near Liverpool from geological evidence, and Mr. G. H. Morton spoke of the erosion of the sea-coast of Wirral, the tongue-shaped peninsula between the Mersey and the Dee.

In Section D (Zoology), the president, Professor Poulton, reviewed the evidence regarding the age of the Earth from the physical as well

BRITISH LIBRARY

as the biological point of view, and contended for a great extension of its habitable period beyond that usually conceded by physicists. A report was read on the biological investigation of oceanic islands; and in Section H (Anthropology), Prof. Haddon called attention to the need of the immediate study of such islands from the anthropological point of view. In the latter section, the president, Mr. A. Evans, spoke on the pre-historic migrations of people and the origin of European races; and Mr. J. L. Myres read a paper on "Cyprus and the Trade-routes of South-Eastern Europe." Mr. Thiselton Dyer, Director of the Royal Gardens at Kew, gave a lecture in Section K (Botany) on the geographical distribution of plants. Section G (Mechanical Science and Engineering) listened to two communications of much geographical interest, one a "Report on the Effect of Wind and Atmospheric Pressure on Tides;" the other by Mr. G. F. Lyster, on "The Physical and Engineering Features of the River Mersey and the Port of Liverpool." Mr. Lyster's paper was felt to be of such value that it was ordered by the General Committee to be printed in full in the Report.

Prof. W. A. Herdman, in addition to his arduous duties as local secretary, has edited the Association's "Handbook to Liverpool," which, although smaller than some similar books in the past, is admirably compiled, and will serve as a valuable scientific guide to the Liverpool neighbourhood for years to come. It contains the following chapters: History and Antiquity of Liverpool, by W. H. Picton; Geology of the Country around Liverpool, by G. H. Morton, with a geological map specially compiled; The Vertebrate Fauna of the Liverpool District, by Dr. H. O. Forbes; The Marine Fauna of the District, by Prof. Herdman; The Entomology of the Liverpool District, by W. E. Sharp; The Botany of the Liverpool District, by Robert Brown; The Climate of Liverpool, by W. E. Plummer; The River and the Tides, by Prof. Oliver J. Lodge; Docks, and other Engineering Works, by Prof. H. S. Hele-Shaw and H. Percy Boulnois; Trade and Commerce of Liverpool, by Sir William B. Forwood; Chemical Industries, by Dr. C. A. Kohn. An appendix is added giving some similar particulars relating to the Isle of Man, the scene of one of the largest excursions of members after the close of the meeting.

RAILWAYS IN AFRICA.*

By Major DARWIN, Sec. R.G.S.

In reviewing the record of geographical work during the past year, all other performances pale in comparison with the feat accomplished by Nansen. It is not merely that he has gone considerably nearer the North Pole than any other explorer, it is not only that he has made one of the most courageous expeditions

* Address delivered to the Geographical Section of the British Association at Liverpool, September 17, 1896, by Major Darwin, as President of the Section. Map, p. 540.

BRITISH LIBRARY

ever recorded, but he has established the truth of his theory of Polar currents, and has brought back a mass of valuable scientific information. When Nansen comes to England, I am certain that we shall give him a reception which will prove how much we admire the heroism of this brave Norwegian.

Besides the news of this most remarkable achievement, the results of a considerable amount of useful exploratory work have been published since the British Association met last at Ipswich. With regard to other Arctic expeditions, we have had the account of Lieutenant Peary's third season in Northern Greenland, from which place he came back in September last, and to which he has again returned, though without the intention of passing another winter there. In October the *Windward* brought home more ample information as to the progress of the Jackson-Harmsworth Expedition than that communicated by telegram to the Association at Ipswich, and on her return from her remarkably rapid voyage this summer she brought back the record of another year. As to geographical work in Asia, Mr. and Mrs. Littledale returned safely from their explorations of the little-known parts of Tibet; the Pamir Boundary Commission, under Colonel Holdich, has collected a great deal of accurate topographical information in the course of its labours; Dr. Sven Hedin continues his important researches in Turkestan; and the Royal Geographical Society was glad to welcome Prince Henry of Orleans when he came to tell us about his journey near the sources of the Irrawaddy. As to Africa, the most important additions to our knowledge of that continent are due to the French surveyors, who have accurately mapped the recently discovered series of lakes in the neighbourhood of Timbuktu, Lake Faguibine, the largest, being found to be 68 miles in length; Dr. Donaldson Smith has filled up some large blanks in the map of Somaliland; and Mr. and Mrs. Theodore Bent have investigated some interesting remains of ancient gold workings inland of the Red Sea. In other parts of the world less has been done, because there is less to do. Mr. Fitz Gerald has proved for the first time the practicable character of a pass across the Southern Alps, thus supplementing the excellent work of Mr. Harper and other pioneers of the New Zealand Alpine Club; and Sir W. M. Conway has commenced a systematic exploration of the interior of Spitzbergen, a region to which the attention of several other geographers is also directed.

It is impossible in such a brief sketch to enumerate even the leading events of the geographical year, but what I have said is enough to remind us of the great amount of valuable and useful work which is being done in many quarters of the world. It is true that if we compare this record with the record of years gone by, we find a marked difference. Then, there was always some great geographical problem to be attacked; the sources of the Nile had to be discovered; the course of the Niger had to be traced; and the great white patches on our maps stimulated the imagination of explorers with the thought of all sorts of possibilities. Now, though there is much to be learned, yet, with the exception of the Poles, the work will consist in filling in the details of the picture, the general outlines being all drawn for us already. Personally I cannot help feeling a completely unreasoning regret that we have almost passed out of the heroic period of geography. Whatever the future may have in store for us, it can never give us another Columbus, another Magellan, or another Livingstone. The geographical discoverers of the future will win their fame in a more prosaic fashion, though their work may in reality be of even greater service to mankind. There are now few places in the world where the outline of the main topographical features is unknown; but, on the other hand, there are vast districts not yet thoroughly examined. And, in examining these more or less known localities, geographers must take a far wider view than heretofore of their methods of study in order to accommodate themselves to modern conditions.

But even if we confine our attention to the older and more narrow field of geography, it will be seen that there is still an immense amount of work to be done. We have been filling in the map of Africa during recent years with extraordinary rapidity, but yet that map is likely to remain in a very unsatisfactory condition for a long time to come. Englishmen and other Europeans have always shown themselves to be ready to risk their lives in exploring unknown regions, but we have yet to see how readily they will undertake the plodding work of recording topographical details when little renown is to be won by their efforts. It should be one of the objects of geographical societies to educate the public to recognize the importance of this work, and General Chapman deserves great credit for bringing the matter before the International Congress last year in such a prominent manner. He confined himself to four main recommendations. (1) The extension of accurate topographical surveys in regions likely to be settled by Europeans. (2) The encouragement of travellers to sketch areas rather than routes. (3) The study of astronomical observations already taken in the unsurveyed parts of Africa in a systematic manner, and the publication of the results. (4) The accurate determination of the latitude and longitude of many important places in unsurveyed Africa. I am certain that all geographers are in hearty accord with General Chapman in his views, and it is, perhaps, by continually bringing this matter before the public that we shall best help this movement forward.

Not only do we want a more accurate filling in of the picture, but we have yet to learn to read its lessons aright. The past cannot be understood, and still less can the future be predicted, without a wider conception of geographical facts. Look, for example, at the European colonies on the West Coast of Africa. Here we find that there have been Portuguese settlements on the Gold Coast since the year 1471, the French possibly having been established there at an even earlier date; whilst we English, who pride ourselves on our go-ahead character, have had trading factories on the coast since 1667. I have here a map showing the state of our geographical knowledge in 1815. Why was it that Europeans have never, broadly speaking, pushed into the interior from their base on the coast, which they had occupied for so many centuries? That they had not done so, at least to any purpose, is proved by this map. Why had four centuries of contact with Europeans done so little even for geographical knowledge at that time? The answer to this question may be said to be mainly historical; but the history of our African colonies can never be understood without a study of the distribution of the dense belt of unhealthy forest along the shore; of the distribution of the different types of native inhabitants; and of the courses of the navigable rivers, all strictly geographical considerations.

Geography is the study of distribution, and early in that study we must be struck with the correlation of these different distributions. If we take a map of Africa, and mark on it all the areas within the tropics covered with dense forest or scrub, we shall find we have drawn a map showing accurately the distribution of the worst types of malarial fever; and that we have also indicated with some approach to accuracy—with, however, notable exceptions—the habitat of the lowest types of mankind. These are the facts which give the key to understanding why the progress of European colonization on the West Coast has been so slow.

Along the coast of the Gulf of Guinea we find settlements of Europeans at more or less distant intervals. All along, or nearly all along this same coast, we find a wide belt of fever-stricken forest, fairly thickly inhabited by uncivilized negro and Bantu tribes. Inside this belt of forest the country rises in altitude, and becomes more open, whilst at the same time there is a distinct improvement in the type of native; and the more we proceed inland, the more marked does this improvement

become. There appears, in fact, to have been a number of waves of advancing civilization, each one pressing the one in front of it towards these inhospitable forest belts. Near the coast the lowest type of negro is, generally speaking, to be found; then, as the more open country is reached, higher types of negroes are encountered—for example, the Mandingoes of the Senegal region are distinctly higher than the Jolas inhabiting the mouths of the Gambia; and the Hausas of the Sokoto empire are vastly superior to the cannibals of the Oil rivers. In both these cases the higher types are probably not pure negroes, but have Fulah, Berber, or Arab blood in their veins; for we see, in the case of the Fulahs, how they become absorbed into the race they are conquering. Near the Senegal river they are comparatively light in colour, but in Adamawa they are hardly to be distinguished by their features from the negroes they despise. Thus the process appears to have been a double one; the higher race driving some of the lower aboriginal tribes before them out of the better lands, and, at the same time, raising other tribes by means of an admixture of better blood. These waves of advancing civilization seem to have advanced from the north and east, for the more we penetrate in these directions, the higher is the type of inhabitant met with, until at last we reach the pure Berbers and the pure Arabs. Thus there are two civilizing influences visible in this part of Africa; one coming from the north and east—a Mohammedan advance—which keeps beating up against this forest belt and occasionally breaking into it; the other, a Christian movement, which, until the middle of this century, was brought to a dead halt by this same obstacle. The map of Africa, showing the state of geographical knowledge in 1815, makes it clear that, except in a few cases where rivers helped travellers through these malarial regions, nothing was known about the interior. No doubt much has been done since those days, but this barrier still remains the great impediment to progress from the West Coast; and those who desire our influence to spread more effectively into the interior must wish to see some means of overcoming this obstacle. On the East Coast of Africa the conditions are somewhat different, as there is comparatively little dense forest there; but the districts near that coast are also usually unhealthy, and how to cross those malarial regions quickly into the healthy or less unhealthy interior is the most important problem connected with the development of tropical Africa.

Other influences have been at work, no doubt, in checking our progress from the West Coast. In old days, the European possessions in these districts were mere depôts for the export of slaves. As the white residents could not hope to compete with the natives in the actual work of catching these unfortunate creatures, and as the lower the type the more easily were they caught, as a rule, there was no reason whatever for attempting to penetrate into the interior, where the higher types are met with. But, though this export trade in human beings is now no longer an impediment to progress, the slave trade in the interior still helps to bar the way. When the forest belt is passed, we now come, generally speaking, to the line of demarcation between the Mohammedan and the pagan tribes, and here slave-catching is generally rife; when it is so, the constant raids of the Mohammedan chiefs keep these border districts in a state of unrest, which in every way tends to impede progress. Thus a mere advance to the higher inland regions will not by any means solve all our difficulties, but it will greatly lessen them; and it is universally admitted that the more communication with the interior is facilitated, the more easy will it be to suppress this terrible traffic in human beings. By the General Act of the Brussels Anti-Slavery Conference of 1890–91, it was agreed by the assembled delegates that the construction of roads, and, in particular, of railways, connecting the advanced stations with the coast, and permitting easy access

BRITISH LIBRARY

to the inland waters, and to the upper courses of rivers, was one of the most effective means of counteracting the slave trade in the interior. Here, then, we have the most formal admission which could be given of the necessity of opening up main trunk lines of communication into the interior.

But not only does geographical knowledge help to demonstrate the necessity of improving the means of communication between the coast and the interior, but it helps us to decide where it is wise to make our first efforts in this direction. In the first place, it is essential to note that if the continent of Africa is compared with other continents, its general poverty is clearly seen. Mr. Keltie, in his excellent work on the Partition of Africa, tells us that "at present (1895) it is estimated that the total exports of the whole of Central Africa by the east and west coast do not amount to more than 20,000,000*l.* sterling annually." For the purposes of comparison, it may be mentioned that the export trade of India is between sixty and seventy million sterling annually, and that India is only about one-seventh or one-eighth of the area of the whole of Africa. On the other hand, the trade of India has been increasing by leaps and bounds, largely in consequence of the country being opened out by railways, and there is every reason to hope that somewhat similar results would occur in Africa under similar circumstances, though the lower civilization of the people would prevent the harvest being so quickly reaped. But, however it may be as to the future, the present poverty of Africa is enough to demonstrate the necessity of pushing ahead cautiously and steadily, and of doing so in the most economical manner possible.

M. Decle, in an interesting paper, read before the International Geographical Congress in London last year, strongly advocated the construction of cheap roads for use by the natives, taking precautions to prevent any traffic in slaves along them. His suggestions are well worthy of consideration; but the cost of transport along any road would, I should have thought, soon have eaten up any profits on the import or export trade to or from Africa. What must be done in the first instance is to utilize to the utmost all the natural lines of communication which require little or no expenditure to render them serviceable; in fact, to turn our attention at first to the rivers and to the lakes. I have already pointed out that the early maps of Africa prove that the rivers have almost invariably been the first means of communication with the interior, and until this continent is rich enough to support an extensive railway system, we must rely largely on the waterways as means of transport.

It may be as well here to remark that geographical knowledge is often required in order to control the imagination. I do not know why it is, but almost every one will admit that, if he sees a lake of considerable size depicted on a map, he immediately feels a desire to visit or possess that locality in preference to others. A lake may be of far less commercial value than an equal length of thoroughly navigable river, and yet it will always appear more attractive. Look at the way in which the English, the French, and the Germans are all pressing forward to Lake Chad; and yet Lake Chad is in reality not much more than a huge swamp, and, in all probability, it is excessively unhealthy. Again, it is probable that the Albert Nyanza will prove to be of comparatively small value, because the mountains come down so close to its shores. Of course, the great lakes form an immensely important feature in African geography, but we must judge their commercial value rationally, and without the bias of imagination.

To develop the traffic along the rivers and on the lakes is the first stage in the commercial evolution of a continent like Africa. But it cannot carry us very far. Africa is badly supplied with navigable rivers, chiefly as a natural result of the general formation of the land. The continent consists, broadly speaking,

BRITISH LIBRARY

of a huge plateau, and the rivers flowing off this plateau are obstructed by cataracts in exactly the places where we most want to use them—that is, when approaching the coasts. The second stage in the commercial evolution will therefore be the construction of railways with the view of supplementing this river traffic. Finally, no doubt, a further stage will be reached, when railways will cut out the rivers altogether; for few of the navigable rivers are really well suited to serve as lines of communication. This last stage is, however, so far off that we may neglect it for the present; though it must be noted that there are some parts of Africa where there are no navigable rivers, and where, if anything is to be done, it must be entirely by means of railways.

Thus, as far as the immediate future is concerned, the points to which our attention should be mainly directed are (1) the courses of the navigable parts of the rivers, and (2) the routes most suitable for the construction of railways in order to connect the navigable rivers and lakes with the coast. As to the navigable rivers, little more remains to be discovered with regard to them, and we can indicate the state of our geographical knowledge on this point with sufficient accuracy for our purposes by means of a map. Of course the commercial value of a waterway depends greatly on the kind of boats which can be used, and that point cannot well be indicated cartographically.

As to the railways, we must study the physical features of the country through which the proposed lines of communication would pass. All the obstacles on rival routes should be most carefully surveyed when considering the construction of railways in an economical manner. Great mountain chains are seldom met with in Africa, and from that point of view the continent is as a whole remarkably free from difficulties. But drifting sand is often a serious trouble, and that is met with commonly enough in many parts. Wide tracts of rocky country also form serious impediments, both because of the cost of construction, and also because the supply of water for the engines becomes a problem not to be neglected. Such arid and sandy districts are, of course, thinly inhabited, and we may, therefore, generally conclude that where the population is scanty, there railway engineers will have special difficulties to face. On the other hand, dense forests are also very unsuitable. We have not much experience to guide us, but it would appear probable that the initial expense of clearing the forest, and the cost of maintenance, in perpetually battling against the tropical vegetable growth, will be very heavy; for it will not do to allow the line to be in constant danger of being blocked. The dampness of the forest, which will cause all woodwork and wooden sleepers to rot, will be no small source of trouble, and the virulent malarial fevers, always met with where the vegetation is very rank, will add immensely to the difficulty, both of construction and of maintenance. The health of the European *employés* will be a most serious question in considering the construction of railways in all parts of tropical Africa, for the turning up of the soil is the most certain of all methods of causing an outbreak of malarial fever; and the evil results would be most severely felt in constructing ordinary railways in dense forests. In making the short Senegal railway, where the climate is healthier than in many of the districts further south, the mortality was very great. Perhaps we shall have to modify our usual methods of construction so as to mitigate this danger, and, in connection with this subject, I may perhaps mention that the Lartigue system seems to be specially worthy of consideration—a system by which the train is carried on a single elevated rail. This is perhaps travelling rather wide of the mark of ordinary geographical studies, but it illustrates the necessity of a thorough examination of the environment before we try to transplant our own methods to other climes.

BRITISH LIBRARY

We may, however, safely conclude that we must as far as possible avoid both dense forests and sandy and rocky wastes in the construction of our first railways.

Then, as to the lines of communication, considered as a whole, rail and river combined, we must obviously, if any capital is to be expended, make them in the directions most likely to secure a profitable traffic. In considering this part of the question, it will be seen that there are several different problems to be discussed: (1) trade with the existing population in their present condition; (2) trade with the native inhabitants when their countries have been further developed with the aid of European supervision; and (3) trade with actual colonies of European settlers. To many minds the last of these problems will appear to be the most important, and in the end it may prove to be so. But the time at my disposal compels me to limit myself to the consideration of trade with the existing native races within the tropics, with only an occasional reference to the influence of white residents. We must, no doubt, carefully consider which are the localities most likely to attract those Europeans who go to Africa with the view of establishing commercial intercourse and commercial methods in the interior; and there can be no doubt that considerations of health will play a prominent part in deciding this point. Moreover, as the lowest types of natives have few wants, the more primitive the inhabitants of the district opened up, the less will be the probability of a profitable trade being established. For both these reasons the coast districts are not likely in the end to be as good a field for commercial enterprise as the higher lands in the interior; for the more we recede from the coast, the less unhealthy the country becomes, and the more often do we find traces of native civilization. To put it simply, we must consider both the density of the population and the class of inhabitant in the districts proposed to be opened up. Of course, the exact nature of the products likely to be exported, and the probability of demands for European goods arising amongst the natives of different districts, are vitally important considerations in estimating the profits of any proposed line of railway; but to discuss such problems in commercial geography at length would open up too wide a field on an occasion like this.

If the importance of considering the density of the population in the different districts in such a preliminary survey is admitted, we may then simplify our inquiry by declining to discuss any lines of communication intended to open up regions where the population falls below some fixed minimum—whatever we may like to decide on. Of course, the question of the greater or less probability of a locality attracting white temporary residents is very important, but unless there is a native population ready to work on, there will be little done for many years to come. Politically, it may or may not be right to open up new districts by railways for the sake of finding outlets for our home or our Indian population; but here I am considering the best lines for the development of commerce, taking things as they are. What, then, shall be this minimum of population? The population of Bengal is 470 per square mile; of India, as a whole, about 180; and of the United States, about 21 or 22. If it is remembered that the inhabitants of the United States are, per head, vastly more trade-producing than the natives of Africa, it will be admitted that we may for the present exclude from our survey all districts in which the population does not reach a minimum of 8 per square mile; it might be right to put the minimum much higher than this. On the map now before you, the uncoloured parts show where the density of population does not come up to this minimum, and we can see at a glance how enormously this reduces the area to be considered. The light grey indicates a population of from 8 to 32 per square mile, and the darker grey a denser population than that. Of course, such a map, in the very imperfect state of our knowledge, must be very inaccurate, as I am

مكتبة قطر الوطنية
Qatar National Library

sure the compiler would be the first to admit. On the same map are marked the navigable parts of rivers. I should like to have shown the dense forests also, but the difficulty of giving them with any approach to correctness is at present insuperable.

Here, then, is the kind of map we want in order to consider the broad outline of the questions connected with the advisability of attempting to push lines of communication into the interior. The problem is how to connect the inland parts of Africa, which are coloured grey on this map, with the coast, by practicable lines of communications, at the least cost, with the least amount of dense forest to be traversed, and, in the case of railways, whilst avoiding as far as possible all thinly populated districts.

It is, of course, quite impossible here to discuss all the great routes into the interior, and I should like to devote the remaining time at my disposal to the consideration of this problem as far as a few of the most important districts are concerned, confining myself, as I have said, to trade with existing native races within the tropics. Taking the East Coast first, and beginning at the north, the first region sufficiently populous to attract our attention is the Valley of the Nile, and parts of the Central Sudan. Wadai, Darfur, and Kordofan are but scantily inhabited, according to our map, and this is probably the case now that the Khalifa has so devastated these districts; but, without doubt, much of this country could support a teeming population, and is capable of great commercial development. The Bahr-el-Ghazal districts are especially attractive, being fertile and better watered than the somewhat arid regions further north. These remarks remind me how difficult it is at this moment to touch on this subject without trenching on politics. Few will deny that the sooner this region is connected with the civilized world the better, and it is only as to the method of opening it up, and as to who is to undertake the work, that burning political questions will arise. The geographical problems connected with the lines of communication to the interior can be considered whilst leaving these two points quite on one side.

A glance at the map reminds us of the well-known fact that below Berber the Nile is interrupted by cataracts for several hundred miles, whilst above that town there is a navigable waterway at high Nile until the Fola rapids are reached, a distance of about 1400 miles, not to mention the 400 to 600 miles of the Blue Nile and the Bahr-el-Ghazal, which are also navigable. The importance of a railway from Suakin to Berber is thus at once evident, and there is perhaps only one other place in Africa where an equal expenditure would open up such a large tract of country to European trade. This route, however, is not free from difficulties. Suakin is hot and unhealthy. Then the railway, about 260 miles in length, passes over uninhabited or thinly inhabited districts the whole way. Though the hills over which it would pass are of no great height, the highest part of the track being under 3000 feet above the sea, it is often said that the desert to be traversed would add greatly to the difficulty of construction. According to Colonel Watson, R.E., however, these difficulties have been greatly exaggerated, for the water-supply would give no great trouble. The sixth cataract, between Metemma and Khartum, would, it is said, make navigation for commercial purposes impossible when the waters are low; if this is so, it is probable that this impediment could be overcome by erecting locks, but it is impossible to estimate the cost of such works. Then again, the Nile above Khartum is much obstructed by floating grass or sudd, making navigation at times almost impossible; but it was Gordon's opinion that a line of steamers on the river, even if running at rare intervals, would keep the course of the stream clear; this, however, remains to be proved.

If the canalization of the sixth cataract should prove to be a necessary, but too

BRITISH LIBRARY

costly an undertaking, then it would be most advisable to carry on the railway beyond that obstacle. This might be done by prolonging the line along the banks of the Nile, or by adopting an entirely different route from Suakin through Kassala. I hope we shall hear something from Sir Charles Wilson as to the relative merits of these proposals during the course of our proceedings. Proposals have also been made for connecting the Nile with other ports on the Red Sea, and all of these suggestions should be carefully examined before a decision is made as to the exact route to be adopted. But in any case, considering the matter merely from a geographical standpoint, and putting politics on one side—a very large omission in the case of the Sudan—it would appear that one or other of these routes should be one of the very first to be constructed in all Africa.

Passing further south, it is obvious from the configuration of the shore, and from the distribution of the population, that the lines of communication next to be considered are those leading to the Victoria Nyanza, and on to the regions lying north and west of the lake.

Two routes for railways from the coast to the Victoria Nyanza have been proposed, one running through the British and the other through the German sphere of influence. Looking at the matter from a strictly geographical point of view, there is perhaps hardly sufficient information to enable us to judge of the relative merits of the two proposals. Both run through an unhealthy coast zone, and both traverse thinly inhabited districts until the lake is reached. The German route, as originally proposed, would be the shorter of the two; but there is some reason to think that the British line will open up more country east of the lake, which will be suitable for prolonged residence by white men. Sir John Kirk, in discussing the question of the possible colonization of tropical Africa by Europeans, said, "These uplands vary from 5000 to 7000 feet in height, the climate is cool, and, as far as known, very healthy for Europeans. The district is separated from the coast by the usual unhealthy zone, which, however, is narrower than elsewhere on the African littoral. Between the coast zone and the highlands stretches a barren belt of country, which attains a maximum width of nearly 200 miles. The rise is gradual, and throughout the whole area to be crossed the climate is drier and the malarial diseases are certainly much less frequent and less severe than in the regions further south." These very advantages, however, may have to be paid for by the greater difficulty of railway construction. Putting aside future prospects, the map shows that the populous region to the west of the lake makes either of these proposed lines well worthy of consideration, though it would perhaps be rash to predict how soon the commerce along them would pay for the interest on the capital expended. What will be the fate of the German project I do not know, but we may prophesy with some confidence that the British line, the construction of which has been commenced, will be completed sooner or later.

The two lines of communication we have discussed—the Suakin and the Victoria Nyanza routes—are intended to supply the wants of widely separated districts; but, looking to a more distant future, they must sooner or later—probably later—come into competition, one with the other, in attracting trade from the Central Sudan. Before this can occur, communication by steamboat and by railway must be opened up between the coast and the navigable Nile by both routes. This will necessitate a railway being constructed, not only to the Victoria Nyanza, but also from that lake, or round it, to the Albert Nyanza; and, as the Nile is rendered unnavigable by cataracts about Dufile, and as the navigation is difficult between Dufile and Lado, here also a railway might be necessary in order to complete the chain of steam communication with the coast. If goods were brought across the Victoria Nyanza by steamer, and taken down the Nile in the same manner from the Albert

مكتبة قطر الوطنية
Qatar National Library

Nyanza to Dufile, this route would necessitate bulk being broken six times before the merchandise was under way on the Nile; by the Suakin route, on the other hand, bulk would only have to be broken twice, provided the sixth cataract were navigable. Thus, if this latter difficulty does not exist, or can be overcome, and if the sudd on the Nile is not found to impede navigation very much, this Nyanza route will certainly not compete with the Suakin route for any trade on the banks of the navigable Nile until a railway is made from the coast to Lado, a distance of over 800 miles as the crow flies, and certainly over 1000 miles by rail. It must be remembered, also, that the Nyanza route passes over mountains 8700 feet above the sea; that the train will have to mount, in all, nearly 13,000 feet in the course of its journey from the coast; and that a difficult gorge has to be crossed to the eastward of the Victoria Nyanza. From these facts we may conclude that it will be a very long time before the Nyanza route will draw any trade from the Central Sudan; so long, that the idea may be neglected for the present.

The line through the British sphere of influence runs to the northern end of Victoria Nyanza, but from Mr. Vandaleur's recent expedition into these regions we learn that a shorter route, striking the eastern shore of the lake, is under consideration. To lessen the expense of construction would be a great boon, but if we look to the more ambitious schemes for the future, something may be said in favour of the original proposal as being better adapted to form part of a line of railway reaching the navigable Nile.

With regard to the comparison between the German and British routes to the Victoria Nyanza, the latest accounts seem to imply that the Germans have practically decided on a line from the coast to Ujiji, with a branch from Tabora to the Victoria Nyanza. This would be a most valuable line of communication; but it seems a pity that capital should be expended in competitive routes when there are so many other directions in which it is desirable to open up the continent. If the Germans wish to launch out on great railway projects in Africa, let them make a line from the south end of Lake Tanganyika to the northern end of Lake Nyasa, and thence on to the coast; they would thus open up a vast extent of territory, and Baron von Schele tells us that a particularly easy route can be found from Kilva to the lake. Such a line of communication, especially if eventually connected with the Victoria Nyanza to the north, would be more valuable than any other line in Africa in putting an end to the slave trade, as it would make it possible to erect a great barrier, as it were, running north and south across the roads traversed by the slave-traders.

A line through German territory connecting Lake Nyasa with the sea would, no doubt, come into competition with the route connecting the southern end of that lake with the Zambesi, and thus with the coast. The mouths of the Zambesi, though they are passable, will always present some impediment to commerce. But after entering the river navigation is not obstructed until the Murchison Rapids on the Shiré river are reached. Here there are at present 60 miles of portage to be traversed, and this transit must be facilitated by the construction of a railway, if this route is to be properly developed; Mr. Scott Elliot tells us that 120 miles of railway, from Chiromo to Matope, would be necessary for this purpose. Beyond this latter point there is a good waterway to Lake Nyasa. Thus a comparatively short line of railway would open up this lake to European commerce, and this route is likely to be developed at a much earlier stage of the commercial evolution of Africa than the one through German territory above suggested. It will be seen that these routes connect fairly populous districts with the coast, and it must also be recollected that the high plateau between Lake Nyasa and the Kafue river is one of the very few regions in tropical Africa likely to attract white men as more or less permanent residents.

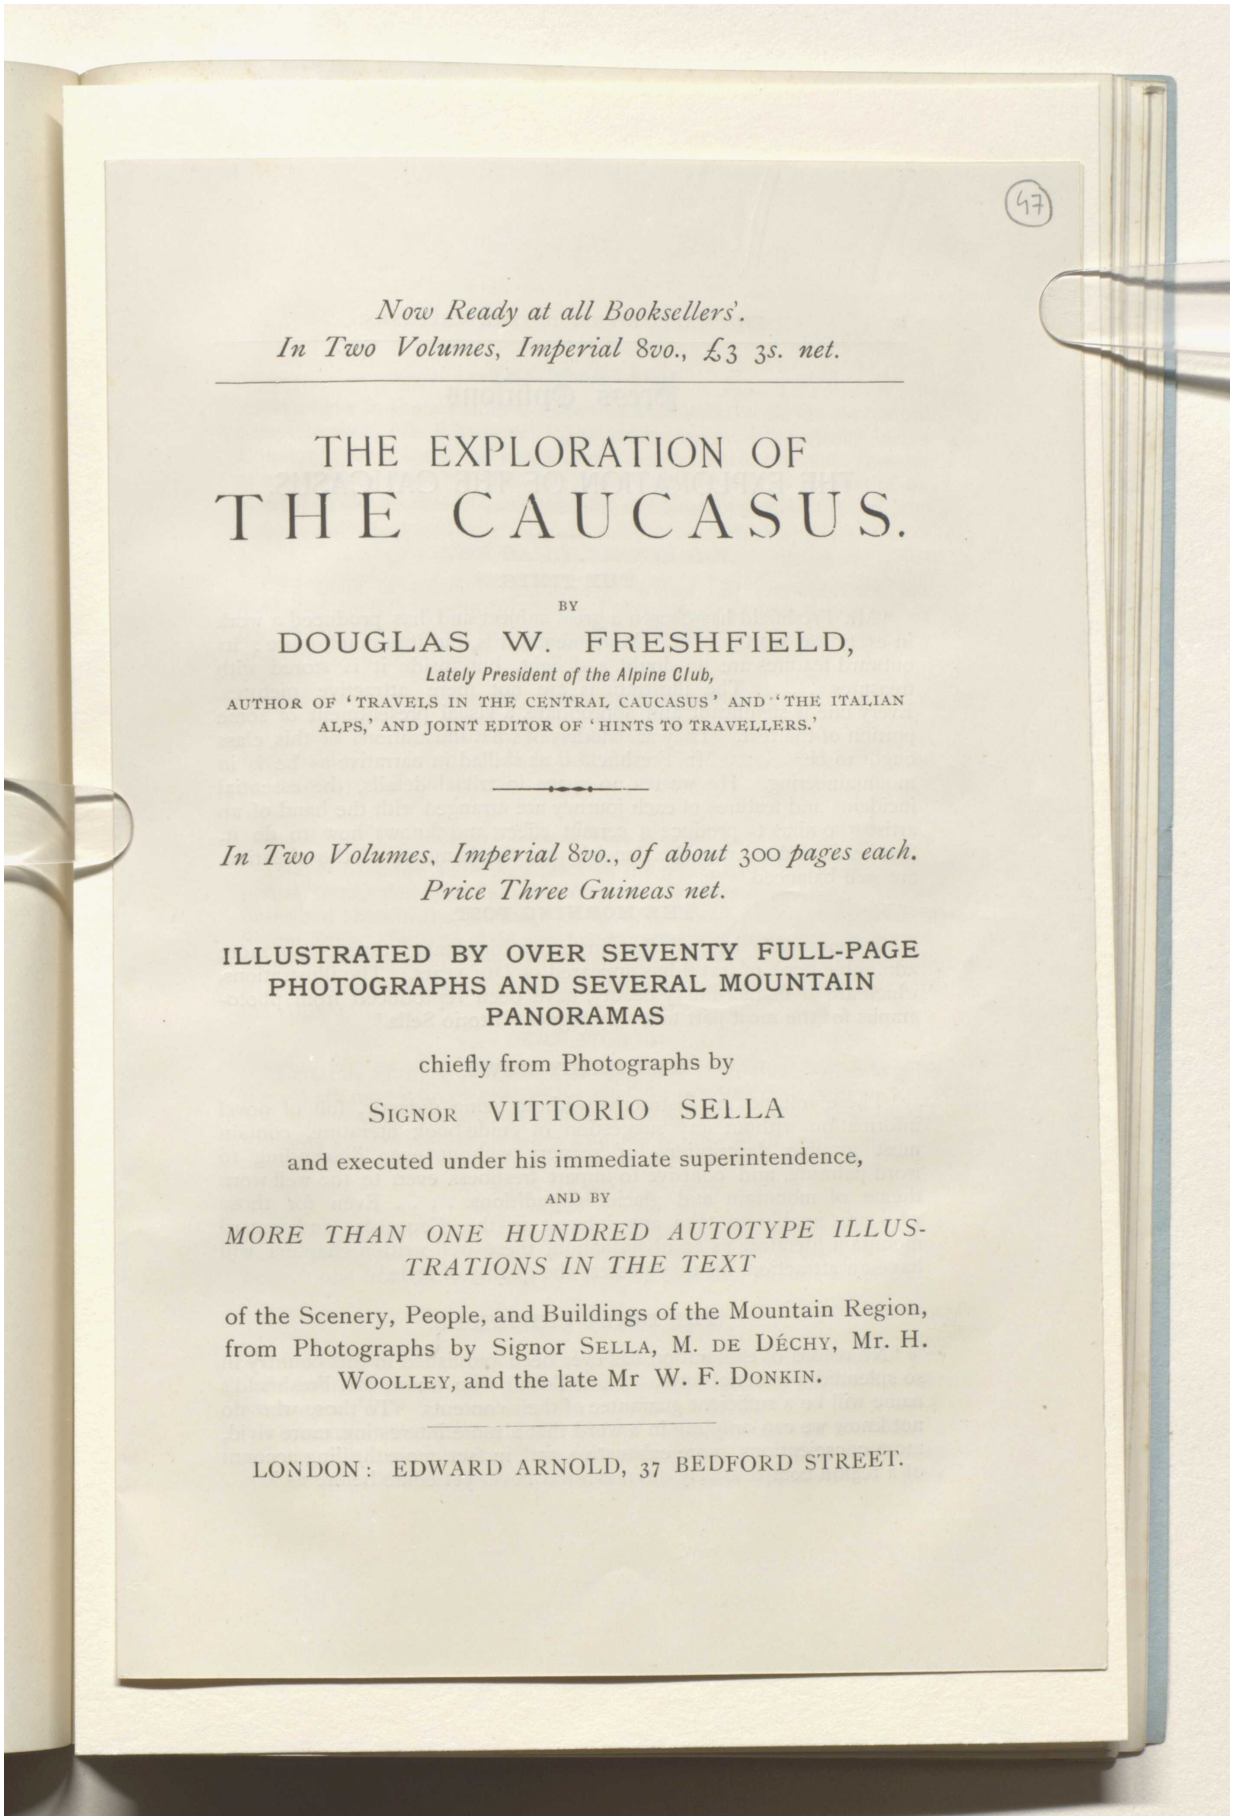
Further south we come to the Zambesi river, which should, of course, be utilized as far as possible. But this line of communication to the interior has many faults. The difficulties to be met with at the mouths of the Zambesi have already been alluded to. Then the whole valley is unhealthy, and white travellers would prefer any route which would bring them on to high land more quickly. Moreover, the Kebrabasa rapids cause a serious break in the waterway, and, as the river above that point is only navigable for canoes, it is doubtful if it would ever be worth making a railway for the sole purpose of connecting these two portions of the river.

As the population of the upper Zambesi valley is considerable, and as the country further from its banks is said to be likely to be attractive to white men, there can be no doubt of the advisability of connecting it with the coast. This naturally leads us to consider the Beira route, as a possible competitor with the Zambesi. A 60-centimetre railway is now open from Fontesvilla to Chimoio (190 kilometres), and it is probable that during the course of the next two years the construction of the railway will be completed from the port of Beira itself as far as the territory of the Chartered Company. This will form the first step in the construction of a much better line of communication to the upper Zambesi regions than that afforded by the river itself. It is true that the gauge is very narrow, and that the first part of the line passes through very unhealthy districts; but this line will nevertheless be a most valuable addition to the existing means of penetrating into the interior of the continent. It is needless to say that the object of this railway is to open up communications with Mashonaland, not for the purposes now suggested.



South of the Zambesi the map shows us that there are no regions in tropical Africa where the density of the native population reaches the minimum of eight per square mile. Here, however, we come to the gold-fields, where there is attractive force enough to draw white men in great numbers within the tropics, and where, no doubt, some of the most important problems connected with railway communications will have to be solved in the immediate future. But, for reasons of time and space, I have limited myself to the discussion of districts within the tropics, where trade with the existing native races is the object in view. The Beira railway does not in reality come within the limits I have imposed on myself, except as to its future development. Had time permitted, I should like to have discussed the route leading directly from the Cape to Mashonaland, its relative merits in comparison with the Beira railway, and as to where the two will come into competition one with the other. But I must pass on at once to consider the main trunk routes from the West Coast leading into the interior of Africa.

Passing over those regions on the West Coast where railways would only be commenced because of the probable settlement, temporary or permanent, of white men—passing over, that is, the whole of the German sphere of influence—we first come to more dense native populations near the coast towns of Benguela and St. Paul de Loanda. The latter locality is the more hopeful of the two, according to our map, and here we find that the Portuguese have already constructed a railway leading inland for 191 miles to close to Ambaca. The intention of connecting this railway with Delagoa Bay was originally announced, and I am not aware to what extent this vast project has now been cut down, so as to bring it within the region of practical proposals. A further length of 35 miles is, at all events, being constructed, and 87 more miles have been surveyed. The Portuguese appear to be very active at present in this district, as there are several other railways already under consideration; one from Benguela to Bihe, of which 16 miles is in operation, another from Mossamedes to Huilla Plateau, and a third from the Congo to the

Press Opinions

ON

THE EXPLORATION OF THE CAUCASUS.

THE TIMES.

'Mr. Freshfield has chosen a great subject and has produced a work in every way worthy of it. Monumental it is, but it is much more: its outward features are no doubt a delight, but inside it is stored with treasures. . . . . The illustrations are not mere attractive pictures. Every one is significant and appropriate, a visual presentment of some portion of the text. They are models of what illustrations of this class ought to be. . . . . Mr. Freshfield is as skilled in narrative as he is in mountaineering. He wastes no space in trivial details, the essential incidents and features of each journey are arranged with the hand of an artist who aims to produce a certain effect and knows how to do it. Sentiment and science, the dangers and the humours of the situation, are well balanced.'

THE MORNING POST.

'It may safely be said that in many important respects no more admirable book of travel has appeared of late years. The illustrations, which are of extraordinary beauty, have been reproduced from photographs for the most part taken by Signor Vittorio Sella.'

THE DAILY NEWS.

'These volumes are instructive without being didactic, full of novel information without any suggestion of guide-book literature, contain most graphic descriptions of scenery without even descending to word-painting, and contrive to impart freshness even to the well-worn theme of mountain and glacier expeditions. . . . . Even for those who are unable to take any interest in the Caucasus, and regard mountain literature as an abomination, these well-written chapters will have an attraction, for they possess the quality of style.'

THE DAILY CHRONICLE.

'No record of exploration has ever been published in this country in so splendid a material form. . . . . To all who know, Mr. Freshfield's name will be a sufficient guarantee of their contents. To those who do not know we can only say in a word that a more interesting, more vivid, more conscientious, more exhaustive, and, in fact, more thrilling account of a region comparatively unknown has never yet come before us.'

THE STANDARD.

'We have in these volumes a book of like character to, but even more complete than, Mr. Whymper's "Travels among the Great Andes of the Equator"; for it is not too much to say that no such complete memoir of a mountain chain has been published since the first awakening of an interest in the ascents of peaks and the structure of glaciers.'

THE DAILY TELEGRAPH.

'No book of travel or exploration within our remembrance has disclosed such a wealth of illustration as the one now before us—a deeply interesting work, the typographical production of which is worthy of unstinted admiration.'

THE ST. JAMES'S GAZETTE.

'If all works of mountaineering had the attraction of Mr. Douglas Freshfield's, such reading would become popular instead of being limited to the shelves of collectors.'

THE PALL MALL GAZETTE.

'Never have the majesty of glaciers, the awe-inspiring silence of perpetual snow, the splendour of mountain scenery, been more vividly described than in the language of Mr. Freshfield and the pictures of Signor Sella. Smooth style and fine humour add to the attractions of a book which will kindle the enthusiasm of mountaineers and spur them to make every corner of this remote range as familiar as the recesses of the Alps.'

THE WORLD.

'Certainly nothing could be more splendid than these volumes with the superb mountain pictures of Signor Sella to adorn their pages. . . . . The whole work forces us to believe that mountaineering is nowadays not only a mere recreation but a valuable handmaid of geography.'

THE ATHENÆUM.

'Mr. Freshfield's book contains the digested study and experience of nearly thirty years. Perhaps, if we must give him a class, we must borrow one from Carlyle, and call him the traveller as man of letters.'

THE ALPINE JOURNAL.

'We heartily congratulate Mr. Freshfield, Signor Sella, and all who have contributed to these noble volumes—appropriately dedicated to the memory of W. F. Donkin.

'The map—the first authentic map of the whole Central Caucasus—will be to future travellers in the Caucasus what the Alpine Club map was to travellers in the South-western Alps, and much more. How

مكتبة قطر الوطنية
Qatar National Library

many expeditions will the enthusiastic climber be able to devise from studying it, especially when Appendix B supplies him with a Climber's Guide in addition.'

THE GEOGRAPHICAL JOURNAL.

'Mr. Freshfield has brought together the material for two monumental volumes, which are placed before the public in a form more splendid than any other book of recent travel can boast.

'The refined and scholarly literary style of the text is Mr. Freshfield's own; the illustrations of unexampled beauty are transmitted direct from Nature through Signor Sella, whose name deservedly shares the title-page, and the skilful German photo-engravers who have reproduced them, enhanced in clearness, if that be possible, and disfigured by no trace of retouching or "artistic improvement." With these photographs and the new map of the Caucasus, drawn by Mr Reeves, the reader is more nearly in the position of an actual traveller than the reader of a book of travel ever was before. To study one of the long panoramas in conjunction with the map is to seem to see the mountain system itself, with its forests, rocks, and snows, its lofty passes and deep-cut valleys, tenanted by the strange remnants of peoples who make their last stand there against the inevitable absorption into Europe.

'While the illustrations are beautiful in themselves, and form a gallery of mountain pictures which it is a pleasure for the least instructed to pore over, their chief value lies in the fact that they are in the truest sense illustrations, supplementing the written description, and enabling it to tell its story with additional effect.'

THE SATURDAY REVIEW.

'We have given but a poor idea of the riches of these two superb volumes. As we have said, there is abundance of climbing adventure. But there is much more. . . . . A monograph of permanent value on one of the most interesting mountain ranges of the world, written in a style that gives it the quality and attraction of literature.'

THE FIELD.

'One of the most charming and instructive books of travel that it has ever been our good fortune to read. . . . . The best series of illustrations that we have ever seen in any work of travel. . . . . It is not too much to say that the map at the end of the book, both as regards its accuracy and beauty, is far and away in advance of any maps of this region that have ever been published in this or in any other country. . . . . Everything seems to have been done to make the book not only attractive but scientifically useful.'

Zambesi. It is difficult to foretell what will be the outcome of these schemes, but our population map is not very encouraging.

Next we come to the Congo, and here there is a grand opportunity of opening up the interior of the continent. In going up this great stream from the coast we first traverse about 150 miles of navigable waterway, and afterwards we come to some 200 miles of cataracts, through which steamers cannot pass. Round this impediment a railway is now being pushed, 189 kilometres of rails (117 miles) being already laid. Then we enter Stanley Pool, and from this point we have open before us—if Belgian estimates are to be accepted—7000 miles of navigable waterway. If this fact is correct, and if the population is accurately marked on our map, then there is no place in all Africa where 200 miles of railway may be expected to produce such marked results. The districts traversed are unhealthy, and the natives are, generally speaking, of a low type; but in spite of these drawbacks, which no doubt will delay progress considerably, we may confidently predict a grand future for this great natural route into the interior.

To the north of the Congo, the next great navigable waterway met with is the Niger. Again, granting the correctness of the population map, it can be seen at a glance that there is no area of equal size in all Africa so densely inhabited, and no district where trade with the existing native population appears to offer greater inducement to open up a commercial route into the interior. Luckily, little has to be done in this respect, for the Niger is navigable for light-draft steamers in the full season as far as Rabba, about 550 miles from the sea; here the navigation soon becomes obstructed by rocks; and at Wuru, about 70 miles further up the river, the rapids are so unnavigable that even the light native canoes have to be emptied before attempting a passage, and there are frequent upsets. From Wuru the rapids extend to Wara, after which a stretch of clear and slow-running river is met with. Above this, again, the Altona rapids extend for a distance of 15 miles, then 15 miles of navigable waterway, and then 20 miles more of rapids are encountered. Yelo, the capital of Yauri, is situated on these latter cataracts, above which the Middle Niger is navigable for a considerable length. The Binue is also navigable in the floods for many miles, the limits being at present unknown; part of the year, however, it is quite impassable except for canoes. The trade with the Western Sudan, which has been made possible by the opening up of this river, is still only in its infancy, and to get the full benefit of this waterway a line of railway ought to be carried on from Lokoja to Kano, the great commercial centre of Hausaland; Mr. Robinson's recent journeys over this country, which we hope to hear about at a later period of our proceedings, have served to confirm the impression that no great physical difficulties would be encountered. The political condition of the country may, however, make the construction of this railway quite impossible for the present; for here we are on the borderland between Mohammedanism and Paganism, where the slave trade always puts great impediments in the path of progress, but where the same circumstances make it so eminently desirable to introduce a higher condition of civilization. The only drawback to the Niger as a line of communication to the Western Sudan is the terribly unhealthy nature of the coast districts which have to be traversed. Any man, who finds a means of combating the deadly diseases here met with, will be the greatest benefactor that Africa has ever had; but of such a discovery there are but few signs at present.

It is perhaps too soon to speculate as to the best means of opening a trade route to Wadi, and the more central parts of the Western Sudan; for we may be sure that little will be done in this direction for years to come. Several competing routes are possible. From the British sphere, we may try to extend our

مكتبة قطر الوطنية
Qatar National Library

communications eastward from the navigable parts of the Binue. The French, on the other hand, may push northwards from Ubangi; whilst, in a later stage of commercial evolution, the best route of all may be found through German territory, by pushing a railway from the shore in a direct line towards Bagirmi and Wadai. To compare the relative merits of these trunk lines is perhaps looking too far into the future, and traversing too much unknown country, to make the discussion at all profitable.

Proceeding northwards, or rather westwards, along the coast we find ourselves skirting the belt of dense forest already described as being the great obstacle to advance in this part of Africa. It is to be hoped that this barrier will be pierced in several places before long. Naturally we turn our attention to the different spheres of British influence, and here we are glad to learn that there are several railways being constructed or being considered, with a view to opening up the interior.

At Lagos a careful survey of a railway running in the direction of Rabba has been made, and the first section is to be commenced at once. To connect the Niger with the coast in this way would require 240 miles of railway, but the immediate objectives are the towns of Abeokuta and Ibadan, which are said to contain more than a third of a million inhabitants between them. No doubt the populous coast region makes such a line most desirable; but whether it would be wise to push on at all quickly to the Niger, and thus to come into competition with the steamboat traffic on that river, is a very different question.

Surveys have also been made for a railway to connect either Kormantain or Apan on the Gold Coast with Insuaim, a town situated on a branch of the Prah. It is believed that the local traffic will be sufficiently remunerative to justify the construction of this line. But, looking to the further prolongation of this railway into the interior, it appears possible that those who selected this route were too much influenced by the desire to reach Kumasi, which is a political rather than a commercial centre. According to the views I have been advocating to-day, the main object of a railway in this quarter should be the crossing of the forest belt, and if, as there is some reason to believe, that belt is exceptionally wide and dense in this locality, the choice of Kumasi as a main point on the route will have been an unfortunate selection. A little further south, nearer the banks of the Volta, it is probable that more open land would be met with, and, moreover, that river itself, which is navigable for steam launches from Ada to Akusi, would be of use as a preliminary means of transport. It is to be hoped that the merits of a line from Accra through Odumase will be considered before it is too late.

I am now approaching the end of my brief survey of tropical Africa, for the best method of opening communication between the upper Niger and the coast is the last subject I shall touch on. With this object in view, the French have constructed a railway from Kayes, the head of steam navigation during high water, on the Senegal to Bafulabe, with the intention of ultimately continuing the line to Bamaku on the Niger. Unexpected difficulties have been met with in the construction of this railway, and, as the Senegal river between Kayes and St. Louis is only navigable for about a quarter of the year, it would hardly appear as if the selection of this route had been based on sound geographical information. No doubt the French will find some other practicable way of connecting the upper Niger with the coast, and surveys are already in progress with that object in view. It may be worth mentioning that the Gambia is navigable as far as Yarbutenda, and that it affords on the whole a better waterway than the Senegal; it is possible, therefore, that a railway from Yarbutenda to Bamaku might form a better means of connecting the Niger with the coast than the route the French have selected.

مكتبة قطر الوطنية
Qatar National Library

At Sierra Leone a railway is now being constructed in a south-easterly direction with a view of tapping the country at the back of Liberia. But here, as in the case of the Gambia route, political considerations are of paramount importance; for no doubt the best commercial route, geographically speaking, would have been a line run in a north-easterly direction to some convenient point on the navigable part of the upper Niger. If such a railway were ever constructed, it would connect the longest stretch of navigable waterway in this region with the best harbour on the coast. But the fact that it would cross the Anglo-French boundary is a complete bar to this project at present.

Proposals for connecting Algeria with the upper Niger by rail have often been discussed in the French press, the idea being to unite the somewhat divided parts of the French sphere of influence by this means. If the views here sketched forth as to the necessity of selecting more or less populous districts for the first opening up of lines of communication into the interior are at all correct, these projects would be simple madness. For many a year to come Algeria and the Niger will be connected by sea far more efficiently than by any overland route, and I feel sure that when the details of these plans are properly worked out we shall not find the French wasting their money on such purely sentimental schemes.

I must now conclude, and must give place to the other geographers who have kindly undertaken to read papers to us on many interesting subjects. All I have attempted to do is briefly to sketch out some of the main geographical problems connected with the opening of Central Africa in the immediate future. Such a review is necessarily imperfect, but its very imperfections illustrate the need of more accurate geographical information as to many of the districts in question. Many blunders may have been made by me in consequence of our inaccurate knowledge, and, from the same cause, many blunders will certainly be made in future by those who have to lay out these routes into the interior. In fact, my desire has been to prove that, notwithstanding the vast strides that geography has made in past years in Africa, there is yet an immense amount of valuable work ready for any one who will undertake it.

Possibly, in considering this subject, I have been tempted to deviate from the strictly geographical aspect of the case. Where geography begins and where it ends is a question which has been the subject of much dispute. Whether geography should be classed as a separate science or not has been much debated. No doubt it is right to classify scientific work as far as possible; but it is a fatal mistake to attach too much importance to any such classification. Geography is now going through a somewhat critical period in its development, in consequence of the solution of nearly all the great geographical problems that used to stir the imagination of nations; and for this reason such discussions are now specially to the fore. My own humble advice to geographers would be to spend less time in considering what geography is and what it is not; to attack every useful and interesting problem that presents itself for solution; to take every help we can get from every quarter in arriving at our conclusions; and to let the name that our work goes by take care of itself.

FROM TEHERAN TOWARDS THE CASPIAN.

By Lieut.-Colonel HENRY L. WELLS, R.E.

TEHERAN, the capital of Persia, occupies a depression on the lowest slopes of the Elburz range of mountains which, running east and west, separates the entirely dry province of Irak from Gilan and Mazanderan, provinces situated on the

مكتبة قطر الوطنية
Qatar National Library

southern shores of the Caspian, and consequently deriving abundance of moisture from the fogs and rain produced by the sun's action on that inland sea. In the latter region the forests recall those of the Indian Terai, and, like them, are infested by tigers and intersected by ricefields. The fogs that roll almost perpetually southwards from the Caspian would, if unchecked by the Elburz, impart their refreshing influence to the arid plains of Persia; but they are vigorously met by the hot, dry air of the central desert, and the mountain-tops of the intervening watershed become, as it were, a battle-field for the ceaseless contests of the two great genii of damp and drought. In summer the climate of the upper mountain slopes is most enjoyable. The sides facing north have a fauna and flora like those of Central and Northern Europe; facing south, they remind one rather of Italy and Spain. All who can, quit the city of Teheran during June, July, and August, to take up their abode in the picturesque villages of the southern slopes of the Elburz range. The most frequented summer resorts are situated at a distance of 7 or 8 miles from the city, and at an altitude varying from 1000 to 1500 feet above it. There are in all some 400 Europeans in Teheran, including members of the various legations, *employés* of the Indo-European Telegraph Department, the English and Russian banks, and the tramway, sugar and glass manufactories, as also hotel-keepers and owners of shops. The head-quarters of the English for the summer months is the village of Gulahek, which was presented to them by Fath 'Ali Shah at the commencement of the present century. It is situated at a distance of $6\frac{1}{2}$ miles from the city and 920 feet above it—that is, at an altitude of 4800 feet above the sea.

A German capitalist has lately obtained a concession for a light electric tramway or railway to connect the various summer resorts with the city, and the enterprise promises to be lucrative. There is already a railway, $4\frac{1}{2}$ or 5 miles in length, from the south-eastern gate of Teheran to a favourite shrine; and a road fit for wheeled vehicles is in course of construction to the Caspian, so that ere long the capital will be reached from the seashore with comparatively little difficulty.

On June 18, 1895, at 7 a.m., three of us left Gulahek for Mazanderan. The lofty Tuchal mountain—a branch of the Elburz—which lies north of Teheran, is so covered with snow in the early summer that the track across its summit, the most direct route to the north, cannot be used before August. Therefore we had to skirt the mountain range in an easterly direction along its base till a suitable pass was reached. Such we found in the Jager Rud, or river, which, rising near the Elburz watershed, flows south until lost in the great desert. The *détour* was picturesque. On our left were rocky heights still crested with snow; in the far distance, behind many intervening ranges, peeped the cone of Demavend, the crater-lip of which has an altitude of 19,400 feet above the sea; in the mid-distance, the morning sun threw lovely tints upon the barren hills; in the foreground, the ripening crops of barley, with patches of luxuriant lucerne and sweet-scented beans, showed the extent of the fertilizing streams. Blue jays and brilliant bee-eaters sat in the trees along the roadside, whilst quails and buntings made a merry noise in the adjoining crops.

About 2 miles east of Gulahek is Sultanetabad, one of the Shah's summer resorts. Another one, Niaveran, is situated a mile further up the slope. These palaces are surrounded by groves of mulberry, poplars, and willows; here, too, thickets of cherry and apricot afford good harbour for woodcock in winter. We followed an avenue of prim *navend* trees, a kind of witch elm, common in Persia, in shape, for all the world, like trees from a toy-box, but very bright and pleasing in colour. Their matted branches give absolute protection to small birds, and must account for the numbers which escape from the hawks infesting the country.

BRITISH LIBRARY

Save for the existence of a few isolated gardens east of Sultanetabad, the limits of cultivation were now attained. On the border waste lands flourish the flowered chickory, and pale yellow and pale pink hollyhocks, through whose wan petals the sunshine has a pretty effect. There is also a picturesque thistle, with flowers varying in hue from ultramarine ash to French grey, which take the form of perfect spheres. In contrast with ripe corn these produce a wonderful effect. Another greyish-blue plant, very common on the edges of the cornfields, has a blue foliage, and the younger sprouts of spiky leaves are of a bright metallic colour. Once beyond the limit of water-supply, all is barren except in spring-time. The remainder of our two hours' ride over the spur which forms the watershed between the Teheran drainage-area and valley of the Jager had, consequently, but little interest.

We commenced ascending the right bank of the river through a deep gorge. The way led over a very rough though well-cared-for mule-track. After four hours in the saddle we reached the picturesque village of Uchan, situated at the junction of two branches of the river, at an altitude of 5800 feet. The valley opens out to a quarter of a mile in width at this place; and the stream, beside which our camp was pitched, has a stony and rocky bed, over which the waters roll in a deafening torrent. Behind us was a narrow strip of cultivation, bordered by poplars, walnuts, and willows, while above were seen the mountains, rising to some 11,000 feet, along the base of which we had travelled from Lashkerek. The air at Uchan was perceptibly cooler than that at Gulahek; between the two places there is a short cut by a steep and difficult pass known as the "Talhouse." On June 19 we started, on mules with a muleteer guide, up the left branch of the Jager river, for general purposes of exploration, as well as to visit a coal-mine belonging to the Teheran gas company. The track, well preserved hitherto, practically disappeared beyond Uchan, but reappeared after two miles at the village of Pachemp. By a bridge in course of construction and other signs, we became aware that the Shah was expected to pass shortly in this direction, *en route* to Lar and Kujur, favourite camping-grounds of his Majesty. The scene was very beautiful. In this upper part of the river's course, the banks lend themselves to cultivation better than below Uchan, and the peasants, like hill-men in all countries, have taken advantage of every available square inch of ground. The crops were all fresh-looking; the wheat was hardly yet in ear; the lucerne, in flower, stood quite 2½ feet high, and men clad in picturesque rags were cutting it. In the patched garments of these peasants was displayed every shade of blue, from indigo to ultramarine ash, the shades being somehow all harmonized by wear and tear. Occasionally a man might be seen wearing a tunic of old crimson plush, which at threadbare points had a plum-coloured sheen.

At the borders of the tiny fields and beside the roaring torrents were clumps of luxuriant stuff, with handsome leaves and large white flowers of the umbellifera class, the size of a saucer. This plant emits a noisome odour when touched. There were plenty of pretty flowers, and quantities of barberry, briars, and dog-roses in full bloom. Above the cultivation the valley was bounded by frowning cliffs of conglomerate and ironstone, in the crevasses of which were patches of frozen snow, whence rushing streams issued across our path.

At Saigon, a small village, we left the king's highway, a track 7 feet broad, but we could trace it for many miles, till it was lost behind a spur surmounted by a white dome, known as the shrine of Aborek. The track we now had to follow was only just passable for laden mules. However, after moving for two miles up the side valley, we arrived at the large village of Lalan. Making for certain black patches which marked the entrance to the coal workings, visible in the distance,

and almost at the summit of a range of mountains fronting us, we managed, after a hard and hot climb, to reach the door of the manager's hut, a grimy one-roomed abode, having on one side of its walls prints of a religious character, and on another guns, rifles, and game-bags. Zakhary, the owner, we found a remarkable man in his way. He is a Chaldean Roman Catholic from the neighbourhood of Urumia (or Urmi), and thus a subject of the Shah, and he spoke in raptures of his native country. Grizzled hair, a calm handsome face, and beautiful teeth made up a countenance not soon forgotten. Above all, his cheerfulness and contentment with his lot most favourably impressed us. He has one fellow-Catholic with him, whose children welcomed us in Chaldean. Zakhary himself, whose own belongings were shortly to join him, spoke excellent French. He has twenty Turks, from the neighbourhood of Tabriz, employed on the works, the Persians refusing to labour underground. The miners are paid 5 *krans* for 650 lbs. (a Persian measure known as *kharwar*),* and can earn up to that sum (or about two shillings) a day. Zakhary has to procure rice, dried fruit, with bread stuff for their consumption, and sells them these articles at cost price, plus carriage. Three mules, to fetch provisions, are provided by the gas company, and these carry broken tools to the city for repairs, making up their loads with coal.

There is a forge at the mine, and hutting for the miners; also an iron-roofed store to protect the coal "got" in the winter from the action of snow and rain. From Zakhary's account, the climate at the mines, which are situated on the southern slope of a range running east and west, is most salubrious. It is only in March and April that rain and mists are annoying. In summer it is not hot, and in winter the snow does not lie for any length of time. Our informant only quits his home twice a year, to attend the festivals of Christmas and Easter respectively in Teheran.

South of the manager's hut is seen a rocky ridge, said to harbour leopards. On the mountains behind the mines are pastures for moufflon, and wild rhubarb abounds. To the east there is a glorious view of Demavend towering into the sky.

The quality of the coal did not impress us much, for it "comes out" as dust; but for the production of gas, in which it is said to be very rich, this does not greatly matter. It is found in sandstone, and it seems likely that it only exists in pockets, *i.e.* is the remains of lacustrine deposits. The seams are vertical, *i.e.* have a "dip" of 90°. They vary from 1 foot to 5 feet in thickness. The "strike" seems to be east and west. One working into which we went was pronounced unsafe, and nothing was going on there, pending the arrival of timbering from Mazanderan. This gallery ran horizontally in from the face of the hill, and wound about, following the seam or pocket. The whole of the roof was coal, and in one place a shaft had been sunk to get at the coal below; this was now full of water.

Zakhary had ingeniously arranged a syphon for the emptying of this shaft. One of our servants nearly fell into it, having followed us along the working without a light; in fact, but for our timely return, to find him on the brink of the shaft, he must have been lost. Two men lost their lives owing to the falling of the roof at the mouth of a working last year—otherwise there have been no accidents. There is said to be no fire-damp, but as no working has yet been pushed more than a hundred yards into the hill, it is possible it may yet be met with.

Zakhary went to Europe to learn printing, and then took to brewing—not a

* Wollaston gives this at 725 lbs; perhaps 625 to 675 lbs., of which 650 is the mean, is more strictly correct.

useful education for a miner. His statement that the whole mountain near his mine is full of coal is not to be relied on. We bade him adieu after promising to revisit him in the shooting season, and started homewards, making the 14 miles to be covered one long race. In camp we were joined by two friends, who had delayed their departure from Gulahek a day later than ourselves, and also by a personage who announced that he was the Shikarchi Bashi to the Shah. The last, a spare wiry man, with small bright eyes and somewhat sly expression, withal an incessant talker, introduced himself by saying that he had been sent to see that we got good sport, and received due honour and hospitality at the hands of the population. It was only by feigning inability to comprehend his egotistical chatter that we contrived to rid ourselves of this intrusive *attaché*; so that, after the first day's proceedings, he changed his tactics, and favoured us but little with his company, except at the hour of starting in the morning. At such time he would appear accompanied by his henchman, both decently mounted. His occupation, apparently self-imposed, was to go ahead and turn out the greybeards of every village through which we passed, all of whom appeared, bringing a lamb as an offering. Had we accepted these lambs, we should have been possessed of a large flock before reaching Mazenderan. What the Shikarchi Bashi made out of the transaction, it was difficult to gather. He probably told each headman that he had persuaded the *sahibs* not to take the lambs, and therefore merited a small sum for his good offices. As regards any service to ourselves, he never came near our camp when we reached the ibex-ground at Sheristanek; and the same thing happened on our entering the bear country in Mazenderan.

From Uchan our road led up the Egil river, a tributary of the Jager, and followed the actual bed of the stream for some distance. The valley is rugged and less picturesque than that of the main stream. We passed Egil village, which has an evil reputation, as it is said to harbour the much-dreaded "stranger-biter" (*gharib gez*), or poisonous bug.

We breakfasted in a lovely spot beyond a village named Ahah (altitude 6700 feet), beneath the shade of walnuts, with a roaring torrent in front. From Ahah the watershed which divides the sources of the Jagerud and Sheristanek rivers has to be crossed by those who wish to get into the valley of the latter. This takes two and a half hours of mountain roads. The summit of the watershed has an altitude of 8700 feet. Except for the first 600 feet, the road presented no serious difficulty, and our muleteer, who lost an animal by falling over the mountain-side, was himself to blame for the mishap.

From the watershed there is a wonderful view of bare mountains; not a tree is to be seen anywhere. The contorted and variegated strata of the mountains to the north-east, in which direction we were going, are suggestive of an enormous slate quarry, about the size of an English county, with altitudes varying from 4000 to 10,000 feet. To the south, and close by, lie the northern slopes of the Touchal range, the southern side of which forms so conspicuous a feature in the Teheran landscape. The track, rising to nearly 12,000 feet, by which the distance from Gulahek to Sheristanek may be traversed in eight hours in the late summer, was visible, with large patches of snow lying across it.

From the watershed down to the Sheristanek valley was a comparatively dull march, though relieved by an occasional peep at the terraced fields and the sight of the Shah's red-roofed *chateau*, situated at the head of the valley. The river appeared a perfectly white roaring torrent. The *chateau* looked prim enough, but badly placed in what must be a stifling hole.

On reaching the valley, we found the crops all green and luxuriant, the foliage of the poplars and walnuts in perfection, and the roaring river even more

Qatar National Library

picturesque than when seen from a distance. Four miles down the valley we reached our camp at the extremity of the cultivation, altitude 6300 feet. Here the torrent enters a wild rocky gorge, foaming and boiling with a deafening noise, and yet in the swirls behind the stones trout are harboured, as we proved when whipping these eddies with a fly. How trout come to be in this river, or why they should exist in this and not in the Jager, or any other river which has a similar course, viz. from the Elburz range into the great central desert, is an unexplained mystery. On the 21st we halted, one of our party going after ibex, the others fishing. Another animal of our caravan met its death here by falling down a precipice when turned out to graze. A tall coarse sword-grass, poisonous to horses, mules, and asses, grows on the watershed between the Jager and Sheristanek rivers. The animals, unconscious of its dangerous properties, eat of it with deadly effect, unless happily prevented from doing so.

On the 22nd our road lay for half a mile down the Sheristanek river, to where it joins the Laura, a stream three times the size of, and, if possible, more rapid and turbulent than, the first-named. Its ochre-coloured waters dashed onwards, swollen with melted snow. The Dcab, or junction of the two streams, is at a wild romantic gorge, in which they are lost to sight amid precipitous crags of red rocks. When united, they bear the name of the Kerij river. There is no road out of this Kerij, nor indeed out of the Sheristanek valley, more practicable than that by which we entered, *viâ* Uchan. We now followed the left bank of the Laura, passing northwards through gap and gorge, in red sandstone and conglomerate, standing rugged and bold with vertical "dip." Further up-stream, where the river-banks are edged by a few trees, the views are very picturesque. Where the strata are less hard, they have weathered into slopes of fine *detritus*; and down them the peasants come at a great rate, almost as if they were snow-slides. Eight miles up the Laura we encamped at *Gachisar*, literally, "head or source of gypsum," where the geological character of the country changes, and the mountains have rounded contours, with some grass, but still not the vestige of a tree. Here, at an altitude of 6700 feet, we passed a very cold night. On the 23rd, when we started across the Kendevan pass, ominous white clouds were overhanging the mountains to the north.

At Gachiser, the main stream of the Laura is crossed by a one-arch bridge, and its right bank is followed for about three-quarters of a mile. Then its valley is abandoned, for it turns sharp east. The gorge, down which a small tributary flows, is followed for another 1½ mile. This gorge had still snow lying in it where the road takes huge zigzags up the rounded slope of the mountain to the north. In an hour and three-quarters from Gachiser, the summit of the watershed between the Caspian and the central plateau of Persia is reached. At an altitude of 10,000 feet, the sandy loam on the south slope of the watershed is covered with flowers; many of the vetch tribe and wild fennel grow here in large clumps. The wind at the top of the pass was bitterly cold; the driving mist was freezing on the posts placed at intervals to keep the traveller from losing the track. There is a small refuge near the summit built in brick; in fact, the whole road shows that an amount of care is bestowed on it such as is observable on no other track in Persia. The zigzags for the descent on the Caspian side are required for a shorter distance than for the ascent from the south. In three-quarters of an hour from the summit we were following the course of one of the branches of the Touchal river, in a country clearly under the influence of the refreshing rain-clouds from the Caspian. Grass, yellow irises, ferns, and succulent water-plants fringed the streams. Further up the mountain-sides, clumps of magnificent columbines, of bluish-purple with white centres, and scarlet poppies, with blooms the size of breakfast-cups and

Qatar National Library

buds the size of walnuts, formed lovely masses of colour. Lavender, and many varieties of a sort of white campion, of the most delicate form, with the flowers arranged with curious regularity, were to be recognized amongst many other beautiful plants which it would require a botanist to classify and describe.

A wetting mist hid all distant features. We descended rapidly, and found the slopes further down clothed with scrub of oak, hornbeam, and sycamore, interspersed with wild pear and apple, buckthorn, and brambles. Here and there more open patches showed hawthorns and other flowering shrubs. The ground between them was literally carpeted with flowers. The presence of the tall yellow spikes of a flowering plant, similar in character to those observed in the hedgerows and brakes in the west of England, prepared us to find cowslips, periwinkles, crowsfoot, wild strawberries, and a crowd of other flowers that fringe the woods at home, besides quantities that were new to us. Wild roses and sweetbriars with blooms of every hue, from darkest pink to white, scented the air. The impression that we were following the drive to some domain on the coast of Devon constantly recurred. We saw also a beautiful shrub of handsomer growth, but with a flower resembling in shape that of the laburnum, only a richer chrome in tint. Another was quite beautiful, like honeysuckle both in leaf and flower, only growing as a rounded bush of graceful form. There were quantities of everlasting pea with dark crimson flowers, and here and there the giant poppy, already described, blazed in deep scarlet grandeur. The roar of a torrent replaced that of waves. We could fancy ourselves at Mount Edgcombe and that, when the mist lifted, Plymouth breakwater or the "Mewstone" would appear in the distance. The mist did eventually lift, to disclose the Chel-haus river boiling below, with precipitous cliffs of ruddy rock clothed in forest wherever trees could hold. These formed the foreground to a magnificent view of gorge, rock, and wood, leading the eye to distant spurs, overtopped in the far distance by a snow-capped range of great altitude and rugged outline. The moisture in the atmosphere gave the soft cobalt tint to the distant mountains so grateful to eyes long used to the glare and the crisp outlines of dry inland Persia. Our camp was pitched on the right bank, about 300 feet above the river, so we were spared the deafening din of its surging torrent, and able to hear the familiar notes of a blackbird which rang out in the stillness of the evening. About a mile south of our camp was the village of Valiabad. The younger brother of the Nasru's-Saltaneh, who came to visit us, thoughtfully brought with him his two *shikaris*, as well as presents of rice and sheep. Talking on the prospects of sport, we were told of bear and stag in the neighbouring forests, and of ibex and moufflon on the hilltops; moreover, that salmon was to be found one day's march further down-stream. The *shikaris*, father and son, were accompanied by a *mirza*, to represent the governor himself, and see that the villages sold us good provisions. These men were of a distinctly Mazanderani type, somewhat darker in complexion than the ordinary Persians. Their jet-black hair was curled in ringlets; moreover, they had brighter eyes and expressions, and were of handsomer face, than the inhabitants of the plateau. They informed us that a certain part of the country was the Shah's preserve, the remainder that of their own immediate master; but that we, having the royal permission to shoot, were privileged to avail ourselves of the whole. We tried for trout that evening, but, after reaching the river with great difficulty, we found it unfishable. On the 24th, owing to the report of three of our party who made a reconnaissance, we decided that the road towards the Caspian was too steep and dangerous for horses, and proceeded to negotiate it on our baggage mules.

Looked at from our camp, the road was found to rise gently as it wound northwards along the face of steep slopes and overhanging precipices. From it no fence

or wall prevents your seeing the abyss, some 1000 or 1500 feet in depth. We looked to our surcingles. Perched on the top of a pack-saddle as high as if riding a 16-hand horse, but with no command over your quadruped, you soon come to the conclusion that such a position is far more dangerous than it would be if one were riding one's own horse, even if he were somewhat fresh, for, at all events, he would not insist on always keeping along the outer edge of the track, as pack-mules obstinately do. When we had once started, the road proved to be less risky than it looked, as it had a width of 7 or 8 feet, and was in good repair. The view from it into the abyss beneath is superb. Numerous cascades, hundreds of feet in height, fall over the bare rock faces of the lower precipices. Issuing from glades hundreds of feet below the road, these cascades form a picture of great magnificence. From where they commence the mountains are more or less clothed in forest to their summits. Nothing can be seen or heard of the torrent that is eating its way into the strata far, far below.

Forty minutes' trotting on our mules brought us to a point whence the road, rounding a spur, dives zigzagging down the crumpled side of the gorge in the Hazar champ, or 1000 twists. From hence is obtained the loveliest of the many lovely views of the Chel-haus chasm. Thence it can be seen for some 20 or 25 miles of its length, viz. from the snow-clad watershed which marks the source of the river to the south, to beyond the Takht-i-Shah (which is hereafter to be described) on the north. Nothing in Kashmir, the Himalayas, or Switzerland resembles it. Maybe it may find a parallel in the rifts in California. Here, close to the road, a rough kind of pagoda has been erected to shelter the Shah when he comes this way, and entice him to stop and admire the loveliest scene in his dominions. Was this building the outcome of his Majesty's own wish, or the result of an inspiration on the part of the Austrian engineer who constructed the road some twenty-six years ago? The zigzags below the pagoda are so steep as to make riding impossible, and the excuse to dismount may be appropriately made, notwithstanding that a stout fence of stonework pillars, with wooden beams, now precludes all danger of falling into space. Towering isolated rocks, which here overhang the track, would each, in a more frequented country, have its distinctive name, and be recognized as the "Eagle's nest," the "Cathedral rocks," or the "Cheddar cliff," respectively. About half a mile below the pagoda a boring or tunnel, 15 feet in length, has been made in the live rock. Gasteiger Khan, the Austrian who built the road, apparently made the most of this, to the Persian mind, extraordinary feat in engineering. On the south side of the tunnel are two inscriptions; and a bas-relief in alabaster has been let into the eastern side. This slab represents his Majesty, Nasiru'd-din Shah, shooting from horseback at a leopard or lion, whilst hounds and hawks pursue other game both in the foreground and on the horizon. In the rear of his Majesty is seen an escort drawn up with military precision. On the north side and over the centre of the arch of the tunnel, Gasteiger has immortalized himself in a Latin inscription, setting forth his distinctions and titles. The strings of mules that bring charcoal, dried fish, and the main rice supply from Mazanderan and the shores of the Caspian to Teheran pass this way.

We soon got into less rocky ground, where the slopes are covered with forest of sycamore, oak, and hornbeam, with underwood of medlar and crab-apple. Butterflies flit about; a lovely large one with black wings is very remarkable. From far below is heard the chop, chop, chop, of the charcoal-burner, while a thin wreath of smoke marks the spot where his devastation is going on. In two places small rills of water cross the track, and here and there rude limekilns show where the stone had been burnt to make mortar for the pillars of the protecting parapet.

BRITISH LIBRARY

One hour and twenty minutes from the pagoda, and we are at the end of the next great spur, and 400 feet below the former. Here the zigzags begin again with a vengeance, and we decide to stop for breakfast. Gasteiger Khan has chosen this point as another suitable halting-place for royalty, and an elevated platform with a rude stone seat gives an excellent place to spread our carpet. The view from this platform (named the "Takht-i-Shah," or King's throne) is in its way as fine as that from the "pagoda." Looking up-stream, you seem to be absolutely in the centre of the valley or causeway. One thousand feet below, still invisible in its tortuous chasm, runs the course of the river. Picturesque precipices, fringed with forest, scored with cascades, and rich with verdure wherever grass can grow, lead the eye up to gentler slopes and park-like clumps accidentally spared by the charcoal-burner, whose fire is ever at work, but is unable to more than temporarily unclothe these verdant mountains. Such fairy glades and cool grots did we look into across the chasm! What a place for *shikar!* But what a chance of breaking your neck and of losing your quarry if you killed it! Whilst we were thus soliloquizing, the sound of three shots rang out from across the chasm, and the sense of distance and the vastness of the scene was brought home to us by the fact that our three pairs of eyes could not see the smoke of the shots, much less the game or the hunter. A passing peasant informed us that the sportsman was one Hidáyat by name, and that he was after ibex, of which he had killed two on the previous day. How this man had got news from such a distance, for there was no way nearer than round by Valiabad, was a puzzle to us. He looked too much a man *ingenui vultus* to have invented his facts for our benefit; yet, in spite of his manner and appearance, we very much doubted them. Looking down-stream, the rift is observed through which the Ogham river comes to meet the Chel-hauz, and the latter shows itself, a foaming white streak, for a few short twists of its madding course. There is no sign of a definite opening through which the river can escape to the sea; ridge interlocks ridge, and snow-capped mountains rise into the distant sky, apparently leaving no means of exit. After breakfast, our baskets were filled with hart's-tongue, spleenwort, *Adiantum nigrum*, and polipodium ferns. Many varieties of seedum were seen in bloom, one species being almost as large as a house-leek. Roman laurel and grass-fern were plentiful.

The morning of the 25th broke cloudless and bright. Two of our party were preparing to make an exploration seaward, to trace the egress of the waters to which our attention had been drawn, when the two shikaris of the Nasru's-Saltaneh arrived in camp with the news that they had marked two bears up-stream in the Shah's preserves, and that they were sleeping amid brushwood and tall grass in one of the mountain valleys, only a few miles from our recently traversed road. The information seemed so authentic, and the men who brought it gave such straightforward replies to our cross-questions, that all other arrangements were put aside in favour of a proposed bear-hunt. Accordingly, we filed out of camp, and took the road to the Keravend pass, revisiting the hill which had attracted us by its luxuriant flowers, but on the summit of which the main object was now a bevy of tawny-coloured vultures awaiting an opportune moment to assail the carcase of a horse. We were soon joined by the *Shikarchi-Bashi* and four beaters, or keepers of the royal preserves; but they professed ignorance as to the presence of the bears, and the first-named functionary took upon himself to deny the truth of the report about them. His action did not, however, shake our confidence in the veracity of the Nasru's-Saltaneh's men.

Having come out of the scrub on to the grass of the upper mountain slopes, we were sitting at luncheon by a stream, when our informants were seen to conduct the *Shikarchi Bashi* over a neighbouring crest; and ere we had completed

our repast by partaking of the conventional cup of coffee, one of them returned to announce that the bears were still in their old place. Our first impulse then was to toss for places and shots. We were four in number. Two, who had previously shot big game in India as "strokes," merely tossed who should accompany them. It was settled that "stroke" No. 1, with his "bow," should remain beside the ravine at the head of which the bears lay, and that "stroke" No. 2 and "bow" No. 2 should accompany the beaters, and, making a *détour*, head the game down the ravine. This was all very well to talk about, but when it came to going up the side of the mountain at anything like the pace the beaters set, "bow" and "stroke" Nos. 2 found it a most difficult proceeding. The young *shikari* Ali was leading at a prodigious pace, and had to be spoken to very roughly, even threatened with punishment, ere he would slacken it. At length it was evident that, if the ravine head was reached, "bow" and "stroke" Nos. 2 would be so blown that it would be hopeless for them to try and shoot; so they took up a position behind rocks commanding the brushwood clump where the bears were said to be lying, as well as the opposite slopes—in fact, similar to that occupied by "stroke" and "bow" Nos. 1, only some 250 yards higher up. Between the two positions, on the opposite slope, were other clumps of brushwood, and the bears were as likely as not to be in them. The energetic beaters were soon seen throwing stones into the brushwood, and for some moments without result. Then suddenly out dashed a lovely fluffy brown bear, and made for the waterway down the ravine. She was followed by a youngster of a year's growth, about the size of a large sheep-dog. In colour the young one was dark brown. The beaters caught sight of the youngster, though they had not seen the old one, and set up frantic yells. Immediately after breaking cover they were lost to view, but the old one soon reappeared, making straight for No. 2. "Stroke" No. 2, having won the toss for the first shot, waited till she was within 70 yards, where she paused and turned half round, apparently to look for the youngster. The beast was then hit hard in the shoulder, and eventually fell plugged with four more bullets than were necessary for her destruction. The youngster now appeared running across the stony side of the mountain to the left front. It was a difficult shot, as he was going a good pace and rather uphill. The result was he was missed clean, and by the time the guns were reloaded there was nothing to be seen but the ears of the beast as it crossed the ridge within easy range. The youngster pegged away gaily over the mountain, and was lost to view. The behaviour of the natives around us, when the dead bear was hauled out of the thicket, supplied a good illustration of the excitability of the Persian character. One youth completely lost his head, and it was only when our own servants arrived that we could get the carcase slung on a stick and carried to a mule for transport to camp.

The Persians had no idea of the meat or skin of a bear being of the slightest value, and it seems that when the Shah shoots one he throws the body, skin and all, into the nearest river, after having shown it to his wives and his other women. There was great difficulty in getting the beast skinned, but liberal *bakhshish* eventually prevailed. The *Shikarchi Bashi*, meanwhile, was taking the credit of the whole affair, and pointing out how well *he* had arranged the beat, and how that all presents that were to be made should be made through him. This meant that no one else would get a *sou*. Eventually by plain speaking he was subdued, and retired, not to appear again for the next three days, *i.e.* till there was a further chance of extorting lambs from villagers.

On June 26 two of our party started for our projected trip to Lower Mazanderan, past the pagoda, and down the Takht-i-Shah, a road already described beyond

BRITISH LIBRARY

the latter point. The face of the mountain is again rock, and the road twists round the contortions of the strata in a very ingenious way. About 3 miles from Takht-i-Shah, Gasteiger Khan seems to have run out of patience, or, more likely, of funds, for he makes a dash for the bottom of the gorge by zigzags such as no laden beast but a mule could get over. Just at the end of these a beautifully clear tributary joins the Chel-hauz on its right bank, and here we watered our tired animals. The river itself was disappointing; rushing and plunging as madly as ever, its turbid waters gave no prospect of fly-fishing, and it seemed doubtful whether even salmon could be hoped for. We had reached a new flora of fig-trees, alders, and elms, with thorny shrubs for undergrowth. Beside the river, patches of corn, ripe for the sickle, were being cut by men and women. The latter made no pretence of covering their faces, and their crimson or scarlet bodices and petticoats, though generally ragged, were extremely picturesque. As a rule handsome, they had, like most women condemned to hard work out-of-doors, a sad expression. Here the small fields were more or less fenced; and the mountains, less precipitous than at Hazar Champ, were clothed with forest to their summits, except where patches of cultivation occupied moderately level spurs. Now and again the encampments of the reapers, hard by the boiling river, showed where they ate, drank, and slept in the open, a tree felled by fire forming a bridge of ingress and egress with some otherwise isolated field. At the foot of the Hazar Champ, the Ogham Rud falls into the Chel-hauz. Up the rocky valley of the former river there is a road to the mountainous district of Hazar Be-ar.

Three miles below the aforesaid confluence of the Ogham Rud, the Maka Rud, with its gentle current, falls in on the left bank of the main river. The Maka Rud valley is most picturesque, more cultivated and less rugged than any we have yet seen. Half a mile below the bridge that crosses this tributary, a green sward hard by the river, with a lovely view in front and picturesque rocks behind, lured us to encamp. Here two alder trees, the one from the right bank having fallen over, as it were, into the arms of the one on our side of the river, formed the piers to a rustic bridge, leading to a small farmer's homestead or huts.

Whilst our tents were being pitched, we crossed over to eat our lunch under the shade of these trees, and were soon joined by a ragged but picturesque individual, who gave us a *salám* of welcome, and showed great interest in our proceedings. He, like all Mazanderanis, was of more civil and gentlemanly instincts than the ordinary Persian. Being one of the landed proprietors of the district, we dubbed him the Laird of Rudbarek, from the name of his domain. He was one, he said, of three brothers who had inherited the freehold of the mountains on either side, and of the cultivated ground on both sides of the river below the confluence of the Maka Rud, and that they paid taxes to the Nasru's-Saltaneh. The Laird was now threshing and winnowing his crop of barley, and anxious to sell us forage, milk, and butter-milk. If only he had been better clad and cleaner, our friend would have been quite an enviable personage. Accompanying us as he did during the remainder of that day and the greater part of the following, we got to know him very well. Indeed, from the first he seemed to have no reserve with us, and we treated him accordingly; moreover, as he was a keen sportsman, we had many subjects of conversation in common. He had shot bears close by his domain, and followed the Mazanderan stags every winter, when they were driven down from the upper ranges. Looking at the lovely glades high up on the mountain-side, he pointed out spots where he had killed extra fine animals, with antlers of twelve points, and more. Strange to say, he knew nothing about preserving skins, and the fact that they could be utilized as a warm covering for himself and children seemed to him quite a revelation. Stags' horns, he said, were in demand, and

BRITISH LIBRARY

hucksters came round regularly to buy them, as well as salted salmon. He was much interested in our rods, flies, minnows, and tackle, and quite expected to see us haul out lots of fish, though August, he admitted, was the time when the rivers get clear and the pools yield their supplies, whether to the spear at night or to line by day. No hooks on lines are used on these occasions. The Laird said that he got on an average sixty salmon a season, varying from fourteen to twenty-five pounds each. We started whipping the milky waters of the river as soon as the sun got behind the mountains, our native friend showing us the pools where the salmon lay, and the spots where the brushwood and trees along the bank would allow of a fly being thrown. These two requirements for success did not often coincide, and the Laird looked quite crestfallen when told that some deep swirl was unapproachable with a fly. At length, as a fly would not entice, a minnow was put on, and the ground gone over again. Just as it was beginning to get dusk, at a lovely spot where the river, passing a huge rock, formed a magnificent run, a fish was hooked. The Laird, though delighted that this proof of his veracity had at length been vouchsafed, was not a bit over-excited, managed the landing-net like an old hand, and eventually brought a salmon trout to bank, weight about fifteen ounces. The fish was free when landed; probably it was accidentally hooked, and had not seen the minnow in the turbid water. In any case, it was the first salmon trout that had been killed with a rod in a Persian river flowing into the Caspian.

The next day, the 27th, we made an expedition northwards, down the river for a two hours' sharp ride. The scenery was magnificent. The river, ever headlong, had a more open valley, allowing of groves of stately alders here and there. The cultivation climbed higher up the slopes. Villagers in all directions were gathering the harvest, and stacking the corn on platforms raised to such a height that the cattle could find shelter underneath, whilst the straw could not be stolen. Wild grape-vine, figs, and pomegranates were in all the nooks, from which rills of water in many places crossed the road. Thick hedges of thorny stuff guarded the way on either side, and gave an impression of there being some sense of care and industry in the tillers of the soil, though this was dissipated by the sight of clumps of thorns dotted about amidst the crops. This charming foreground was even surpassed by the more distant views. We could now see far above the mountains that shut in the river. On its right bank forests clothed them as far up as the snow and cold of winter permitted. Above the forests grassy rounded slopes, fit pastures for deer, ibex, and moufflon, carried the eye to summits where snow still clung even in the mouth of June.

On the left bank the country was less steep, so clusters of mud huts could be seen here and there. Veritable snowy ranges formed the background far away to the south.

Further north, as the valley opened out the vegetation became more sparse, as though we had reached a belt where the rain-clouds seldom touched, but passed over to break on the higher ground. Further still away to the north, thick forest was again visible, clothing all the mountains, which rose to a considerable altitude. We lunched in a grove of ancient alders on an island in the river near to the mosque of Bandi, with its roof of picturesque shingle, showing we were near a forest land, and one where the ordinary mud roof of Persia was unable to cope with the rainfall.

Reluctantly we returned northwards; time would not permit of our pushing down to the sea. That evening a try was again made for fish, but without success. The 28th found us climbing up the Hezar Champ, and a terrible climb it proved. The black butterflies were gay as ever, and a Bohemian wax-wing visited us at lunch, which we ate in the shade of Gasteiger Khan's tunnel.

That night we pitched our tents near our former camping-ground of Valiabad, and the next day pushed over the Kendevan pass and down the Laura valley to-

where the Sheristanek falls into it at Doab. The next morning the *Shikarchi Bashi* appeared, but not till one of our party had started over the mountains by the short cut for home, hoping to get a shot at ibex on the way. The rest of us were honoured with a full parade of lambs at every village through which we passed, and on July 1 we reached our homes at Gulahek.*

THE MONTHLY RECORD.

THE SOCIETY.

The New Session.—The first meeting of the New Session will take place on Tuesday, November 10. It was hoped that Dr. Nansen might have been able to come to England and open the session with an account of his remarkable expedition. Unfortunately, he will not be able to leave Norway till towards the end of January, when it is expected that he will address the Society. The first paper of the session will be an account of the expedition under Mr. Jackson, which is pushing its way and carrying out scientific observations in Franz Josef Land; the paper will be by Mr. Arthur Montefiore Brice, as will be seen from the programme inserted in the present number. This will be followed before Christmas by papers on Uganda and Unyoro, by Lieutenant S. Vandeleur, and on the Sources of the Niger by Colonel J. K. Trotter. Other interesting papers, as will be seen, are in preparation for the meetings after Christmas. During the session special meetings will probably be held in connection with the 400th anniversary of the voyage to America by Cabot and of the route to India by Vasco da Gama. For other special features reference is made to the Programme.

Special Medal to Dr. Nansen.—At a recent meeting of the Council, it was decided to award a special gold medal to Dr. Fridtjof Nansen, in recognition of the value of the geographical and other scientific work which has been accomplished by his North Polar Expedition. Dr. Nansen has already received a Royal Medal from the Society.

EUROPE.

Geographical Work in Finland.—The Finnish Geographical Society at Helsingfors has recently sent us their publications for the years 1894, 1895, and 1896, which show a record of solid geographical work of a very satisfactory character. There appears to be an awakening to the value of geographical study in Finland, which is accompanied, not only by the production of such memoirs as the volumes under notice contain, but by an earnest effort to adopt whatever is good in the geographical teaching of other countries in the schools of Finland. The papers in the *Vetenskapliga Meddelanden af Geografiska Föreningen i Finland* are

* For a general illustration of the country traversed by Colonel Wells, the reader is referred to map of a Route along the Alburz Mountains, between Tehran, Astrabad, and Shahrud, by Lieut.-Colonel Beresford Lovett, R.E., to be found at page 120, vol. v., *Proceedings* (New Series) of the Royal Geographical Society. The section of country now treated may be identified by the names Gatchasir and Waliabad on that map, and is between long. 51° and 51° 40′.

BRITISH LIBRARY

published in the Swedish language, with a German abstract. Thus, as in the memoirs of the Hungarian Geographical Society, which publishes French or German abstracts, the subject of the papers can be at once perceived by the scientific men of Western Europe, and a full translation can be undertaken when the importance of the memoir seems to warrant it. Much inconvenience would be saved, and the labours of geographers would be simplified, if other societies published in little-understood languages would follow the same example. It would be an excellent rule if every scientific paper not printed in English, French, or German were accompanied by an abstract in one of these languages. A. Thesleff gives a description of the sand-dunes of Eastern Finland, where they are increasing rapidly on account of the destruction of forests. The maximum height of these dunes is from 70 to 80 feet, and they are much less covered with vegetation than the dunes of other countries. J. E. Rosberg describes the sand-dunes of the eastern shore of the Gulf of Bothnia, which have been very little studied. All the dunes are found in the neighbourhood of rapid rivers carrying much sediment, and as a rule on the south side of the river-mouth, because of the prevailing northerly wind. They stretch in most instances in parallel chains along the coast, with lagoons between the ridges. The greatest height observed was about 65 feet, and the onward movement amounted to a little over 20 feet per year. The formations were found frequently at a considerable distance inland, up to 15 miles from the sea. The same author gives a long memoir on the deltas of the northern part of the Gulf of Bothnia, tracing the changes which have taken place in many of them in historic times, and endeavouring to arrive at a theory of delta-growth on a coast which is rapidly rising. He recognizes four main types: (1) True "Scheeren deltas" with widely distributed alluvium, like that of the Kyröelf; (2) partial "Scheeren deltas" with numerous false deltaic islands, like the Torneelf; (3) submarine deltas freshly upheaved to the surface, like that of the Uleelf; and (4) true submarine deltas not showing on the surface, like that of the Kalajoki. The memoir is fully illustrated by plans of a large number of Finnish deltas. R. Hammarström describes with maps the depth of Lake Lappajärvi, and R. Boldt that of Lake Lojo: the former lake, although larger and deeper, closely resembles Derwentwater in its bathymetrical type; the latter appears to form a deep uniform basin, surrounded by a wide shallow rim bearing numerous islands. R. Hult deals with the distribution of timber-trees in Finland, and R. Herlin elaborates the palæontological plant-geography of northern Satakunda.

Ancient Topography of the Étangs de Hourtin and Lacanau.—An interesting paper by M. Dutrait has recently been published in the *Bulletin* of the Bordeaux Society of Commercial Geography, on the ancient topography of the lagoons (étangs) of Hourtin and Lacanau and the probable position of the ancient port of Anchises, Department of Gironde. The results of the discussion are as follows: (1) The ancient coasts of Aquitaine were cut up into gulfs. (2) These gulfs have been obstructed and changed into lagoons, or lakes, owing to the deposition of the sands on the coast, arising from the destruction of soil resulting from forest clearing, and by the subsidence and erosion of a large island which formerly lay off the shore. (3) The lagoons of Lacanau and Hourtin, by their level, depth, and other details of their topography, agree exactly with this general rule. (4) The port of Anchises mentioned in 1538, in use until 1700, but which disappeared in 1770, was situated on a considerable estuary, the northern outflow of the Étang de Hourtin; the position of the mouth and the direction of the estuary are well known. (5) The village called Anchise was built on the edge of the marsh of Belsarieu, where the waters of the outflowing stream are lost from sight, being buried under the dunes to the south-west of the forest of Brisquette, the

BRITISH LIBRARY

advance of which had obstructed the outflowing water. (6) The Étang de Lacanau has had two outlets, one to the north, the Trou-du-Fer, the other from the centre, the Port Saint-Vincent, whose position on the coast is exactly determined. The author adds that the name Balania, which he finds is derived from the celtic word *balan* = broom plant, occurs on many old charts in place of the name Anchise; and that the dunes to the south of the mouth of the Anchise bear the name "les Genêts" (*i.e.* brooms).

ASIA.

Exploration of the Amu-daria.—It appears that during the stay of the Khan of Khiva at Moscow at the time of the coronation of the Czar, it became known that the Amu-daria had again begun partly to flow in the Uzboi, since a dam, which directed all its waters into Lake Aral, had been destroyed by the inhabitants of the khanate of Khiva. The great river has already reached and partly filled up the Sari-kamish depression, which is situated, as is known, to the south-west of Lake Aral. Consequently, General Glukhovsky, who for years has devoted his energies to the scheme of diverting the Amu into the Caspian Sea, and has published a detailed work on this subject ('The Diversion of the Amu-daria into its Old Bed leading to the Caspian Sea, and the Acquisition of a Water-communication from the Frontiers of Afghanistan to the Caspian Sea, the Volga, and the Baltic Sea,' St. Petersburg, 1893), has induced the two ministries of War and Communications to send out a new expedition to explore the present possibilities for such a canal. The last telegraphic news is to the effect that General Glukhowsky is already on the banks of the Amu, and a full report of the present state of the river is soon expected.

M. Bonin's Journey in South-Eastern Tibet.—An important journey of exploration in the region between the upper Yangtse-kiang and its tributary the Yalung-kiang has lately been carried out by M. Bonin, French vice-resident in Tongking (*Comptes Rendus*, Paris Geographical Society, 1896, pp. 234, 250). South of the main route from Peking to Lhasa this region had remained unvisited by Europeans, and in great measure even by the Chinese themselves. A surprising result of the journey is the discovery that below the sharp angle made by the Kinsha near the town of Li-kiang (at which angle Captain Gill finally left the stream on his journey to Tali-fu in 1877), it makes a wide sweep to the north, joining the Yalung in about 28° N. lat. instead of 26° 35′, as has been hitherto supposed. The stream which has been considered as the Yang-tse, and which was crossed by Mr. Hosie under that impression in 1883, turns out to be merely a small tributary. The current delineation of the river has been derived from D'Anville's map, but as the agents employed by the Jesuits in their survey of China were unable to penetrate into these wild regions, that map was based (for his particular section of the country) on vague reports only. From Tali-fu M. Bonin proceeded north to Li-kiang, which town he was the first European to visit. Hence, instead of crossing the Yang-tse by the iron bridge over which passes the route to Yong-pe, he turned north-west, and crossed over to the left bank at the sharp angle above referred to. Before finding a route across the precipitous mountains which bound the stream on the north-east, M. Bonin was obliged to ascend the stream for several days. The plateau of Tsong-tien was at last reached by a snow-covered pass 14,500 feet high, and a terribly rugged and difficult path led thence to Yunning-tu-fu (Yung-ning). During the last day's march the traveller looked down on the Yang-tse flowing below in a deep gorge.* Yunning-tu-fu,

* M. Bonin did not, therefore, trace the river continuously during its northward sweep, but it is to be supposed that he did not fall into the error (otherwise attributable to Mr Hosie) of mistaking a tributary for the main stream. Is it just possible that a bifurcation takes place, such as was hinted at in a neighbouring region by Garnier? (see Yule's introduction to Gill's 'River of Golden Sand,' p. [107], (abridged edit.).

about which hardly anything has been known hitherto, is peopled by a mixture of Chinese from Yunnan, Kutsongs, Mosos, and Sifans. North of this town the explorer traversed the Tibetan kingdom of Meli, into which the Chinese even have never penetrated. It is entirely in the hands of the yellow lamas, to whom the king himself belongs, and is known to the Chinese on this account as Huang-Lama ("yellow lamas"). The lamasery (placed on the side of a mountain) was composed of three-storied houses with white walls, balconies, verandas, etc., which recalled a town of South Europe. From Meli M. Bonin crossed the Yalung, and made his way over several very high passes to Ta-tsien-lu.

AFRICA.

Captain Bòttego's Expedition.—Letters describing the progress of Captain Bòttego's Expedition to Somaliland down to March last have been published in the *Memorie* of the Italian Geographical Society (vol. vi., 1896, p. 149). The leader himself writes, first from Lugh, the important Somali town on the middle course of the Jub, and afterwards from a point a little south of the Daua river, in about 40° 40′ E. long. Captain Ferrandi also writes from Lugh, where he has remained as chief of the newly founded Italian station. From Brava the route (shown on two sketch-maps accompanying the letter) led first westwards to the Webi Shabeli; then northwards to the district of Baidoa, where the population is said to be more dense than in the most thickly peopled parts of the valley of the Po (apart from the large cities); and thence again west to the Jub, or Ganana, at Lugh. Baidoa forms a perfectly level plain, about 1650 feet above the sea, with a soil devoid of pebbles, producing abundance of durra and cotton. Lugh had been attacked by a band of marauding Amharas (who had come from Imi by way of the Web) shortly before the arrival of the expedition, and the inhabitants had abandoned the place. They returned after Captain Bòttego's arrival, but the prevailing feeling of insecurity had prevented the arrival of the usual caravans from the Benadir coast for the interior. The country between the coast and Lugh is partly composed of red sandy clay, rich in magnetite, and occasionally mixed with fragments of crystalline rock, and partly of grey or yellowish strata. The former is covered with trees and thorny scrub, with little grass, while vegetation, and especially grass, is much more abundant in the grey soil. Beyond Lugh the expedition followed the south bank of the Daua for some distance, afterwards diverging from the stream and ascending the plateau to the south. Along the Daua the strata were generally horizontal, and seemed to represent an old sea or lake bottom. Salt is found over the whole district, especially east of the Web river, where is a mine, near which ruins of an ancient city were reported. Captain Bòttego heard frequently of a river named Sagan, in the direction in which he was marching. This river is said to flow into a lake (not Abbaia), and to be distinct from the Omo. The Amhara Burgi dwell on its banks. Meteorological observations have been made throughout by Captain Bòttego, who gives the broad results in his letters.

French Expedition across Equatorial Africa.—The two French travellers, M. Versepuy and Baron de Romans, have accomplished a journey across Africa from east to west by way of Lake Albert Edward and the equatorial forest (*Revue Française*, September, 1896). Their original intention had been to reach Mount Kenya and Lake Rudolf, but, the road in this direction being closed by hostilities with the Masai, they were obliged to change their plans. After leaving Katue, on Lake Albert Edward, they came into collision with hostile natives. Through the forest—in which they suffered severely from fever—they appear to have, on the whole, kept to Stanley's route, though in the reverse direction. We regret to state that M. Versepuy succumbed at Chantilly, soon after his return to

مكتبة قطر الوطنية
Qatar National Library

France, to dysentery, contracted during the journey (*Mouvement Géographique*, No. 36).

French Steamer for the Shari.—M. Gentil, who is proceeding to the Shari basin by way of the Ubangi, taking with him a small steamer in sections to place upon the former river, has, according to the September number of the *Bulletin du Comité de l'Afrique Française* (p. 275), been delayed for some months at the station of Krebeje, founded by him in 5° 46′ N. lat., on the banks of the Tomi, an affluent of the Kemo, itself a northern tributary of the Ubangi. M. Gentil proposes to make for the Nana (a southern tributary of the Gribingi, explored by Maistre), on which he hopes to launch his steamer (see also *Revue Française*, 1896, p. 492).

The French in the Niger Basin.—The *Bulletin du Comité de l'Afrique Française* (1896, No. 8) contains the account of a journey in the west of Borgu by M. Deville, who, early in 1895, was commissioned to visit the district of Buay, which had not been reached by the French expeditions of 1894–95 to the region north of Dahomé. According to M. Deville, Borgu is composed of several independent kingdoms, of which Buay is one. The chief town is placed by him about 50 miles north-west of Niki (visited by Captain Lugard), and the kingdom is said to extend from 10° to 12° N. lat., and from 2° 20′ to 4° 20′ E. long. It lies on the watershed between the basins of the Weme and Niger, the line of partition nowhere attaining a greater altitude than from 1300 to 1650 feet. There are some forests on the side towards the Niger, but elsewhere the surface is covered with tall grass, interspersed with *karite* trees, and supplies pasturage for the flocks of the Fulah herdsmen. It is furrowed by many streams, which mostly dry up during the hot season, but enough moisture remains in the soil (which is very fertile) to admit of cultivation. The natives possess a small but active breed of horses. M. Deville thinks that the name Adafudia, given by Duncan as that of the chief town of this region, may be composed of two words used in the country as an expression of contempt, the meaning of which was misunderstood by the English traveller.

AMERICA.

Mr. Fitzgerald's Expedition to the Chilian Andes.—Mr. E. A. Fitzgerald, who recently returned to England from his expedition in the New Zealand Alps, has started on a fresh journey, the main object of which is the ascent of Aconcagua the highest summit of the Andes. The expedition consists of ten persons in all—Mr. Vine, geologist; Mr. de Trafford, surveyor; Mr. Philip Gosse, naturalist; and Mr. Fitzgerald, with guides and servants. From Buenos Aires, the party will proceed by railway to Mendoza. Here they will commence the ascent of the mountains, making direct for Aconcagua, and afterwards for the side valleys of the Andes. The objects of the expedition are scientific, and the ascent of the mountain will be made in a leisurely manner. Mr. Fitzgerald's object is to watch the effect of the various altitudes on the system, and from this to see whether it is possible to climb higher peaks in the Himalayas.

Project for a Route from the Amazons to Cuzco by way of the Purus.—The distance from the headwaters of the Purus to the left bank of the Amarumayu, or Madre de Dios, is about 90 miles. The advantage of such a route would be that there are no rapids on the Purus, as is the case on the Madeira. It is proposed by M. A. Pimenta Bueno that the mixed Commission which is to fix the Peru-Brazilian boundary-line between Madeira and Yavari, should also be instructed to explore the country between the headwaters of the Purus and Aquiry, and the left bank of the river Madre de Dios.

Explorations in the Argentine Republic.—On May 15, 1896, Dr. F. P. Moreno, director of the Muséo de La Plata, returned to Buenos Aires from his great journey of exploration begun in January. In December last year Dr. Moreno had sent out from Mendoza several expeditions composed of twenty-six engineers, geologists, botanists, and cartographers for the exploration of the districts bordering on the Andes lying to the south. He himself followed in the middle of January, and traversed the country between Mendoza and 47° S. The route followed was across the Rio Grande and the Colorado to Chos-Malal, the capital of Neuquen, thence to Codihue, to the Rio Bio-Bio, across the Collon Curá to Junin de los Andes and the lakes of Nahuel Huapi, Lacar, Caleufú and Miaten. These explorations complete a series begun about the end of 1894 on the Bolivian frontier, in the course of which 25,000 miles have been travelled over by the various expeditions. The collections, of the most various kinds, fill 400 chests, and 2000 photographs have been taken. The territories of Neuquen, Rio Negro, and Chubut have been explored and surveyed with special care. Dr. Moreno is convinced that the much-talked-of but still unidentified Bariloche pass lies on the Lago de Gutierrez. North of Lago Nahuel Huapi eight new lakes have been discovered, and fifteen south of it. The mysterious Rio Teteleufu is now accurately known from its source. In many places it has a depth of more than 25 feet. The beauty and fertility of the neighbourhood of Nahuel Huapi are much praised, and it is stated that a brilliant future awaits this tract as soon as it is connected with the east coast by a railway.—Dr. Polakowsky in *Petermanns Mitteilungen*, 1896, No. 9.

POLAR REGIONS.

Mr. S. A. Andrée's Polar Expedition.—In the last issue of *Ymer* (1896, Häft 3), Mr. S. A. Andrée publishes a report on his balloon expedition to Spitzbergen. It is known that the *Virgo*, which had on board, besides the balloon expedition, a party of geologists and zoologists, left Tromsö on June 14. After the steamer had called at Isfjord, and next at the Norway islands, a suitable place for building the balloon-house was found, on June 23, on Danes' island. It took nearly one month to land the balloon and to build a house for filling it. It was ready on July 20; the filling of the balloon began on July 23, and in the evening of July 27 the balloon was filled and ready to start. But the expected winds from a southern quarter did not come, and on August 17 the expedition had to pack up the balloon (the ship was freighted till August 20 only), and it started on its return journey on August 20, reaching Göteborg nine days later. From a table of the directions and force of the wind, from July 27 to August 16, which is given by Andrée, it appears that during these three weeks the wind blew chiefly from northern quarters, or was very feeble and changing. Only on July 29 and 30, and next on August 2 and 3, was there for a few hours a feeble southern wind, which, however, changed in the afternoon to a wind from the north or north-east. It appears, moreover, from the journal of Captain H. C. Johanessen, who cruised north of Spitzbergen during the same time, that, with the exception of August 9, when a fresh wind blew for a few hours from east-south-east, and the next day when a feeble south-east, with snow, was felt, the wind was always from northern quarters. Andrée explains at length why he did not take advantage of these short hours, the chief reason being that these winds were too feeble to carry the balloon, with its guide-rope, any distance northwards. The idea of taking advantage of any wind for a polar balloon-journey evidently was also discussed, but was abandoned because it offered relatively little interest, and because all probabilities were in favour of the balloon being lost, if landing took place, as it probably would, in some uninhabited spot. The loss of the balloon would have raised the costs of a

مكتبة قطر الوطنية
Qatar National Library

new expedition to 106,000 kroner, while now, the balloon being in working order, the costs of a new expedition would not exceed 53,000 kroner, provided that the next year's expedition is taken to Spitzbergen on board a ship of the Swedish navy. Mr. Andrée fully believes in the possibility of such an expedition, if only the balloon-house is ready earlier in the summer. There was no lack of southern winds in the earlier part of the stay at Danes' Islands. This year's expedition is not quite fruitless. It has proved the possibility of a balloon being filled in Spitzbergen, and of a pigeon-post being established between Spitzbergen and the Continent, while astronomical, magnetic, and meteorological observations were made, as well as geological explorations under Prof. De Geers, and hydro-geographical measurements under Prof. Arrhenius. At the same time Mr. Grönberg has made good natural history collections.

MATHEMATICAL AND PHYSICAL GEOGRAPHY.

Vertical Distribution of Snow Plants and Habitations.—Two papers on vertical distribution, by pupils of Prof. Ratzel, appear in the second volume of the *Wissenschaftliche Veröffentlichungen des Vereins für Erdkunde zu Leipzig*. Dr. Magnus Fritzsch gives the following figures (English feet) as the results of his survey of the Ortler Alps:—

The south-western and western slopes of the mountains are the most favourably situated, as is indicated by the bolder figures, which show the maximum height of each line; while the figures in italics, denoting the lowest position of each line, are found for the north-eastern and northern slopes. The orographic snow-line is "the line which joins the wreaths of snow protected by their position and the nature of the surrounding ground." It is interesting to compare these figures with those obtained by Dr. Hupfer for Etna. In summer some wreaths of snow lie on the mountain, as they do on Ben Nevis in our own country, although its summit is below the climatic snow-line. On Etna, in 1893, there were five small snow-wreaths on the north-west, north, and north-east of the summit plateau, between 9000 and 9900 feet. Dr. Hupfer gives the vertical zones of the mountain as follows:—

III. Waste region { (*b*) Snow-wreath region. (*a*) Pasture region (8850 feet).
II. Forest region { (*b*) Summer-green or birch region (6560 feet). (*a*) Ever-green or pine region (6070 feet).
I. Cultivated region { (*b*) Summer-green cultivated plants, and upper limits of agricultural region (5080 feet). (*a*) Ever-green cultivated plants, and upper limits of the olive (2620 feet).

It would appear that the forest limit is somewhat lower on Etna than on the Ortler Alps, while agricultural operations are carried on only about 500 feet

higher on the slopes of the volcano, despite its more southerly and insular position, which may be partly explained by the dryness of Sicily during the warm months. The beautiful map which accompanies Dr. Hupfer's paper shows that the distribution of trees is neither so high nor so extensive as it was seventy years ago.

GENERAL.

Population Maps.—In the second volume of the scientific publications of the Leipzig *Verein für Erdkunde* there are two papers on the distribution of population, one on the kingdom of Saxony, by Dr. Richard Buschick, and the other on West Central Africa, by Dr. Vierkandt. The former is of especial interest from the map, which shows the distribution of the people by using various symbols for small settlements, and various combinations of thin and thick lines which follow the boundaries of the settlements, whose areas are large enough to be traced. The map is fairly effective, and gives more precise information than that constructed on the usual plan of colouring the chosen political region according to the average number of inhabitants per unit area. In the case of a large-scaled map, such as that given for the Zwickau district, the white space is actually uninhabited. The value of these maps would be enhanced if the space inside the lines bounding an area of settlement were shaded or coloured to show the average density of the population per unit area, as well as the approximate number of inhabitants within these lines. The large number of villages with between twenty and two hundred inhabitants, and their regular distribution on the lower lands, is in marked contrast to the relatively much greater number of single settlements and larger villages in the mountains. It is interesting to compare these maps with that constructed by Mr. Bosse for the Royal Scottish Geographical Society's beautiful *Atlas of Scotland*, recently prepared and published by Mr. Bartholomew. In this map the country without any permanent inhabitants has been outlined and left white, and the density of population below this line calculated for each parish and indicated in the usual way. In addition, the number of inhabitants in each town has been indicated by special signs. This makes the map exceptionally graphic and precise in the way it presents population statistics. On comparing this with a contour map, it is seen that comparatively few inhabitants live permanently above 500 feet in Scotland. Dr. Vierkandt's population maps of West Central Africa are constructed in the usual way. The data, however, are very defective, and the author has usually to rely on the qualitative estimates of travellers. These differ according to the ideas of their authors, which are usually affected by the nature of the country previously traversed. The explorer coming from the desert is likely to term a region thickly inhabited that another, after passing through the populous parts round the lower Niger, would call thinly settled. The result of a critical discussion of the available information leads Dr. Vierkandt to conclude that ordinary estimates of the population of West Central Africa are too high, and he reduced Prof. Supan's total of nearly 37 millions to nearly 24 millions. With this alteration he points out that the total number of inhabitants in Africa, as estimated by Prof. Supan, is about 150 millions.

Place-Names.*—Besides a glossary of 266 pages, containing compact and interesting explanations of a number of well-selected names from all parts of the world, this new work by Canon Taylor contains a prologue of 35 pages, discussing and expounding many points of interest with reference to place-names, and an appendix

* 'Names and their Histories, alphabetically arranged as a Handbook of Historical Geography and Topographical Nomenclature.' By Isaac Taylor, M.A., etc., Canon of York. London: Rivington, Percival & Co. 1896.

BRITISH LIBRARY

of 88 pages, in which the elements most commonly met with in Indian, Turkish, Magyar, Slavonic, French, German, and English names are treated of. The last section is naturally the fullest. It extends to 46 pages, and is divided into five sections—on names containing survivals of grammatical inflection; on personal names; on names indicating occupations and status; on names of hundreds, shires, and parishes; and on those of towns and townships. This plan of relegating much of the matter to an appendix has many recommendations. It not only saves space, but it makes the subject dealt with more interesting and instructive. It ought, however, to be supplemented by an index containing references, both to the elements of names treated of and to the names explained or given as examples. In the prologue, curiosity is roused again and again about names about which no explanation is given in the glossary, at least under the names in question, and which cannot be found in the appendix (if they are there at all) without a long search. It is also to be regretted that there is no section in the appendix dealing with Celtic names in general, or Scotch and Irish names of Celtic origin in particular.

Geological Survey Report.—The Annual Report of the Geological Survey and Museum of Practical Geology for 1895 is a record of steady progress and much useful work. It contains the usual summary of work accomplished during the past year, to which every geographer studying a special region should refer. Perhaps the most interesting item in the report is the announcement that the half-crown machine-coloured geological map of the London district, on a scale of 4 miles to the inch, has sold well enough to justify "the expectation that the same system may be continued and extended." The issuing of geological maps at a reasonable and not prohibitive price will help geographers in every district, and we hope that the department will soon issue fresh sheets at a similar cost.

Popular Geography in Manchester.—At the Liverpool meeting of the British Association, a paper by Mr. J. Howard Reed was submitted, describing the work of the "Victorians," a number of members of the Manchester Geographical Society who deliver popular lectures free of charge. During the past five years over three hundred lectures have been delivered in Manchester and the surrounding districts, and over ninety thousand hearers have been reached. The audiences are principally of the working class, but also include the members of many well-known literary and scientific clubs, and students of continuation schools. The lectures given include such titles as: "Shaping of the Earth's Surface by Water-action," "Map Projection," "India," "China, Korea, and Japan," "Polar Exploration," "Across the Rocky Mountains," "Canada," "Across Africa with Stanley," "Uganda," etc. Applications for lectures are made to an honorary secretary, who conducts all correspondence and makes arrangements with the local societies and the lecturers. The engagement of the halls, printing, and similar matters are carried out on the spot by the local people. This system has proved so satisfactory, and the enthusiasm of the voluntary workers has been so well maintained, that no hitch has ever occurred. The terms on which the lectures are given are very simple. Any member of the Manchester Geographical Society or any affiliated society is entitled to apply for lectures. Lantern apparatus and volunteer operator are supplied when required. A nominal fee is charged for each lecture, travelling and lantern expenses being added when incurred. Any balance in hand at the end of each season is applied to the upkeep of lantern plant and the making and purchase of new slides. Another important branch of voluntary work consists in the analysis of some two hundred British and foreign scientific journals. This is most useful for scholars and students. It enables them to follow up, with ease, the literature on any special subject.

OBITUARY.

Baron Sir Ferdinand von Mueller.

We learn with much regret of the death of Baron Sir Ferdinand von Mueller, K.C.M.G., F.R.S., the eminent Government Botanist of Victoria, Australia. For nearly half a century Von Mueller's name has been intimately associated with the progress of science and exploration in Australia, and especially with the development of its vegetable resources. He was born at Rostock, in Germany, in June, 1825, losing his parents at an early age. He obtained a training in pharmacy, and in his leisure time devoted himself to the study of botany and chemistry. In 1846–47 he studied at the University of Kiel, where he took the degree of Ph.D. For several years he investigated the botany of Schleswig and Holstein. In 1847, in order to counteract a hereditary tendency to phthisis, he emigrated to Adelaide, in South Australia, where he commenced his career as assistant to a chemist, and during the following four years devoted himself to the investigation of the flora of the colony. From 1848 to 1852 he travelled over 4000 miles, mainly for botanical purposes. In 1852 he was appointed Government botanist to the colony of Victoria by Mr. Latrobe, the first Governor, and here he at once entered upon the labours for the exploration of the continent and development of its vegetable resources and capabilities that only ceased with his death. From this year dates also his series of publications on the botany of Australia, which in extent and value represent no small proportion of an Australian bibliography. In 1855–56 he accompanied as botanist the expedition under the command of A. C. Gregory for the exploration of North and Central Australia, and was one of the four to reach Termination Lake in Central Australia. Some 6000 miles of previously unknown land was traversed, and abundant collections made of the various forms of vegetation. On Mueller's return to Melbourne he was appointed Director of the Botanical Garden of that city. Whilst rendering immense services, not only to Australia, but to many other countries, he failed to satisfy the wishes of the colonists for a garden which should, like Kew, be as ornamental as useful. Mueller was neither a practical horticulturalist nor a landscape gardener, and the Victorians, seeing with envy in the capital of a sister colony (Adelaide) the erection of a garden as æsthetic as scientific, relieved him of the directorship of the garden, at the same time, with rare liberality, retaining him in the position of Government botanist, with undiminished salary, library allowances, and appliances for pursuing his labour in scientific and economic botany.

Though mortified almost beyond endurance by this action of his fellow-colonists, Mueller, with undiminished zest and liberality, continued his exertions as their benefactor to the day of his death. He was the introducer into Australia of many useful plants from other regions, in exchange sending abroad plants native to Australia of more or less economic value. He had a leading hand in introducing that most useful of Australian trees, the eucalyptus, into Algeria, India, the Riviera, and other countries, in some of which it is of essential service as timber and fuel, and in others as an aid in draining marshy land. He was the first to raise the great *Victoria Regia* water-lily. Indeed, his immense knowledge as a botanist had almost always a practical end in view, and not a few Australian industries are largely indebted to him for their development. It was also partly due to his suggestion that the camel was introduced into Australia and first used for exploring purposes in 1860. His own travels in Australia for botanical purposes, on foot and on horseback, covered some 25,000 miles. After he himself had ceased, owing to

مكتبة قطر الوطنية
Qatar National Library

his official duties, to be able to travel, he had a directing hand in many of the important expeditions that went out from Victoria as well as other colonies.

In recent years Baron von Mueller was actively interested in the promotion of Antarctic exploration, and was greatly disappointed that the efforts made, both in this country and in Australia, proved futile. He was a voluminous author, but his writings are mostly of a strictly scientific character. The titles of over a hundred papers by Mueller are given in the Royal Society's catalogue of scientific papers. This is exclusive of independent works on descriptive and economic botany, and of which his 'Fragmenta Phytographiæ Australiæ' covers about a dozen volumes. Almost from the date of his arrival in his adopted continent, he had entertained the ambition of producing a 'Flora Australiensis,' and when the several governments of the Australian Colonies appointed one of the most distinguished botanists in England, Mr. G. Benthan, F.R.S., to undertake the work, Mueller, at once recognizing the wisdom of the selection, and that an access to the Australian collections contained in European Herbaria was essential to the perfection of the work, generously offered the use of his own unrivalled Herbarim, notes, and observations, in aid of the undertaking. During the whole sixteen years occupied in the publication of this gigantic undertaking, which extended to seven volumes, Mueller was unceasing in his efforts to contribute to its success, working in unbroken harmony with its author throughout. Of his own numerous works three especially are of permanent value, the 'Eucalyptographia,' a history with excellent drawings of the Eucalypti of the continent; the 'Select Extratropical Plants eligible for Industrial Culture in Australia,' a work unique of its kind, and overflowing with valuable suggestions of a thoroughly practical nature; and his 'Introduction to Botanic Teaching in the schools of Victoria.'

Few men have received so many honours as the late baron. He was one of the first three in Australia to receive the Order of St. Michael and St. George; he was promoted to Knighthood in the Order in 1879. In 1871 he was made a hereditary baron by the King of Würtemberg. From Portugal and from Spain he received high orders. He was made a Fellow of the Royal Society in 1861, and in 1888 the society awarded him one of its Royal medals. He was a corresponding member of some 150 scientific societies. He had been a Fellow of the Royal Geographical Society since 1858.

Personally Baron von Mueller was a man of a warm heart and great kindliness of nature. Though a botanist by choice and profession, he was in other respects a man of great culture, interested in many branches of knowledge, and a lover of music, the practice of which art he zealously advocated amongst the young and old of the colony. He was a voluminous correspondent, ever ready to help his friends; somewhat vain, perhaps, but of a vanity that was never offensive. He has rendered services of a high order to Australia, in the history of the advancement of which his name will always be held in high honour.

Professor Josiah Dwight Whitney.

Professor Josiah Dwight Whitney, who died last August 24 at the age of seventy-seven, commenced the long series of geological labours which have made his name famous in 1840, when he was at work on the survey of New Hampshire. After spending two years of study in Europe, supplementary to his university training at Yale, he worked out the geology of the Lake Superior region in conjunction with Mr. J. W. Foster, the results being published in 1849, 1850, and 1851. These surveys involved a large amount of topographical mapping as a necessary preliminary to the geological delineation; and in most of his subsequent

View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984185.0x000011

مكتبة قطر الوطنية
Qatar National Library

work Mr. Whitney had occasion to lay the foundations by means of a pioneer geographical survey. In 1854, after several years' travelling in the west of the United States, he produced a work on the 'Metallic Wealth' of that country, including a comparison with the rest of the world. A similar volume, 'The Mineral Resources of the United States,' has since been made an official annual publication of the national geological survey, and is a document of the utmost value to students of economic geography. Mr. Whitney was engaged in succession on the geological surveys of Iowa, Wisconsin, Illinois, and California, devoting ten years' work to the scientific study of the last-named state. He was for a time Professor of Chemistry in Iowa University, and from 1865 until his death he has occupied the chair of geology at Harvard. It is impossible, in a brief note, to enumerate his published contributions to geological and geographical science. The name of Mount Whitney, the highest summit of the Rocky mountains in the United States, perpetuates his memory and records the esteem in which he was held by his contemporaries. Professor Whitney had been an Honorary Corresponding Member of the Royal Geographical Society for many years.

Dr. J. A. Moloney.

Dr. Moloney's death, at the early age of thirty-eight years, adds another name to the long list of victims to the hardships of African exploration, for to these must, no doubt, be attributed the aortic aneurism from which he suffered, and which ended fatally on October 5 last. Dr. Moloney was the son of the late Captain Moloney, of the 60th Rifles. He was born at Newry, in Ireland, and graduated at Dublin University, after previously studying medicine at St. Thomas' Hospital. His name first came into prominence as an African traveller through the part which he took in Captain Stairs' expedition to Katanga on behalf of the Congo Free State, which resulted in the extension of the state's authority over that part of the Congo basin. The death of Captain Bodson (the second in command) at Bunkeia, King Msidi's capital, and the dangerous illness of Captain Stairs, threw the task of bringing the expedition back to the coast on Dr. Moloney, who succeeded in so doing after countless difficulties and hardships. In 1893 he published an account of the expedition under the title 'With Captain Stairs to Katanga.' In 1895 Dr. Moloney was entrusted with a mission to the country west of Lake Nyasa, and succeeded in inducing several of the native chiefs to place themselves under British protection. He had been a Fellow of the Royal Geographical Society since 1892.

CORRESPONDENCE.

Makran.

Davos Platz, October, 1896.

If it will not be thought to be unduly prolonging the correspondence on this subject I should like to make a few remarks with reference to Colonel Holdich's letter in the *Journal* for the current month, and, in the first place, to express my regret for having misread him in the way he points out.

Colonel Holdich will, I dare say, be amused to learn that after putting Fahraj near Bampur "out of the question" I now find myself under the necessity of reinstating it as the starting point of Ibnu Khurdadhbeh's extremely puzzling route "from Fahraj to Sind." I am led to this by a further and more careful comparison of what is to be gathered on the point from the above-mentioned geographer with what is stated by Yakubi and Istakhri. After my previous and

مكتبة قطر الوطنية
Qatar National Library

unfairly long communication I cannot ask for the space that would be requisite if I were to state the grounds of my new conclusion, which must await some other time and some different channel of publication, but I shall be happy to submit them privately to Colonel Holdich if he would care to know them. He would, I feel sure, be satisfied with them.

To put the result summarily, Fahraj near Bampur is the place locally called *Fahra* in the middle ages. Then the *Basurjan* of Ibnu Khurdadhbeh, the *Masurjan* of Idrisi, and the *Masakan* of Istakhri, are one and the same place. This, in all probability, occupied the site of the present Sarbaz. It is stated to have been 24 farsakhs from Fahra, while Sarbaz (according to Sir F. Goldsmid's route) is 73 miles distant from that place. In Ibnu Khurdadhbeh's time it was the chief town of "the Schismatics" (for his *Medinetu 'l Kharun* read *Medinetu 'l Khuruj*), and these people, we know from the later Arab writers, were settled along the course of the Sarbaz river. Subsequently *Rask* became their capital. This place, lower down the river and 40 miles from Sarbaz, is not mentioned by Ibnu Khurdadhbeh, but I would identify it with his "village of *Yahya bin Amr*," 10 farsakhs from Basurjan (*Sarbaz*), and would suppose that Yahya was then the headman of the place, or that he was, perhaps, its founder. From Rask onwards to Panjgur, I must confess I can make nothing of the route, nor can I identify a single one of the ten intervening stations. According to the later Arab geographers, there was a route from Rask through the present Bampusht district to Dizak, and thence to Panjgur, the entire distance from the first place to the last being 6 stages, while modern itineraries and maps would make it about 230 miles. How, then, can we account for Ibnu Khurdadhbeh's 93 farsakhs, or say 336 miles—perhaps 370 miles? The route cannot have proceeded from Rask through the Kej valley, otherwise Kej, the capital and probably the most ancient place in the valley, would surely have appeared among the stations; but it does not, nor does any other place east or west of Kej shown in published maps. There I must leave the difficulty. Perhaps Colonel Holdich, with the far greater advantages he possesses, can solve it. Allowing it its full weight, it does not, in my opinion, counterbalance the evidence in favour of the identifications above stated, though in present circumstances I can only offer these for provisional acceptance.

M. R. Haig.

The Discovery of the very Important Lundai Sin, or Swat River.

October 12, 1896.

In the *Geographical Journal* for this present month there is a letter on the subject of "Makran," by Lieut.-Colonel Holdich, R.E., on which subject I have nothing to say at present; but, in the last paragraph of the letter, referring to the serious mistakes made with respect to that part of the Kafiristan, which has caused some trouble, and more discussion, he says, "We found that the river flowing through Kafiristan from the west into the Chitral or Kumar [*sic*] river, and correctly called Arnawai, . . . was also called 'Bashgol' and '*Lundai Sin*;'" and that he has "*discovered one other very important Lundai Sin, which is also called the Swat river.*"

It is to this last "discovery" I have more particularly to refer. Any small or minor river may be, and is, called Landaey Sin—not "Lundai"—by the Afghan people and others dwelling near them. *Land* is the Pushto adjective for "small," "little," "short," etc., and the diminutive form of that adjective is *landaey* for the masculine singular, *landa'í* for the feminine, and *landí* for the plural, both masculine and feminine. Sin, or Sind, a corruption of Sanskrit *sindhu*, means a

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984183.0x00004e

مكتبة قطر الوطنية
Qatar National Library

sea or river; consequently any small river would be called the Landaey Sin without that being the proper designation of such river.

As to the discovery that the "very important Lundai Sin is called the Swat river," it is a great mistake. The river of Panj-korah and the river of Suwat, or Suwad, having united, join the river of Kabul and its tributaries at Do-bandí, a little to the north of the village of Shaikh Isma'il, and is *then* known as the Landaey Sin, or Small or Little river, until north of Atak it unites with the Aba Sin, or Father River, or Father of Rivers, the name by which the Sindhu or Indus is known in those parts by the inhabitants generally. The Landaey Sin is also shown in the map of the "Mullah's Explorations" in 1876.

A person cannot stay long at Peshawar or in its district without soon knowing what Landaey Sin refers to; and in "An Account of the Province of Peshâwar" which I submitted to Government in 1851, for which I received the thanks of the Government of India, and which was subsequently published in the *Transactions of the Bombay Geographical Society* in 1852, I described the Landaey Sin. In my Pushto Dictionary, published in 1860, the Landaey Sin will be found described at pp. 636 and 877, in my "Account of Upper and Lower Suwát to the source of the Suwát river," in the *Journal of the Asiatic Society of Bengal* for 1862, and also in my 'Notes on Afghanistan,' etc., pp. 215 and 243, and other places; and by the name of Landaey Sin the united rivers have been known "from time immemorial."

H. G. Raverty, Major, Bombay Army (Retired).

GEOGRAPHICAL LITERATURE OF THE MONTH.

Additions to the Library.

By HUGH ROBERT MILL, D.Sc., *Librarian*, R.G.S.

The following abbreviations of nouns and the adjectives derived from them are employed to indicate the source of articles from other publications. Geographical names are in each case written in full:—

A. = Academy, Academie, Akademie.	Mag. = Magazine.
Ann. = Annals, Annales, Annalen.	P. = Proceedings.
B. = Bulletin, Bollettino, Boletim.	R. = Royal.
Com. = Commerce, Commercial.	Rev. = Review, Revue, Revista.
C. Rd. = Comptes Rendus.	S. = Society, Société, Selskab.
Erdk. = Erdkunde.	Sitzb. = Sitzungsbericht.
G. = Geography, Geographie, Geografia.	T. = Transactions.
Ges. = Gesellschaft.	V. = Verein.
I. = Institute, Institution.	Verh. = Verhandlungen.
J. = Journal.	W. = Wissenschaft, and compounds.
M. = Mitteilungen.	Z. = Zeitschrift.

On account of the ambiguity of the words *octavo*, *quarto*, etc., the size of books in the list below is denoted by the length and breadth of the cover in inches to the nearest half-inch. The size of the *Journal* is 10 × 6½.

EUROPE.

Austria—Alpine Provinces. *M.G. Ges. Wien.* **39** (1896): 529-540. **Richter.**

Ueber einen historischen Atlas der österreichischen Alpenländer. Von E. Richter.

On a projected historical atlas of the Austro-Hungarian monarchy, with suggestions for such a work dealing in detail with the alpine provinces. The paper is reprinted from a memorial volume to Prof. Franz von Krones of Graz, only fifty copies of which appeared.

Austria—Bosnia and Herzegovina. *Globus* **70** (1896): 165-170; 184-190. **Hoernes.**

Bosnien und die Hercegovina in Vergangenheit und Gegenwart. Von Dr. Moriz Hoernes. *With Illustrations.*

Austria-Hungary.

Monumenta Hungariae Juridico-Historica. Corpus Statutorum. Tomus iv. Pars Prima. Statuta et Articuli, Municipiorum Hungariae Cis-Danubianorum. Budapestini, 1896. Size 10 × 6½, pp. lxxxiv. and 916. *Presented by the Hungarian Academy of Sciences.*

Austria—Rainfall, etc.

Hydrographischer Dienst in Oesterreich. Jahrbuch des K. K. hydrographischen Central-Bureaus. II. Jahrgang 1894. Wien: W. Braumüller, 1896. Size 14½ × 10½, pp. xxvi. and 552. *Map and Diagrams. Presented by the K. K. Hydrographische Central-Bureau in Wien.*

Denmark. **Willaume-Jantzen.**

Meteorologiske Observationer i Kjøbenhavn bearbejdede af V. Willaume-Jantzen med et Résumé des Observations Météorologiques de Copenhague. Kjøbenhavn: G. E. C. Gad, 1896. Size 10½ × 8½, pp. 68 and xlviii.

Denmark—Bornholm. **Paulsen.**

Oversigt K. Danske Vidensk. Selsk. Forhand. (1896): 246–286.

Régime magnétique de l'île de Bornholm. Par Adam Paulsen. *With Maps.*

A very minute magnetic survey which led to some interesting results.

France—Aquitaine. *B.S.G. Com. Bordeaux* **19** (1896): 353–360, 385–396. **Dutrait.**

Topographie ancienne des étangs de Hourtin et de Lacanau et position probable du port d'Anchise. Par M. Dutrait.

Includes a sketch-map of the actual and the probable original outline of a section of the coast. See Monthly Record.

France—Chamonix. **Whymper.**

Chamonix and the range of Mont Blanc. A Guide by Edward Whymper. London: John Murray, 1896. Size 7½ × 5, pp. xiv. and 192. *Maps and Illustrations. Price 3s. Presented by the Author.*

Mr. Whymper's guide-book is, as might be expected, an original work of value to the student as well as to the mountaineer and the tourist. The historical chapters include what is practically a history of the origin of mountaineering, the first ascents of Balmat, Paccard, and de Saussure being described in detail. "A chapter of accidents" affords salutary warning to rash climbers, and an account of the observatories on the summit brings the scientific "record" of Mont Blanc up to date. The last seven chapters forming the guide-book proper describe the ways to Chamonix and the excursions to be made from it. Nine appendices supply statistical information as to peaks and passes, lists of guides and their tariffs, and tables for converting measures in feet and metres.

France—Garonne. *Ann. G.* **5** (1896): 368–385. **Lemoine.**

Essai sur l'hydrométrie du bassin de la Garonne. Par M. Georges Lemoine. *With Maps and Diagrams.*

France—Gascony. **Grandjean.**

Switzerland.

Régime des eaux en Suisse. Bassin du Rhin depuis ses sources jusqu'à l'embouchure de la Tamina. Première partie. Surfaces des Bassins de réception, des zones de 300 en 300 m. au-dessus de la mer, des rochers, des forêts, des glaciers et des lacs. Deuxième partie. Stations limnimétriques au point de vue de leur emplacement et de leur repèrage avec profils en travers pour chaque station et pentes relatives de l'eau à la surface. Travail exécuté par la Section hydrométrique de l'Inspectorat fédéral des travaux publics, 1895. Size 15½ × 10½, pp. 56 and 8. *Map and Plates. Presented by Professor Paul Chaix.*

United Kingdom—England. **Norris.**

Catalogue of the Huntingdonshire Books collected by Herbert E. Norris. Written with Notes by Himself. Cirencester, for Private Circulation, 1895. Size 8 × 5¼, pp. 52. *Presented by the Author.*

This bibliography of Huntingdonshire comprises about five hundred entries dating from 1610 to 1895, relating to the county and to the constituent parishes. The references are not only to books, maps, or other publications referring to the locality, but include works written by natives or residents of the county.

United Kingdom—England. **Ward.**

Thorough Guide Series. North Devon [including West Somerset] and North Cornwall from Exmoor to the Scilly Isles, with a description of the various approaches. By C. S. Ward. Twenty Maps and Plans by J. Bartholomew. Seventh Edition. Revised. London: Dulau & Co., 1896. Size 6¼ × 4½, pp. xvi. and 160. *Price 3s. 6d. Presented by the Publisher.*

Excellent maps on the scale of half an inch to a mile are included.

United Kingdom—Geological Survey. ——

List F. Memoirs, Maps, etc., issued by the Geological Survey of the United Kingdom and the Museum of Practical Geology. Size 10½ × 7½, pp. 68. *Index Maps. Presented by the Director-General of the Geological Survey.*

United Kingdom—Ireland—Donegal. *Blackwood's Mag.* **160** (1896): 467–480. ——

In Dark Donegal: The Tourist on the Celtic Fringe.

Les tentatives des Franciscains au moyen age pour pénétrer dans la Haute-Éthiopie. Par F. Romanet du Caillaud.

Africa. **Leo Africanus.**
The History and Description of Africa and of the notable things therein contained, written by Al-Hassan Ibn-Mahommed Al-Wezaz Al-Fasi, a Moor, baptised as Giovanni Leone, but better known as Leo Africanus. Done into English in the year 1600 by John Pory, and now edited, with an Introduction and Notes, by Dr. Robert Brown. 3 vols. London: Printed for the Hakluyt Society, 1896. Size 9 × 6, pp. viii., cxii., and 1120. *Maps. Presented by the Hakluyt Society.*
The death of Dr. Robert Brown left his work on these volumes unfinished, but so near completion that it was judged advisable to issue it without further addition. The sheets were revised in passing through the press by Dr. E. Denison Ross, and a valuable series of maps with notes, which are the result of his independent study, was contributed by Mr. Ravenstein. The main body of the work is an exact reprint of Pory's translation, the editor's care having been devoted to a biographical and critical introduction and to explanatory notes.

Algeria. *B.S.G. Paris* (7) **17** (1896): 145–153. **Vuillot.**
Note sur un voyage de Nefta à Ghadamès (mars-avril 1893) exécuté par MM. Cazemajou, capitaine du génie, et Dumas, lieutenant au 4e spahis. Par Paul Vuillot. *With Map and Illustrations.*

of the Survey executed by Sir Thomas Maclear, F.R.S., in the years 1841–48, by David Gill. Cape Town: W. A. Richards & Sons, 1896. Size 13 × 8½, pp. xiv., 174, and 292. *Maps, Plates, and Diagrams.*

This is a report of the utmost scientific value, presenting the full record of the great geodetic survey of South Africa, which forms the basis of all future cartography in that region. Dr. Gill's paper on the subject printed in the *Report* of the Sixth International Geographical Congress presents in brief the results which are here set forth at length.

Sudan Almanac.

Sudan Almanac, 1896. Compiled at the Intelligence Division, War Office. Size, 6 × 4, pp. 18.

The Tampico Harbour Works, Mexico. By E. L. Corthell, D.SC., etc. *With Plate and Illustrations.*

Includes the record of automatic tide-gauges on the Gulf of Mexico.

United States—Bureau of Ethnology. **Powell.**

Thirteenth Annual Report of the Bureau of Ethnology to the Secretary of the Smithsonian Institution, 1891–92. By J. W. Powell, Director. Washington, 1896. Size 12 × 8, pp. lx. and 462. *Illustrations.*

In addition to the official report, this volume contains papers on prehistoric textile art of Eastern United States, by W. H. Holmes; on stone art, by Gerard Fowke; on aboriginal remains and native dwellings in Arizona and Omaha, by various writers; and a remarkable translation of Zuni creation myths, by F. H. Cushing, showing the primitive ideas of the wanderings of the human race largely actuated by the search for the middle of the Earth.

United States—California. **Perrine.**

Earthquakes in California in 1894. By Charles D. Perrine.—Bulletin of the United States Geological Survey. No. 129. Washington, 1895. Size, 9½ × 6, pp. 26. *Presented by the U.S. Geological Survey.*

United States—California—San Francisco Peninsula. **Lawson.**

Sketch of the Geology of the San Francisco Peninsula. By Andrew C. Lawson.—Fifteenth Annual Report of the United States Geological Survey to the Secretary

of the Interior, 1893–94. By J. W. Powell, Director. Pp. 405–476. Washington, 1895. Size 12 × 8. *Map and Illustrations.*

The maps include some fine reproductions of relief models of the site of San Francisco.

United States—Census. ———

[Eleventh Census of the United States, 1890.] Report on Manufacturing Industries in the United States. Part i. Totals for States and Industries (pp. 1002). Part ii. Statistics of Cities (pp. xliv. and 828); Report on Real Estate Mortgages. Washington, 1895. Size 12 × 9½, pp. viii. and 944. *Diagrams.*

GENERAL.

Aërial Navigation. *Scottish G. Mag.* **12** (1896): 290–298. **White.**

Aërial Navigation. By A. Silva White.

Bibliography. ———

Catalogue of the Library of the India Office. Vol. i. Supplement. London: Printed by Eyre & Spottiswoode, 1895. Size 9 × 6, pp. 384. *Presented by the Secretary of State for India.*

Bibliography. ———

Ministère de la Guerre. Bibliothèque du Dépôt de la Guerre. Catalogue. Tome Huitième. (Supplément i.) Paris: Imp. Nationale, 1893. Size 10 × 6½, pp. ii. and 530. *Presented by the French Minister of War.*

The supplement contains the titles of works exclusively relating to military science, including military geography.

Bibliography. **Campbell.**

The Literature of Geography: how shall it be recorded? By Frank Campbell. Reprinted from the 'Report of the Sixth International Geographical Congress, London, 1895' (pp. 391–398). Size 10 × 6½, pp. 8.

Bibliography. ———

Geographical Index (Extra-European) to Books, Periodicals, etc., 1895. Map Room, Intelligence Division, W.O., 31st December, 1895. Size 11 × 7½, pp. xviii. and 86. *Presented by the Intelligence Division, War Office.*

This geographical index to books is now being published monthly.

Bibliography—Spanish. ———

Librería de Penella y Bosch . . . Barcelona. Catálogo de las Obras de fondo y surtido clasificadas por Materias y seguidas de un Indice alfabético de Autores y Traductores. Barcelona: Penella y Bosch, 1896. Size 8½ × 6½, pp. viii. and 228.

A priced catalogue of Spanish works.

British Colonies. **Gill.**

The British Colonies, Dependencies, and Protectorates, Physical, Commercial, Descriptive, Political, Social, Historical. By George Gill. London: G. Gill & Sons, [1896.] Size 7½ × 5½, pp. 472. *Maps. Price* 2*s.* 6*d. Presented by the Publishers.*

A fairly careful compilation. The maps printed in colour, if somewhat rough, are effective. The spelling on maps and in text differs in many cases; and the deviations from the R.G.S. rules for place-name orthography, which the author says he follows "as far as usage renders it desirable," naturally do not commend themselves to those who strive after uniformity.

British Empire. *Nineteenth Century* (1896): 27–33. **Young.**

Commercial Union of the Empire. By Sir Frederick Young, K.C.M.G.

Cartography. *XIV. Jahresb. G. Ges. Bern*, 1895 (1896): 169–174. **Brückner.**

Die Frage der Weltkarte im Massstab 1: 1,000,000 vor dem Londoner Geographenkongress. Bericht . . . von Herrn Prof. Dr. Ed. Brückner.

Church Missionary Society. ———

Proceedings of the Church Missionary Society for Africa and the East. Ninety-seventh year, 1895–96. London: Church Missionary House, 1896. Size 8½ × 6, pp. lxxiv., 432, and (366). *Maps. Presented by the Church Missionary Society.*

Colonization.

Institut Colonial International. Compte rendu de la Session tenue à la Haye les 9, 10, 11, et 12 Septembre 1895. Paris: A. Colin et Cie., 1895. Size 9½ × 6½, pp. 428.

Education. **Dubois.**

Les Colonies et l'Enseignement Géographique. Conférence faite sous le patronage de l'Union Coloniale Française. Par M. Marcel Dubois. Paris: L. Chailley, 1896. Size 8½ × 5½, pp. 32.

A plea for fuller instruction in Geography as an incentive to colonial enterprise.

Education. **Herbertson.**

On the Importance of Geography in Secondary Education and the Training of Teachers therein. By Andrew J. Herbertson. Reprinted from the 'Report of the Sixth International Geographical Congress, held in London, 1895' (Congress Report, pp. 83–87). Size 10 × 6½, pp. 6.

Education. **Lehmann.**

Die Vorbildung der Geographielehrer auf den Universitäten. Von Dr. Richard Lehmann. Separatabdruck aus dem Berichte des Sechsten Internationalen Geographenkongresses. London, 1895. [Congress Report, p. 72.] Size 10 × 6½, pp. 12.

A reprint of Dr. Lehmann's paper on the University education of teachers of geography.

Education. *B. Union G. Nord de la France* **18** (1895): 97–135. **Lejeal.**

La Géographie dans l'Enseignement primaire: Conférences faites devant les instituteurs de l'arrondissement de Boulogne-sur-Mer. Par M. Lejeal.

Education. **Levasseur.**

La Géographie dans les Écoles et à l'Université. Par E. Levasseur. Extrait des Comptes-rendus du Sixième Congrès International de Géographie tenu à Londres en Juillet, 1895. [Congress Report, pp. 27–70.] Size 10 × 6½, pp. 46.

This comprehensive paper gives the fullest description of the official French system of geographical education with specimens of the syllabus for different school-courses.

Educational—Text-book. **Wethey.**

A New Manual of Geography for Middle and Higher Forms in Schools. With a Preface on the Oral Method in teaching Geography. By E. R. Wethey. Vol. iv. Europe. London: Rivington, Percival & Co., 1896. Size 7½ × 6, pp. xii. and 314. *Maps and Plans. Price* 2*s.* 6*d. Presented by the Publishers.*

This is a new manual very carefully compiled, and containing a vast amount of information which is brought together with a surprisingly small number of mistakes. The plan resembles the old type of school-geography, being almost entirely tabular, and every artifice of variety of print and arrangement is employed to give full and clear expression to the grouping of facts. How far this improvement of the old style is preferable to the popular method of continuous narrative must be left for practical teachers to decide.

French Colonies. *B.S.G. Commerc., Paris* **18** (1896): 329–347. **Henry of Orleans.**

Madagascar, Indo-Chine Française, Yunnan, Assam. Notes commerciales et coloniales. Par le Prince Henri d'Orléans. *With Map.*

French Colonies. **Roux.**

Comment rendre nos Colonies prospères. Conférence faite sous le patronage de l'Union Coloniale Française. Par M. J. Charles-Roux. Paris: L. Chailley, 1896. Size 9 × 6, pp. 56.

Geneva Geographical Society. *Le Globe, Mém. S.G. Genève* **35** (1896): 1–46. **Claparède.**

Coup d'œil sur la Société de Géographie de Genève depuis sa fondation (1858–1896). Par M. Arthur de Claparède, Président.

Geographical Congress. *XIV. Jahresb. G. Ges. Bern* (1895): 3–26. **Brückner.**

Rapports du Comité du Ve Congrès international des sciences géographiques et des commissions spéciales sur l'exécution des résolutions votées à Berne en 1891. Rédigés par M. Ed. Brückner.

Geographical Papers. **Venukoff.**

M. Venukoff. Études géographiques. Paris: A. Reiff, 1896. Size 7 × 5, pp. 168. *Presented by the Author.*

A collection of papers reprinted from various French journals, dealing with various geographical questions, chiefly relating to Central-Asian explorations.

Geographical Progress. *B.S.G. Paris* (7) **16** (1895): 405–515. **Maunoir.**

Rapport sur les Travaux de la Société de Géographie et sur les Progrès des Sciences géographiques pendant l'année 1894. Par Ch. Maunoir.

Geographical Speculation. **Le Plongeon.**

Queen Móo and the Egyptian Sphinx. By Augustus Le Plongeon, M.D. London: Paul & Co., 1896. Size 10 × 7, pp. lxvi. and 278. *Portraits and Illustrations.*

This curious work argues that the Maya civilization was the most ancient, and gave origin to the civilizations of Egypt and Eastern Asia, professes to find documentary evidence of the former existence and disappearance of the mythical Atlantis, and even reproduces an ancient South-American sculpture which is held to contain a representation of the map of the western continent as known to modern cartographers.

Geographical Year-book. ——

Jahresbericht des Frankfurter Vereins für Geographie und Statistik. Siebenundfünfzigster bis neunundfünfzigster Jahrgang, 1892-93 bis 1894–95. Im Namen des Vorstandes herausgegeben von Dr. Friedrich Clemens Ebrard. Frankfurt am Main, 1896. Size 10 × 6½, pp. 152.

Geography. **Markham.**

Address to the Royal Geographical Society. By Sir Clements Markham, K.C.B., F.R.S., President. From the *Geographical Journal* for July, 1896. Size 10 × 6½, pp. 16.

Geography. *B. American G. S.* **28** (1896): 146–156. **Dodge.**

Geography from Nature. By Richard E. Dodge.

Suggestions as to home geographical studies in the neighbourhood of New York city.

Geography. *XIV. Jahresb. G. Ges. Bern* (1895): 73–86. **Poinsard.**

Curiosités géographiques. Comment la Géographie explique les phénomènes sociaux. Par M. Léon Poinsard.

Geography as a Science. **Batalha-Reis.**

On the definition of Geography as a Science, and on the conception and description of the Earth as an organism. By J. Batalha-Reis. Reprinted from the 'Report of the Sixth International Geographical Congress, held in London, 1895.' Size 10 × 6½, pp. 14.

German and Austrian Alpine Club. **Emmer.**

Register zu den Vereinsschriften des Deutschen und Oesterreichischen Alpenvereins einschliesslich jener des Oesterreichischen Alpenvereins und des Deutschen Alpenvereins. 1863–1894. Von Johannes Emmer. Graz, 1896. Size 9 × 6, pp. 166.

A valuable index to the publications of the German and Austrian Alpine Club.

German Colonies. **Meinecke.**

Koloniales Jahrbuch. Beiträge und Mittheilungen aus dem Gebiete der Kolonialwissenschaft und Kolonialpraxis. Herausgegeben von Gustav Meinecke. Achter Jahrgang. Das Jahr 1895. Berlin: Carl Heymanns Verlag, 1896. Size 9½ × 6½, pp. 318. *Portrait.*

German Colonies. *M. Deutsch. Schutzgeb.* **9** (1896): 49–52. ——

Geographische Positionen einiger Punkte in Deutsch-Ostafrika, in Kamerun, auf den Marshall-Inseln, sowie im Schutzgebiete der Neu-Guinea-Kompagnie nach den Angaben der Nautischen Abtheilung des Reichs-Marine-Amts.

German Colonies. *M. Deutsch. Schutzgeb.* **9** (1896): 115–116. ——

Geographische Positionen einiger Punkte in Kamerun und im Schutzgebiete der Neu-Guinea-Kompagnie nach den Angaben der Nautischen Abtheilung des Reichs-Marine-Amts.

Lady Travellers. *Blackwood's Mag.* (1896): 49–66. ——

Lady Travellers.

An inadequate account of some travellers who happened to be women. Those noticed are Ida Pfeiffer, Alexandrine Tinne, Lady Baker, Mrs. Bishop, Miss Gordon

Qatar National Library

the colonies and the mother-country. He points out the political bearings of the monopoly of submarine cables being vested in one nation; and gives a map of submarine lines coloured to distinguish British, French, and other cables.

Royal Navy List. **Lean.**

Lean's Royal Navy List. . . . By Lieut.-Colonel Francis Lean. London: Witherby & Co., 1896. Size 9½ × 6, pp. xviii. and 476.

Sixth International Geographical Congress.

Resolutions considered and passed by the Sixth International Geographical Congress, held in London, 1895. Size 10 × 6½, pp. 10.

Sixth International Geographical Congress. **Erödi.**

Jelentés a Londonban tartott hatodik nemzet-Rözi földrajzi congressusról ('Report of the Sixth International Geographical Congress of London'). [Dr. Béla Erödi.] Size 9½ × 6½, pp. [16.]

Sixth International Geographical Congress—Report.

Report of the Sixth International Geographical Congress, held in London, 1895. Edited by the Secretaries. London: John Murray, 1896. Size 10 × 6½, pp. xxxvi., 806, 84, and 190. *Maps and Illustrations.*

A note on this volume appeared in the *Journal* for September, p. 290.

Sixth International Geographical Congress. **Campos.**

La Geografía en 1895. Memoria Sobre el VI. Congreso Internacional de Ciencias geográficas celebrado en Lóndres. Por Rafael Torres Campos.—Bol. Soc. Geog. Madrid. Tomo xxxviii. Nos. 1, 2, y 3. 1896. Pp. 48.

Statesman's Year-Book. **Keltie and Renwick.**

The Statesman's Year-Book. Statistical and Historical Annual of the States of the World for the year 1896. Edited by J. Scott Keltie with the assistance of I. P. A. Renwick. [Second Edition.] London: Macmillan & Co., 1896. Size 7½ × 5, pp. xxxii. and 1164. *Maps. Price* 10*s.* 6*d. Presented by the Publishers.*

The Statesman's Year-Book, for, we believe, the first time, has been issued in a second edition on account of the great demand. This year's issue contains a series of excellent political maps bearing on burning questions in South Africa, the Pamirs, and Venezuela.

Tropical Hygiene. *Rev. Scientifique* (4) 6 (1896): 326–335. **Stokvis.**

La colonisation et l'hygiène tropicale. Par M. Stokvis.

Vasco da Gama Celebration. **Soveral.**

The Fourth Centenary of the Sea Route to India. Homage to Dom Vasco da Gama on the Anniversary of the Fourth Centenary of the Discovery of a New Route to India. Presented to the Geographical Society of Lisbon by Vicomte de Soveral. Lisbon: National Printing Office, 1896. Size 10 × 6½, pp. 6.

NEW MAPS.

By J. Coles, *Map Curator*, R.G.S.

ARCTIC REGIONS.

North Pole. **Herrich.**

Neueste Handkarte der Gebiete um den Nordpol. Scale 1 : 20,000,000. Nach zuverlässigen Quellen bearbeitet von A. Herrich. 3 Auflage, Glogau. Verlag von Carl Flemming. *Price* 1 *mark.*

This is a small circumpolar map, on which the routes followed by all the principal Polar expeditions since 1827 are laid down, and is specially interesting as showing the route followed by Dr. Nansen, and also the track of the *Fram.*

EUROPE.

Denmark. **Danish General Staff.**

Generalstabens topografiske Kaart over Danmark. Scale 1 : 40,000 or 1·5 inch to a stat. mile. Kalkograferet og graveret ved Generalstaben Kjobenhavn 1896. Sheets—Lögstär, Thisted, Feggeseind. *Presented by the Danish General Staff, through H.E. the Danish Minister.*

England and Wales. **Ordnance Survey.**

Publications issued since September 7, 1896.

1-inch—General Maps:—

England and Wales:—109, 153, hills photozincographed in brown, 1*s.* each; 100, 218, 235, 348, 351, 352 (revised), engraved in outline, with contours, 1*s.* each.

England and Wales:—**Devonshire** (revision), 117 N.W., S.E., 124 N.W., 130 N.W., N.E., 1*s.* each. **Lancashire** (revision), 36, 2*s.* **Yorkshire** (revision), 63, 95, 164 W., 2*s.* each; 82, 83, 96, 97, 114, 118, 148, 151, 2*s.* 6*d.* each.

25-inch—Parish Maps:—

England and Wales:—**Durham** (revision), VIII. 1; XIII. 3, 7; XVII. 1, 2, 3, 7, 11, 12, 16; XVIII. 1, 5, 6, 9, 14, 16; XIX. 2, 8, 9, 10, 11, 14, 15; XX. 2, 3, 5, 6, 7, 10; XXV. 2, 3, 4; XXVI. 1, 3*s.* each. **Essex** (revision), XLI. 9; XLIX. 11; LVIII. 7, 10; LIX. 14, 15; LXVI. 16; LXVII. 3, 4, 5, 7, 8, 9, 11, 12, 13; LXVIII. 10, 13, 14, 15; LXXIV. 8; LXXV. 1, 4; LXVI. 1, 2, 3, 3*s.* each. **Hampshire** (revision), XII. 7; XIX. 1; XX. 1, 2, 6, 9, 10, 11, 15; XXVII. 16; XXVIII. 3, 7, 9, 10, 11, 13, 14, 15; XXXI. 16; XXXII. 2; XXXIV. 5, 7, 9, 15, 16; XXXV. 4, 5, 7, 8, 11, 12, 13, 14, 15; XXXVI. 1; XXXIX. 11, 12; XL. 1, 2, 3, 4, 5, 6, 7, 8, 10; XLI. 5, 10, 11; XLII. 1, 2, 4, 8, 11, 12; XLIII. 1, 2, 5; XLIX. 3, 3*s.* each. **Kent** (revision), XVII. 1, 3, 4, 7, 9, 10, 11, 12, 13, 14, 3*s.* each. **Middlesex** (revision), IX. 7, 11, 15, 16; XI. 2, 9, 13; XV. 1, 3, 4, 10, 14, 3*s.* each. **Northumberland** (revision), LXXXII. 12, 16; LXXXIII. 11; LXXXIV. 5, 7, 9, 11, 12, 14, 15; XCI. 4, 5, 7, 11, 12, 15; XCII. 8, 13; XCIII. 2, 10, 14, 15; CI. 1, 2, 3, 4, 5, 6, 7, 9, 10, 12; CII. 2, 4, 5, 8, 12, 15; CIII. 13, 14, 15, 16; CVIII. 3, 3*s.* each. **Surrey** (revision), X. 5; XI. 11; XVI. 14; XX. 12, 15; XXIII. 6, 16; XXIV. 3, 13, 14, 15, 16; XXV. 12, 13, 15, 16; XXVI. 1, 2, 3, 5, 6, 7, 10; XXXI. 1, 4, 5; XXXII. 1, 2, 3, 6, 7, 8; XXXIII. 1, 2, 3, 5, 6, 7, 3*s.* each.

(*E. Stanford, Agent.*)

England. **Bartholomew.**

New plan of Eastbourne from the Ordnance Survey, by John Bartholomew, F.R.G.S. Scale 295 yards to an inch. W. H. Smith & Son, London, 1896.—New plan of Hastings and St. Leonards from the Ordnance Survey, by John Bartholomew, F.R.G.S. Scale 335 yards to an inch. W. H. Smith & Son, London, 1896. *Price 1s. each, on cloth. Presented by Messrs. J. Bartholomew & Co.*

These plans are reductions from the Ordnance Survey, which have been corrected and brought up to date by the local authorities. They are accompanied by explanatory letterpress, and are furnished with indexes.

England. **Bartholomew.**

London Environs. Fifty mile radius. By John Bartholomew, F.R.G.S. Scale 1 : 253,440 or 4 stat. miles to an inch. J. Bartholomew & Co., Edinburgh. *Price 2s. on cloth. Presented by Messrs. J. Bartholomew & Co.*

The country within a radius of more than 50 miles is included in this map. The approximate distance of any place from the metropolis can be seen at a glance, as concentric circles, 5 miles apart, are drawn from London as a centre.

Germany. **Kgl. Preuss. Landes-Aufnahme.**

Karte des Deutschen Reiches. Scale 1 : 100,000 or 1·5 stat. miles to an inch. Herausgegeben von der Kartogr. Abteilung de Kgl. Preuss, Landes-Aufnahme, 1896. Sheets: 248, Friedeberg i. d. Neum; 347, Fraustadt; 353, Wesel; 372, Glogau; 378, Krefeld. *Price 1·50 marks each sheet.*

Scotland. **Bartholomew.**

Bartholomew's Reduced Ordnance Survey of Scotland. Sheet 9, Berwick and Haddington. Scale 1 : 126,720 or 2 stat. miles to an inch. John Bartholomew & Co., Edinburgh, 1896. *Price 2s. on cloth. Presented by Messrs. J. Bartholomew & Co.*

This is a revised edition of Sheet 9 of Bartholomew's reduced Ordnance Survey of Scotland.

ASIA.

Indian Government Surveys. **Surveyor-General's Office, Calcutta.**

Indian Atlas, 4 miles to an inch. Sheets: No. 14, district Peshawur and parts of districts Kohat, Rawal Pindi and Hazara (Punjab), Buneya, Swat, Kabul, and Terah (Afghanistan), additions to 1892; No. 103, parts of districts Azimgurh, Ghazipur and Benares (N.W. Provinces), Tirhoot, Sarun, Patna, Shahabad, and Gya (Bengal), additions to 1895; No. 121, district Howrah, and parts of districts 24 Paganas, Burdwan, Khulna, Nadia, Jessore, Faridpur, Backergunge, Midnapore, and Hooghly (Bengal), with additions to 1895. Quarter-sheets: No. 35 S.E., parts of native states Oodeypore, Jhallawar, Partabgarh and Banswara (Rajputana), and of Gwalior, Indore and Western Malwa Agencies (Central India), with additions to 1891; No. 38 N.W., parts of district Nasik and of Dang, Baroda, Bansda, and

Parts of Northern Shan States, Season 1894–95.—Gujarat, 16 miles to an inch, April, 1896.—Upper Burma, 16 miles to an inch. Second edition, 1894, with corrections to boundaries up to October, 1895, 2 sheets.—District Noakhali, Lower Provinces (Bengal), 5 miles to an inch, with additions and corrections to boundaries and roads to February, 1896.—District Hazaribagh, Lower Provinces, Bengal, 5 miles to an inch, with additions and corrections to roads up to April, 1896.—District Nowgong, Assam, 5 miles to an inch, additions and corrections to November, 1893.—District Raipur, 5 miles to an inch, Seasons 1862–64 and 1866–72, additions to March, 1892, 2 sheets. —District Mirzapur, 16 miles to an inch, February, 1896, 6 sheets.—District Mizapur (N.W. Provinces of Oudh), 12 miles to an inch, 1896.—District Garhwal (N.W. Provinces and Oudh), 12 miles to an inch, 1896.—District Meerut (N.W. Provinces and Oudh), 8 miles to an inch, 1896.—District Moradabad (N.W. Provinces and Oudh), 8 miles to an inch, 1896.—District Muttra (N.W. Provinces and Oudh), 8 miles to an inch, 1896.—District Muzaffarnagar (N.W. Provinces and Oudh), 8 miles to an inch, 1896.—District Partabgarh (N.W. Provinces and Oudh), 8 miles to an inch, 1896.—District Shahjahanpur (N.W. Provinces and Oudh), 8 miles to an inch, 1896.—District Backergunge (Bengal), 8 miles to an inch, 1890.—District Bogra (Bengal), 8 miles to an inch, 1890.—District Purnea (Bengal), 8 miles to an inch, 1889.—District Rajshahi (Bengal), 8 miles to an inch, 1890.—Map of Sundarbans (Bengal), 16 miles to an inch, 1890.—Central Province Survey, Index to the Forest Surveys in District Sambalpur; No. 14 party, November, 1895.—Index to the Forest Surveys in district Bilaspur; No. 14 party, November, 1895. *Presented by H.M. Secretary of State for India, through India Office.*

AFRICA.

Swaziland. **Miller.**

Sketch-Map of Swaziland made for the Umbandine Swaziland Concessions Syndicate, Ltd. By Allister M. Miller. Scale 1 : 190,000 or 3 stat. miles to an inch. London: published by Edward Stanford, 1896. *Presented by the Publisher.*

In the absence of any regular survey of this part of South Africa, this will be of service to persons visiting the country. Means of communication are laid down, and a good general idea of the physical features is given. All land lower than 1500 feet above sea-level is coloured green, and the positions of native kraals, approximate elevations, and nature of the forests are indicated by symbols.

Tunis. **Babelon, Cagnat, and Reinach.**

Atlas Archéologique de la Tunisie. Edition spéciale des cartes topographiques publiées par le Ministère de la Guerre, accompagnée d'un Texte Explicatif par MM. E. Babelon, R. Cagnat, S. Reinach, membres de la Commission de l'Afrique du Nord. Description de l'Afrique du Nord entreprise, par ordre de M. le Ministre de l'Instruction Publique et des Beaux-Arts. Parts iii. and iv. Paris: Ernest Leroux, 1895–96.

This atlas is being compiled under the direction of the Minister of Public Instruction and Fine Arts. It is composed of the sheets of the large-scale government survey of Tunis, on which archæological information is given. It is accompanied by letterpress, written by MM. E. Babelon, R. Cagnat, and S. Reinach.

West Africa. **Marchand.**

Mission Marchand, le Transnigérien, le Bandama et le Bagoé. Carte levée et dressée de 1892 à 1895. Par le Capitaine Marchand. Scale 1: 500,000 or 8

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence

Qatar National Library

stat. miles to an inch. 2 sheets and letterpress. Service Géographique des Colonies, Paris, 1896. *Presented by the Service Géographique des Colonies.*

This map is based on the results obtained by Captain Marchand during his third journey in the vicinity of the great bend of the Niger, the surrounding country having been taken from Captain Binger's map of 1892. In addition to this, the itineraries of other travellers have been used, while some of the country has been sketched in from native report. The lines of railway which it is proposed to construct are laid down, and the position of all military posts and the limits of forests are shown. The map is accompanied by an index of names and explanatory letterpress.

West Africa. **Pobéguin.**

Carte de la Côte d'Ivoire (Région Côtière de Fresco au Cavally). Levée et dressée par H. Pobéguin, Administrateur Colonial, par ordre de M. le Gouverneur Binger, 1895–96. Scale 1 : 150,000 or 2·3 stat. miles to an inch. Sheets : Cavally, Grabo—Haut San Pedro, Kremoue—Kouati, Doboue—Sassandra, Fresco—Haut Sassandra, Daguire—San Pedro, Drewin—Tabou, Béréby—Cap des Palmes, Cavally. Ministère des Colonies. Paris, 1896. *With Index. Presented by the Service Géographique des Colonies, Paris.*

These sheets complete the map of the Ivory Coast, which embraces the country between the Cavally river on the west and the Bandama on the east. It contains a large amount of detail, and is accompanied by an index sheet.

AMERICA.

United States. **U.S. Geological Survey.**

Geologic Atlas of the United States. Scale 1 : 125,000 or 2 stat. miles to an inch, and 1 : 250,000 or 4 stat. miles to an inch. Folios : Stevenson (Alabama, Georgia, Tennessee); Lassen Peak, Smartsville, Marysville (California); Pike's Peak (Colorado); Nomini (Maryland, Virginia); Three Forks (Montana); Cleveland, Pikeville, McMinnville, London (Tennessee); Knoxville (Tennessee, North Carolina); Fredericksburg (Virginia, Maryland); Staunton (Virginia, West Virginia). Department of the Interior, United States Geological Survey; J. W. Powell, Director. Washington, D.C. *Presented by the U.S. Geological Survey.*

Venezuela. **Sievers.**

Nördliches Venezuela. II. Hohenschichten, Hydrographie, Orte u. Verkehrswege. Scale 1 : 3,000,000 or 47·3 stat. miles to an inch. Von W. Sievers. Petermann's 'Geographische Mitteilungen,' Jahrgang 1896, Tafel II. Gotha : Justus Perthes. *Presented by the Publisher.*

AUSTRALIA.

Western Australia. **Stanford.**

The Western Australia Goldfields. Scale 1 : 1,647,360 or 26 stat. miles to an inch. Edward Stanford. London, 1896. *Presented by the Publisher.*

On this map the positions of all the principal goldfields of Western Australia are indicated, but, in addition to this, it is a good map of the south-west portion of the colony, on which all railways, roads, and explorers' routes are laid down.

World. **Bartholomew.**

Handy Reference Atlas of the World. Edited by J. G. Bartholomew, F.R.S.E., F.R.G.S. Fifth edition, with complete index and geographical statistics, 1896. London : John Walker & Co., Ltd. *Prices 7s. 6d. and 10s. 6d. Presented by the Publishers.*

This atlas has now reached its fifth edition. It has been revised, and several new maps have been added. Being of octavo size, it will be found very handy for reference when reading a newspaper or book.

PHOTOGRAPHS.

Malay Peninsula. ———

Four photographs of the Sakai natives of the Malay Peninsula, taken in 1894–95. *Presented by George C. Morant, Esq.*

These photographs will be chiefly interesting to anthropologists. They were taken for Mr. George C. Morant, 1894–95.

N.B.—It would greatly add to the value of the collection of Photographs which has been established in the Map Room, if all the Fellows of the Society who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they will be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

DISINTEGRATING
AND
SCREENING MACHINERY
FOR ALL KINDS OF MATERIAL.

THE "DEVIL" DISINTEGRATOR is the best for moderately fine and coarse grinding.

THE "MULTIPLE" GRINDER is the best for very fine and impalpable grinding.

THE MAGNETIC SEPARATOR is the most Perfect Machine for Separating Iron and Steel from any other material.

THE VIBROMOTOR provides a New Mechanical Motion by which Oscillating, Shaking, and Gyrating Machinery can be worked **without the usual objectionable and harmful vibration of the whole fabric and buildings connected with such machinery,** and is the best method of working Coal Screens, Separators, Concentrators, and all Screening Machinery.

BENJAMIN EDGINGTON'S
Tents and Outfits for Africa and the Tropics.
DOUBLE-ROOF RIDGE TENT
As supplied to the Fellows of the Royal Geographical Society.

Made from a Special Canvas, treated by the Copper Rot-Proof Process.

"*December* 3, 1895.

"Dear Sir,

"After four years in East Central Africa, I have no hesitation in saying that, as far as my experience and observation go, your tents are the best that can be procured.

"I have seen other tents, when almost new, torn to pieces after a tropic storm, or giving way after one rainy season, while one of your double-roof tents which I used constantly for two years in Central Africa, is still as strong and sound as ever.

"Yours faithfully,
"R. U. MOFFAT, M.B.,
"Medical Officer, Uganda Protectorate."

H.M. Commissioner H. H. JOHNSTONE writes:—"Nothing could be more serviceable or thoroughly good than those last supplied by yourself, August 16, 1893." (Order for Tents.)

Surgeon-Major PARKE wrote, March 28, 1893:—"I lived under canvas almost continually from 1887 until we emerged from Africa with Emin Pasha in December, 1889. *Unquestionably* yours *are the best Tents made.*"

W. GORDON STABLES, M.D., R.N., says:—"Mr. Edgington's Tents and Cots are the best in the world for comfort in camping out."

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that,

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his admission fee, and "£2 as his first annual subscription, or he may compound, either at his entrance by one payment of "£35, or at any subsequent period on the following basis:—

Fellows of 20 years' standing and over	...	...	...	£12 10s.
„ 15 „ „	and under 20	...	...	£16
„ 10 „ „	„	15	...	£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the Society so long as "he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's Periodical Publications.

Copies of the Regulations and Candidates' Certificates may be had on application at the Society's Office, 1, Savile Row, London, W.

GABARDINE COMBINATION SPORTING OUTFITS

OUTSIDE GABARDINE, INSIDE RAIN-PROOFED TWEEDS (Burberry's Patent).

PROOF AGAINST WAIT-A-BIT THORNS AND SPEAR-GRASS. RAIN, SLEET, OR SNOW. HOT AND COLD WINDS. ANTS AND TROPICAL INSECTS.

(The latter points are of special importance for India and Africa.)

Yet perfectly VENTILATING, very DURABLE, and as COMFORTABLE as ordinary Tweed Garments.

"For lightness combined with strength, nothing has been found to equal the material known as GABARDINE, manufactured by Burberry, of Basingstoke. This substance deserves special recommendation, as one suit will generally outlast three or four made of other and perhaps more expensive cloth."—*The Sportsman in South Africa.*

Write to **T. BURBERRY & SONS,** 30, Haymarket, LONDON, and BASINGSTOKE,

Stating climate required for, and Estimates, Information, and suitable Patterns will be sent free.

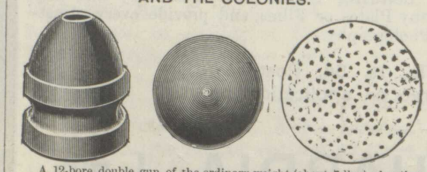
NOTICE.

PHOTOGRAPHS.



ROYAL GEOGRAPHICAL SOCIETY.

It would greatly add to the value of the Collection of Photographs which has been established in the Map Room of the Royal Geographical Society, if all the Fellows who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they would be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

J. & W. TOLLEY'S

"UBIQUE" Ball and Shot Gun.

AN INVALUABLE WEAPON FOR INDIA AND THE COLONIES.

A 12-bore double gun of the ordinary weight (about 7 lbs.), shooting from both barrels shot with the pattern and penetration of a first-class shot-gun, and conical bullets up to 150 yards, with the accuracy of an Express rifle.

PRICE FROM 20 GUINEAS.

Col. PARKER-GILMORE (the eminent author and explorer) writes: "The 'Ubique' is a weapon I should advise all visitors to India or Africa to become possessed of."

From Lieut. H. M. BIDDULPH, Rifle Brigade, Srinagar, Kashmir, India, June 10, 1893: "I must write to thank you for the magnificent gun you made for me. I mean the 'Ubique' 12-bore. I consider it a marvellous weapon, and fully equal to, if not a great deal better than, the various similar weapons in the market. What astonished me is that you do not advertise it to shoot well up to 150 yards. I have made two bulls out of three shots with it at that distance, and on two or three occasions have killed running animals with it at 160 to 180 yards. In a year's shooting trip I have killed more than half my total bag with it. *The shooting at small game was most satisfactory. I brought down two mallard with it at 45 yards. Geese, duck, ramchikor, chikor, sand-grouse, pigeons, snipe, and hares were shot with it. I give you a complete analysis of its doings.*"

From O. J. MORRIS, Esq., Fort Victoria, Mashonaland, S. Africa, May 28, 1893: "Both the weapons ('Ubique' and '577 'Magnum' express rifle) are most satisfactory. J—— shot a fine lioness with the 'Ubique' one early morning. It has demolished various big buck, and one of the biggest Koodoo Bulls I ever saw was killed by J—— with it, and with shot it has kept the camp well supplied with birds. *Game is getting rather scarce about here, and some other waggons travelling with us depend entirely on us for meat.*"

"UBIQUE" GUNS

FOR LARGE GAME SHOOTING.

MADE IN 10 AND 8 BORES.

10-bore firing 8 drs., and 8-bore firing 10 drs., powder.

Giving greater penetration than a rifle. Light and handy as a gun.

NOTICE.

The "PROCEEDINGS OF THE ROYAL GEOGRAPHICAL SOCIETY," new series, consists of 14 volumes, extending from 1879 to 1892.

Each volume covers on an average 840 pages, the selling price being 18s. per volume.

These volumes not only contain full reports of the papers read at the Royal Geographical Society, by all the great travellers and geographers of the period, but constitute a record of exploration and geographical work in all parts of the world.

Each volume contains numerous maps, all of them original, embodying the results of exploration, and executed in the best style. In the 14 volumes there are some 350 maps, besides numerous illustrations of characteristic scenery in the least-known parts of the world.

It is believed that a complete set of the *Proceedings* would be a valuable addition to public libraries and other institutions, while many private individuals might wish to have the volumes. As it is desired to reduce the stock in hand, the series is now offered, bound in cloth, at £6 per set. Application to be made to the Chief Clerk, Royal Geographical Society, 1, Savile Row, London, W.

In addition to the *Proceedings*, the Society has issued four volumes of "Supplementary Papers," containing a large number of Memoirs and Narratives of considerable length, besides several valuable Bibliographies. These will be sold for half price, £2 for the four volumes. These contain over 30 Maps and numerous Illustrations.

PUBLISHERS' ANNOUNCEMENTS.

The attention of Fellows of the Society is called to the following new books of Travel, etc.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

HISTORICAL CHURCH ATLAS.

Illustrating the History of Eastern and Western Christendom until the Reformation, and that of the Anglican Communion until the present day. By EDMUND MCCLURE, M.A. Containing 18 Coloured Maps, and some 50 Sketch-Maps in the Text. Demy 4to, cloth boards, leather back, 16*s*.

This Atlas is intended to indicate some of the stages of the Church's expansion, and at the same time to show briefly the interdependence of ecclesiastical and secular history. The information given on the maps has been necessarily limited by their size and number, but the main features of the spread of the Christian faith have been, it is hoped, broadly traced, and the allied changes in political geography sufficiently depicted.

THE ANCIENT HEBREW TRADITION AS ILLUSTRATED BY THE MONUMENTS. A Protest against the Modern School of Old Testament Criticism. By Dr. FRITZ HOMMEL, Professor of the Semitic Languages in the University of Munich. Translated from the German by EDMUND MCCLURE, M.A., and LEONARD CROSSLÉ. With Map. Large post 8vo, buckram boards, 5*s*.

"Under the weight of Dr. Hommel's cumulative evidence, the latest fortress of the 'Higher Criticism' will have to be promptly evacuated or surrendered at discretion. The book has been admirably translated by Mr. McClure and his coadjutor."—*Daily Chronicle.*

"We are profoundly grateful to Dr. Hommel for work whose results will do much to reassure many a timid and distressed believer."—*Record.*

"We can recommend Dr. Hommel's well-argued and deeply interesting book to the careful consideration of all Biblical students."—*Oxford Review.*

THE STRUGGLE OF THE NATIONS: EGYPT, SYRIA, AND ASSYRIA. By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. MCCLURE. With Maps, Three Coloured Plates, and over 400 Illustrations. Demy 4to (approximately), cloth, bevelled boards, 25*s*.; half-morocco (bound by Riviere), 50*s*.

This is a companion volume to "The Dawn of Civilization," and contains the history of the ancient peoples of the East from the XIVth Egyptian Dynasty to the end of the Ramesside period. This interval covers the sojourn of the Israelites in Egypt and their Exodus therefrom. The recent discovery of an Egyptian stele mentioning the Israelites gives special interest to this volume, where the matter is discussed with his usual acumen by the author.

"The translation by M. L. McClure is in both cases excellent. Professor Maspero's presentation of the new learning is at once eminently popular and attractive."—*Times.*

"The author has throughout attempted to reproduce for us the daily life of the various peoples of whom he treats, and in this he has succeeded admirably."—*Academy.*

THE DAWN OF CIVILIZATION (EGYPT AND CHALDÆA). New and Revised Edition. By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. MCCLURE. With Map and over 470 Illustrations, including Three Coloured Plates. Demy 4to (approximately), cloth, bevelled boards, 24*s*.; half-morocco (bound by Riviere), 48*s*.

*** Professor Maspero, by using the result of the most recent researches in Egypt and Mesopotamia, has brought this new Edition up to the latest date.

STAR ATLAS. Gives all the Stars from 1 to 6·5 magnitude between the North Pole and 34° South Declination, and all Nebulæ and Star Clusters which are visible in telescopes of moderate powers. Translated and adapted from the German of Dr. KLEIN, by the Rev. E. MCCLURE, M.A. Imperial 4to, with 18 Charts and 80 pages Illustrative Letterpress. Cloth boards, 7*s*. 6*d*.

EVENINGS AT THE MICROSCOPE; OR, RESEARCHES AMONG THE MINUTER ORGANS AND FORMS OF ANIMAL LIFE. By the late P. H. GOSSE, F.R.S. A New Edition, Revised by A. JEFFREY BELL, M.A., Secretary R.M.S., Professor of Comparative Anatomy and Zoology in King's College, London. Profusely Illustrated. Crown 8vo, cloth boards, 5*s*.

THE ROMANCE OF SCIENCE: The Machinery of the Universe. Mechanical Conceptions of Physical Phenomena. By A. E. DOLBEAR, A.B., A.M., M.E., Ph.D., Professor of Physics and Astronomy, Tuft's College, Mass. Small post 8vo, with several Diagrams, cloth boards, 2*s*.

PATRIARCHAL PALESTINE. By the Rev. A. H. SAYCE, Professor of Assyriology, Oxford. Crown 8vo, with Map, buckram boards, 4*s*.

This book is the first to apply the Tel-el-Amarna tablets, both published and unpublished, towards elucidating the condition of Syria at this period. It also contains a recent and important revision of the Egyptian Geographical Lists bearing on Palestine.

THE "HIGHER CRITICISM" AND THE VERDICT OF THE MONUMENTS. By the Rev. Professor SAYCE, Queen's College, Oxford. Fifth Edition. Demy 8vo, buckram, bevelled boards, 7*s*. 6*d*.

"A really valuable and important work; perhaps the best which Professor Sayce has yet written."—*Academy.*

ANCIENT HISTORY FROM THE MONUMENTS—THE HISTORY OF BABYLONIA. By the late GEORGE SMITH. Edited and brought up to date by the Rev. Professor A. H. SAYCE. Fcap. 8vo, cloth boards, 2*s*.

BIBLE PLACES; OR, THE TOPOGRAPHY OF THE HOLY LAND. A Succinct Account of all Places, Rivers, and Mountains of the Land of Israel mentioned in the Bible, so far as they have been Identified; together with their Modern Names and Historical References. By the Rev. Canon H. B. TRISTRAM, D.D., LL.D., F.R.S. New Edition, brought up to Date. With Map. Crown 8vo, half bound, 5*s*.

LONDON: NORTHUMBERLAND AVENUE, W.C.; 43, QUEEN VICTORIA STREET, E.C.
BRIGHTON: 129, NORTH STREET.

MESSRS. METHUEN'S LIST.

TO BE PUBLISHED SHORTLY.

FROM TONKIN TO INDIA. By Prince Henri of Orleans. Translated by Hamley Bent, M.A. With 80 Illustrations and Map. Crown 4to, 25*s.*

The travels of Prince Henri in 1895 from China to the valley of the Bramaputra covered a distance of 2100 miles, of which 1600 was through absolutely unexplored country. No fewer than seventeen ranges of mountains were crossed at altitudes of from 11,000 to 13,000 feet. The journey was made memorable by the discovery of the sources of the Irrawaddy.

THREE YEARS IN SAVAGE AFRICA. By Lionel Decle. With an Introduction by H. M. Stanley, M.P. With 100 Illustrations and 5 Maps. Demy 8vo, 21*s.*

Few Europeans have had the same opportunity of studying the barbarous parts of Africa as Mr. Decle. Starting from the Cape, he visited in succession Bechuanaland, the Zambesi, Matabeleland, and Mashonaland, the Portuguese settlement on the Zambesi, Nyasaland, Ujiji, the head-quarters of the Arabs, German East Africa, Uganda, and British East Africa.

ADVENTURE AND EXPLORATION IN AFRICA. By Captain A. St. H. Gibbons, F.R.G.S. With Illustrations by C. Whymper, Photographs, and Maps. Demy 8vo, 21*s.*

This is an account of travel and adventure among the Marotse and contiguous tribes. There is a map by the author of the hitherto unexplored regions lying between the Zambesi and Kafukwi rivers and from 18° to 15° S. lat.

BRITISH CENTRAL AFRICA. By Sir H. H. Johnston, K.C.B. With 220 Illustrations and 6 Maps. Crown 4to, 30*s.* net.

"A fascinating book written with equal skill and charm—the work at once of a literary artist and of a man of action, who is singularly wise, brave, and experienced."—*Westminster Gazette.*

"This book takes front rank as a standard work by the one man competent to write it."—*Daily Chronicle.*

THE HILL OF THE GRACES: or, The Great Stone Temples of Tripoli. By H. S. Cowper, F.S.A. With Maps, Plans, and 75 Illustrations. Demy 8vo, 10*s.* 6*d.*

A record of two journeys through Tripoli in 1895 and 1896. The book treats of a remarkable series of megalithic temples which have hitherto been uninvestigated, and contains a large amount of new geographical and archæological matter.

THE BENIN MASSACRE. By Captain Boisragon. With Map and Portrait. (Second edition.) Crown 8vo, 3*s.* 6*d.*

This book is written by one of the two survivors of the massacre.

"The most impressive and moving narrative of African adventure and of British bravery that we have read for many months."—*Daily Mail.*

"Realistic and terrible."—*Morning Post.*

MESSRS. METHUEN'S NEW CATALOGUE and BOOK GAZETTE sent to any address.

METHUEN & CO., 36, Essex Street, W.C.

SAMPSON LOW, MARSTON & COMPANY'S NEW BOOKS OF TRAVEL AND ADVENTURE.

THE PIONEERS OF THE KLONDYKE: BEING AN ACCOUNT of two years' police service on the Yukon. Narrated by M. H. E. Hayne, of the North-West Mounted Police, and recorded by H. West Taylor. Illustrated by photographs taken on the spot by the narrator. Crown 8vo, cloth, 3*s.* 6*d.*

ROUGHING IT IN SIBERIA. With some account of the Trans-Siberian Railway and the Gold-Mining Industry of Asiatic Russia. By Robert Louis Jefferson, Author of "Awheel to Moscow," etc. With Map and numerous Illustrations. Crown 3vo, cloth, 5*s.*

THE FARÖE ISLANDS. By J. Russell-Jeaffreson, F.R.G.S., Author of "The Most Northerly Hospital in the World," "Sport in Iceland and Spitzbergen," etc. With Map and Illustrations. Crown 8vo, cloth, 7*s.* 6*d.*

The author records his personal experiences during a summer tour in the Farões, and gives an historical account of the Islands, together with a detailed description of the whaling and other industries. Sport, both with rod and gun, forms a prominent feature of the volume, and there is no stint of anecdote, incident, and adventure.

NEW AND CHEAPER EDITION OF MR. H. M. STANLEY'S GREAT WORK.

Carefully Revised throughout by the Author, with a New Preface, and somewhat Abridged by the omission of matter no longer of interest.

IN DARKEST AFRICA: OR, THE QUEST, RESCUE, AND retreat of Emin Pasha, Governor of Equatoria. By H. M. Stanley, M.P., D.C.L., etc. Crown 8vo, with Map and all the Original Illustrations, cloth, 5*s.*; gilt edges, specially suitable for schools prize book or Christmas gift. 6*s.*

JOURNAL OF A TOUR IN CANADA, THE UNITED STATES, and Mexico. By Winefred, Lady Howard of Glossop. With 32 Illustrations. Crown 8vo, cloth, 7*s.* 6*d.*

JOURNEYS AMONG THE GENTLE JAPS IN THE SUMMER of 1895. By the Rev. J. Ll. Thomas, M.A., F.R.G.S. With a Special Chapter on the Religions of Japan, a Map and Portrait. Crown 8vo, cloth, 7*s.* 6*d.*

"A very pleasant and readable account of certain phases of Japanese life. . . . Mr. Thomas has used excellent powers of perception to no small advantage."—*World.*

SIAM: ON THE MEINAM FROM THE GULF OF AYUTHIA. By Maxwell Sommerville, Professor of Pennsylvania University. Together with Three Romances illustrative of Siamese Life and Customs. With 50 Illustrations. Demy 8vo, cloth, 14*s.*

London: SAMPSON LOW, MARSTON & COMPANY, Limited, St. Dunstan's House, Fetter Lane, E.C.

CLOTHED WITH AIR

CELLULAR UNDERWEAR AND SHIRTS.

THE HEALTHIEST AND MOST ECONOMICAL FOR TRAVELLERS.

Extract from C.T.C. HANDBOOK AND GUIDE, 1896-97, p. 52.

"From the peculiar manner in which CELLULAR CLOTH is woven (forming a network of minute air-cells next the skin), it allows, even more fully than wool, the free evaporation of perspiration on the side next the skin. . . . It is less bulky, and is lighter to carry; it dries much more quickly; it is more easily washed, and its prime cost is much smaller. Last, but not least, it is quite free from that bane of all woollen goods, the liability to shrinkage."

BEST FOR ALL SEASONS AND CLIMATES.

ESTIMATES FOR OUTFITS SUPPLIED ON APPLICATION.

To be obtained in all the principal cities and towns in the United Kingdom, the Colonies, and India.

Illustrated Price List of full range of Cellular goods for Men, Women, and Children, sent Post Free on application.

DR. J. COLLIS BROWNE'S CHLORODYNE

ONLY GENUINE

ORIGINAL AND

IS THE GREAT SPECIFIC FOR CHOLERA,

COUGHS, COLDS, ASTHMA, BRONCHITIS.

DIARRHŒA, DYSENTERY.

We have never used any other form of this medicine than Collis Browne's, from a firm conviction that it is decidedly the best, and also from a sense of duty we owe to the profession and the public as we are of opinion that the substitution of any other than Collis Browne's is a deliberate breach of faith on the part of the chemist to prescriber and patient alike.—We are, Sir, faithfully yours, SYMES & CO., *Members of the Pharmaceutical Society of Great Britain, His Excellency the Viceroy's Chemists.*

DR. J. COLLIS BROWNE'S CHLORODYNE. — Dr. J. C. BROWNE (late Army Medical Staff) DISCOVERED a REMEDY to denote which he coined the word CHLORODYNE. Dr. Browne is the SOLE INVENTOR, and, as the composition of Chlorodyne cannot possibly be discovered by Analysis (organic substances defying elimination), and since the formula has never been published, it is evident that any statement to the effect that a compound is identical with Dr. Browne's Chlorodyne *must be false.*

This Caution is necessary, as many persons deceive purchasers by false representations.

GENERAL BOARD of HEALTH, London, REPORT that it ACTS as a CHARM, one dose generally sufficient.

Dr. GIBBON, Army Medical Staff, Calcutta, states: "2 DOSES COMPLETELY CURED ME of DIARRHŒA."

From SYMES & Co., Pharmaceutical Chemists, Simla. *Jan.* 5, 1880.

To J. T. DAVENPORT, London.

DEAR SIR, — We congratulate you upon the widespread reputation this justly-esteemed medicine has earned for itself all over the East. As a remedy of general utility, we much question whether a better is imported, and we shall be glad to hear of its finding a place in every Anglo-Indian home. The other brands, we are happy to say, are now relegated to the native bazaars, and, judging from their sale, we fancy their sojourn there will be but evanescent. We could multiply instances *ad infinitum* of the extraordinary efficacy of DR. COLLIS BROWNE'S CHLORODYNE in Diarrhœa and Dysentery, Spasms, Cramps, Neuralgia, the Vomiting of Pregnancy, and as a general sedative, that have occurred under our personal observation during many years. In Choleraic Diarrhœa, and even in the more terrible forms of Cholera itself, we have witnessed its surprisingly controlling power.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Vice-Chancellor Sir W. PAGE WOOD stated publicly in Court that Dr. J. COLLIS BROWNE was UNDOUBTEDLY the INVENTOR of CHLORODYNE, that the whole story of the defendant Freeman was deliberately untrue, and he regretted to say it had been sworn to."—See *The Times*, July 13th, 1864.

DR. J. COLLIS BROWNE'S CHLORODYNE is the TRUE PALLIATIVE in NEURALGIA, GOUT, CANCER, TOOTHACHE, RHEUMATISM.

DR. J. COLLIS BROWNE'S CHLORODYNE is a liquid medicine which assuages PAIN of EVERY KIND, affords a calm refreshing sleep WITHOUT HEADACHE, and INVIGORATES the nervous system when exhausted.

DR. J. COLLIS BROWNE'S CHLORODYNE rapidly cuts short all attacks of EPILEPSY, SPASMS, COLIC, PALPITATION, HYSTERIA.

IMPORTANT CAUTION.

The IMMENSE SALE of this REMEDY has given rise to many UNSCRUPULOUS IMITATIONS. Be careful to observe Trade Mark. Of all Chemists, 1s. 1½d., 2s. 9d., and 4s. 6d.

SOLE MANUFACTURER,
J. T. DAVENPORT, 33, Gt. Russell St., W.C.

TENTS

FOR THE

TRAVELLER

AND

EXPLORER.

Write for our "Red Bound Catalogue" of Tents and Camp Equipment, post free.

THE MOST PERFECT TENT is PIGGOTT BROS. & CO.'S "PROSPECTING TENT." Made double. The inner roof being suspended 12 inches below the ridge, allows of a free circulation of air between the outer and inner roofs. The inner roof has ventilators, protected by mosquito net. *Made from Green Waterproof and Rot-Proof Canvas.*

PIGGOTT BROS. & CO., MANUFACTURERS,
57, 58, 59, Bishopsgate Street Without, LONDON.

EXPLORERS AND TRAVELLERS

Should always include in their food stores a supply of

BOVRIL

Which contains in an easily digestible form the entire nourishment of Prime Ox Beef, obtained from selected cattle reared in Australia and South America.

In Nansen's "Farthest North" a Photograph taken by Dr. Nansen of the "Fram" embedded in the Ice shows packages branded BOVRIL containing our food preparations taken by the gallant explorer.

BOVRIL (British, Foreign, and Colonial) LTD., LONDON,

FOOD SPECIALISTS AND CONTRACTORS TO H.M.'S GOVERNMENT.

BRITISH LIBRARY

The
Geographical Journal.

No. 6. DECEMBER, 1897. Vol. X.

THE PRESIDENT'S OPENING ADDRESS, NOVEMBER 8, 1897.

During the recess geographers and explorers have not been idle. Progress has been made and good work has been done in several directions, to which it becomes my duty to allude in opening the present session. The most important step taken by the Council has been the resolution to grant diplomas to students who had gone through a complete course under Mr. Coles. This measure has already had an excellent effect on our system of instruction, and I have no doubt that the diploma will be very highly valued, and sought for by increasing numbers of candidates. Its possessor will, if his ambition leads him either to active work in the field or to the equally useful labours connected with literature and education, find that our diploma will often serve him in good stead. Our graduates will be included in the list of referees.

The gigantic task of making a classified catalogue of our library is at length so far completed that the tickets are all arranged in continents, Asia is arranged in countries and has been used by Fellows, and Europe is quite completed, and has been much used for reference. Cards for all works and periodicals of the last five years are kept complete and ready for the use of readers. The whole number of title-cards is 71,735. The execution of such a vast undertaking involves much thought, as well as hard work, and reflects great credit on Dr. Mill, our librarian, and on Mr. Heawood, his assistant in this task.

Before passing on to the work of our explorers, I must dwell on the loss we have sustained by the death of Sir Rutherford Alcock. I was his colleague on the Council for a period of twenty years, and had good reason to know how anxious he always was to further the best interests of our Society. Judicious, patient, and courteous, he was esteemed by us all, and his able advice helped us out of many a difficulty. The

مكتبة قطر الوطنية
Qatar National Library

period of his presidency will always be remembered for the energy with which he advocated African exploration, the results of his efforts being represented by the memorable expeditions of Joseph Thomson.

The recess has been signalized by the publication of two important geographical works: the admirable monograph on British Central Africa, by Sir Harry Johnston, with its fascinating chapters on the scenery and the physical aspects of that region; and the 'First Crossing of Spitsbergen,' by Sir Martin Conway; while we have ourselves brought out Sir William Macgregor's interesting paper on British New Guinea in the form of a small volume.

There has also been much activity in the field, the fruits of which you will, I trust, gather and enjoy during the coming session. In Africa, Mr. Cavendish, who only completed his twenty-first year last May, has made a very remarkable journey from Berbera, across the Somali country, to the river Jub, and then inland to Lake Rudolf. He shares with the late Captain Bòttego the honour of being the first to explore the western shores of that lake; he has collected important information respecting the region between the basin of Lake Rudolf and the White Nile, has helped to solve the problem of the Omo river, and has returned to the coast at Mombasa. With regard to Siam, we may expect another communication from Mr. H. Warington Smyth, whose two previous papers give us the assurance that it will be a valuable contribution to our knowledge, as well as a source of pleasure to those who listen to it. In Central Asia the labours of Dr. Sven Hedin, which have been continuous during several years, are of great geographical importance. Among other achievements, he has ascended Mustagata to a height of 20,000 feet, and mapped its glaciers; he has, at the utmost peril of his life, crossed the desert of moving sandhills between the Yarkand and Khotan rivers; he has traversed a previously unknown route along the northern rim of the great Tibetan plateau; and he has solved the geographical problem relating to Lob Nor. We hope to have Dr. Sven Hedin with us on the 22nd, when we shall listen to a paper of the deepest interest, read by a young but most accomplished and enthusiastic geographer. Dr. Sven Hedin has devoted himself to the study of geography since he was a boy at school, is a splendid linguist, and is well versed in all those collateral studies which are required by those who wish to become real adepts in our science.

Not less important and quite as interesting are the explorations now being carried on in the Afridi country by our gallant associate, Sir William Lockhart. We must all feel enthusiastic on reading of the skill and ability with which my old friend is conducting a most difficult campaign, and of the brilliant dash and devotion of the Gordon Highlanders and other troops who are serving under him. As Fellows of this Society, we rejoice that the success of our arms also entails successes for the cause of geography.

BRITISH LIBRARY

Our friend and associate, Mr. Fitzgerald, is also returning from his arduous examination of Aconcagua, which is believed to be the loftiest peak in the Chilian Andes. Personally I have taken a great interest in this last enterprise of the gallant young explorer, because I have known the mountain of Aconcagua by sight better than any other in the world, gazing at it daily during many months that I was at Valparaiso, and once having had a nearer view of it, from a shoulder of the Campana de Quillota. That Mr. Fitzgerald will give us an exceedingly valuable account of his labours in the Andes we, who know his powers of description, can have no doubt. I may add that there is no region in the world less known than, and which offers so many geographical problems for solution as, portions of the Chilian Andes to the south of Aconcagua.

There will, so far as I am aware, be no new work from the antarctic regions during the ensuing season, unless, as I hope, the Belgian Expedition, commanded by M. de Gerlache, should be able to send news of any discovery before the close of the session. But the efforts of our Council to procure the despatch of a British Antarctic Expedition have never ceased. Last June we had a conference, and subsequent correspondence with the Australasian premiers and agents-general on the subject; and an appeal has since been made to Lord Salisbury. Meanwhile Sir George Newnes has supplied funds for an enterprise, to be conducted by Mr. Borchgrevink, who, it will be remembered, visited Victoria Land in 1895, on board the whaler *Antarctic*, commanded by Captain Kristensen. I understand that his plan is to sail from England next July, land at Cape Adare in Victoria Land, winter there, and attempt to make a journey into the interior in the spring. We wish Mr. Borchgrevink all possible success in his undertaking.

In the arctic regions there has been much activity this summer, and it is reported that it was the most open season that has been known for many years. We hear this from Mr. Jackson; from Mr. Pike, who sailed round Wyche's Land to the east of Spitsbergen; and from Colonel Feilden, who has been in the Kara sea and along the east side of Novaya Zemlya. We look forward to an account of his second visit to Spitsbergen from Sir Martin Conway; and to interesting papers from Colonel Feilden and Mr. Arnold Pike, who will describe to us the very remarkable absence of ice this season in two distant parts of the northern seas.

In my report on our existing knowledge of the arctic regions, which was printed in our *Proceedings* for September, 1877, just twenty years ago, I pointed out that there were four important portions which needed exploration: First, the regions north and west of the Parry islands, to be reached by way of Jones sound; second, the north side of Greenland; third, the North-East Passage; and fourth, the exploration

مكتبة قطر الوطنية
Qatar National Library

of the archipelago known as Franz Josef Land. The first has not yet been attempted. With regard to the second, we hear of two contemplated undertakings. Mr. Peary intends to adopt the plan of taking Eskimo families up Smith sound, and, with their aid, to discover the most northern land to the north of Greenland. Captain Sverdrup, Nansen's companion, is fitting out the *Fram*, also with the intention of proceeding up Smith sound and exploring the unknown part of the north coast of Greenland. I greatly fear that neither Peary nor Sverdrup have any adequate conception either of the difficulty of navigating the channels beyond Smith sound, or of travelling over such ice as is met with beyond Robeson strait. This was not the route I recommended for completing the discovery of the Greenland coast, an achievement second to none in geographical interest. The third enterprise enumerated by me in 1877, namely, the North-East Passage, was achieved by Baron Nordenskjöld three years afterwards. It was reserved for the Jackson-Harmsworth expedition to achieve the fourth—the exploration of Franz Josef Land.

We now have to welcome Mr. Jackson, Mr. Armitage, and the other members of the expedition on their safe return, and to congratulate Mr. Harmsworth on the valuable results of his patriotic munificence. Our explorers have passed three consecutive winters in the arctic regions close to the 80th parallel. They have maintained themselves in excellent health throughout that long and trying period; they have diligently registered observations, and have completed exhaustive researches in the zoology, botany, and geology of a new region. This alone is a great work; but it is only a small part of what has been done under Mr. Jackson's command. That explorer, always, I believe, accompanied by Mr. Armitage, has made daring sledge-journeys and boat-voyages, and by these means he has given us a completely new idea of Franz Josef Land. In this present year, by the examination, under exceptionally trying and difficult circumstances, of the land mass to the westward, I think he has surpassed all he had done before, and it will now be our privilege to hear, from Mr. Jackson's own lips, the interesting story of his expedition and its work.*

RECENT JOURNEYS IN PERSIA.†

BRITISH LIBRARY

have been the constant theme of historians for more than two thousand years, but to-day it presents so great a variety of interesting problems, and has so faithfully preserved its ancient immutable civilization, that every traveller who has once crossed its great plateau is fired with the desire to return again and again. Before approaching the subject of my three journeys, I would give a brief description of the country upon which we are about to enter.

The kingdom of His Imperial Majesty the Shah stretches, roughly speaking, for 1000 miles from east to west, and for 800 miles from north to south—an area rather larger than that of the countries composing the Triple Alliance. In the provinces which border the Caspian sea the rainfall is very heavy, but, with that small exception, the most noticeable feature is the dryness of Persia, and this is the main cause of its delightful climate. I have mentioned this before anything else, as it appears to me that sufficient attention has not been paid to the enormous effect that deforestation has had, not only on Persia, but on Central Asia generally. It is this fact, and this alone, I would urge, that explains how great armies were able to march across countries the sterility of which would, at the present time, bar the progress of anything beyond a very moderate force; and, conversely, it is upon the successful solution of this problem that the future of these desiccated regions (I use the term advisedly) depends.

To continue, both on the north and south, the great Iran plateau is held up by mighty ranges, which are traversed by mule-tracks, and it is owing to the rugged nature of these passes that the isolation of Persia from the rest of the world is partly due. The plateau once reached, the traveller finds himself on a series of broad plains with mountain ranges on each side of him, which trend to the north-west with amazing regularity. For instance, when travelling to my district of Kerman, a distance of 600 miles from Tehran, I traversed the same great plain throughout, and never lost sight of the two parallel ranges at any portion of my journey. These mountains, which rise to great elevations, are, as my previous remarks would show, entirely bare of timber, while the whole country consists of desert with rare oases, dependent for their existence upon "kanats." By this term, underground channels which tap distant springs in the hills are signified, and it may be imagined how costly and laborious a system this is, the water being frequently carried a distance of over 30 miles to the village it supplies.

There are no navigable rivers in Persia, with the exception of the Karun, and it is extraordinary that between the Indus and this river, a distance of 1500 miles, no considerable body of water reaches the sea. To the north, owing to the heavier rainfall, it is different, and there are two or three rivers of moderate volume flowing into the Caspian sea.

This summary would not be complete without a reference to the

Qatar National Library

appalling wastes known respectively as the Dasht-i-Kavir and the Dasht-i-Lut. These two great deserts stretch right across Eastern and Central Persia, with the result that there is much less communication between neighbouring provinces of the Persian Empire than their juxtaposition would lead one to expect, the wastes of salt-swamp and sand dividing the districts more completely than any range of mountains, however difficult its passes might be.

It was at the beginning of 1893 that I obtained permission to rejoin the "Bays," at that time stationed in the Punjab, *viâ* Persia, and I first of all travelled to Odessa, where Colonel C. E. Stewart, Her Majesty's consul-general, and a prominent Fellow of this Society, not only gave me much valuable advice, but also furnished me with letters of introduction. In consequence, I did not enter Persia by the usual route, but crossed from Baku to Uzun-Ada, the starting-point of the Transcaspian railway, and thence steamed down the eastern coast of the Caspian to its south-east corner. At Ashurada, we lay to off the Russian naval station for a few hours, and soon after reached the end of the "Murdab," or lagoon, where we rowed through myriads of duck and every sort of aquatic bird, to the rickety pier of Bunder Gez, after traversing which, we found ourselves nearly up to the knees in mud. There being no hotel, and tents being out of the question, we were only too glad to find quarters at the telegraph office, where a room was placed at our disposal.

After two days' delay, we started for Astrabad in wet weather, and enjoyed a very full experience of what muddy roads can be. The mules were not so badly off, their loads being high up on their backs; but the ponies, which carried my servant and myself, must have been very weary, as we could hardly ever keep our feet out of the mud, so deep was it. Five hours' marching through the mire only brought us 7 miles on our way, but, as we were told that the road upon the morrow was much better, we decided to halt for the night, and found quarters in the village of Kurd Mahalla, in the house of its headman. Our host professed himself a profound theological student, and, after introducing the subject generally by stating that all Europeans worshipped machines, was anxious to know whether we English worshipped a steamer or a locomotive.

On the following morning the country, which had hitherto been a melancholy tangle of low thorns and bushes, became quite park-like, and, as it cleared up, matters looked more cheerful. On passing through the village, which covers a large area, we saw wheat being thrashed by means of a see-saw—a girl sitting on one end of the plank, and pulling herself up and down by a rope suspended above her. It was nearly sunset when, amid a deafening chorus of jackals, we entered the city of Astrabad, through a dilapidated gate. Inside not a soul was to be seen, and we rode on for a considerable distance before we pounced upon a

BRITISH LIBRARY

stray citizen, whom we induced to guide us to the house of the British agent. My first inquiries were as to the possibility of travelling up the river Atrek to Bujnurd, but my host told me that the country was so disturbed, that the Persian Government would insist on sending a large escort with me, which would have effectually prevented my mixing with the Turkomans, and so I determined not to seek any aid from the authorities.

For about a week I made constant shooting-trips into the Elburz range, during the course of which I bagged a few wild boar, but saw no sign of the magnificent stags that roam the forests. Meanwhile my

THE FARMAN FARMA'S GARDEN AT MAHUN.

preparations were being made, and upon their completion, I marched off due north across a rich alluvial plain, until we sighted Ak-Kala, a fort that commands the bridge over the Gurgan, and the home of the Kajar tribe, whose chief is now Shah of Persia. We then turned due east, and followed up the river, until we reached the encampment of Moussa Khan, the chief of the Ak Ata Bai, the most powerful tribe of Yomut Turkomans. The camp consisted of about thirty "alachuk," and as I lived in these superior nomad dwellings for nearly a month, it might be as well to describe them.

We must first of all imagine a huge beehive framework of wood, some 16 feet in diameter; over this thick black felt is stretched, and we have an ideal movable house, which, in cold weather, is infinitely superior to any tent. Inside are the "lares and penates," packed up in big trunks, while the rifles of the owners hang within easy reach.

BRITISH LIBRARY

Strips of carpet are stretched round wherever there are joinings in the felt, and altogether, when the fire is lit on the hearth, one enjoys a feeling of real comfort.

I had a letter of introduction from Colonel Stewart for my host, and in it my plan of travelling up the Atrek was mentioned. Moussa at first, however, utterly declined to help me, averring that I was sure to be robbed, if not killed, in which case he would be held responsible by the Persian Government. He was also at a loss to know the object of my journey, and, as Colonel Stewart had not mentioned that I was an officer travelling on leave, I told him that I was a Fellow of the Royal Geographical Society. When he found out that the object of this Society was the collection of geographical information, he could not conceal his contempt for a body which existed solely for this purpose, while I am afraid that he thought me mentally weak for taking so much trouble without the hope of making money thereby. For three days nothing was settled, a hot discussion being eternally carried on in Turkish, until I told him that if he would not help me, he would lower his reputation for hospitality in Europe—this is always a terrible threat—and, as I also presented him with a revolver, he finally agreed to send me on to the Atrek, where further arrangements would be made.

It was across the snowy steppe that we marched, after bidding farewell to our host at the ford of the Gurgan, or Wolf river, which is apparently the same as Hyrcania, the Greek name for this district. After a long day we sighted the Atrek, and were glad to reach an encampment, as the snow was falling somewhat heavily. In the morning I was informed that forage for the next five stages must be bought, as none could be procured further on. This was followed by an intimation that I must purchase a camel for £40 to carry it. Fortunately, I guessed that the desire to sell me a camel at five times its value was the reason for the alleged scarcity of barley, so I declined to do anything but move on. This was not so easy, as the Yomut Turkomans are very loth to speed the parting guest without first fleecing him, so that it was noon before the march was resumed, more or less parallel to the yellow-coloured Atrek, to which river, as to the Tiber, the epithet of "flavus" is most appropriate. Our way lay across what should be a fertile country, but the treeless, snow-covered steppe looked extremely dreary, and, to add to our discomfort, no meat was procurable, as all the sheep were dying of some disease, and we had, consequently, to depend upon shooting a few pigeons, which were hard to approach.

For two or three days we were accompanied by a "mollah," or priest, and, under his guidance, we steadily ascended the left bank of the Atrek, as far as a point opposite Chat, where we forded the river, and followed up the right bank through a mass of low hills. Our escort consisted of three or four Turkomans, who, whenever they met another

BRITISH LIBRARY

party, took the most warlike precautions, until they discovered whether those approaching were friends or foes. About 20 miles above Chat our priestly guide intimated that he was going no further, so, before continuing our march the next morning, I sent him a silver watch and a present of money. However, he returned them without thanks, and intimated that he would like my telescopic-sighted rifle, which he had greatly admired. At the same time the muleteers came in weeping, and said that the Turkomans were going to take their mules and also rob me. I tried to quiet them, and sent my servant into the "alachuk" to harangue the heads of the tribe, while I got the mules loaded

THE TAFTAN RANGE, SARHAD.

up. For an hour we waited, hearing only a stormy flow of Turkish from the council-room, so, when the mules were ready, I thought that I had better see what was going on. I found Joseph dancing about in an agitated state, and upon my entrance he told me that they plainly spoke of robbery, and would not let us leave. He advised the rather foolish expedient of attacking them; but, instead, I told him to say how I loved the mollah, and I patted that scoundrel so violently on the back to show my affection, that he could not go on speaking.

The Turkomans thought it very funny, and when I ran the mollah outside, they brought his horse, and he came along with us just as if everything had been arranged to his satisfaction. I forgot to mention

that, before the acute stage was reached, I was asked to give a letter for him to show in case of complaints. In it, I wrote that I expected to be robbed, and only hoped that any future traveller would have him punished, had he the chance. Before saying good-bye to our friend, who only accompanied us for a couple of miles, I offered to give him a second note. This he felt sure would not be as laudatory as he imagined the first to be, so he said that the former one would suffice, and I am confident that he considers it to be couched in the most complimentary terms. That night we were not asked into the village near which we halted; so, surmising from this pointed lack of hospitality that treachery was intended, we kept watch. At about 2 a.m. some six or seven Turkomans sneaked quietly out with their rifles, and approached the tent. Finding, however, that we were awake, they appeared to be surprised, and, after talking together, went quietly back to bed.

As we were close to the country of the Goklans, I decided to change my tactics, and on the following morning abused the Turkomans for their violation of hospitality, and threatened them with the vengeance of the Governor of Bujnurd, who was, I said, a great friend of the British Government. This bluff, which, I am sure, lost nothing when interpreted into Turkish, had its effect, and our guides, finding the game up, rode away, and, after firing a few shots at us from about half a mile off, to which we made no reply, left us in peace.

The Goklan Turkomans received us in quite a different manner, and said that Huck Nafass, our mollah, was not only "wanted" by the Persian Government for several acts of robbery, but that any Goklan would shoot him on sight, had he an opportunity. I was consequently delighted to feel that I had escaped from his clutches without harm, and can only put it down to the fact that, although I was without an escort, he imagined that I held some very strong cards up my sleeve. We were soon joined by Mustapha Kuli, who had been Captain Napier's guide in 1877, and it is, I think, thanks to him that I was so well treated.*

* Note on the Yomut and Goklan Turkomans.

(*a*) *Jafar Bai.*—This tribe inhabits the district near the mouth of the Atrek, and, as regards wealth, may be considered the most important division. They possess fisheries, and also cultivate more extensively; in addition to this, they engage in commerce.

The Jafar Bai have two divisions of Yarali and Norali, and number 2000 families to the south of the Atrek, and 1000 families to the north. They are generally on bad terms with the Ata Bai, their neighbours to the east.

(*b*) *Ata Bai.*—The Ata Bai include 2000 families to the south of the Atrek, and 1000 to the north. Although not as rich as the Jafar Bai, the Ata Bai have more power, as many of the smaller divisions are under their protection.

There is a subdivision called Ak Ata Bai. Ak = white.

(*c*) Friendly to, or perhaps under the protection of, the Ata Bai are the following divisions:—

We were told that the road to Bujnurd lay across the Hanaki pass to the south, and that we were to quit the Atrek, up which we had been marching hitherto. The cold was intense, although it was the middle of February, but once over the pass we descended rapidly, until, at Semalgan, two marches further on, we found the heat quite oppressive.

Before reaching the town of Bujnurd, we had to cross another range of hills, where the fresh snow was so deep that it took us

---

Ganyokmaz	400 families.
Bolgai	300 „
Daz	1000 „
Dovoji	1000 „
Badragh	200 „

These divisions are generally on terms of feud with—

Amir	100 families.
Kuchik	300 „
Tatar	100 „
Salak	100 „
Kujuk	1000 „

To summarize, of the Yomut tribe there are 8500 families in Persian territory, and 2000 in Russian territory to the north of the Atrek.

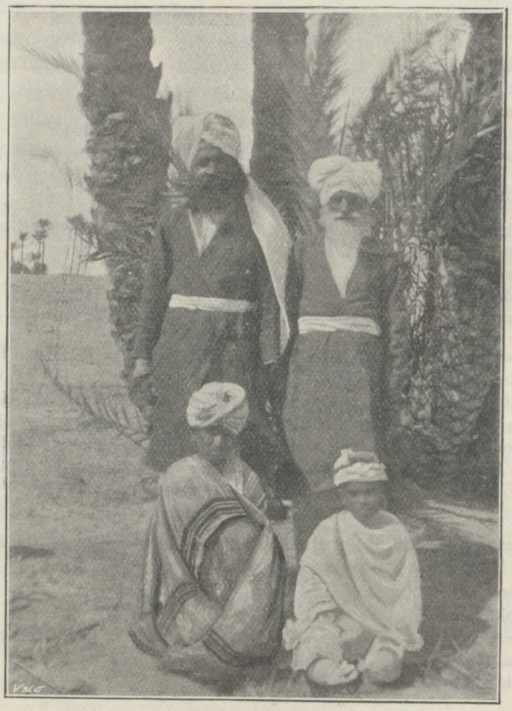
Perhaps 20 per cent. of the tribes on either side cross the Atrek in order to change their pastures; but this custom is on the decline, as a tax is charged on all the tribesmen who graze their flocks on the northern bank. All the Yomuts profess to be at feud with the Goklans, who are now a much weaker and quieter tribe than formerly.

Goklan Turkomans.

The following divisions inhabit Russian territory to the north of the Atrek, on the road between Kizil Arvat and Bujnurd.

Sorali	1500 families.
Toktamash	
Kek	
Kal Guzl	
Ak Kal	

The following subdivisions inhabit Persian territory:—



Kal Guzl	2500 families.
Toktamash	
Kai	
Tamak	
Eilyangi	
Ark Kali	
Karnas	
Dadi	
Kar Abali Khan	
Jan Ghur Balghy	

In former times the Goklan country was famous for its breed of horses, but, owing to its proximity to the powerful chief of Bujnurd, the tribe is now very quiet and weak, while its horses have shared in the general decline.

hours to accomplish even a few miles. Upon reaching the plain, whereon lies the city, I had my first experience of an "istakbal," or reception, a troop of Persian cavalry escorting us to the town, where we were lodged in one of the governor's houses. When we went to pay our respects, we were conducted up the winding staircase of a tower into the presence of the Sani-i-Dowleh, the redoubtable warden of the marches, who, for fifty years, has been warring against the

THE GOVERNOR OF MAGAS AND FAMILY.

Turkomans. His Excellency told me, that when he was a young man it was almost impossible to till the fields, and that at Bujnurd there were generally some hundreds of Turkoman prisoners, waiting to be ransomed or exchanged for captive Kurds. Nowadays there is comparative peace, cattle-lifting on a small scale having taken the place of the wholesale raids of the good old times.

My experiences among the Turkomans will show that they are still a somewhat wild and lawless race, but, from a reference to the pages of the great traveller, Vambéry, one can see how much Russia has

BRITISH LIBRARY

benefited Central Asia generally, and Persia in particular, by suppressing the Turkoman terror. These freebooters raided North-East and Central Persia down to the Dasht-i-Lut, while every man, woman, and child that was captured would be sold into lifelong slavery, and also endure religious persecution at the hands of their Sunni masters. Prof. Vambéry has told me that he observed such innumerable cases of cruelty towards Persian captives that, although he personally was well treated, he regards the Turkomans with abhorrence. I should have mentioned that both Bujnurd and Kuchan are peopled by Kurds, whom Shah Abbas (the contemporary of Queen Elizabeth) transported from his north-west to his northern frontiers, in order to form a buffer between Persia and the Turkomans. The experiment may be considered to have been a success, as the Kurds are splendid fighters, and have never been greatly worsted by the Turkomans.

The town of Bujnurd, which is situated on a fair-sized and well-watered plain at an elevation of 3800 feet, contains perhaps 20,000 inhabitants, and is increasing at a rapid rate. The bazaars are extensive and well stocked with Russian and English goods, sugar, hardware, and crockery coming from Russia, while the calico and muslin bore Manchester or Bombay labels.

From Bujnurd to Kuchan there was a choice of routes, so I selected that one which followed up the course of Atrek, as it had not been travelled over by either Captain Napier or Sir Charles Macgregor, both of whom had pursued the road which keeps further south. Shirwan, which we reached on the second day, is under Kuchan, and is nearly as large as Bujnurd, while the valley of the Atrek, which is here open and undulating, forms one of the most fertile districts of Persia. At Kuchan the walls were in the most dilapidated condition, owing to previous earthquakes, while within a very short time this terrible calamity was again destined to destroy thousands of lives, and then be repeated, to annihilate the remnant that had escaped. At the time of my visit there was a great deal of commercial activity owing to the opening of the road that has brought Meshed within easy reach of the Transcaspian railway at Askabad, while my eyes were gladdened by the sight of lines of waggons, which gave quite a civilized look to the place.

For the remaining 90 miles I hired a waggon, its owner agreeing to reach Meshed on the third day; and we started off with the pleasant feeling that this section of the journey was practically an accomplished fact. Unfortunately, at about 5 miles from Kuchan, one of the horses had a violent attack of colic; so we had to halt for the night, as the poor beast was quite unfit to proceed, and it was not until February 28 that I drew up at the consulate-general at Meshed, where I was warmly welcomed by Mr. Ney Elias, whose untimely death this Society is now deploring. In his obituary notice, mention was made of the kindness he showed to all his juniors, and of this I have received innumerable

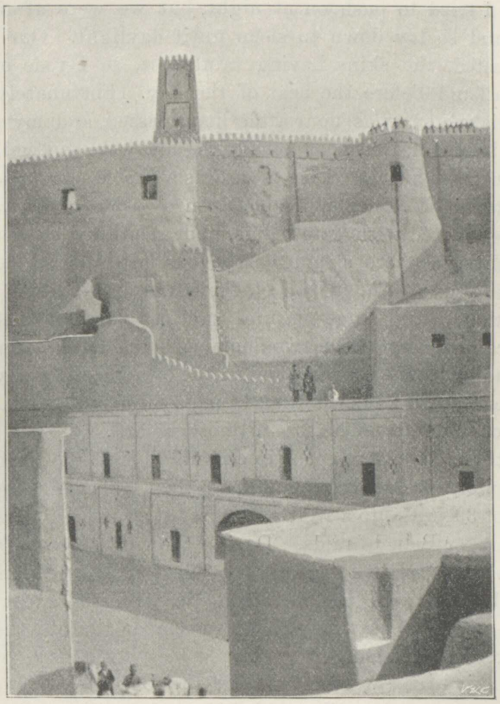
proofs during the five years that have elapsed since I was first his guest.

Meshed, as is well known, contains the famous shrine of the holy Reza, the last of the twelve Imams, and is the religious centre of Persia. The mosque is of great magnificence, but has been so fully described by Mr. Curzon, that I would refer to his work in connection with this subject. I was much tempted to linger in the society of my fellow-countrymen; but, as every week's delay meant more heat in the Dasht-i-Lut, I had to hurry through with my preparations, and after a week's stay continued my southward journey. As far as Turbat I was on a well-known road, which had been travelled over by Dr. Bellew in the seventies; but between Turbat and Jumain I found that several villages shown on the map were in ruins or unknown, while the river, termed the Kal Salah, which is shown as flowing east, actually trends to the west, and is lost in the swamps to the north of Bajistan.



At Tun, I was on the northern edge of the great Dasht-i-Lut, which lay between us and Kerman, and which had not been traversed, in this particular portion, since the illustrious Marco Polo crossed it, in the opposite direction, when travelling from Kerman to "Tonocain" *viâ* Cobinan. As the great Venetian was not only a most accurate observer, but also wielded a graphic pen, I feel sure that I cannot do better than give his words, when describing the Dasht-i-Lut, which signifies the "Naked desert"—a most appropriate name. He says, "When you depart from this city of Cobinan, you find yourself in a desert of surpassing aridity. There are neither fruits nor trees to be seen, and what water there is is bitter and bad, so that you have to carry both food and water. The cattle must needs drink the bad water, will they nill they, because of their great thirst." Friar Odoricus, in the succeeding century, who was apparently struck by another phase of the desert, describes it in the following lines. He says, "Now, that sea is a wondrous thing, and right perilous. For it is all of dry sand, without any moisture, and it shifteth, as the sea doth when in storm, now hither, now thither; and as it shifteth, it maketh waves, so that countless people travelling thereon have been overwhelmed and drowned, and buried in those sands."

Our chief preparation consisted in engaging a few donkeys to carry forage for our mules, and, as there were said to be tanks with water on the way, we expected very little trouble. We soon left the Tun oasis behind, and entered the silent desert, where not even a crow is to be seen. At the fourth mile was a tank of sweet water, where I insisted upon filling up my private water-skin, and at night we halted near the well of Khushab, which means "sweet water." It was much too salt for me in spite of its name, so I was very glad that I had taken the precaution to fill my "mussuck." On the following morning, after drinking tea, only a pint remained; but we were promised excellent water

at the evening's stage of Chahar Gunbaz, and so commenced the march in hope. Throughout the day we approached a snow-clad range, which appears on no map, and, as we were at the end of March, I estimated its height at 7000 or 8000 feet. The heat and thirst were very trying and, to add to our discomfort, the water at the stage was simply green with salt. I attempted to drink it with lime-juice tablets dissolved in it, but in vain, and so I could only envy the others, who were able to swallow it with apparently no ill results.

THE FORT AT BAM.

We were only about 15 miles from Duhuk, which lay under the range referred to; so, after a sleepless night, we pressed on as soon as it was light, and by 10 a.m. we were able to enjoy beautiful water running down from the hills. The villagers were anxious to see the first European that had passed that way, and, considering their isolation, knew a good deal about what was going on in the world. We had to halt a day, as every one experienced such bad effects from the water of the day before, that I was most thankful not to have touched it.

Duhuk is built in a gap half a mile wide, which separates the Tabas Kuh—the general name for the chain of mountains between Tabas and Duhuk—from the Mur Kuh, which latter range runs south-south-east towards Naiband.

The onward journey lay through Arababad and Zenagun, where we saw palm trees for the first time. Another waterless stretch separated us from Naiband, so, warned by experience, we hired three donkeys to carry water, and marched to Ab-i-garm, where there are extensive salt marshes and groves of tamarisk. As we had still many miles to accomplish, I tried to push on at night, but we were afraid of losing the track, and so lay down to sleep until daylight. Our water was again exhausted, the skins having tainted it, so I rode on, in order to reach Naiband before the heat of the day. Fortunately the track was fairly distinct, but as hour after hour passed, and my pony began to be dead beat, I feared that I had lost my way, especially as there were two or three places where there was a choice of routes. Finally, however, I turned a corner and came upon a vision of fairyland. The hillside was covered with date palms, underneath which were glimpses of the bright green crops, and at the summit was an old fort in a state of picturesque ruin. Upon entering the grove, I saw streams in every direction, while huge natural grottoes completed the picture. My first care was to send off two donkeys laden with water, in charge of a man who knew the country, and in the evening the caravan crawled in, the water having reached them some 5 miles out, when they were all feeling too much exhausted to go another yard.

Two or three days were spent in climbing about the Naiband range, while the mules were recovering, and we then traversed another waterless stretch of 39 miles, to a well with forty steps, which was said to be a favourite spot for Beluchi raids. During the next stage to Darband, we passed ruins that I believe to be those of Marco Polo's "Cobinan," as the modern Kuhbenan does not at all fit in with the great traveller's description, and it is just as well to remember that in the East the caravan routes seldom change.*

We now skirted the western edge of the Dasht-i-Lut, and followed the main caravan road until at Ab-Bid we kept away to the east of the main road in order to explore the district of Kuhpayeh, which was then a blank on the map. We approached Kerman from the east, and I little thought that within so short a time it was to be my home. The city lies at the end of a low limestone range, and was once impregnable, to judge by the huge old forts that are still imposing in their decay. Its position on the confines of the great desert, and at the confluence of four important routes, has always rendered it of

* This question is dealt with more fully in a paper which I read before the Society of Arts on May 20.

importance, but, being on the frontier of Afghanistan, it has suffered terribly at each invasion from that quarter, as well as in the great fight for power that took place at the end of last century. Situated at an altitude of 5500 feet, its climate is extremely pleasant, while its inhabitants are particularly friendly to Europeans. At the present day, it is on account of its carpets that Kerman is justly renowned, although very few of the finer qualities are exported to London. These exquisite fabrics, woven in silk and wool, reproduce designs dating from many

KUBEH-I-SUBS OR "GREEN DOME" AT KERMAN.

centuries back, while the harmonious and lovely colours throw all other carpets into the shade. Among the buildings of interest now extant is the Kubeh-i-Subs, or "Green Dome," which contains the following inscription:—"The work of Ustad Khojeh Shukr Ullah and Ustad Inayet Ullah, son of Ustad Nizam-i-Din, architect of Isfahan." The date is 640 Anno Hejrah, or 1242 Anno Domini. Our interest is considerably augmented by the fact that we know that Marco Polo was at Kerman shortly after this date. In the illustration it will be

BRITISH LIBRARY

noticed that there is but half of the building still standing; this is not the result of an earthquake, but is the handiwork of a former governor, who had heard a rumour that treasure existed under the great dome.

During my stay of a week I met several of the merchants of the place, both Mohammedan and Parsi, and I was particularly struck by their polished manners, which are, I afterwards heard, renowned throughout Persia.

About the middle of April, after a few days' rest, I determined to take a straight line to "Pasargardæ" *viâ* Pariz and Baonat, as thereby I could fill in several blanks on the map, while, owing to the altitude being fairly high throughout, I hoped not to suffer from the heat. When some five marches to the west of Kerman, I received a most cordial invitation to visit H.R.H. the Farman Farma, who was the Governor-General of Kerman and Persian Baluchistan, and, upon accepting it, was so hospitably entertained that I accompanied my new friend to Bahramabad. Among many other experiences, I was introduced to the sport of shooting gazelle off horseback, which consisted in the riders spreading across a plain with intervals of 500 or 600 yards between each, and driving the quarry off its feeding-ground. In time the gazelle break back, when the sportsmen gallop to cut them off, and shoot them with slugs, propelled by a heavy charge of powder. The Farman Farma, who is a great sportsman, on more than one occasion shot a right and a left at full gallop. I have also seen hyenas, lynxes, foxes, and hares bagged in the same way.

When, after being entertained right royally for about a fortnight, I resumed my journey, I had had an agreeable experience of Persian life, enjoyed by very few travellers, coupled with a warm invitation to return during the following winter. Upon entering the unexplored district of Baonat, we were followed by a band of seven nomads, who were evidently on the look-out to attack us. However, we took all precautions, and maintained a bold front, and, although both my rifle and gun were broken, we carried them in a very conspicuous manner. This band kept parallel to our march for three days, but they fortunately did not otherwise molest us. It is a remarkable coincidence that Captain Stotherd, of the Hyderabad Contingent, was set upon less than a month later, about 30 miles to the south of where I passed, and, although he had only a single orderly with him, he accounted for four of the brigands, killing their chief. It is more than probable that he was attacked by the same gentlemen who took so keen an interest in my movements, and it is satisfactory to feel that Captain Stotherd made so good an impression on them.

Upon arrival at Shiraz, after a visit to the world-renowned ruins at Persepolis, I was most kindly received by Dr. Scully, who told me that I had come at an interesting crisis, as there was war to the death

between the townspeople and the nomads. The very next morning we were awakened by hearing volleys inside the town, and, climbing up to the roof of the telegraph garden, which is about half a mile from the walls, we saw a regular fight taking place at the gate nearest to us. Fortunately, we were at right angles to the line of fire, and so could look on without much risk, until the nomads, who were greatly outnumbered, finally retreated. During these very stormy times, it was wonderful to see with what utter contempt for danger the English telegraph officials behaved, and it was mainly owing to the confidence felt in their reports at Tehran, that the necessary steps were taken to patch up a peace.

It was now the end of May, so it was necessary to travel by night

PASS OF THE "OLD WOMAN" BETWEEN SHIRAZ AND BUSHIRE.

down the famous passes of the "Old Woman" and of her "Daughter," which have been so vividly described in Mr. Curzon's monumental work; and, after turning night into day for nearly a week, I was only too pleased to find myself on board the British India steamer at Bushire, where white bread and a whisky peg appeared to be delicious beyond expression.

Karachi was reached early in June, and the rest of the summer was spent in compiling my work and planning fresh journeys, until, in October, 1893, accompanied by Surgeon-Major Brazier Creagh and Lance Duffadar Sultan Sukhru, of the 3rd Punjab Cavalry, I landed at Chahbar, in Persian Baluchistan. This port was chosen, as since

Grant's journey, some ninety years ago, no European had travelled to Bampur by Geh.

Before entering Persian Baluchistan, however, a few words as to its character would perhaps not be out of place. The whole of the coast-line from Bashikird nearly to Karachi is spoken of as Makran, the district extending inland as far as the first important range of hills, thus including a strip of land from 60 to 70 miles wide. For some 20 to 40 miles from the coast there is a sand desert, with small hamlets, which draw their supply of water from shallow wells. Behind this is another belt of about the same size, consisting of low hills composed of mud or slate. Proceeding further inland, it will be noticed that there are continuous ranges of mountains running from east to west parallel to the sea, and so regular is this formation, that all attempts at opening up communications in these parts must be done either to the east or west, as any road direct to the coast will lead across range after range of rugged hills.

Thanks to the kindness of Mr. Possman, the director-general of the Persian Gulf telegraphs, we found camels awaiting us (at Chahbar), and, owing to the exertions of Mr. Lovell, in charge of the telegraph office, we were able to get twenty-seven of these uncouth beasts of burden loaded up the day after landing. The quarrels as to the partition of loads, and the interest taken by so many people in the camels, revealed to us the fact that several of these animals were divided into legs, each of which had a separate owner. The usual plan, we were informed, was for the driver to have one leg's interest in each camel, which was allowed in lieu of wages and rations.

Our first march brought us to Tez, the famous Arab port in mediæval times, but now no signs of departed greatness exist, except the innumerable tombs of deceased worthies, and we had to drink filthy water out of a shallow hole, and be thankful that there was enough for all our party. Although marching by day was terribly trying for man and beast alike, the Baluchis spent so long in wrangling over the loads, and in tying them on, that it was 10 a.m. before the last of our camels started off for the second march, and, as the heat was terrible, our horses very soon began to give in. We therefore halted for several hours in the shade, near some water-holes, riding on to camp in the evening. We there found only about half of our caravan, the other portion having halted 2 or 3 miles back, in a rage at being compelled to march some 12 miles, as they said that 7 miles is the limit of a march in Baluchistan. Travellers in this country should be provided with an inexhaustible fund of patience, as the only part that the Baluchi camel-driver plays is to try and prevent any load whatever being put on his camel, while, if at all discontented, he will decamp without giving any notice.

BRITISH LIBRARY

In order to attempt an earlier start, we halted for a day, and then pushed on at sunrise the following morning. However, the march was long, and by the time we reached Pesh Mant our horses had to be led, so utterly prostrate were they. Many of the party also suffered from sun fever, mainly because they got slightly chilled before the sun rose, and so felt the sudden change acutely. After four trying marches, we struck the Geh river, where we decided to make another halt. Just before reaching camp, I saw a couple of wolves, which fact is interesting, as they are not known to exist so near the coast. In the bed of the "kaur," the Baluchi term for river, we found isolated pools of doubtful water at this point; but a march higher up, we came upon a bright flowing stream, bordered by palm groves.

Geh is a large village, built in the fork between two branches of the river, and, with its palm groves, forms a delightful picture. As so many of our party had suffered from fever, we determined to leave the invalids and make a rapid march in light order to Fanoch, returning to Geh by a different route. This we did with great success, finding at Mokht, a village near our route, a remarkable kind of glass bangle, of which I have given specimens to the British Museum.

The pass below Fanoch must be a unique road. For 7 or 8 miles one has to scramble over boulders of the most varied hues, every colour of the rainbow being there, which gives an effect of great beauty. In the case of being overtaken by a "seelab," or spate, in this pass, the loss of the entire caravan would ensue, as the sides are precipitous almost throughout. The morning after our arrival, we set forth to climb the Kuh-i-Fanoch, also termed the Kuh-i-Sufeed, or "White mountain," the summit of which is reached at 4735 feet. After four hot hours spent in climbing, we stood on the top, and were able to look across to the unknown districts lying to the west, while to the north we could clearly descry the shapely Basman peak.

Upon returning to Geh, we retraced our steps down the pass, and then kept further north, striking the Sirha river at Ichan, called "Hochan" by Captain Grant. Both when going to and returning from Fanoch, we crossed the Maluran river,* which is shown as draining

into the Geh river, whereas it is really a tributary of the Kaur-i-Binth.* Along its banks, as well as those of the Sirha river, there are almost continuous lines of date groves. The Sirha pass, which lay between us and Bampur, beggars description, and I am still surprised that we got safely over it, as I should never have believed that laden camels could climb up the cliffs they did without accident. My companion's mare indeed fell, but luckily there was a deep pool below, so no harm was done.

At Bampur we found that Pahra—the Pura of Arrian—was now the seat of government, and so pushed on there, where we were received by the Assad-i-Dowleh, who is a fitting ruler for such a wild race. He was civil enough, thanks to the Farman Farma; but when we informed him of our intention of touring in Sarhad, he tried to discourage us by every means in his power. Having engaged camels with extreme difficulty, we marched due east to Magas, where the kindest inquiries were made after the late Sir Oliver St. John. We then turned north into unexplored country, and, at the end of December, reached Khwash, the capital of Sarhad. This word has been written and spelt in so many different ways, that I would mention that it is the Sarhaddi method of pronouncing "khosh," meaning "sweet."

We were now close to the giant range whose highest peak is the great volcano of Taftan, or the "boiling," locally known as Chehel Tan, or the "Mountain of the Forty Beings," and as we were afraid that snow might hinder our ascent, we marched up its valley, where

---

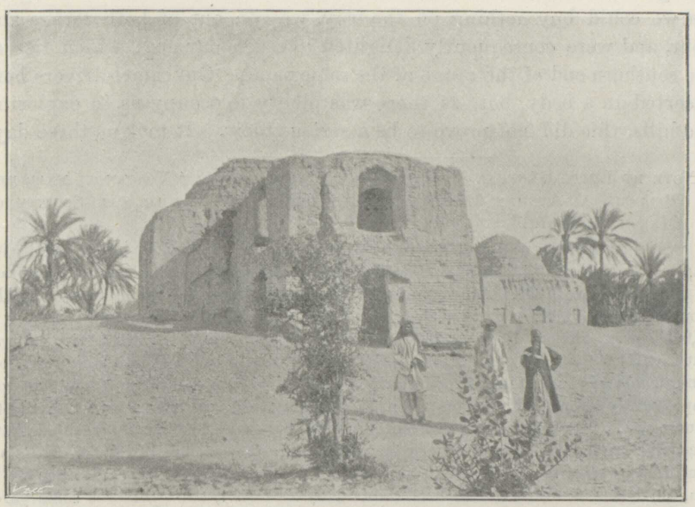
The following is the list of villages on the river Sirha from Ichan downwards:—

Kondel Mant, right bank.	Geladun, left bank.
Abaud, left bank (opposite Deh Mullah).	Washkosh, right bank.
	Bandan, ,,
Deh Mullah, right bank.	Pothan (opposite Bandan), left bank.
Khushk, left bank.	Mokht, right bank.
Gurani, right bank.	Afzilabad, left bank.
Mirabad, left bank.	Hudian, ,,
Shah Karpad, left bank.	

Thence 4 miles to Naokinja, where I halted between Chahbar and Geh.

I crossed both of these streams at two places, some miles apart, so that I have reason to believe in the accuracy of the above list.

* There are five streams which make up the Kaur-i-Binth, as the Fanoch river is called below the pass. Beginning from the west—



1. The main stream, up which runs the road to Ramishk. Mirabad is the only village of importance that we could see.
2. Kaur-i-Kantekon. This stream flows almost due north to south.
3. Kam Kaur, with village of Kam just above Fanoch, and Haimini on an easterly branch.
4. Kaur-i-Magen, with two hamlets, Magen and Band-i-Bengi, on its banks.
5. Kaur Espate. This stream flows in just below Fanoch, the hamlet of Espate being some few miles up it.

we camped at an altitude of 6550 feet, near a large cave, which protected our horses from the intense cold. My companion was unfortunately ill, so, as the weather looked very threatening, I decided not to wait, but to make the attempt on the following morning.

For 7 miles the track led up the valley, which then terminated in an extraordinary fissure, termed the Band-i-Gelu. Creeping up this, we found ourselves in a valley, which smelt strongly of sulphur, but the going was easy enough until we began to climb the actual peak. First of all, we had to scramble over boulders, but these at 11,000 feet were replaced by soft lava ash, so that it was 2 p.m., after eight hours' incessant climbing, when we reached the summit at 12,850

TOMBS OF THE KAIANIAN MALIKS AT JAIK.

feet. We here found a plateau about 400 yards square, the northern portion of which is termed the Kuh-i-Ziarat, or "Sacrifice hill," while separated by a slight depression lay the Mader Kuh, or "Mother hill," which is still the actual object of worship for most Sarhaddis, although nominally they are Mohammedans. The volcano, which was belching out blinding clouds of sulphurous smoke, consists of two apertures, each some 3 yards in circumference, which apparently united a few feet below the surface, as there was only a yard or so of ground between them. With considerable difficulty, we extricated specimens of the sulphur and sal ammoniac, and then turned our attention to plane-tabling. At the elevation we were at, we could see Sistan and the lake of Zirreh, mentioned in Matthew Arnold's great poem, while to the north-west

the boundless Dasht-i-Lut stretched for hundreds of miles. The descent was easy, in comparison, and by 9 p.m. we were safely back again in camp.*

The whole of this valley is full of ruined villages, and opposite them are oval-shaped caves hewn out of the rock. These were some 8 feet in length, 6 feet in width, and 5 feet in height. No marks of smoke were visible, and, as they were very difficult of access, I would hazard the theory that they were humble imitations of the rock tombs at Pasargardæ.

After stopping long enough to allow my companion to scale the great volcano, on New Year's Day, 1894, we started forth to find the village of Basman, the whereabouts of which was uncertain to a degree. As we could buy nothing on the way, we ran out of both forage and flour, and were consequently delighted to reach our goal, which lies at the southern end of the range of the same name. Our camel-drivers here deserted in a body, but, as there was plenty to occupy us in exploring the hills, this did not prove to be a serious blow. It took us three days

* Note by Lieut.-General McMahon in a Paper on the "Volcanoes near the Beluchistan-Afghan Frontier," read before the Geological Society on March 24, 1897.

"Since this paper was read the authors have been in personal communication with Captain P. Molesworth Sykes, now in England on leave, who ascended the mountain on Christmas Eve, 1893. After gradually ascending ravines in the hills around the mountain, the exploring party arrived at the foot of the actual cone at an elevation of 10,000 feet. Thence up to 11,000 feet the ground traversed consisted of boulders; but from 11,000 feet upwards it was covered with fine volcanic ash, into which the foot sank deeply at every step. From this point up to the top the smell of sulphur was unpleasantly strong. The summit consists of a plateau covering an area of about 400 square yards. On its northern and southern sides the ground is slightly elevated above a central depression. The northern elevation forms the sacrifice hill, where goats are sacrificed by pilgrims; whilst the southern portion is called *Mader Kuh* ('Mother hill'). On the latter were, at the time of Captain Sykes's visit, two apertures some yards apart, each apparently 3 or 4 yards wide, which appeared to be connected with each other. From both of these, dense white sulphurous smoke and some flames were issuing. So strongly sulphurous and suffocating was the smoke, that these apertures could only be approached from the windward side; and, owing to the heat and smoke issuing from them, they were approached with difficulty even from that side. Sulphur and sal ammoniac were extracted from the edge of one of the apertures.

"Captain Sykes has paid several visits to the burning petroleum springs at Báku, on the western shore of the Caspian sea, and he is satisfied that the heat, smoke, and flames on the summit of the Koh-i-Taftán were not due to petroleum. There was no smell of petroleum, and the smoke was not dark and carbonaceous.

"Captain Sykes brought home a specimen of the rock found *in situ* on the Koh-i-Taftán, and this proved, on examination, to be a vesicular, andesitic lava. As the summit of the Koh-i-Taftán is still deeply covered with fine ash, this volcano must have been active during a comparatively recent geological period; but, as no fresh lava-streams were observed by Captain Sykes on his way up the mountain, it is not probable that the volcano has been active during the lifetime of the present generation.

"The authors infer, from Captain Sykes's observations, that the volcano is now in the solfatara stage of its existence. The flames seen by Captain Sykes are probably due to the emission of hydrogen sulphide (H_2S), a very common product of solfatara action."

to scale the great peak, from our camp at Basman village, but at last we arrived at the summit, and set up the plane-table at an altitude of 11,210 feet above the sea. We were on what is generally supposed to be an extinct volcano, and it is interesting to note that even here there is a legend of a saint called Kedr, who still lives in the mountain, just as in Greek mythology a giant is imprisoned beneath Etna. The mountain is locally termed Kuh-i-Zendeh, or the "Mountain of the Living Man."

Upon returning to Basman, we enjoyed excellent moufflon-shooting, until the Farman Farma sent some of his transport for our use, and we rejoined him at Bampur. In his company, we travelled along the

THE LAJJI VALLEY ON THE BELUCH-KALAT FRONTIER.

unexplored tract of country where the Bampur river and the Halil Rud mingle their waters in the Jaz Morian. Additional interest was felt by us, knowing it to have been the road that Alexander the Great used in his march from India.

Upon arrival in Rudbar, we turned northwards and left the Farman Farma, in order to explore the site of Marco Polo's "Camadi," where the china exhibited, together with the seals and other curios, were found. We came upon a huge area littered with yellow bricks 8 inches square, while not even a broken wall is left to mark the site of what was formerly a great city, under the name of the Shehr-i-Jiruft.

It was now late in March, so we were only too glad to traverse the Jabal Bariz range and gain the elevated plateau of Iran, and, just a year

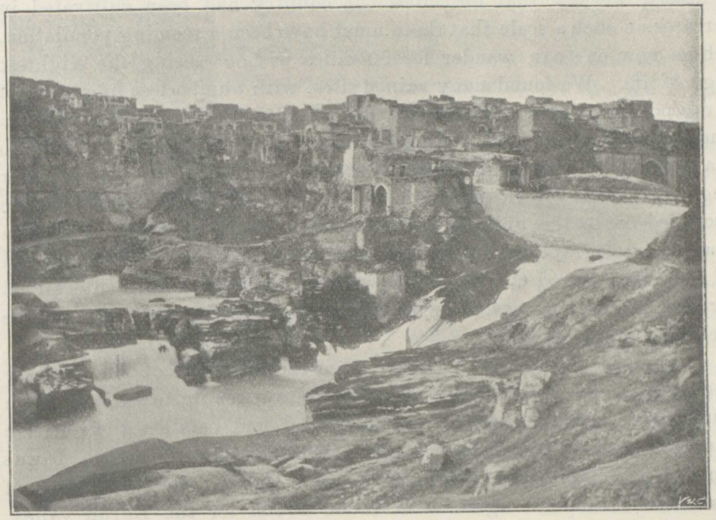
after my first journey, I again entered Kerman. Here our party broke up, Surgeon-Major Brazier Creagh returning to India by Bunder Abbas, while I continued my journey towards Tehran. At Yezd I was most hospitably entertained by the manager of the Imperial Bank of Persia, and at Tehran, Mr. Coningham Greene, Her Majesty's *chargé d'affaires*, not only made me free of the Legation, but also presented me to H.I.M. the late Shah, who was interested at hearing about so remote a corner of his empire. I travelled to England in rather over a fortnight by the newly opened line from Petrovsk, on the Caspian sea, taking the faithful Sultan Sukhru with me as a reward for his excellent work, and reaching London late in June.

After four months at home, spent in compiling my second journey, I was appointed to be the first consul for Kerman and Persian Baluchistan, and, accompanied by my sister, who shared my future wanderings throughout, we reached Tehran at the end of 1894. We there spent a most delightful winter, enjoying the kind hospitality of Sir Mortimer and Lady Durand, so that it was a great wrench to leave all civilization behind and start forth on the long journey of 600 miles, which lay between us and my district. As far as Kashan, we followed my route of 1894, but for the onward march to Yezd I kept a good deal to the east, passing through Natunz and Kuhpa. Thereby I was able to fill in a large blank that has existed on the map quite close to Ispahan, while, as so often happens in Persia, I found the district to be quite as populous as the one bordering the main road.



Kerman was reached at the end of March, and for some months we were busy enough, what with consular work and settling down. When, however, it grew hot in June, I determined to explore Sardu, so as to trace out Marco Polo's route, and we had a most delightful trip while occupied with this task, during which we scaled the highest peak of the Lalazar range, 13,700 feet above sea-level—no mean feat for a lady to accomplish. There was also the best of moufflon-shooting, and we picked up several carpets woven by the nomads, while the climate at an altitude of over 8000 feet was perfection. However, we were forced to return home by quick marches to meet H.R.H. the Farman Farma, who was once again appointed governor of the province, and the autumn was spent at Kerman, as we found interesting occupation in trying to unravel the ancient history of that city. I cannot say we were unsuccessful, as our offers of a reward for old stones and curios produced a number of reflet tiles, and I am proud to state that we captured a wasp unknown to science, when collecting insects for a friend.

In January, 1896, telegraphic orders came for me to join Colonel, now Sir Hungerford, Holdich on the Perso-Beluch frontier, which instructions I should have been quite unable to obey, without considerable delay, had not my kind friend, the Farman Farma, lent me his own transport.

Thanks to this, we started off on the third day, leaving our household gods to look after themselves, and within a week we had reached Bam, until recently the frontier fortress of Persia. Everywhere I was shown the greatest courtesy, so that forage and supplies, which usually are impossible to collect, were ready at each stage, and from Regan, with only a day's halt, we were able to load up fifteen extra camels with all supplies, before crossing that portion of the Dasht-i-Lut which lay between us and Pahra. There my old acquaintance, the Assad-i-Dowleh, treated us well, and it only took two days to engage thirty spare camels and to load up supplies for twenty days, as the villages

THE WATER-MILLS OF SHUSTER.

to the east were too small to be counted upon to any great extent. As far as Magas, we followed the route that we had taken in 1893, after which we continued nearly due east, reaching the British camp at Kohuk on February 24, having accomplished the march of 600 miles, mainly across desert, in forty days.

Sir Hungerford Holdich * has already read an interesting paper about the geographical side of the frontier commission, during which we marched with our headquarters as far as Jalk, while excursions were made to the various points of interest along the frontier. Both at Jalk and Kohuk we found numerous tombs which were built by the Kaianian maliks, and which appear among the illustrations. On one

BRITISH LIBRARY

of them I found a brick bearing the date of 1027 Anno Hejra, or 1617 of our era. This confederacy of chieftains appears to have ruled in Sistan and Baluchistan during the prosperity of the Sefavi dynasty, and, as far as we know, they were crushed by Nadir Shah about 150 years ago, although Pottinger mentions that they still owned villages early in this century.

We accompanied the British Commission on its long march to Quetta, so that my sister may claim to be the first lady who has ridden from the Caspian sea to India, a distance of nearly 2000 miles. While travelling up the valley of the Rakshan, through what is now a desert, we saw that for miles the country had been cultivated in terraces on such a scale that there must have been a teeming population, where now one can wander for 50 miles without seeing the slightest sign of life. We found many ruined sites, with numberless fragments of Arab pottery, beads, and bracelets, and felt that it was only deforestation that could have changed the country from a smiling plain of plenty to "a barren and dry land, where no water is." Daily, the thermometer registered over 90° in our tents, so it was with light hearts that we ascended on to the uplands of Baluchistan, until, at Kalat, we again reached a telegraph wire—that pioneer of civilization—and at the end of April we entered Quetta, where we were all most kindly entertained by the late Sir James Browne, whose name will live long on the Beluch country side.

We were on the way to Simla, when the sad news of His Majesty the Shah's death reached us, and it was quite touching to see how much our Persian servants felt the calamity that had befallen their native country. Nearly a month was spent in Simla, during which I was enabled to compile my work up to date, and at the beginning of June we were once again at Karachi, bound for the Karun valley. We were caught by the beginning of the "monsoon," and, as we were on board the worst roller that the British India Company possesses, we were very glad to reach the shelter of the Persian Gulf. For the first time, I visited Bahrein, when we rode on donkeys to the famous wells, and also saw the extraordinary phenomenon of a spring of fresh water bubbling up in the sea, which is very shallow indeed all round the islands. The pearl fisheries were in full swing, and it was a most picturesque sight to see the fleet of little vessels all busily engaged in fishing for oysters. The weather was too hot and our stay too short for a visit to the site of Sir E. Durand's and the late Mr. Theodore Bent's excavations; but there are few places so accessible that would, in my humble opinion, yield a richer harvest than this ancient home of the Phœnicians, where Erythras, the "Red King," lies buried.

Off Bushire we again experienced rough weather, but when once we entered the lovely Shat-el-Arab, the moist heat was overpowering, and as, at Mohamerah, we found that the fortnightly boat was not due to

BRITISH LIBRARY

start up the Karun for another week, we continued our journey to Busreh, where Captain Whyte, Her Majesty's consul, received us most hospitably.

Before entering the valley of the Karun, I would mention that that river was opened to the commerce of the world in 1888, and that ever since Messrs. Lynch Brothers have maintained a fortnightly service, in spite of much hostile intrigue on the part of some of the inhabitants of this district, who did their best to thwart the Shah's policy. However, the extraordinary tact of Messrs. Lynch's agents has overcome much obstruction, and every one is now alive to the advantages that they have conferred upon the district, so that we may soon hope to see this system of mutual benefit placed on a thoroughly sound and solid basis.

It is but 117 miles from Mohamerah to Ahwaz, but this occupied the best part of two days to accomplish, as we anchored at night. At Ahwaz, where a few years ago there were but wretched huts, warehouses and caravanserais of imposing appearance now line the bank, while great activity is everywhere visible. After spending a few days with Messrs. Lynch's agent, Mr. Parry, in his company I proceeded up to Shuster on the s.s. *Shushan*, the larger boat, the s.s. *Mal Amir*, not being able to surmount the natural barrage that crosses the river in five separate reefs. This is the crux of the Karun question, as, if the ancient dam were repaired, there would be water enough to fertilize millions of acres which now lie idle and useless. At Shuster, one of the dirtiest, hottest, and most fanatical towns in the world, we lived in cellars for the greater part of the day, as at 8 a.m. the thermometer regularly registered 108° Fahr., while at noon 129° was the average reading. As may be supposed, we were only too glad to return to the comparatively cool climate of Ahwaz, where I had left my sister, and here July was spent. In August, I was so weak from fever and pleurisy that I had to seek medical advice at Busreh, and again enjoyed every comfort at the consulate, for which I shall ever be grateful. The moist heat was so trying that the doctor ordered a sea voyage, so that early in September we returned to Tehran by the roundabout way of Bombay, Aden, Brindisi, and Constantinople.

I was very anxious to have the Ahwaz-Ispahan road properly mapped as far as its junction with the Shuster route, as, until quite recently, Ahwaz barely existed, and so there was no road running to it shown on the map. Here the great value of my faithful plane-tabler came in, as I was able to send him in charge of my caravan through the Bakhtiari country and feel quite confident that when we met again at Tehran, he would have an excellent route report to give in, in which hope I was not disappointed.

The winter was again spent under the same hospitable roof at Tehran, where I saw H.I.M. Muzzufur-i-din Shah more than once, who evinced

BRITISH LIBRARY

much interest in the photographs that I had taken on the Baluch frontier. Moreover, I had the opportunity of making the acquaintance of the leading Persian statesmen, one of whom, His Excellency the Nasir-ul-Mulk, is here to-night, having paid us the compliment of returning to England the moment his official duties on the continent were finished.

In conclusion, I would mention that, after travelling for many thousand miles in Persia, I still wish to travel there again, and, although perhaps the free open-air life and the glorious climate have something to do with this, I cannot but feel that it is also owing to the Persians themselves being so hospitable and friendly a race.

Before the reading of the paper, the PRESIDENT said: We have to welcome here this evening an officer who has seen a good deal of a very interesting part of Persia, and from whom we have received several letters of great interest, though I believe we have not before had the pleasure of listening to him in this room. I will now call upon Captain Sykes to read his paper.

After the reading of the paper, the following discussion took place:—

The PRESIDENT: I would now ask his Excellency, Nasir-ul-Mulk, to open the discussion by some observations.

His Excellency, the NASIR-UL-MULK: I am very pleased to have had the opportunity of being present at this meeting, and of listening to the very interesting lecture of Captain Sykes. As you have seen, Captain Sykes has shown himself a very active explorer, and has availed himself of the opportunities afforded him to give you new information about the outlying parts of Persia. I am afraid that all he said was about the outlying parts and the deserts, and that may give you the idea that all parts of Persia are the same. As you know, Central Persia is desert, but the borders are very beautiful and fertile places, and I am sure that Captain Sykes on another occasion will give you information about these parts also. I have to thank him for the kind allusion he has made to myself, and again to express the pleasure I have had in being present at this meeting.

Major-General Sir FREDERIC GOLDSMID: I am afraid that any remarks which I can make on the very interesting paper we have just heard would involve too distant a retrospect to warrant attentive consideration on your part. My knowledge of Persia goes back to so ancient a date, that anything I may now say on that country must be of comparatively little interest. About thirty-four or thirty-five years ago I had the honour of addressing this Society at a meeting presided over by Sir Roderick Murchison. I had then recently returned from the coast of Mekran, which I had been sent to explore under orders from Bombay. Although we, in Sind, were neighbours to Mekran, we knew very little of that province in those days. I was ordered to go along the coast as far as I could, and see whether the country was fitted for the setting up of our telegraph line, whether the people were fitted for protecting that line, and whether I could make any permanent arrangements for its protection. Accompanied by an escort of Sind horse, I reached Gwádar in about seven weeks, exploring and taking notes the whole way, and making my report to the Bombay government. From Gwádar I should have continued the exploration, but was directed to return, lest our little acquaintance with Western Mekran should lead us into political complications. Consequently, I put my camels and horses into boats, and returned to Karáchi. A few years later, I reached this very place, Gwádar, from the neighbouring port of Charbar,

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

having travelled thither by a strictly "overland" route from the Caspian. Later again I reached Gwádar direct, coming from the same starting-point in Northern Persia. When the late Sir Henry Yule kindly measured my journeys, and put them down at 7000 miles in Persia and Baluchistan only, I confess to a feeling of gratification; but I could not then foresee the work that was to be accomplished by other travellers in Asia during the second half of this memorable period of sixty years which we are now celebrating.

The paper we have heard read is an admirable one in many respects. It is simple, truthful, we all understand it, and, more than that, it shows what we have to do. The points which the writer has touched upon are points of very great interest indeed, and I only hope that, by further study of these particular regions, we may soon have a more complete map than heretofore. I do not like taking up your time further, but, as relevant to the occasion, will ask your permission to quote a few words from a lecture which I delivered at the Royal United Service Institution in 1877, when Sir Rutherford Alcock was in the chair:—

"We require consuls both on the east and west of Persia: good, well-trained men who are likely to promote, by their personal character, the honour and credit of our country. Kerman or Yezd in the east, and Kermanshah and Shuster in the west, Meshed in the north, and Bunder-Abbas on the seaboard, would all be points worthy of consideration in any scheme for the extension of the Asiatic consular service. . . . Holders of these posts, like the late worthy consul, Keith Abbott of Tabriz, might, by judicious local exploration and inquiry, be scientifically, as politically, useful." In referring to Consul Keith Abbott of Tabriz, I would interpolate the name of Colonel Stewart, also of that city, whose presence here to-night at once recalls his travels and services.

Let me add that in three of the places named, consuls or vice-consuls have in late years been appointed. I think I am right in saying that General Maclean was appointed to Meshed, one or two officers were appointed at various times to Yezd, and Captain Sykes is, we know, at Kerman. One word more, if I may be allowed to say it—and it would be ungrateful and ungracious if I did not do so—that is, that I agree in every word that Captain Sykes has said in regard to Persian hospitality. I can, from my own experience, testify most heartily and honestly to this estimate of the native character.

Sir Mortimer Durand: There are many here so much better fitted than I am to continue the discussion of Captain Sykes's lecture from a geographical point of view, that it is inadvisable for me to take up your time very long. I would only like to say that I entirely concur with everything Sir Frederic Goldsmid says about the credit due to Captain Sykes for his remarkable journey, and I wish a great many more would follow his example. I have often been struck by the small number of English travellers who visit Persia. I am sure my distinguished friend, the Nasir-ul-Mulk—whom I take this opportunity of congratulating upon the high honour conferred on him by Her Majesty—will bear me out in saying that the Persians, as a nation, very thoroughly appreciate, in more ways than one, any sympathetic interest which Europeans show towards them. I think it is in every sense desirable that more Englishmen should travel through Persia to learn something of the country and people. It is a most interesting country and people. There is one aspect of the question which has not been touched on to-night, and about which I should like to say a few words—I mean the interest of the country from an artistic point of view. I think it would well repay any one of artistic tastes to spend some months or a year in Persia. He would see that it is a very beautiful country. We have heard a great deal of the arid nature of the mountains. There is a very great deal of barren and bare country about the capital, but

Qatar National Library

BRITISH LIBRARY

if you could see the exquisite colours which the barren hills take at sunset, and at other times, you would agree that Persia has its beautiful side. I remember when I left Tehran on February 14, I was particularly struck with this. It was a typical Persian day, the sky cloudless, the sun bright. To the north stretched a long range of mountains of dazzling purity, covered with snow from the summit to the foot, and far away to the east, rose the mighty cone of Demavend. To the south we saw the great plain stretching into the blue distance, and rising out of it, range after range of snow-clad hills, the more distant being considerably over 100 miles away, yet, in the exquisitely pure dry Persian air, the farthest range was perfectly clear. The whole was one of the most beautiful things I have ever seen. Now, that is merely one aspect of Persia, but it is worth dwelling upon. From every point of view, I wish I could see more English travellers in the country, but they must be travellers of the right stamp, like Captain Sykes and the charming and intrepid lady who accompanied him in his wanderings. I hope I may live to see more Englishmen following their example, and that greater interest in, and knowledge of, Persia may gradually result.

Colonel C. E. Stewart: It is some sixteen years since I read a paper before this Society on Persia, where I spent many years, and I am now glad to listen to a paper by Captain Sykes on that country. Captain Sykes told you that on his way to Persia he came to me at Adessa and asked me for letters of introduction. I gave him one to a friend of mine, a chief of the Yomut Turkomans whose friendship I had gained some years ago. I am sorry my friend did not treat Captain Sykes better; at all events, I had found him most kind. It surprised this chief very much, when I was with him, to hear that I possessed a portrait of him. This portrait had been done by my wife, who had met him on board a Caspian steamer when he was an officer in the Russian service. Sixteen years ago, a man was scalped in my presence in this part of the world; but on the present occasion we had a good dinner, with knives and forks. Whatever else the Turkomans have done, they have advanced much in civilization, which is due to Russian example. This chief, after holding a commission as major in the Russian service, had entered the Persian service as colonel of cavalry. I must say I found him a most pleasant, intelligent host, and in every way I enjoyed my time with him. I am sorry he was not more civil to Captian Sykes.

In another part of Persia described by Captain Sykes, I have been as far as Naiband. He describes Naiband as a sort of Paradise, but I suffered a good deal in crossing the desert to get there. My recollections go back more readily to the Turkomans than to the desert, because they live in a beautiful green country, where, if it were not for the mosquitoes, one could spend a happy time. I remember on two occasions I could not see the colour of my hands, they were so covered by mosquitoes.

Mrs. Bishop: My claim to be a Persian traveller is rather a slight one. I travelled in Persia for a year for about 1500 miles. The region in which I travelled was chiefly Western Persia, from Baghdad to Isfahan and in the Bakhtiari country, and the Karun region, from Dupulun to the source of the Karun, and then through what is sometimes called Persian Kurdistan to the Turkish frontier near Urumiah. I should like to ask Captain Sykes if in the desert, between Meshed and Kerman, he met with any traces of ancient irrigation, irrigation canals, ditches, or reservoirs, such as occur in immense numbers in some other parts of Persia now entirely desert. I should also like to know whether there was any desert vegetation, such plants as assafœtida, which is plentiful on the Upper Elam mountains, and also the colocynth gourd, which affects deserts. There is one more question: Has the road for which a concession was granted when I was in Persia, I mean from Ahwaz to Burujird, become an accomplished fact?

Captain Sykes: In reply to Mrs. Bishop's three questions, I do not think that there was ever more irrigation or cultivation in the Dasht-i-lut than nowadays; in pre-historic times there is reason to believe that the desert formed an inland sea, in support of which theory, Sir Frederic Goldsmid mentions that at Yunasi or Yunsi, on its north-west edge, there is a tradition that the prophet Jonah, or Yunas, was cast up there and hid for three days under a gourd. As to the second question, I am afraid that I am not much of a botanist, but I have seen assafœtida growing in the hills near Kerman, but always at a higher elevation than any portion of the Dasht-i-lut, where, indeed, one only sees stunted camel-thorn bushes. Finally, I regret to state that the Ahwaz-Burujird road has not, as yet, been commenced.

The President: We have listened to a very interesting paper this evening, and as regards the journey from Khorassan to Kerman, I believe, from what Captain Sykes has told us, that we shall be able to make some not unimportant additions to the map of Persia which was brought out under Mr. Curzon's supervision a few years ago. I therefore think we may all look forward with great interest to the additions Captain Sykes will be able to give us. We have all noticed, I think, how very interesting it is for an accomplished traveller like Captain Sykes to travel over a country little known, but which has many geographical and many historical reminiscences connected with it, and I was particularly interested in hearing him refer to the routes of Alexander and to the identification of places mentioned by Marco Polo and Friar Odoric. It reminds me how very much we owe to our late associate, Sir Henry Yule, as regards this country and other parts of Asia. If it had not been for his elucidations of the great work of Marco Polo, and for his having first brought to the notice of Englishmen the very interesting narrative of Friar Odoric, we should not now be able to listen to the researches of those travellers who have benefited by what Sir Henry Yule has written. We have much to thank Captain Sykes for besides the paper he has read to us. We have all been extremely interested in looking at the very beautiful photographic sketches he has shown us on the screen, especially those buildings at Kerman, and the golden-domed mosques and tombs at Meshed. We also have to thank him for kindly bringing here, and placing in the next room for our inspection, a number of interesting products connected with the province of Kerman, also some tiles and other older remains. I feel confident, therefore, that you will all wish me to convey to Captain Sykes a very cordial vote of thanks for his communication this evening.

A JOURNEY TO SIWA IN SEPTEMBER AND OCTOBER, 1896.

By WILFRED JENNINGS-BRAMLY.

The famous oasis of Siwa, which lies about 300 miles west of Cairo, cannot be said to have fallen from its high estate, for it is probably much as it was when Herodotus, Strabo, Diodorus, Plutarch, and Pliny thought it worthy of mention; only it has stood still while the world went on. What it was in the days of its fame before the reign of Cheops it is still—the first halting-place on the great desert high-road to the west. Alexander the Great visited it, and it was well known in the Roman occupation of Egypt, but it was not until 1792 that its fame reached Western Europe through the visit of Alexander Browne. Mehemet Ali sent an expedition which gathered much knowledge of the place, and enabled him to fix the taxation

of the oasis at £2000. Several modern travellers have visited Siwa, including Dr. Rholfs, M. Bricchetti, and a journalist, Mr. Ward, who did not succeed, however, in gaining admission to the inner town. As circumstances favoured me in this respect, and as my return journey lay through new country, an account of my expedition may be of interest.

As the safest way of undertaking a risky expedition is to take so small a party that you excite neither attention nor alarm, I limited my equipment to the barest necessities, for the important thing is not to look worth robbing. One night, encamping at the Arej or el Bahrein—that hunting-ground *par excellence* of the robbers of the desert—a Beduin who joined us said he wondered I was not afraid of being murdered and robbed. "The laugh would be all on my side when I found you looking in my empty pockets," I said. The Beduin, after a moment's thought, remarked, "But you would be dead then;" upon which, suddenly impressed with the excellence of my joke, he laughed long and loud. My guide's sense of humour, which lay dormant on most occasions, was so thoroughly roused on this, that it never quite fell asleep again, and he was for ever reminding me I had said I would laugh after I was dead.

Besides this guide, my only companions were my servant Abdulla and three camels to carry us and our slender outfit—a sack of rice and of flour, three goatskins of water, tea, sugar, coffee, ten tins of desiccated soup, two of porridge, and a few apples and lemons. Two skins of water would with care last us five days, without allowing any for cooking or washing.

Mr. C. W. Ward has given so graphic a description of the road which he followed in his unfortunately fruitless attempt to enter Siwa, that I feel I have nothing new to say about the route, except that at Moghara I was fortunate enough to find some bones partly embedded in the sandstone, partly lying on the sand, which, on being examined at South Kensington, proved to belong to the precursor of the horse. Mr. Ward has described Ghara, that strange town built on the summit of a rock which rises some 40 feet out of a low damp plain surrounded by hills. It is supposed never to contain more than forty men at one time, but I fancy that I saw a good many more. When we arrived, every inhabitant was within the walls. At sunset the gates are shut, as in other towns, such as Siwa, and until sunrise none may either leave or enter. We shouted for food, and a basket full of dates was let down by a rope over the walls. Having to encamp in the low damp ground, we should have been bled as a preparation for the Siwa fever we should be exposed to, but the barber could not come out that night, and next morning he was too busy to attend to us. My guide was much disturbed, and the attack of fever I suffered from on the return journey was always attributed to this omission. Mosquitoes did their best to fulfil the barber's duties. They swarm in sufficient numbers to prove annoying even to the Arabs.

I was in a hurry to get on to Siwa, for the demands of the people for provisions were extortionate, and my resources small. We filled our goatskins, and pushed on. The water of the well of Ghara has a most abominable taste. It is, in fact, scarcely drinkable until it has been at least a day in the skins. Even then it is a wise precaution to hold your nose for some seconds after drinking.

Between Ghara and Siwa, old Dau, my guide, was terribly alarmed by our meeting a party of Uled Ali ("sons of Ali") Beduins. Their reputation as robbers is bad—but presumably they did not think us worth robbing, except in the friendly way of drinking up all our coffee, which Dau, in his relief at finding them friendly, obsequiously made and offered them.

I have until now been lucky enough to get on with the Beduins I have met.

Happily for me, the heat doesn't knock me up, and I can walk in the desert as long as in England. I heard that the Beduins gave me the name of the walking Englishman, and once or twice were kind enough to say that I was one of themselves. Trifles like these are important when dealing with men who have the minds of children. With them whether you are to live or die depends so often on a trifle that it is as well to have as many trifles as possible in your favour. I wore their dress in my trip to Siwa, not with the idea of taking any one in at close quarters, but of making myself unnoticeable at a distance. I generally walked some way in front of my men and camels. I did this because the incessant drone of the Arab songs became intolerable to me, and as I found Abdulla couldn't possibly get on without his eternal song, I used to put a mile between us when the track was clear.

Once or twice, on reaching the brow of a sandhill, I would find myself in sight of a string of camels. The first thing the Beduins would do was to load and hold their flint-locks at the ready. They meant no harm; it is the ordinary etiquette of the desert, at which no one dreams of taking offence. Then I would have to sit down to show I meant no mischief, and conversation would be carried on in shouts. I generally asked them for a bowl of camel's milk, which they always gave if they had it. On one occasion I came upon a solitary Beduin watching his herd of camels grazing. That man had probably not seen a human being for weeks. He was squatting on the ground. He neither moved nor turned his head. I asked him for milk, and he pointed to his camels and said, "Take it." As the art of milking camels never formed part of my school curriculum, this invitation was of little use to me. But I could not rouse that man to more active hospitality. He probably looked upon my appearance as an impertinent intrusion.

After a long tramp my Arab garments were in a disreputable condition, and as we drew near Siwa I saw little prospect of entering the town in any other character than that of a beggar. Little guessing what honours were in store for me, I put off my entry till dusk. On foot as usual, and some way in front of my men, I passed through the mile and half of gardens. The vegetation was magnificent. Each garden was surrounded by a mud wall, over which the foliage of the palms drooped most invitingly. But with the uncertainty of my reception before me, I do not pretend to say my mind was in a state fully to take in the peaceful beauties of the scene. At that hour not a soul was about, and I was not observed until I had crossed the bridge that spans the narrow canal running through the outer square, and was well into the middle of the further half of the square. Then the men assembled in the booths in front of me suddenly became aware of my presence, and came forward in a mass; I was soon surrounded. We exchanged greetings. Of course they soon heard that I was a stranger, though my shawl was so arranged that they could see nothing of my face but my left eye; but that is, unfortunately, blue. One man tried to pull my shawl aside—a liberty I resented, and he kept his distance; but things were becoming unpleasant. Dau hurried up just then, and told me not to lose a minute, but push through into the inner square by an open gateway I had not seen. This inner or Government square, as it is called, is reserved for the deliberations of the aristocracy of Siwa—the thirty-five or forty landowners. The rabble have no right to enter its precincts without leave, but the excitement of my arrival destroyed all rules of etiquette, and the noisy and unfriendly mob followed me in.

I looked round. There were tents in the middle of the square, and some dozen Egyptian police were strolling about—a comforting sight to me. On my left there was an out-jutting building, afterwards known to me as Government house. On a

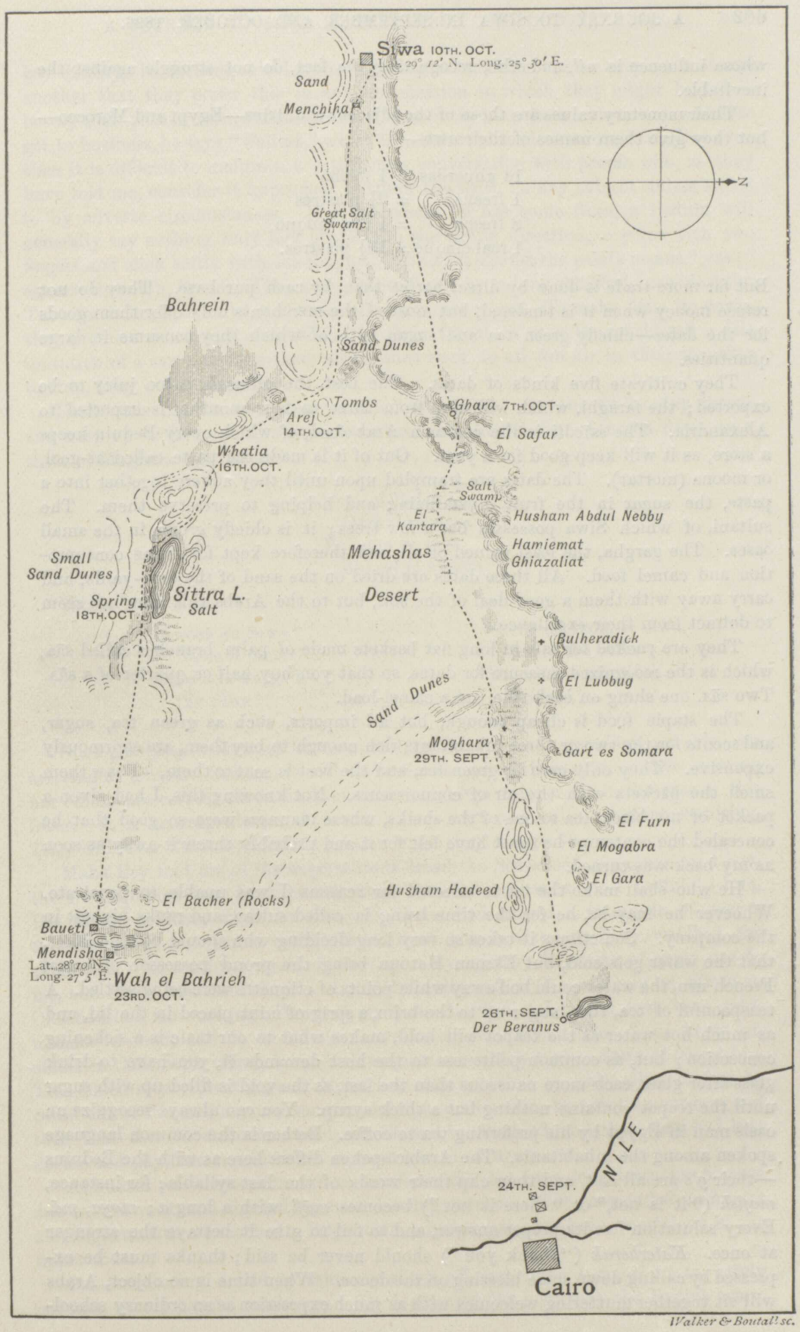
bench running along it I saw a grave assemblage of sheiks, sitting in conclave. In the centre sat a man in European clothes. This I knew must be Maha Bey. There was only one thing to do: I went up to him, and, speaking in English, addressed him by name, and asked if my presence was likely to increase his difficulties. Luckily for me, my rags and tatters, and my face burnt black, were not too much for his presence of mind. Hearing me speak English, he rose to receive me, and I believe his courteous reception saved me from much unpleasantness. Seeing the Mudir rise, the sheiks all stood up. My sudden appearance had silenced the mob. All eyes were turned on me. There was no time to explain, and with any one less quick at seizing the situation than Maha Bey, the danger I was in might have assumed alarming proportions. Speaking in the deliberate way in which Arabs exchange greetings, Maha Bey told me in English that if I would be guided by him, he fancied my arrival might be turned to some use. "I must talk with the sheiks for a minute," he said; "my orderly will take you to my tent, where I will follow you in a few minutes and tell you what to do."

Just then I remembered I had about me a passport. It was on parchment, and had an undeniably official look about it. With all the dignity I could assume, I produced the precious document and handed it to Maha Bey as my credentials. Not a ghost of a smile played on his face as he read it and returned it to me with a bow. He told me afterwards it had struck him then what to say about me. He soon followed me to his tent, and informed me I had become a colonel in the British army. The Government, he had told the sheiks, tired of waiting for the payment of the taxes, now three years overdue, had sent me to see what answer they were giving to his demands. I had hurried along alone, not wishing, unless absolutely forced to do so, to alarm Siwa by bringing my armed escort with me. As soon as I knew who and what I was, we returned to the sheiks, who in the mean time had been deliberating.

Maha Bey placed me at his right hand. I announced the fall of Dongola—an important piece of news to them, as the only help they could ever expect, if they meditated rebellion, must come from there. A change now came over them. From having absolutely refused to pay anything, they begged for a few days' respite before giving a final answer, and, before the assembly broke up, I received an invitation to attend that evening's feast in the inner town, given by Sheik Ekman Haboun, the leader of the Senoussi, or fanatical party. Maha Bey refused to accept until Ekman Haboun had promised to use his great influence towards having the taxes gathered. I was invited because Maha Bey took it for granted that I must be, as his guest, but I fancy my host thought it a bitter pill to have to consent to my entering the rock-hewn walls of the inner town at his invitation, for I believe I am the first Christian who has penetrated so far.



As we waited to go in, and afterwards as we sat in his tent, Maha Bey told me all he knew of the place. The people are in the habit of exchanging their dates for tea and sugar, and sometimes other small luxuries they can afford. No money ever passes. It is needless to say they are shamefully cheated, and, never receiving payment in money, they have none to give to the tax-gatherer. Maha Bey had interviewed the caravan of merchants just arrived, and informed them he had forbidden the Siwans to accept anything but money for their dates. As the merchants had brought everything but money, affairs were at a deadlock, and Maha Bey intended to stay in Siwa until money was forthcoming.

Mahomet Saïd leads the Government party. Not being such a fanatic as Hatoun, his attitude was naturally more friendly towards me. He and his party have the support of a Mahmoor and two policemen sent from Cairo—individuals

whose influence is *nil*, and who, recognizing the fact, do not struggle against the inevitable.

Their monetary values are those of the adjacent countries—Egypt and Morocco—but they give them names of their own—

14 ghuerdas = 1 freena
1 freena = $2\frac{1}{4}$ piastres
8 freena = 1 real cinquo
1 real cinquo = $19\frac{1}{4}$ piastres.

But far more trade is done by direct barter than by cash purchase. They do not refuse money when it is tendered, but most of the merchants only offer them goods for the dates—chiefly green tea and sugar, both of which they consume in large quantities.

They cultivate five kinds of dates. The best, the ghrasali, is too juicy to be exported; the faraghi, which will keep from three to four months, is exported to Alexandria. The saïedii is the common Arab food, of which every Beduin keeps a store, as it will keep good for a year. Out of it is made the paste called ar-gool, or moona (mortar). The dates are trampled upon until they adhere together into a paste, the sugar in the fruit crystallizing and helping to preserve them. The sultani, of which Siwa possesses but a few trees; it is chiefly grown in the small oases. The gargha, the least valued of all, and therefore kept for home consumption and camel food. All these dates are dried on the sand of the date-yards, and carry away with them a good deal of the soil, but to the Arabs this does not seem to detract from their excellence.

They are packed for sale in long flat baskets made of palm branches called sāa, which is the recognized measure for dates, so that you buy half or quarter of a sāa. Two sāa, one slung on each side, are a camel-load.

The staple food is cheap enough, but all imports, such as green tea, sugar, and scents for the two or three inhabitants rich enough to buy them, are enormously expensive. They only care for green tea, and the best is sent to them. I saw them smell the packets with the air of connoisseurs. Not knowing this, I had given a packet of my black tea to one of the sheiks, whose manners were so good that he concealed the contempt he must have felt for it and probably threw it away as soon as my back was turned.

He who shall make the tea is selected for reasons I was unable to penetrate. Whoever he may be, he for the time being is called sultan, and ranks highest in the company. Sometimes it takes so very long deciding who should be tea-maker, that the water gets cold, but Ekman Hatoun being the proud possessor of a real French urn, the water could boil away while points of etiquette were being settled. A teaspoonful of tea, then sugar up to the brim, a sprig of mint placed in the lid, and as much hot water as the teapot will hold, makes what to our taste is a sickening concoction; but, as common politeness to the host demands it, you have to drink glass after glass, each more nauseous than the last, as the void is filled up with sugar until the teapot contains nothing but a thick syrup. You can always recognize an oasis man in Egypt by his preferring tea to coffee. Berber is the common language spoken among the inhabitants. The Arabic spoken differs here as with the Beduins —their *g*'s are all soft, and they clip their words of the last syllable; for instance, *mafish* ("it is not," or "there is not") becomes *māfi*, with a long *a*; *moya*, *mā*. Every salutation has its proper answer, and to fail to give it betrays the stranger at once. *Katerherak* ("thank you") should never be said; thanks must be expressed by calling down some blessing on the donor. When time is no object, Arabs will sit together muttering welcomes with as much expression as an ordinary school-

boy displays in reciting his lessons. Strangers meeting are so suspicious of one another that they prefer this to any conversation in which they might be led to betray their past or future movements. If one or the other is in a hurry and wishes to get to business, he says "Salimt," which is understood to close salutations; but even then it is difficult to maintain a satisfactory conversation with people who, as they have told me, consider it imprudent to speak the truth on any subject unless forced to by adverse circumstances. If asked where he has come from, a Beduin will generally say nothing, only jerk his head in the wrong direction, or point with two fingers and click softly with his tongue. The click against the palate means "yes;" against the teeth, "no." They also express "no" by jerking the head back slightly. The camels are spoken to in a series of sounds, not words. To make them lie down, they produce much the same sound in their throat as may be considered a fair imitation of a saw; to urge them along, they suck up all the air in their mouths; to stop, they hiss a long *iisss*.

Each oasis has its own song "ramie," which the caravans on leaving intone and keep up for hours with a persistence perfectly distracting. I noted down two, those of Moghara and Siwa—

"Gour el Helab ou
Gart el Somara
Ya doun ya rase
Kaheel el andara."

While Siwa sings—

"Aween ya Siwa!
Yalla fi tamar
Oues zeit wagged,
Ya Siwa?"

"Where art thou, O Siwa,
Where the dates
And oil are plentiful,
O Siwa?"

Siwa possesses a fever of its own, and, as I have said, travellers are bled on arriving at Ghara. Onions are said to be an antidote. However, neither bleeding nor onions are certain cures, for they told me a large number die in the year of this fever. It is accompanied, as I found in my own case, with constant vomiting. They call fever humma, and use quinine when they can get it.

Maha Bey told me of the superstitious dread the Siwee had of cannon, and how the absurd report that he kept one under his bed had been most useful to him. His fifteen soldiers, when he reviewed them, had caused a stampede of over a thousand into the inner town, where from the battlements they watched the evolutions with a calmer sense of security. My military title was of great use to me, and Maha Bey assured me I should be quite safe if I could rely on my men. Of Abdulla I felt sure, and Dau was easily hoodwinked. I might have been commander-in-chief, and it would not have astonished him. The Kadi knew an officer in Cairo with whom I was well acquainted, which made a bond of friendship. This added to my prestige, and Maha Bey was not slow to make what capital he could out of the military romance he had wound around me by pointing out now and then that the Government would not leave him unaided, and that they had best decide and pay, and not force me to return with an army.

At sunset we were summoned to the feast, and led by a long tortuous passage cut in the rock and lighted by men bearing torches. The passage led up higher and higher, until we reached a large room, which must have been somewhere in the upper town.

Before entering I had to take my shoes off, and when I saw my toes barely covered by my ragged stockings, I felt I scarcely did justice to the British army.

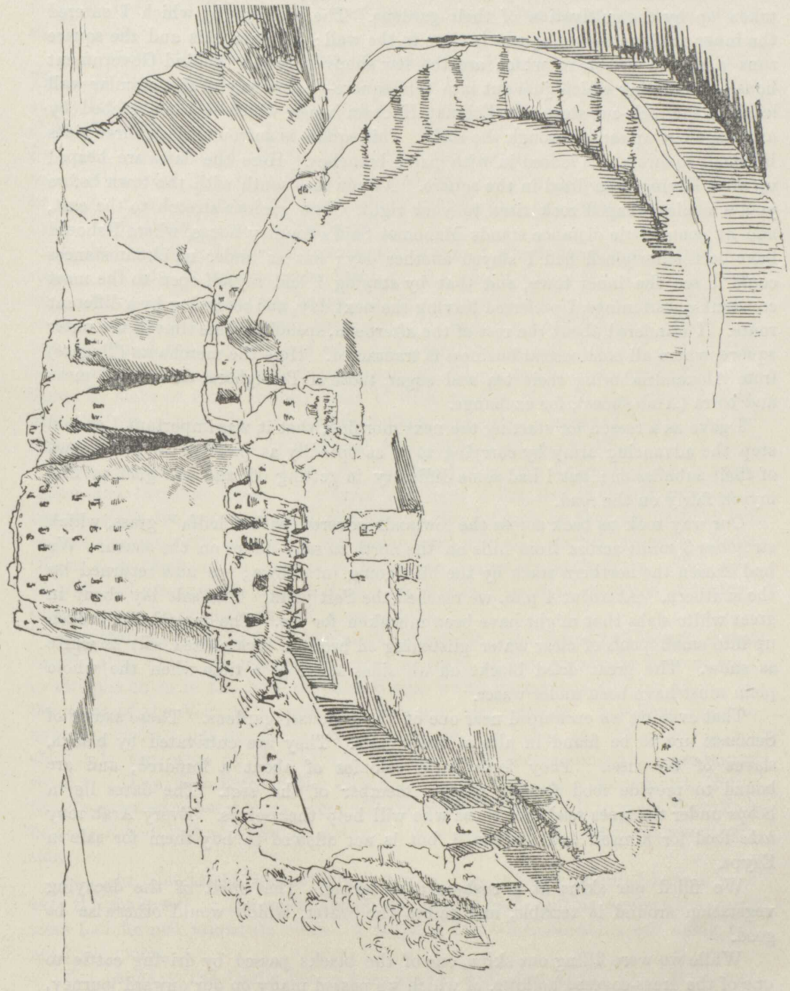
مكتبة قطر الوطنية
Qatar National Library

The manners of my host and his guests were, however, if not cordial, perfectly courteous.

There were several round tables placed down the middle of the room, candles burned in candlesticks, all of which had been imported from Cairo at a fabulous cost. Lamps of olive oil were also about the room. The food was more than abundant. A whole sheep stuffed with rice, raisins, and pistachio nuts; soup, chicken, vegetables, succeeded each other. Then came trays of delicious fruit—the trays made of woven date-fibre; the fruit, delicious black grapes, figs, a small variety of water-melon, sweet lemons, pomegranates, and mandarins. Our host did not sit down, but directed the servants, who were most likely slaves. There is still some traffic in slaves from Kura, the price of one of these being a small roll of blue and black cloth, such as the natives wear. I fancy most of the Siwans' dislike of admitting Christians to their town is the dread that their slave trade will be interfered with. There was no conversation during the meal, for any one to talk would have meant a disregard for the other more important function of eating.

After a long dinner we rose and washed our hands in brass basins, with water poured out of ewers. Then all sat on the divans round the room. A servant then walked round, showering rose-water over us so liberally that another had to follow with a towel and wipe us dry, and while he did this a third stifled us with incense. This unpleasant ceremony cost our host a large sum, for rose-water imported from Egypt becomes of fabulous value, and the servants were unpleasantly liberal in dispensing it. The conversation was carried on in Arabic when they addressed either Maha Bey or me, but in Berber—of which neither he nor I understood a word—when they spoke among themselves. We had English to fall back on when they were sufficiently engaged to leave us alone. My tent meanwhile had been pitched close to Maha Bey's, and I slept in all security, watched over by his sentinels. Next morning Maha Bey, kindly wishing to show me as much of the place as he could, found a reason to visit the tombs and the villages of Menchiha, some $1\frac{1}{2}$ mile from Siwa. As we crossed the canal beyond the first square, I caught some of the small fish. They positively swarm, even in the puddles on its side. Once a year the poor of Siwa have a grand fishing, and catch enormous quantities to feed on. Threading through the outskirts of the town, I saw a few poor houses. The children I saw, and one woman, who came out of a doorway and gave me water kindly enough, were all black, and I suspect these are slaves.

The Siwans themselves, though darker than Beduins, have nothing of the negro about them. They are of Berber race, and their faces are long and lean, cheek-bones very prominent, eyes dark. Their expression is forbidding; lank and wiry, they look as if they could endure any hardship.



We reached the tombs first. They were hollows cut in the rock, said to be made by the Romans. They were quite empty, though a few bones could still be seen lying about. Maha Bey had found these tombs the resort of all that was disreputable in Siwa, and had had them emptied. From report, Siwan morals are of the lowest, even in native eyes; so we will hope that he did good work. We went on to the village Menchiha, a curious little town built high up on a rock some 50 feet high. As at Ghanhara and Siwa, at night the gates are shut and the inhabitants safe within the walls. Their gardens spread out all round in lovely vegetation. Five springs of different temperature flow from the rock and irrigate the gardens. This water is quite sweet, and the women come down and carry it up into the town above—an arduous task.

The sheiks received us most kindly, showed us their beautiful gardens—of which they were justly proud—and then gave us a luncheon of fruit, most delicious

and refreshing, and even lent us donkeys for our ride back to Siwa, which we reached in time to rest before the hour for the decisive meeting at Sheik Suleyman's tomb that evening. On very important occasions such as this, the sheiks assemble on the saint's tomb, and he is supposed to preside over and direct their counsels.

DATE-DRYING YARD, SIWA.

It all passed off satisfactorily. They decided the taxes should be paid if time were given them. In the mean time, no merchant might give goods in exchange for dates; everything had to be paid for in money, and the Government share deducted. Of the inner town I saw nothing but the room in which we dined. The women are

Qatar National Library

shut up within its walls, and all they see of the world is from slits at the top of the harem town walls. Rock and wall rise some 50 feet above the plain. The gates and passages leading up into it are cut in the rock. The women never come out, and after sunset every man has disappeared within.

At the foot of this wall—in the first square through which runs the canal—are the booths where the men spend most of their day, that is, such time as is not taken up by the cultivation of their gardens. The archway by which I entered the inner or Government square is close to the wall; between this and the square runs a narrow street, in which are the few shops of Siwa. Behind Government house—a building which juts out into this square—a doorway in the circular wall leads up the rock-cut steps into Eckman Haboom house, which is then reached by a passage cut upwards through the rock. This square is surrounded on three sides by small square yards fenced in with palm branches. Here the dates are heaped up after having been dried in the square. As you face south with the town before you, a conical-shaped rock rises to your right. The gardens stretch to the east, and at some little distance stands Mahomet Said's country house, where I should have been entertained had I stayed another day; but as under no circumstances could I see the inner town, and that by staying I laid myself open to the most constant questionings, I preferred leaving the next day, and returning by a different route. I wandered about the rest of the afternoon, spending some time in the outer square, where all commercial business is transacted. Here the merchants (Tugars) from Alexandria bring their tea and sugar, those of Banegharsi their dried meat and balra (Arab shoes), for exchange.

I gave as a reason for starting the next morning, that it was important I should stop the advancing army by carrying to it as speedily as possible the good news of their submission; but I had some difficulty in getting off, and was glad to find myself fairly on the road.

Our way took us back across the lowlands covered with "halfa" grass, which stretches 3 miles across from hills on the north to sand-dunes on the south. We had chosen the northern track by the hills going into Siwa; we now returned by the southern. At about 4 p.m. we reached the Salt plain. The salt lay about in great white slabs that might have been mistaken for ice. The ground was broken up into small pools of clear water glistening on beds of crystallized salt as white as snow. The great dried blocks on all sides spoke of a time when the whole plain must have been under water.

That evening we encamped near one of the Senoussi gardens. These sauya of Senoussi are to be found in almost every oasis. They are cultivated by blacks, slaves of Senoussi. They form little colonies of about a hundred, and are bound to provide food for any passing member of the sect. The dates lie in heaps under the trees ready for those who will help themselves. Every Arab may *take* food for himself and his camel, but is not allowed to buy them for sale in Egypt.

We filled our skins at a rush-covered spring. The smell of the decaying vegetation around is terrible, and taints the water, which would otherwise be good.

While we were filling our skins, one of the blacks passed by driving cattle to one of the grass-covered hollows, of which we passed many on our onward journey. He seemed astonished to see me, but said nothing. It was on this, our second day from Siwa, that Dau admitted his ignorance of the route for which I had engaged him as guide. He implored me to return the usual way, but it would have been awkward if the English colonel had reappeared on the scene, having missed his army; so I decided to push on, trusting to our being able to follow the track of

BRITISH LIBRARY

seventeen donkeys, which shortly before had been driven from the Wah el Bahrieh, or small oasis, to Siwa.

We reached the sand-dunes before night, and followed the track by moonlight as long as we could, encamping at midnight. The next day we travelled across flat rock and dunes. Three conical hills, known to Dau as landmarks, happily kept us straight, for the track was difficult to follow on rock, though Abdulla found it here and there by a turned stone, which showed white on its newly exposed side.

We reached the Arej that evening, walking down a steep passage in the rock. The sand slips under your feet, and the camels had a bad time coming down. Once at the bottom, we found ourselves in a valley surrounded by almost perpendicular cliffs of limestone, some 140 feet high. We could see nothing beyond. The Bahrein ("two rivers") with its date-palm forest stretching as far as the eye could see, visible from the tableland above, had now entirely disappeared. Abdulla brought us in some excellent dates, which proved that the palms in the Arej are looked after, though common property.

In the morning I saw the tombs, thirty-six of which have been opened and robbed. A row of squares gape black on the side of the rock. I climbed into many, but found nothing but bodies lightly covered with sand, and some mummy cloth. The walls in some were decorated: one had the hooded snake, others had been scribbled over by Romans with rude scratchings, and Arabs of a still later date had in some cases added their names. These tombs were evidently once closed by slabs of rock carefully built in with smaller bits, till the whole looked uniform. In places the rock sounds hollow, and other unopened tombs may be there; yet it is difficult to believe that Arab robbers left any unrifled.

The mosquitoes of the Arej were terrible, as they are wherever there is vegetation, and therefore water. We dared not light a fire, lest it should serve as a beacon to the robbers that infest the place. We suffered so that we decided not to pass another night in misery, and at sundown next day started onwards. Some Ghara men came up an hour or so before we started, to fetch dates. The Arej bears so bad a reputation that strangers are looked upon with suspicion; but these turned out to be friendly and harmless enough.

Our road was easy to find; landmarks known to Dau seemed to abound. From the Whatia, which we reached the next morning at ten, an abrupt descent took us straight down to the level of Lake Sittra, which we reached the day after. In the trees of the Whatia I noticed some small night-herons. I believe them to be a new variety, but unfortunately I missed the one I shot at. Their cry is not absolutely the same as that of the ordinary night-heron, and they are much smaller. They flew back in the direction of the Bahrein. There must, therefore, be some open water there; that of Lake Sittra is far too salt to make it possible fish can live in it, and I saw no living thing either in, or on, or near this southern side.

The lake is about 14 miles long and 3 wide. On the west, stunted bushes grow near the shallows; on the south—where we stood—sand drifting against the palm trees had formed miniature cliffs. A range of low white sandhills ran along the northern shores.

The palms on the banks bear a good deal of fruit, but it is of little use except as food for the camels. The road is too little used to make it worth while to tend the trees.

A spring of fresh water rises among the rushes at the east end of the lake. So difficult is it to see where salt ends and fresh water begins, that I hesitated before tasting it, when I found it far sweeter than that we had drunk in the Arej.

The ground, as we left the lake to the east, was covered with bushes, and I saw quantities of the spoor of hares.

From here to the smaller oasis there are five days' travelling across the most desolate waste, destitute of water, and even of the usual desert vegetation, so the camels had to live on the dates we carried for them. On leaving the lake there is a long track of wackla, or swamp, encrusted with salt. The track has to be carefully kept by the camels, for it is easy for them to flounder into depths from which it would be impossible to extricate them.

The only difficulties of the road began now. Dau lost his way on the evening of the next day, and as we could only carry just enough water to take us to the oasis without any delays, things looked rather black. We were not cheered by stumbling upon a man, woman, and child, and their donkeys, all lying dead—evidently of thirst. They were not all together. The woman, her child in her arms, had died first; near her lay one donkey. The man had struggled on some little way, and lay on the sand face upwards, his clenched hand stiffened in a last convulsion. The poor wretches had tried to quench their thirst with lemons, the skins of which lay scattered on the ground.

We went on climbing sandhill after sandhill, always hoping for the sight of some Al-haman, or landmark. Dau became very melancholy. I tried to take a cheerful view of things, though I cannot say that I felt in high spirits; but my attempts were considered irreverent by Dau, who thought the Prophet would be more likely to help us if we acknowledged the straits we were in. We still had some water, but we dared not drink it. Not knowing in the least where we were, we could not judge what chance there was of getting to the oasis before it was exhausted. On the late afternoon of the third day we suddenly came upon the Bacher, a group of rocks which we knew to be near the small oasis. Our difficulties were then at an end, and that night saw us encamping with my old friend the Omdeh of Mindescha.

ANCIENT TRADING CENTRES OF THE PERSIAN GULF.

By Captain ARTHUR W. STIFFE, R.I.M.

This place is still an important place of call, and of trade with India, the Red Sea, and Zanzibar, chiefly only transhipment. It is the capital of the Arab country of Omán, and the residence of the prince, now designated Sultan or Seyyid, but formerly called the Imám of Maskat.† The country has long been in an unsettled state, owing to civil wars and dissensions, and has declined in importance, especially since the separation of the Zanzibar dependencies. It is now under British influence, and a Political Agency is established there. The town lies in a cove, one of a series close together on the north-east point of Arabia, which are all surrounded by precipitous rocky hills rising to several hundred feet abruptly from the water's edge. At the inner end of each cove is a small sandy beach, at the mouth of the little valley, or wadi, which forms the inland continuation of the

* The accent should be on the first syllable. Map, p. 660.

† This title has a religious significance, and is not now assumed by the sovereign of Omán.

BRITISH LIBRARY

cove. The rocks are dark-coloured serpentine, here and there showing foliation well marked,* and it is part of an area of depression, the coves being submerged valleys, which had been excavated by subaërial agencies before the submergence took place. The bed of the sea sinks rapidly to a depth of upwards of 2000 fathoms at a distance of 10 or 12 miles from the coast.

The appearance of the coast from the sea is extremely picturesque, the rugged dark hills rising one range above another, until apparently joining the great back range, elevated about 6000 feet. Although from seaward the country appears utterly barren and desert, without any sign of vegetation, the valleys lying among the hills are more or less fertile where irrigated, which is done by means of wells, with so-called Persian water-wheels, and kanáts, or subterranean aqueducts. It produces fruits and vegetables, and many date-palms are grown. The coves abound with fish of excellent quality. The small cattle of the country are noted, and flocks of sheep or goats are numerous.

The map of the group of coves is from a survey by the author. Each one has a village or town at the head, built on the sandy beach close to the water's edge, so that the sea even washes the base of the houses, which extend back as far as the rugged ground will permit. They all may be considered suburbs of Maskat. The intervening hills are so rugged that, although there are some passes over them, much of the intercourse is carried on by water in large canoes. The houses fronting the water are mostly of two or three stories, and coated with white cement. The hills and passes are all crowned by small towers or forts for defence, with walls and gates across the passes. Maskat itself and Matrah, the place next in importance, are enclosed on the land side by walls, with towers at intervals. From Matrah only is there any pass into the interior of the country.

There are two large forts, built by the Portuguese, one on each side of the cove, on the summits of the hills overlooking the town, and two outer and less important, called Sírah, on the next projecting points of the cove; they are all in a very ruinous condition. The east side of Maskat cove is formed by three detached masses of rock; the outer, commonly called Maskat island, rises 350 feet above the sea, and can only be climbed with difficulty at a few points; it is much the largest, being 1400 yards in length, and is separated by a shallow strait, only a foot or two deep, from the second and smaller hill, and this again by a still shallower passage from the third, which is crowned by one of the great forts (Jaláli), and has a low sandy isthmus between it and the rocks surrounding the town, on which isthmus now stands the British Residency.

Outside the wall of Maskat there is a large suburb, occupying all the available ground in the valley, and consisting of huts of the usual material of Arab villages, viz. matting made of the stems and leaves of palm fronds.† Here there is a bazar, which is a busy scene in the morning. A curious kind of auction goes on constantly. Men walk about calling out the last bid made for some article they carry for sale, which seems to go on until some offer is made which they will accept.

Of the two principal forts, the eastern, Jaláli, already mentioned, occupies the whole of the top of the rock on which it stands. Its front is a long curtain wall with two tiers of embrasures, with a round tower with flagstaff at each end, the only access being by a flight of steps cut in the rock on the harbour side. This

fort was much damaged by artillery fire during a civil war some years since (about twenty, I believe), and remains in a most dilapidated state, as the Arabs appear never to repair anything. We had given the Sultan of that time two guns of position—24-pounders, I think—and these were used with great effect by one side in the quarrel—I think, by the rebels, *i.e.* the unsuccessful party. This fort was built by the Portuguese in 1587, and called by them San Joao.

Opposite to this, on a hill overhanging the town, stands the other principal fort, now called Meráni. It has a ruined battery near the water, above which rises the body of the fort, occupying the top of the hill. It is an irregular structure adapted to the available space, and has two large round towers, with tall flagstaffs, as in all Arab forts, the higher tower being connected only by a double wall with the

INSCRIPTION OVER GATEWAY IN FORT MERANI.

main fortress. The guns mounted are very old, mostly Spanish or Portuguese, and the carriages dropping to pieces. The iron guns are all dangerously unserviceable. The brass guns are in better order; one bears the inscription, "Don Phelippe rey de Ispaña," and another the inscription, "Don Juan de Acuña de su conseio de cuera y su Capitan general de la artilleria año 1606." This fort was built in 1588, according to an inscription over the inner gateway in old Portuguese, which has been rendered for me as follows: "Reigning the most high and most faithful Henry, powerful and first of that name. King Henry our lord, in the eighth year of his reign on the crown of Portugal, ordered by Don Duarte de Menezes, his viceroy of India, that should be erected this fortress, of which Belchior Caleça was its first captain and founder, 1588." *

I cannot understand this date (unless it is the date of *completion*; it may well have taken many years to build, being so extensive), as Henry died in 1579, and did not reign eight years. It was named by them Fort Capitan.† In 1581 the news of the seizure of Portugal by the Spaniards reached India. The fort is only strong from the difficulty of access, and the old entrance gates, one within the other, are still carefully guarded. Over an arched window, 30 inches span, cut out of one stone, is carved, in letters 3½ inches long, an Ave Maria (copy attached). The two smaller outer forts, which had also batteries near water-level, are still more ruinous.

* A facsimile is attached.

† A fort was commenced on this site by Da Lisboa thirty years previously, in 1552.

The Sultan's residence is a large three-storied building near the centre of the town, a quite plain, rectangular block. It is a relic of the Portuguese occupation, having comprised the governor's residence, factory, chapel, warehouses, and barracks. The Arabs call it El Jereza, a corruption of Igrezia (church). On an old wooden gate of the custom-house is cut "Anno 1624."

The wadi extends up behind the town for a mile or more, and is cultivated in patches, with vegetables and a few date trees. The wells, worked by bullocks, are about half a mile from the town wall, and are defended by a square tower or fort, loopholed for musketry. A small cemented aqueduct, generally out of repair, has

INSCRIBED OVER A WINDOW IN FORT MERANI.

been made to bring the water down to the landing-place for shipment. The water-course draining this valley passes through a culvert under the town wall into the sea. It is quite dry except after rain.

From Matrah there is a track or way winding through the hills into the interior, and, after following it about half a mile, you come on a plain among the hills with a small village, called El-Felej, where there is a castellated country residence of the sultan, very dilapidated, with a grove of date and other trees, and some cultivation. The water is brought from the upper part of the valley by an underground channel, or *kanát*. This is the only approach by land to Matrah, whence Maskat is generally reached by water.

As regards the actual productions of the place, they are unimportant; it being chiefly a port for transfer of trade. The speciality is the manufacture of *halwah*, a sweetmeat much in request, and of which large quantities are exported. It is made chiefly of the gluten of maize. Large quantities of dates brought from the coast of Bátinah are exported. It is a port of call for the Gulf mail steamers, and some English merchants are established here, also many Hindus (Banians), all traders.

The climate of Maskat is extremely hot, even in the winter, and there is but little rain, which falls in the winter. It is out of the track of the cooling south-west monsoon, which is cut off by Ras-el-Hadd; but in that season light south-

easterly airs at times temper the heat. Abd-er-razzak,* 1442, says that in May "the heat of the sun was so intense that the sword in its scabbard melted like wax," etc. I can almost pardon him his exaggeration.

History.—Turning to the history of the place, it is only speculation to inquire whether the Moscha and Omana mentioned in the Periplus † are the Maskat and Omán of the present day. Dean Vincent argues that they are not, but it is possible they may be intended for these places, and misplaced in the itinerary, some confusion in the application of names having arisen. The description given of the places seems more applicable to Maskat, than any other part.

We have a brief glimpse of the place ‡ in the ninth century, indicating it as the last port of call for the Arab vessels proceeding to India, which is all I have been able to trace of its earliest history.

FORT OF FELEJ.

Colonel Taylor, formerly political agent in Turkish Arabia, and, I believe, a great Arabic scholar, gives a short account of the history § of Omán "from authentic sources of Arabian tradition," but does not specify any authorities. He says nothing about the period between the eighth and seventeenth centuries, and does not mention the long Portuguese occupation. His account says that the first native Arabian who entered Omán was one Malik bin Fakham of Nejd, four centuries before the Christian era, ‖ who, with some hundred followers of the Hinávi tribe, settled at Jaalan or Bahla, two towns in the interior some 70 miles to south-westward of Maskat; and fortified Rastag, an ancient city in the mountainous district of Omán, 30 miles westward of Maskat. Successive additions to the numbers of these Arabs enabled them, after obstinate resistance, entirely to expel the Persians from the province. His successors continued in power until the mission of Mohammed.

* Hakluyt Society, vol. 22, 'India in the Fifteenth Century.'
† 'Periplus of the Erythrean Sea.' W. Vincent, D.D. 1800.
‡ *Geographical Journal*, vol. vi. No. 2, August, 1895, p. 169.
§ 'Bombay Government Records,' No. 24, New Series, 1856.
‖ Colonel Ross says the probability is that Malik bin Fahm entered Omán in the early part of the second century A.D., and that the part he played is probably exaggerated. The country up to his time was under the Persians, the date of whose conquest is not known.

In 571 A.D. a powerful prince of the dynasty, named Jalanda, equipped a fleet and seized Hormúz island, which was established as a rendezvous of a piratical fleet. They were converted to Islam in 621 A.D. by invitation of the Prophet.

Dr. Badger (Hakluyt Society, vol. 44, 1871) gives a translation of an Arab history of Omán, containing the period between 661 and 1856, by Salih-ibn Razik.

I propose here, however, to touch chiefly on the Portuguese occupation of the seaboard of Omán. The above Arab author gives only a short space to the period 1154 to 1557, and does not mention the Portuguese conquests; nor is there any record of the overlordship of Hormúz, which existed at the time of the appearance of the Christians. He admits a hiatus in the annals from 1154 to 1429, and these are also said to be obscure up to 1560.* His account of the recapture of the places from the Portuguese will be referred to later on.

Marco Polo (1260–95) does not mention Maskat *by name*, Kalatu † (Kalhát) is mentioned as frequented by numerous ships from India, and as "subject to Hormos." "Many good horses are exported to India; the number from this and the other cities is something astonishing." The probable reference to Maskat is that "the Melic of Hormos has a castle which is still stronger than this city (Kalhát), and has a better command of the entrance of the gulf." Abulfeda (1273–1331) also does not mention Maskat by name. Ibn ‡ Batuta (1324–25) went by sea to Omán, and arrived at the city of Kalhát, "which is situated at the foot of a mountain. The inhabitants are Arabs and schismatics, which they keep secret, because they are subjects to the king of Hormúz, who is of the Súnni sect." He mentions the markets and a fine mosque, "whose walls are covered with coloured tiles."

Edrisi (1153) mentions in Omán, first Kalhat and Súr, and then Sohár, which he says is one of the most ancient cities of Omán, and of the richest. Maskat is mentioned as a populous town.

We may, I think, gather from all this, that in the thirteenth and fourteenth centuries Maskat was a less important place than Kalhát.

The first appearance of the Portuguese on the coast of Omán was that of D'Alboquerque,§ who with six ships left Socotra on August 10, 1507, and sailed up the coast of Arabia. He anchored, says the chronicle, at Calayate (Kalhát), an anchorage on the coast, about 25 miles to north-westward of Ras-al-Hadd, and there got some supplies. It was badly populated, with many old edifices, the sea beating against it; on the land side was a wall, about the height of a lance, reaching to the sea, not a single tree, and all supplies came from the interior. It was under Hormúz,‖ and they fished as far as Ras-al-Hadd, and it was the seat of the

* In Colonel Sir E. C. Ross's 'Annals of Omán' (translation of Kishf-al-Ghummeh. Calcutta: 1874), there is a similar hiatus from 1153-1406. Nor is there any mention of the Portuguese conquests, or of Hormúz.

† Colonel Yule's 'Marco Polo,' vol. ii. p. 448.

‡ 'Voyage d' Ibn Batouteh. Trad. de C. Depémery et B. R. Sanguinetti.' Paris: 1895. The translation of Rev. Sam Lee (1829) appears less accurate.

§ The Commentaries of the great Afonso D'Alboquerque, translated from the Portuguese edition of 1874 (Hakluyt Society, 1875–84), from which I abstract largely.

‖ Confirmed by Marco Polo, 1271–94 (see *ante*). Colonel S. B. Miles says the supremacy existed since 1270. Colonel Miles was Political Agent in Maskat, and wrote a valuable report on the Portuguese in Eastern Arabia in the Administration report for 1884–85, printed in No. cevii., 'Selections from the Records of the Government of India, Foreign Department' (Calcutta: 1885). He does not always quote the authorities he has consulted. I have quoted in one or two places from this report.

مكتبة قطر الوطنية
Qatar National Library

chief governor from Hormúz. They next anchored off Curiate (Karyát), stormed and took it, and put all to the sword who tried to escape, including women and children *; they plundered and burnt it, "so that not a house was left standing, not even the mosque, one of the most beautiful ever seen." They cut off the noses and ears of the prisoners, and sent them to Hormúz. Thirty-eight ships, great and small, were burned. It was a large town, and contained about 5000 to 6000 men, an entrepôt of ships which came to collect dates.

Thence the squadron went to Maskat, where the people submitted to be vassals of the King of Portugal, being aware of the destruction of Curiate, and agreed to pay tribute and furnish supplies. A "captain" having arrived with 10,000 men from the interior, hostilities ensued, and the town was taken after a stout resistance. D'Alboquerque put men, women, and children to the sword, sacked the town, and burnt it to the ground, including the large and beautiful mosque, and thirty-four "ships" in all. Some men and women who had been taken alive had their ears and noses cut off, and were then released. "It is," says the account, "a large and populous city, supplied from the interior with much wheat, maize, barley, and dates for lading ships. It is part of the kingdom of Ormus."

The unhappy "Moors" returned when the Portuguese embarked, to try and put out the flames. "The Moors call the interior the *island* of Arabia.† It is a very small land (!) governed by a king called the Benjabar"—this is the name of a tribe in the vicinity (Beni-jábar).

At Maskat the Portuguese got "Moorish" pilots, and, passing six desert islands—the Daimániyah group—came to Soor,‡ where they were at first defied by the "Alcaide;" but who, on the Portuguese preparing to attack, submitted to be vassals of the King of Portugal. They took possession of the fort, hoisted the Portuguese flag on it, and left the "Alcaide" in charge. The fort was of a square shape, with six towers round it, and two very large towers over the gate. There were about six thousand inhabitants and one hundred "cavaliers," the greater part "armed with steel armour: plates arranged after the manner of a roof tiled with slates. The fore quarters of the horses were similarly defended."

The last place in Omán they visited was Orfacão (Khor-Fakán), which was attacked and taken with the usual mutilation of captives and merciless slaughter, after which the place was burnt. It was a large town, with a wall on the land side, and lies at the foot of a very high mountain. Now it is a small fishing-village, and I saw no remains of the old town; it lies in a small cove at the northern end of the Bátinah district.

So much for the first visit of a Christian power to this country. The invaders thence sailed to Hormúz.

In August, 1508, Alboquerque returned to the coast *en route* to Hormúz, "intending to attack Calayate," which had been spared the previous year. It was taken after some fighting, and the town sacked and burnt, including the mosque, "which the Moors took much to heart, for it was a very large building with seven naves, all lined with tiles, and containing much porcelain hung upon the walls." It was burnt to the ground; twenty-seven ships, large and small,

---

* I must express my horror at the barbarous cruelty of the "great" commander, both here and throughout this cruise, towards people whose only offence seems to have been that they were of a different race and religion. The details are stated in the Commentaries in a matter-of-fact manner.

† As they do now, Jezíret-el-'Arab.

‡ Sahár, still the principal town on that part of the Omán littoral, called Bátinah.

were also burnt; and then Alboquerque ordered them to cut off the noses and ears of all the Moors whom they had captured, and left them on the shore and returned on board, "*giving many thanks to our Lord.*" They then apparently proceeded to Maskat. Faria y Souza * says Calayate was burned "to be revenged for some injuries done to some Portuguese." Alboquerque also touched at Maskat, on his way to Hormúz, in 1815.

In 1522 † a concerted rising took place simultaneously at Hormúz, Bahrain, Maskat, Karyát, and Sahár. Many Portuguese were killed; the number is given as one hundred and twenty. It was, however, suppressed, and Sahár destroyed with "fire and sword" by Dom Luis de Menezes, who was sent from Maskat with two ships to relieve Hormúz, then closely besieged. In 1526, Lope Vaz de Sampayo, on his way to Hormúz with five ships, reduced the "towns of Calayate and Muscate, which had revolted;" but no particulars are given. In 1550–51 "the great Turk," being offended at the proceedings of the Portuguese, fitted out a naval expedition ‡ consisting of sixteen thousand men, in "strong galleys" and other vessels, under the command of Pirbec (Pir Beg), who is described by our author as an "old pirate," but who was apparently the Turkish admiral, who attacked and took Maskat after a siege of a month; and, having failed in his siege of Hormúz fort, was beheaded after his return. He did not attempt to hold Maskat permanently, but sacked the place and removed all the ordnance. The garrison were made to work in the galleys, but were mostly released at Hormúz.

In 1581 § another Turkish expedition under Alibec (Ali Beg), "a Turk used to robbing," consisting of three galleys, was fitted out at Mocha, and surprised Maskat. He landed his main force at Siabo,‖ while "the galleys entered the port with those that remained, and began to 'play' their cannon furiously, so that he might come in on their backs; which succeeded, and he entered and plundered the town." His land force advanced through the narrow pass from Sudáb to Maskat, "so narrow that two men cannot pass it abreast; no one imagining he would attempt it." The Portuguese fled to Matero (Matrah), a town a league distant, and, not thinking themselves safe there, went to Bruxel,¶ a fort 4 leagues inland. They returned to Maskat after the departure of the Turks.

It was in 1588, according to the old inscription referred to already, that the fortress now called Meráni was completed, which strengthened the hold of the Portuguese on the place and country. Sahár, which had been taken and burnt by the Portuguese in 1522 (see *ante*), appears to have revived, for in 1616 its trade "much lessened the customs of Ormus and Mascate;" and an expedition was despatched from Maskat, which, with the aid of twelve hundred Arab auxiliaries, took and plundered the place, and left a garrison in the fort. It was retaken by the Imám in 1643.

After the loss of Hormúz in 1622, Maskat became the most important place held by the Portuguese, and was the headquarters of their fleet.

In 1640, the garrison of Maskat, which had been much reduced, repulsed an attack on the place by the Imám's * forces. In 1648 Maskat was again besieged, and the Portuguese had to accept humiliating terms, being confined to Maskat, and giving up their other possessions in the country. Finally, in 1650, after another siege, Maskat also was surrendered, and the Portuguese finally expelled from Omán.

In the account given by Dr. Badger's author (already quoted), a detailed account is given, showing that the loss of the place was due, in part at least, to treachery on the part of a Hindu trader, "a worshipper of the cow," † whose daughter had attracted the attention of the Portuguese commandant. In a note to Colonel Ross's book (*op. cit.*), he says, "One story current is that the Arabs entered Maskat in the guise of peaceful peasants, hiding their arms in bundles of firewood, and that they took the opportunity of the Portuguese garrison being assembled without arms at chapel to attack and massacre them."

Captain Hamilton,‡ in his 'New Account,' gives a long and circumstantial account of the final scene, which he had "from a very old renegade who was at the tragedy, being then a soldier, who reckoned himself about a hundred years old, and by his aspect could not be much less." This story gives as the cause of the final hostilities a gratuitous insult offered by the commandant to the "king of that province." He says only those of the garrison were spared at the final surrender who "consented to embrace" Mohammedanism.§

During the reign of Nadir Shah, between 1736 and 1741, the Persians occupied Omán,‖ having, in the first-named year, gained a footing under the pretence of assisting one of two rival claimants to the Imámate, but they appear to have been finally driven out in the latter year.

The subsequent history of the country is not of sufficient general interest to relate at length. The fortunes of the country culminated under the great ruler Seyyid Said-bin-Sultan, 1804–56,¶ since whose death it has rapidly declined, owing to intestine wars and the loss of the African dominions (Zanzibar, etc.), which fell to another son, and has since remained a separate state.

About 1800 the French attempted to gain over the Imám in furtherance of their designs on India, but this was frustrated by the British. Seyyid Said continued throughout his reign our loyal ally, and co-operated with our forces in the expedition against the independent piratical ports in 1819, and in the disastrous Benu-bu-'Ali affair in 1820.

---

* Nassir bin Murshid, who appears also to have recovered Karyát, and all Omán except Maskat and Matrah, and was one of the strongest rulers Omán ever had.

† Colonel Miles (*op. cit.*) says that one of the several objections to this romantic story is that the Banians have never brought their wives to Arabia, much less their unmarried daughters.

‡ 'Pinkerton's Voyages,' vol. viii.

§ Wellsted gives the date of the final capture of Maskat as 1658, which is incorrect. He was not an accurate observer. The date has been the subject of controversy, but is now fixed by Mr. Danvers from Portuguese records ('The Portuguese in India,' by F. C. Danvers. 1894).

‖ As well as Bahrain and other islands in the gulf.

¶ Dr. Badger's author. Colonel Hamerton says 1807, and is more likely to be correct ('Bombay Government Records,' No. 24, New Series, 1856).

POTAMOLOGY AS A BRANCH OF PHYSICAL GEOGRAPHY.*

By Professor ALBRECHT PENCK, Ph.D.

Of the different departments of physical geography treating of the hydrosphere, none has advanced more slowly than the science of rivers. Oceanography has developed in a wonderful way. The limnology advocated by Forel at the London Congress of 1895 has become a separate flourishing branch; only the hydrology of running water is still in a very unsatisfactory state. The fact that it has not a name of its own corresponding to oceanography or to limnology, indicates its neglected position, but there can be no doubt that it must gain equal rank and follow the same evolution as the two other above-named branches of hydrology.

The science of rivers, which may be called potamology, must be treated under five different heads—

1. The physics of running water.
2. The volume of water and its fluctuations.
3. The action of water on its bed.
4. The distribution of running water on the Earth.
5. Rivers as a scene of organic life.

As to the physics of running water, hydrotechnologists have recognized the dependence of velocity on the declivity of the water surface and depth. But all formulas based on these elements alone are not satisfactory. Thus neither the old formula of Chézy, the newer of Bazin and Darcourt, nor the complicated one of Ganguillet and Kutter can be accepted. The problem is, in fact, more complex than has been generally supposed. If we have a body of moving water, its motion will depend—

(i.) Upon its own mobility, changing with its temperature.
(ii.) Upon the forces of gravity and rotation acting upon it.
(iii.) On the resistance caused by the form of its bed and by its surface.

The mean velocity of a river may vary—

(*a*) With its temperature.
(*b*) With its volume, height of the fall, and geographical latitude.
(*c*) The width and declivity of the river bottom and the area of the river surface.

Some physicists have commenced to treat the question in a theoretical way, and have shown how complicated the movement of each water-particle is—how it moves in very intricate spirals. But a more empiric way can be followed also, by establishing relations between the factors just named and the results of stream-measurements. We must not forget that the only way of determining the mean velocity of a stream is by measuring the volume of water which passes through a given channel in a given time.

In treating of the volume of water, potamology comes into intimate relation with climatology. All river water (with the very inconsiderable exception of the water which comes from volcanic vents) is derived from the sea. No part of the water which is evaporated from the sea and has fallen as precipitation on the land is fixed there, for we see no general sinking of the sea-level, which should happen if any measurable part of the rainfall were permanently held by the soil. The quantity of river water is therefore equal to the quantity of sea water which is carried as moisture in the air to the land. The first rough estimation of the quantity of river water pouring into the sea by Dr. Murray shows that it is

* Paper read in Section E (Geography) at the Toronto Meeting of the British Association, August, 1897.

BRITISH LIBRARY

considerably (four or five tenths) less than the amount of precipitation. We must assume, therefore, that only a part of the rainfall on the land is derived directly from the sea. The other comes from the evaporation of rain-water already fallen on the land. The proportion between the total rainfall of the region and the quantity of river water escaping from it shows how many times the water of oceanic origin has been precipitated and reprecipitated in that region. Taking, for example, Bohemia, where the yearly rainfall is 17·3 inches, and the height of run-off is 4·8 inches, we must assume that 4·8 inches of water have been brought during the year from elsewhere to Bohemia, and have fallen there three and a half times as precipitation. Therefore high scientific interest is attached to the knowledge of this proportion. On the other hand, the proportion between river water and the rainfall of a region has high practical value. It allows one to determine the quantity of river water from the precipitation.

Hydrotechnologists have laid much stress on this proportion, the so-called "coefficient of run-off," and it is generally thought that this might be a constant factor for a distinct river. This is not correct. Recent investigations by Mr. Newell, of the Geological Survey of the United States, and by myself have shown that the coefficient of run-off varies not only from river to river, but also from year to year for the same river. It varies with precipitation: the higher the rainfall is, the higher also the coefficient of run-off.

In Central Europe the height of run-off is zero up to a certain height of precipitation. That corresponds to the well-proved fact that many dry countries have no rivers. Over that height (nearly 17 inches), the height of the run-off grows with that of the rest of precipitation, and is nearly three-quarters of the latter. This rule holds good for different kinds of rivers, for those coming from impermeable soil (Moldau in Bohemia, Enns), as well as for rivers from permeable regions (Traun, upper Elbe in Bohemia). It is correct for rivers coming from woodlands (upper March) and for rivers coming from steppes (lower March); the quantity of run-off seems thus to be independent of the soil and of the covering of a land with vegetation. This is contrary to the ruling opinions, and the quantity of river-water of a certain region seems only to be dependent on its climate, and especially on its rainfall.

This rule has been established only for a very limited part of the land surface. Our knowledge of the quantity of water running in the rivers is restricted to the smaller rivers in Central Europe and North America and to the Mississippi. The huge volume of water in the St. Lawrence has, so far as I know, never been exactly measured. We know nothing about the water masses in the Amazons and Congo. It would be very desirable if geographical investigations were extended in this direction, and if river-gaugings were made at the mouths of the larger watercourses. This will not only be of scientific interest. The bulk of water in a river multiplied by its fall-height gives a measure of its energy. The more electricity will be used, the more the watercourses will gain value as motive powers, and every measurement of their volume will help to determine a force of nature.

The fact that the quantity of river-water changes with the climate is very well known. Prof. Woeikof has worked out a valuable classification of the rivers based on the dependence of their high water on rainfall and the melting of the snow. This classification is mainly based on facts taken from European and Asiatic rivers, and it would be very desirable if data on the annual rise and fall of the rivers of other continents would be gathered. Prof. Brückner has shown how the mean annual height of rivers changes in a cycle of thirty-five years. Indeed, the height of a river may be taken as corresponding to its volume, but it is also influenced by the condition of its bed. Climatic changes will be shown more clearly by the

BRITISH LIBRARY

variations of the quantity of water than by variation of the heights of a river. Not all rivers are constantly flowing; a great many of them dry up in dry seasons or dry years. It is very hard to separate those two types on maps, in order to gain true conceptions of the water-supply of different countries. Those rivers which are covered with ice during the winter, as all great rivers of higher latitudes are, deserve special interest. Mr. Rykatscheff has arrived at important conclusions as to climatology based on the time of the closing of rivers by ice, and it needs no words to say how great are the practical advantages of an exact knowledge of the length of time during which our great waterways are ice-bound. Dr. Forster has shown, in his discussion on river-temperatures, how one can get a forecast of ice-formation by an observation of the river-temperatures, and he thus proved the necessity of measuring the river-temperatures, which, as we have already seen, play an important part in the movement of the water. Numerous rivers lose their water in limestone districts showing Karst phenomena. They have for several years attracted interest, especially in Austria. Other rivers lose their water in their own gravels, and the number of such blind-ending rivers is rather great.

Dealing with the action of water on its bed, potamology comes in close contact with geology and geomorphology. It is now a nearly generally accepted theory that valleys have been dug out by rivers, and may be regarded as widened river-courses. Prof. W. M. Davis has worked out the general system of evolution of river-basins, but the action of rivers on their beds cannot yet be traced out in all directions. There seems to be a correlation between the quantity of water, the width and depth of a river, but which is the normal relation between the two quantities is not determined, and there has been established no delimitation between deep and shallow rivers, the former deepening their courses, the latter shifting from side to side. The conditions under which the river begins to wind, forming meanders, are not cleared up. Even the way it pushes its detritus forward is not sufficiently known. Very flat mountain rivers permit us sometimes to recognize how small stones are transported. They are rolled and pushed forward considerably slower than the water itself runs; with increasing velocity, the whole bottom of such a river begins to move, and this is also the case with larger rivers. When they are in flood, then all the bottom gravel is moving; whilst in general every pebble goes separately on its way from one gravel bank to the next. Thus the gravel banks move downward. The changes of the river-bed produced in this way can only be stated by comparing exact maps of the river bottom made at different times. Maps of the rivers, in a very large scale, with indications of the depth, are as necessary as bathymetrical maps of lakes. The maps of some river-mouths made for nautical purposes, and the excellent maps of the rivers of Holland made by the Water-statt, may be regarded as very good examples. It must be hoped that they will be imitated elsewhere. The fine river descriptions which have been published in Germany show in general a want of maps of the river-beds.

No less attention than to the bottom material of the rivers must be attached to the suspended material they contain. It is the waste of land carried into the sea. It affords the means, as Dr. J. Croll and Sir Archibald Geikie have shown, for determining the duration of geological time, and considerable scientific interest must therefore be attached to its evaluation. The river Nile shows how great the practical value of river mud is; Egypt owes its existence to the regular inundations and refreshing of the soil by the Nile. Careful determinations of the quantities of river mud have been undertaken here and there merely for economical purposes. Finally, the materials dissolved in the river water require attention and examination. Rivers coming from old gneissic and granitic rocks have everywhere a dark colour, owing to dissolved humic alkaline salts. These are the black rivers

whose colours contrast sharply with those of the milky or white rivers full of suspended material.

The distribution of running water on the Earth's surface has been the chief object of mere geographical research. The river courses have been mapped; their basins are clearly shown on our maps. The general state of the cartography of a land represents, in general, the state of our knowledge of the distribution, length, and width of its rivers. Each evaluation of these quantities can be made on the special maps of most of the states of Europe and North America, but it must be said that many of the data given us in our handbooks are not sufficiently accurate. They are often of very old dates, and differ very much from one another. It is very necessary, therefore, to determine them anew. Attempts in this direction show the cause of many of the discrepancies. The lengths of many rivers and the areas of their basins depend very much upon the assumption that is made on the site of their mouth. Take, for example, the St. Lawrence river. If you assume the mouth at Quebec, or at Grosse Isle where the waters become marine, you will get different values of its length and catchment basin. It will be necessary, therefore, for exact data, to indicate the point which is taken as the river's mouth. As to the river-lengths, it must also not be forgotten that their measurement gives very different results on maps of different scales; and as to river-basins, every one who has tried to follow their boundary in nature knows very well how difficult it is to trace them. Sharp watersheds are very rare. In general they are very indistinct, and areas of considerable extent near the water-parting have subterranean drainage. The exact determination of the lengths and areas of the basins of the rivers, even of well-mapped countries, seems to be, therefore, a pure geographical task of potamology which, to a great extent, remains still to be done. As to the other rivers, it must be borne in mind that every new exploration will influence our knowledge of their length and catchment basin, and that we, therefore, can only gain approximate values for them. Many of the Asiatic, African, and Australian rivers, being more or less temporary, will vary with climatic changes, and their lengths and basins evaluated in wet periods will be far greater than in dry periods. For those rivers it will be of value to give upper and lower limits for the above-named quantities.

Considering rivers as a scene of life, potamology comes into an intimate connection with biology; the river water has its inhabitants, which are confined to it. Every river-basin is in this way a distinct zoogeographical or phytogeographical province. By establishing the relations of fauna and flora of different rivers, geographical changes on the Earth's surface may be detected; *e.g.* by the affinities between the fishes of the Danube and the Caspian sea, it can be shown that the Black sea between them is of comparatively recent origin. Rivers are also the most common agents of geographical distribution. They carry with them the seeds of the plants of their borders and their basins, on natural rafts they transport land animals, and thus in a wider sense river-basins become geographical provinces; while the rivers are for their own inhabitants the means of voluntary migrations, of involuntary for the non-human inhabitants of their shores. Their function for man varies with his evolution. In times of a very primitive culture, they may cause involuntary migrations, carrying the savage along on a floating tree. They may check those great migrations of peoples which are confined to the land, and they become ways of communication between different lands and nations, when man has attained such a degree of civilization that he masters the forces of nature.

In this state of civilization men attach special attention to rivers, in order to make use of them or to prevent the damage they do. Thus in the last few years, several States created hydrographic departments with the special purpose of practical investigations on rivers. The Dominion of Canada and the United States have

BRITISH LIBRARY

their hydrographic bureaus for the study of irrigation; Germany, Austria, and Hungary have their hydrographic bureaus for studying river-floods. But if much is already done as to investigation for practical purposes, more still remains to do in order to develop potamology to a well-founded branch of physical geography.

THE TOPOGRAPHICAL WORK OF THE GEOLOGICAL SURVEY OF CANADA.*

By J. BURR TYRRELL, M.A., B.Sc., F.G.S.

Most of the difficulties encountered in making a geological survey of Canada have arisen from the want of good topographical maps. In the absence of an ordnance or similar survey, the Geological Survey, as the only organization charged with the mapping of the Dominion as a whole, has had to undertake, concurrently with the geological work, extensive topographical surveys from its very inception to the present time. The surveys in Canada that are available for topographical maps are, in general, Dominion Lands and Crown Lands surveys. The former is based on an accurate system, but applies only to Manitoba, the North-West Territories, and a narrow belt along the Canadian Pacific railway in British Columbia; and its operations have, thus far, been confined to a portion of the railway belt, and to the country south of the North Saskachewan and lying between the Rocky mountains on the west and the boundary between Ontario and Manitoba on the east.

The Crown Lands Departments of Ontario and Quebec have made cadastral surveys in the southern portions of their respective provinces from time to time, to meet the requirements of advancing settlements. As these townships are surveyed independently, and sometimes not very correctly, extensive surveys have to be made to check and correct them, and to add roads, railways, etc., that have been constructed since they were surveyed. The other provinces have made no surveys available for mapping purposes except in isolated areas.

Again, the Geological Survey, as the pioneer preceding the lumberman, the miner, and the settler, has frequently to make explorations and surveys in districts that are subsequently cadastrally surveyed by the Dominion Lands or Crown Lands. The maps issued by the survey may conveniently be divided into—

(1) Preliminary maps on scales varying from 8 to 25 miles to 1 inch. These are usually the results of reconnaissance and exploratory surveys in the great areas of Northern Canada.

(2) Detailed maps on scales of 1, 4, and 8 miles to 1 inch. These maps are published in sheets of standard size and on standard scales, and their publication must obviously proceed more slowly than those of the first class.

As the topographical work of the survey is for mapping purposes only, it is necessary to strive after no greater accuracy and no greater detail than is required for the scale of the map in view. The methods of survey used are therefore of an elastic nature, varying with varying circumstances, and are usually a combination of two or more of the following:—

(1) Transit or compass and chain surveys or triangulation.
(2) Micrometer or, if on roads, odometer surveys.
(3) Paced surveys.

---

(4) Track or time surveys checked by sextant latitudes, and sometimes by longitude observations.

The order of description is by provinces, commencing with Quebec and Ontario, the two provinces of Canada till confederation in 1867, and then the others in succession from east to west. While the work on the standard sheets is not less important, and does not require less ability or diligence on the part of those engaged in it than the exploratory surveys of the north and west, yet, as a description would be largely a recital of the number of miles of roads, lakes, and streams surveyed in each year, it has been abbreviated, and the sheets in each province dealt with *en bloc*.

Quebec.—In 1844 and 1845 Messrs. Logan and Murray made a triangulation of the peaks in the hills that form the watershed of Gaspé peninsula. They also made micrometer surveys of portions of the Chatte, Great Cascapedia, Bonaventure, Matane, St. Anne, and St. John's rivers, in all 299 miles. In 1857 and 1858 the work in this district was continued by Mr. Richardson, who surveyed the Magdalen, Restigouche, Patapedia, and Great Metis rivers, and several tributary streams and lakes, in all about 200 miles. In 1862 Mr. Bell surveyed portions of the Dartmouth, York, Malbaie, and Grand rivers, for an aggregate distance of 106 miles. In addition, about 100 miles of traverse-lines were measured with the micrometer. In 1858 Sir W. E. Logan surveyed the upper part of the River Rouge and thirty-two tributary lakes. Dr. Ells in 1881 to 1883, and Mr. Low in 1882 and 1883, completed the information required for the mapping of Gaspé peninsula, 15,100 square miles, on the 4-mile scale. Dr. Ells made a chained survey of the shore-line road from Little Pabos, on the bay of Chaleurs, to Grand Metis, on the St. Lawrence, and micrometer surveys of the Salmon branch of the Cascapedia, Grand Pabos, and upper portion of the Bonaventure. Other roads and the coast-line were measured by pacing; Mr. Low triangulated the peaks in the Shickshock mountains, and made micrometed traverses of the south branch of the Ste Anne, Little Cascapedia, and west branch of the Magdalen rivers.

In 1858 Sir W. E. Logan surveyed the upper portion of the river Rouge and thirty-two tributary lakes in the Grenville district. These surveys, with the subsequent measurements, in the same district, by himself and Mr. J. Lowe, amount to about 2600 miles, and form the basis of the so-called Grenville map, covering an area of 1200 square miles.

The work on what is known as the "Eastern Townships" map-area was commenced by Sir W. E. Logan in 1848, and continued by himself, at varying intervals, up to 1871; by Mr. Richardson in 1850 to 1852, 1854, 1855, and 1863 to 1868; and by Mr. Webster from 1870 to 1876. The paced measurements of roads and exploration lines by Messrs. Logan, Richardson, and Webster amount to about 17,000 miles, and cover an area of 26,380 square miles. The publication of the three sheets thus far issued was delayed by the uncertainty as to the exact horizon of some of the members of the Quebec group, so called. The additional surveys, to bring them up to date, necessitated by this delay, were made by Messrs. Ells in 1886 to 1890; Garoux in 1886 to 1894; Adams, 1886 and 1887; A. R. Low in 1889 and 1891; and McConnell and Ord in 1880; in all about 8600 miles.

In 1857 Lieut. Ashe determined, telegraphically, the longitude, as compared with Cambridge, of Quebec, Three Rivers, Montreal, Ottawa, Kingston, Toronto, Collingwood, Windsor, and Chicago. So uncertain were the longitudes at that time, that an important place like Chicago was placed by the two best authorities as in longitude 88° 23′ and 87° 28′ W. respectively, whereas Ashe's observations gave 87° 37′ 44″, a difference of 9′ 44″ in one case, and of 45′ 16″ in the other. Signals were interchanged with Cambridge which had been determined by the interchange of several hundred chronometers with Greenwich.

BRITISH LIBRARY

In 1870 Mr. Richardson made a micrometer survey of the canoe-route from the upper portion of the Ashuapmouchouan river, by Nikobau River Lake, Abatagamaw and Chibougamoo lakes, to Lake Mistassini, and of the shore-line of the latter for 30 miles. His provisions failing to reach him, he was forced to abandon the survey of Mistassini and return to Lake Nikobau, where they were stored. From Nikobau he carried his traverse by the Foam-fall and Clearwater rivers to the St. Maurice, which had been surveyed previously by the Crown Lands Department. From Kirkendach, on the St. Maurice, a survey was made of the route by the Hair-cutting river and south-east branch of the Gatineau, and the Gatineau to the Desert. Of the surveys thus made, 274 miles were measured with the micrometer, and 300 miles were track survey.

In 1871 Mr. McOuat carried a micrometer-traverse in a north-westerly direction for 90 miles from the Mistassini river to the lake of the same name, and thence along the lake-shore to the end of Mr. Richardson's survey of the previous year. He also surveyed 150 miles of the coast-line of the lake to a point on the main north-west shore, about 70 miles from the extreme south-west point.

In 1885 Mr. A. P. Low commenced at the terminal point of Mr. McOuat's survey, carried his traverse up the west side to the north end, and down the east side to Big Narrows, where he connected with McOuat's survey 139 miles. He found the average length of the lake to be about 100 miles, and average width 12 miles. From the outlet of the lake he made a track survey of the Rupert river to Hudson bay, 300 miles.

In 1891 to 1894 Dr. Ells made about 3200 miles of odometer and 400 miles of paced surveys in the Grenville and Pembroke map-areas, 6900 square miles.

Labrador Peninsula.—In 1887 Mr. A. P. Low surveyed Agumska, Weston, and other islands in James bay. In the following year he made a track-survey of Big river from its mouth upwards for 160 miles, of the canoe-route by the headwaters of Bishop Roggan river to the south branch of Great Whale river, and of the latter to the main stream, and thence to Hudson bay, 350 miles. He also made a micrometer survey of the route from Richmond gulf to Clearwater lake, 63 miles. In 1892 Mr. Low made a micrometer traverse from Lake Mistassini by the Rupert, Kawashagami, and East Main rivers to Hudson bay, 326 miles, and of the East Main between the Kawashagami and Chegami branches. In 1893 and 1894 Mr. Low, with Mr. Eaton as topographical assistant, continued his explorations in the Labrador peninsula. The micrometer traverse was continued from the mouth of the Tshegami branch, where it connected with the surveys of the previous year, up the East Main river, 104 miles, to where the route to Nichieun leaves the main stream. From this point a track survey, checked by sextant latitudes, was made of the route by way of the headwaters of Big river, Nichieun, and Kaniapeskau lakes, and the Koksoak river to Fort Chimo, upwards of 600 miles. In February, 1894, having wintered at North-west River Post, a micrometer survey was carried from the post up the Hamilton river to Sand-girt lake, thence up the Attikonak branch to the Height of Land, down the Romaine river for 115 miles, thence by portage-route to the St. John river, 702 miles. From this point a track survey was made to the mouth, 72 miles. From Sand-girt lake micrometer surveys were made of the Ashuanipi river, Petitsikapow, and other lakes, 293 miles, and track surveys of the canoe-route to Lake Michikamau, and of the lake itself, 269 miles. Total in the two years, 1100 miles of micrometer, and 940 miles track surveys. In 1895 Messrs. Low and Eaton made a micrometer traverse from the head of Lake Mouchalagan by way of the headwaters of the Manicugan and Outardes rivers to the Height of Land, and thence by a chain of lakes to Naokokan lake, on Big river. In 1896 Mr. Low continued his micrometer survey of 1888 from the outlet of

مكتبة قطر الوطنية
Qatar National Library

Clearwater lake, surveying Clearwater and Lower Seal lakes, and Larch and Koksoak rivers, to Mugava bay.

In 1887 Mr. Cochrane made a track survey of Twenty-mile bay of Grand lake, of a chain of lakes and streams to Shabogama lake, and of the Mekiskan river to Red Flower-hill portage.

In 1895 Dr. Bell made a micrometer survey of the Mekiskan from the end of Mr. Cochrane's survey to Mattagami lake, of Mattagami lake and Nottaway river, and of the shore-line of Rupert bay to Rupert House. A track-survey was made of Waswanipi lake and river between the Hudson's bay post and Lake Mattagami. In 1896 Dr. Bell, with Mr. Brock as assistant, made track surveys of the Mekiskan river between Shabogama lake and where the route to Waswanipi leaves it, and of the lower portions of its principal branches; of the route from Waswanipi post to Lake Nemiskan on the Rupert river, and of the route by way of Waswanipi river from the post of the same name to Wakanichi lake, where it connected with Mr. Richardson's traverse of 1870.

New Brunswick.—The topographical work in New Brunswick, commenced by Mr. Robb in 1868 and 1869, was continued by Dr. Ells in 1873–78, and by Mr. Broad in 1878–82 in the southern portion of the province. The north-eastern portion was surveyed by Dr. Ells and his assistants in 1879, 1880, and 1881, and the north-western and adjoining portions of Quebec by Mr. McInnes in 1884–89. It is difficult to give an estimate of the distances measured, but Dr. Ells in 1877 to 1880 surveyed 2950 miles with chain odometer and pacing, an average of nearly 750 miles a year. These surveys, with the topographical information available from other sources, furnished the material for mapping the province—27,200 square miles on a scale of 4 miles to 1 inch.

Nova Scotia.—Sir W. E. Logan in 1868, and Mr. Hartley in 1868 and 1869, made a survey of the Picton coalfield; in the Springhill coalfield, Mr. S. Barlow in 1871 to 1877, and Mr. McOuat in 1873 and 1874, made chained surveys aggregating over 1300 miles. The survey of the island of Cape Breton, commenced in 1872 by Mr. Robb, and continued by Mr. Fletcher after the death of the former in 1874, was completed in 1882. Since 1882 Messrs. Fletcher and Fairbault have extended these surveys westward on the mainland to Windsor on the Bay of Fundy and Halifax on the Atlantic coast. Thus, with the island of Cape Breton, 13,180 square miles have been surveyed in detail for mapping on a scale of 1 mile to 1 inch. Messrs. Fletcher and Fairbault estimate the measurements made by themselves and their assistants at 34,600 miles. In 1881 Mr. W. B. Dawson made a topographical survey of the Laurencetown, Montagu and Waverly goldfields, the coast being borne in equal proportions by the Survey and Provincial Government. In 1884 Messrs. Ells, A. E. Barlow, and Giroux made chain, micrometer, and paced surveys aggregating 1003 miles, to complete for publication the Cumberland coalfield map, begun by Mr. S. Barlow some years previous.

Ontario.—In 1845 Sir W. E. Logan made a micrometer survey of the Ottawa river from the Joachim rapids to the head of Lake Temiscaming, and of the Mattawa river from its mouth to the Lake Nipissing portage, in all 280 miles. The work in this district was continued in 1847 and 1853–56 by Mr. Murray. During these years he surveyed Lake Nipissing, the French, Sturgeon, Wahnapital, Spanish, Maganetawan, Muskoka, Petawawa, Bonnechere, and York rivers and numerous tributary streams and lakes. In 1857 and 1858 he surveyed the Thessalon, Missisanga, Goulais and numerous other streams and lakes between Blind river and Lake Superior. Mr. Murray's surveys in 1847 and 1853–58 amount in the aggregate to 2780 miles measured with the micrometer, besides between 300 and 400 miles by pacing. In 1846 Mr. Murray surveyed the Koministiguia for 40 miles; and in

BRITISH LIBRARY

1852 a number of lakes and streams between Kingston and Balsam lake, 400 miles. In 1869, 1870, and 1871 Dr. Bell surveyed Nipigon and Long lakes, White, Black, Nie, English (East) and Kenogami rivers, the canoe-route from Lake Nipigon by way of Ombabika and Albany rivers to the confluence of the latter with the Kenogami, and numerous lakes and streams between the Nipigon and the Pie—total, 1865 miles of micrometer, 181 miles of paced, and 367 miles of track surveys.

In 1872 Messrs. Selwyn and Bell made a joint track survey of the canoe-route from Hawk lake by the English river (west) to Separation lake, where they separated, Dr. Selwyn continuing the survey down the English and Winnipeg rivers to Lake Winnipeg, 461 miles from Hawk lake; and Dr. Bell by Sandy portage and the Winnipeg river to Rat portage, 29 miles from Separation lake. In 1872 Mr. McOuat made a micrometer survey of Lake Abitibbi and of the river of the same name to the first fall. In 1877 Mr. Cochrane surveyed the river from the end of Mr. McOuat's survey to its confluence with Morse river.

Dr. Bell, in 1875, surveyed the upper portion of the Montreal (west), the Mattagami, Missinaibi, Michipreston, and lower portion of the Moose rivers; in 1885, Lakes Wabatongwashene, Oba, Esnagami, and other lakes and streams in the vicinity; and in 1885 Lake Seul, Lake Joseph, the Attawapishkat river from Lake Lansdowne to Hudson bay, the shore of Hudson bay between the mouths of the Attawapishkat and Albany, and the Albany, except the portion surveyed by himself in 1870. In 1887 Dr. Bell made a track survey of the canoe-route from the great bend of the Montreal (east) river to Raish-ko-chagami lake on the Frederick House river.

Messrs. Lawson and J. W. Tyrrell in 1883 and 1884, and Messrs. Lawson, A. E. Barlow, and Smith in 1885, made a detailed survey of the Lake of the Woods, Rainy lake, the Winnipeg river from Rat portage to the Dalles, and other lakes and streams in the vicinity, for publication on a scale of 2 miles to 1 inch. This work has been extended to the north and east over the Rainy lake, Hunter's island, Seine river, Shebandowan and Manitou sheets, by Dr. Dawson in 1886 and 1887, Mr. Smith 1888 to 1891, and Mr. McInnes 1890 to the present time. These sheets are published on the 4-mile scale, and cover an area of 19,230 square miles. They are full of lakes and connecting streams, the water-routes thus formed being the only means of communication through the greater part of the district. Of the larger lakes, the Lake of the Woods has an area of 1770 square miles, Rainy lake 345 square miles, Lac des Mille Lacs 105 square miles.

Messrs. Bell and A. E. Barlow in 1888 to 1891, to complete the information for the Sudbury and French river sheets, made micrometer surveys of the upper portion of Spanish river, Panach and Rogomasing lakes, and Veuve and Vermilion rivers, the shores and islands of Bay of Islands, and McGregor bay and peninsula. In 1892 Dr. Bell surveyed Key, Henvey, and Byng inlets. Mr. Barlow in 1887 made a micrometer survey of Lake Temagami, and in 1892 and 1893, with Mr. Johnston as assistant, surveyed the western portion of Lake Nipissing, Abashing and Keepawa lakes, canoe-route from Temagami to the mouth of Temagami river, and made paced surveys of the roads in the Nipissing and Temiscaming sheets—in all 1080 miles of micrometer, 170 miles of paced, and 45 miles of boat-log surveys.

In 1895 and 1896 surveys of roads, amounting in the aggregate to about 5100 miles, were made by Dr. Ells, Mr. Grioux, and Messrs. Adams and Barlow in the Pembroke, Cornwall, and Haliburton map-areas respectively. In the same years the writer made a traverse with transit and chain across the province from Georgian bay to Kingstown. In 1893 Mr. Dowling made log surveys of Red Trout and Gull-rock lakes, and track surveys of the connecting streams, of the Mattawa, and upper portion of Berens river.

MANITOBA AND NORTH-WEST TERRITORIES.—In 1873 Dr. Selwyn made a track survey of the Saskachewan river from Rocky Mountain House on the North Branch to Cumberland House, 798 miles. In 1878 and 1879 Dr. Bell made track surveys of the shore of Lake Winnipeg between Dog Head and Drunken river; of the Nelson, Hayes, and Grass rivers; of the canoe-route from Split lake on the Nelson to the Churchill and lower portion of the Churchill, in all 1710 miles. In 1879 Mr. Cochrane, Dr. Bell's assistant, surveyed Gode and Inland lakes, the eastern portion of Oxford lake, and the connecting streams, 585 miles. In 1880 and 1881 Mr. Cochrane made track surveys of—

(1) Canoe-route from Cross lake by Pine, Moose, and Saskachewan rivers to Cumberland House, 242 miles.

(2) Canoe-route by Grassberry river to Thog portage, thence by Churchill and Deer rivers to Reindeer lake, and Reindeer lake, 763 miles.

(3) Route by Cochrane river, Hatchet lake, and Black river to Lake Athabasca, and north shore of the lake, 625 miles.

(4) Athabasca river from the mouth to its confluence with the Clearwater, thence by the Clearwater and Churchill rivers to Thog portage, 760 miles.

(5) Route from Pelican lake to Cumberland House.

Total measurements, 2390 miles.

In 1881 and 1882 Dr. Dawson, with Mr. McConnell as assistant, made 2315 miles of odometer, and 110 miles of paced and track surveys in the country between Medicine Hat and the Rocky mountains on the east and west, and the 49th parallel and the Red Deer river on the north and south respectively. Dr. Dawson, with Mr. Tyrrell as assistant in 1883, and with the writer as assistant in 1884, made a reconnaissance survey of that portion of the Rocky mountains lying between the parallel of 49° and 51° 30′. These surveys were continued northward to the North Saskatchewan by Messrs. McConnell and the writer in 1885, and by Messrs. McConnell and Russell in 1892.

In 1883 and 1884 Mr. McConnell, with Mr. Dowling as assistant in the latter year, made 1800 miles of odometer surveys of trails and exploration lines, and 250 miles of river traverse in the country between Medicine Hat and the eastern end of the Cypress hills on west and east and the 49th and 51st parallels. Mr. Tyrrell in 1885, and Messrs. Tyrrell and Dowling in 1886, made similar surveys and explorations in that portion of Alberta and the adjoining districts, lying between 110° W. and 115° W. and 51° 30′ N. and 54° N.

The above-mentioned surveys of Messrs. Dawson, McConnell, and Tyrrell have been published, on the scale of 8 miles to 1 inch, in the Bow and Belby, Cypress hills, and Northern Alberta maps, and cover an area of 100,000 square miles.

In 1882 Mr. Cochrane made track surveys of Berene, Big Black, and Poplar rivers, and of the headwaters of Severn and Pigeon rivers, 287 miles. In 1886 Mr. A. P. Low made a micrometer traverse from Lake Winnipeg to Hudson bay by way of the Buens river to Family lake, thence by the headwaters of Poplar river and the middle branch of the Severn to Severn lake, thence by the Fawn and Severn rivers to Fort Severn, 882 miles.

In 1887 to 1891 Messrs. Tyrrell and Dowling surveyed, with micrometer or boat-log, Winnipegosis, Dauphin, Red Deer, Waterhen, and other lakes and portions of Lake Winnipeg; also made track surveys of the Bad-throat and other rivers to the east of Lake Winnipeg, and odometer surveys of trails and exploration lines in North-Western Manitoba. In 1895 and 1896 Mr. Tyrrell continued the work in this district, and surveyed the Gunisao, Black, Pigeon, Blood, Pine, and Wolf rivers, the Playgreen lakes, the canoe-routes from Sipi-wesk lake to Nelson House, and from Paint lake to Sturgeon river.

BRITISH LIBRARY

In 1887 Mr. McConnell surveyed the Liard river, from the mouth of the Dease to the Mackenzie, and the lower portion of Hay river. In the winter of 1887–88 track surveys were made from Fort Providence northward to Fort Rae, and southward to Lake Bischo. In 1888, as Mr. Ogilvie had been instructed to make a micrometer survey of the Mackenzie river and Peel river portage, a sketch traverse of the river and mountain features only was made of this portion of the route. A detailed running survey was made of the Porcupine river from the mouth of Bell's river to the Yukon. In 1889 and 1890 Mr. McConnell made track surveys of the route between the Peace and Athabasca rivers by the Pelican, Loon, and Wabiskaw rivers, 400 miles; of the Red river from its mouth upward for 200 miles; of the trials to the Buffalo-head hills and Trout lakes, and of the tributaries of the Athabasca below Fort McMurray. In 1892 Messrs. Tyrrell and Dowling made traverses of the Beaver, Mudjatick, Cree, Black, Geikie, and Whitefish rivers, of Black and Reindeer lakes, and of the south shores of Athabasca and Wollaston lakes. Distances were estimated, except on lakes and quiet reaches, which were surveyed with boat-log. They also made micrometer surveys of Black and Deer rivers, and of the Churchill between the mouth of Deer river and Frog portage.

In 1893 and 1894 Mr. J. B. Tyrrell made exploratory surveys in the "Barren Lands." In 1893, with Mr. J. W. Tyrrell as topographer, he made a traverse from Lake Athabasca to Hudson Bay. A survey of the north shore of Lake Athabasca from Chipewyan to Fond du Lac was made with boat-log and solar compass. From Black lake the survey was carried by the Chipman and Dubaunt rivers to the head of Chesterfield inlet, 905 miles. Of this distance 290 miles were on rivers, where the distances were estimated, and 615 miles were through lakes, where the distances were measured with a boat-log, and bearings taken with solar or prismatic compass. As the tides prevented the use of the log with any degree of accuracy, the traverse of Chesterfield inlet and west coast of Hudson bay to lat. 61° 32′, where the severity of the weather compelled the abandonment of the survey, was a time survey. A similar survey was made of the 200 miles between Fort Churchill and York.

In 1894 Mr. J. B. Tyrrell carried another traverse from Du Brochet post on Reindeer lake by the Cochrane, Thlewiaza, and Kagan rivers to lat. 63° 7′, thence eastward by chain of lakes and the Ferguson river to Hudson bay, 815 miles. From the point at which he abandoned his survey the previous year, he continued it southward to Churchill. A time survey was made of the route between Churchill and Gull lake. Total distance surveyed in 1893 and 1894, 2900 miles, of which 1073 miles were log, 1312 track in canoes, and 515 part track survey on foot and part pacing. The distances thus obtained were checked by numerous observations for latitude.

British Columbia.—In 1871 Mr. Richardson made paced surveys of roads in the country between Yale and Quesnel, aggregating 428 miles. From 1872 to 1874 he was surveying stream trails and exploration lines in the Comox and Nanaimo coalfield. In 1875 Dr. Selwyn made a time survey of the trail from Quesnel to McLeod's lake, of the canoe-route from McLeod's lake by the Pack, Parsnip, and Peace rivers to Smoky river forks, and of Pine river from the "forks" to its mouth. During 1875 and 1876 Dr. Dawson surveyed trails, lakes, and streams in the country between the Fraser river and the coast range on the east and west, and Bella Coola valley and Francois lake on the south and north respectively. In 1878 Dr. Dawson surveyed the islands, channels, and inlets of the north and east coasts of the Queen Charlotte islands. In 1879 Dr. Dawson made a traverse from the Skeena river to Edmonton. From Hazelton the survey was carried by the trail from Hazelton to McLeod's lake, thence by the valley of the Parsnip and the Pine

مكتبة قطر الوطنية
Qatar National Library

river pass to the "lower forks" of Pine river, thence across country to Dunvegan. From this point side traverses were made through Grande Prairie and southward to Smoky river, and of the lower portions of the Wapiti and Smoky rivers. From Dunvegan an exploratory traverse was made to the Athabasca river, near the mouth of Marshhead creek; from this point the survey was carried down the Athabasca, with a side traverse of Lesser Slave lake and river, to Athabasca landing, and thence by trail to Edmonton. The trail from Smoky river "forks" to old Fort Assineboine was surveyed by Dr. Dawson's assistant, Mr. McConnell. In 1885 and 1886 Mr. Bowman triangulated the peaks in the Cariboo district, and measured 255 miles of roads and trails.

In 1887 Dr. Dawson, with Messrs. McConnell and McEvoy as assistants, made an exploratory survey of the region of the headwaters of the Yukon, Liard, and Stikine rivers. Mr. McConnell made a micrometer survey of the Stikine from the end of Hunter's survey to Telegraph creek. A carefully paced traverse was made from Telegraph creek to Dease lake by Mr. McEvoy. From Dease lake Dr. Dawson made a detailed track survey, following the lines of the Dease, Upper Liard, and Pilby rivers to the confluence of the latter with the Lewes, about 900 miles. He also carried it up the Lewes to enable him to add the mountain features and make some additions to the lakes as surveyed by Mr. Ogilvie. Numerous points were fixed in latitude by sextant observations, and a number of chronometer longitudes were obtained. In 1877 Dr. Dawson made a general reconnaissance of the southern interior of British Columbia. In 1882, 1883, and 1884 Mr. Bowman, the importance of the district having been increased by the completion of the Canadian Pacific railway, extended the work of 1877.

The geological intricacies of the region, however, necessitated the doubling of the scale of the original map, and, consequently, the re-delineation of the topography. Of the four new sheets which now cover the old map-area, the north-west or Kamloops sheet was re-surveyed in 1888 to 1890 by Dr. Dawson and his topographical assistant, Mr. McEvoy. A loose network of triangles, based on the Canadian Pacific railway and other surveyed lines, was carried out between points, each of which was occupied as a transit station and sketch-point, elevations being determined barometrically and by angles of elevation. Other details of topography were filled in from paced and track surveys checked by latitude observations. The north-east or Shuswap Sheet was surveyed in the same way by Mr. McEvoy in 1891, 1892, 1894, and 1895. This, with the Kamloops sheet, forms a contoured map of 12,800 square miles of rugged mountainous country on a scale of 4 miles to 1 inch. The topographical work for a similar sheet to the south-east of the Shuswap has been in progress since 1894. This, the so-called West Kootanie sheet, is under the direction of Mr. McConnell, who has been assisted in 1894 and 1895 by Mr. Russell, and in 1896 and at the present time by Mr. McEvoy. The latter has completed for publication a detailed plan of Trail creek mining district on a scale of 1 mile to 1 inch.

In 1889 Dr. Dawson made surveys with boat-log of the Upper and Lower Arrow lakes and northern portion of Kootanie lake, and track surveys of the intermediate portions of the Columbia and Kootanie rivers between Revelstoke and Nelson. In 1893 Mr. McConnell, assisted by Mr. Russell, made a track survey of the Finlay river from its confluence with the Parsnip to Lake Thutade, 220 miles; of the Omineca river from its mouth to the Omineca-Sitleka pass, 113 miles; and of the trail from Old Hogem to Tacta lake, 42 miles. In 1893 Mr. McEvoy surveyed 300 miles of the Nasse river and its tributaries, and made 230 miles of exploratory traverses on foot.

BRITISH LIBRARY

HISTORY AND LITERATURE OF THE KLONDIKE REGION.

The literature of the upper Yukon, on a tributary of which the Klondike gold-fields are situated, is unfortunately still of a very meagre character. The adventurous agents of the Hudson's Bay Company, by whom the very existence of the great river within British territory was first made known hardly more than fifty years ago, appear to have been little given to writing accounts of their journeys, except in the form of reports to the Company, few of which have been made widely known. The actual discoverer of the upper Yukon was Mr. Robert Campbell, who, after exploring the region of the Liard river, pushed on to the Pelly, establishing on it the post known as Pelly Banks, and, at its confluence with the Lewis, that of Fort Selkirk (1840–52). The Porcupine, one of the principal tributaries of the Yukon, was also explored by him to its sources. Little notice seems to have been taken by geographers of these discoveries, to which no allusion is made in the publications of the Royal Geographical Society. A brief account of Mr. Campbell's journeys is to be found in Begg's 'History of British Columbia' (p. 131). The identity of the new river with that of which the mouth had been discovered by the Russian Glazunov in 1833 was not at once suspected, many maps of the period showing it as the upper course of the Colville, which empties itself into the Arctic ocean. Although the treaty between Russia and Great Britain in 1825 (Hertslet, vol. iii. p. 362) had fixed the 141st meridian as the boundary between their respective territories, Fort Yukon, in about 145° W., was founded by the Hudson's Bay officials in 1846. This post was reached in 1860 by the American naturalist, Mr. Robert Kennicott, travelling under the auspices of the Smithsonian Institution for the purpose of making natural history collections; he had journeyed by way of the Mackenzie, Peel's river, and the Porcupine. No detailed account of this journey appears to have been published, and brief notices only are to be found in the 'Reports' of the Institution (see especially that for 1862, p. 39). Although devoting their chief attention to the lower river, several more recent American expeditions have explored the part of the stream within British territory, the most important being those of Schwatka (1883) and Everett (1884). In 1885 the former published an account of his journey under the title 'Along Alaska's Great River.' But the most important explorations in the region of the upper Yukon and its tributaries were those of Dr. G. M. Dawson, of the Canadian Geological Survey, and his associates, who in 1887–88 traversed the whole region, and for the first time executed accurate surveys of its natural features. The Geological Survey published the reports of Dr. Dawson (1888) and Mr. McConnell (1889), whilst an account of Mr. Ogilvie's surveys was published at Ottawa in 1890. The last-named has since continued his surveys, and his latest report was issued during the current year. Mr. Warburton Pike's book, 'Through the Sub-Arctic Forest,' published in 1896, gives the account of a canoe-voyage down the Pelly and Yukon rivers to the Bering sea; whilst the geological results of an expedition under Mr. E. J. Spurr, sent down the Yukon in 1896 by the United States Geological Survey Department, have lately been given in outline in a report to the United States Senate (*Journal*, vol. ix. p. 667). The recent rush to the gold-diggings has already begun to swell the literature of the region, in the form of magazine articles and larger works. Articles have appeared in the September numbers of the *Fortnightly* and *Contemporary Reviews* and the *Nautical Magazine*; and quite recently an account of two years' police-service on the Yukon, by M. H. E. Hayne and H. West Taylor, has been published under the title 'The Pioneers of the Klondyke' (Sampson Low). A small hand-book entitled 'All about Klondyke,' edited by H. A. Belcher (Simpkin, Marshall),

Qatar National Library

may also be mentioned. For the general geography of the region, Reclus's *Géographie Universelle* (vol. xv.), and the lately issued volume of the new edition of Stanford's 'Compendium,' by Dr. S. E. Dawson, may be consulted. A good general map of the region, including the results of the latest surveys, seems still a desideratum, though it may be hoped that such may soon be published by the Canadian Survey Department. Sketch-maps are given in most of the books and papers above mentioned, and in particular Mr. McConnell's report is accompanied by a large scale-map in nine sheets. A general map of the north-west parts of the British territory on a large scale was also issued by the Canadian Ministry of the Interior in 1888, and this shows clearly the results of the surveys of Dr. Dawson's party. As one of the routes to the goldfields is by the lower Yukon, it may be of use to refer briefly to the literature dealing with that section of the river, which is far more voluminous. Mr. F. Whymper's 'Travel and Adventure in the Territory of Alaska' (1868) describes the journeys made by him as a member of the American Expedition in connection with the proposed Asiatic-American Telegraph. Mr. Dall, in his book 'Alaska and its Resources' (1870), gives both the results of his own travels and a summary of our knowledge of the country at that time. Mr. H. W. Elliott's work, 'An Arctic Province' (1886), has also a chapter on the Yukon region, the history of which is treated of in Bancroft's 'History of Alaska' (1886). With regard to the region of the passes leading to the upper Yukon, Mr. Seton Karr's paper published in the *R.G.S. Proceedings* (vol. xiii.), and Dr. Aurel Krause's work, 'Die Tlinkit-Indianer' (Jena, 1885), may be mentioned. Finally, it may be of interest to note that prospecting for gold was carried on by the Russians in the southern parts of the region during their occupancy of Alaska (cf. Erman's *Archiv für Wissenschaftliche Kunde von Russland*, vol. xxv. (1867), p. 229).

THE MONTHLY RECORD.

EUROPE.

Oceanographical Researches in Loch Fyne.—The results of Dr. Mill's further investigations on the circulation of the water in Loch Fyne have recently been published.* The observations were carried out on board the Fishery Board's cruiser *Garland*, on two occasions, the first from April 2 to 6, and the second from September 3 to 11, 1896. The results of his earlier observations, undertaken between 1886 and 1889, are fully discussed in his paper on the 'Clyde Sea Area,' published by the Royal Society of Edinburgh (see also the *Geographical Journal* for October, 1894, pp. 344–349). The general results of the work on Loch Fyne in 1896 are summarized as follows: The flood-tide brings in water from the upper and deeper layers of the Arran basin, which is thoroughly mixed in passing Otter spit before high water, and fills the Gortans basin with a nearly homothermic mass, which is passed on through Minard Narrows into the Upper basin, where it does not sink through the cold deep water in summer, but only mixes with the upper layers above 20 fathoms, becoming more superficial in its effects as the tide passes upwards. In the ebb there is, at the upper end of the loch, only a superficial movement, but at the platform between Furnace and Minard the rush of the surface current into the Gortans basin, while it is strongest at half-ebb, draws up the deep cold layers to a slight extent, causing a slight mixture with the warmer water. The homothermic mass pours out into the Arran basin, acting on the ebb probably in the same way

* Part III, 'Fifteenth Annual Report of the Fishery Board for Scotland,' pp. 262–279.

BRITISH LIBRARY

as at Furnace on the flood. Thus there is always in progress a gentle mingling of the deep waters of the two deep basins through the intermediate shallow basin. The rapid surface current of the ebb carries out the excess of fresh water from the Arran basin, while the small underflow from the Arran basin passes in water of higher salinity with the flood. This circulation is liable to be accelerated or checked by the influence of wind.

The Development of the Peninsula of the Apennines.—In notes on this subject which Dr. Th. Fischer contributes to the August and September numbers of *Petermanns Mitteilungen*, he points out, among other things, that, while north of Campania transverse breaches in the mountains of the peninsula do not occur on a great scale, and scarcely affect the regions of the Apennines at all, south of that province they form a very marked feature. Straits, closed only in geologically recent times, connected the Campanian gulf with the Adriatic, and the Tyrrhenian sea with the Ionian, both at the isthmus of Catanzaro, and further south at the constriction immediately to the north of Aspromonte, while a marginal breach isolated the heights of Poro on the west, and a longitudinal channel severed Gargano and the Apulian tablelands from the Apennines; so that there existed here, probably in middle Pliocene times, six islands in place of the continuous stretch of land reaching to the straits of Messina. Extending his view to neighbouring countries, Dr. Fischer confirms, from his own observations, the accuracy of the view of Suess, that the Apennines are continued in the folded mountains on the north margin of "Little" Africa, and he describes the north-west basin of the Mediterranean as bordered on the east and south by a series of folded mountains stretching from Genoa, through Sicily, along North Africa to Melilla, and then back to Gibraltar and the south coast of Andalusia, on the inner side of which there is a vast area of sunken land, which he calls the Tyrrhenis, characterized almost everywhere on the marginal faults adjacent to the mountains by volcanic activity, and still represented by fragments rising above the surface of the water. Speaking of the terraces of Calabria and Sicily, he states that recent investigations have clearly established the fact that, at least in Calabria, a prolonged elevation, interrupted by periods of repose, and hence indicated by the formation of terraces, has taken place in quaternary times. This elevation apparently increased in intensity towards the straits, towards which part the elevation that may almost everywhere be shown to have taken place in Sicily also seems to have reached its greatest amount. From the south-west angle of the Sila to the straits, Cortese has demonstrated the existence of five terraces, all characteristic shore formations, increasing in height towards the south. In a special note on Gargano and Apulia, Dr. Fischer points out that recent geological observations tend to establish the intimate relationship of these tracts to the Apennines, notwithstanding the existence of the Pliocene channel above referred to. The hippuritic limestones of Gargano are exactly similar to those of the Apennines; and in the Neapolitan Apennines numerous more or less tabular masses of limestone, not unlike the tablelands of Apulia and Gargano, have been discovered. The result of the investigations hitherto made would seem to be that Gargano and Apulia are portions of the pre-Miocene Apennines less affected than the central parts of the system by the folds accompanying the elevation of those mountains, afterwards separated from the central mass by a series of faults, and behaving as a rigid mass during the last decisive post-Eocene movements of the Apennine system. Dr. Fischer makes light of the phytogeographical evidence in favour of a supposed recent land-connection bringing these parts of Italy into closer relation with the opposite coasts of the Balkan peninsula than with the Apennine peninsula. Some of the plants common to the Dalmatian coast and Gargano, but not met with in the rest

of Italy, might, he thinks, have been introduced by winds and currents; and as for the Valonia oak (*Quercus ægilops*), which occurs here and there in Apulia, but nowhere else in Italy, that might have been planted by man on account of its valuable acorn-cups.

The Rainfall of Western Europe.—In the first part of the newly issued volume of the *Annales du Bureau central Météorologique de France* (Année, 1895; Paris, 1897), Dr. Alfred Angot publishes a paper on this subject, which supplements that on the rainfall of the Iberian peninsula, which appeared in 1895. In both Dr. Angot calculated the mean annual and monthly rainfall for the thirty years 1861–90, and reduced the returns from stations which were not active during the whole period to the thirty years' means, by means of interpolations. In this way comparable results have been obtained, a matter of great importance in the case of rainfall which varies greatly from year to year, and we may regard this paper as the most important contribution to the climatology of Central, Western, and Southern Europe that has appeared since Dr. Hann's classical discussion of the mean pressure for the same region, also studied on a thirty-years mean, from 1851 to 1880 (*Pencks Geographische Abhandlungen*, ii.: Wien, 1887). Some general laws of rainfall distribution are beautifully illustrated in the maps which accompany Dr. Angot's paper, and tables of rainfall for 271 selected stations. At the first glance, the influence of mountains in deflecting the water-vapour upwards into regions of lower temperature, and so cooling and condensing it, is so apparent that one is inclined to say that relief and rain maps are congruent. But a closer study of the great mountain regions on the rainfall map shows that the central areas receive less rain than the periphery, and the windward slopes more than the leeward. An area of minimum rainfall is usually found not far from the foot of the lee side of the high ground; for instance, in the upper Rhine plain, the upper valley of the Loire, and in the east of our own islands. The winter rains are mainly cyclonic, and, owing to the low temperature, are rarely heavy, save in the extreme western mountains, and rapidly diminish towards the east, where even such lofty regions as the Alps receive comparatively little rain. In February least rain falls over Europe as a whole, even when due allowance is made for the shortness of the month. In spring the cyclone tracks are often directed to the Mediterranean region, which receives abundant moisture, while North-Western Europe has its minimum precipitation. As the summer advances, and the temperature increases and permits large supplies of water-vapour being formed in the lower regions, the mountainous districts, especially in the heart of Europe, have very heavy rains. But the whole Mediterranean region is exceedingly dry, and in July we have a most striking contrast between the wet Tyrol, where the rainfall is at its maximum, and the dry north of Italy, where it is at its minimum. The need for maps of mean monthly rainfall, and not merely seasonal ones, is clearly demonstrated in Northern Italy, where June is wet while July is very dry. Autumn is rainy everywhere, especially along the Mediterranean littoral. In October the *régime* of cyclonic rains begins, and the winter conditions become apparent, but the vertical temperature-gradient is slightest about this season, and so the atmosphere can hold much water-vapour, and the rains are heavier than in the corresponding spring months.

Mode of Formation of the Dunes of Gascony.—M. E. Durègne, who has been engaged for some years in careful investigations of the dunes which occur in the coast region of the south-west of France, outlines the chief results of his conclusions respecting their mode of origin in the *Comptes Rendus* (vol. 124, p. 1041). The dunes with which his remarks are more specially concerned are those of the Teste-de-Buch (Gironde) and of Messanges (the Landes), and his surveys have shown that these are incorrectly drawn on existing maps. Instead of forming

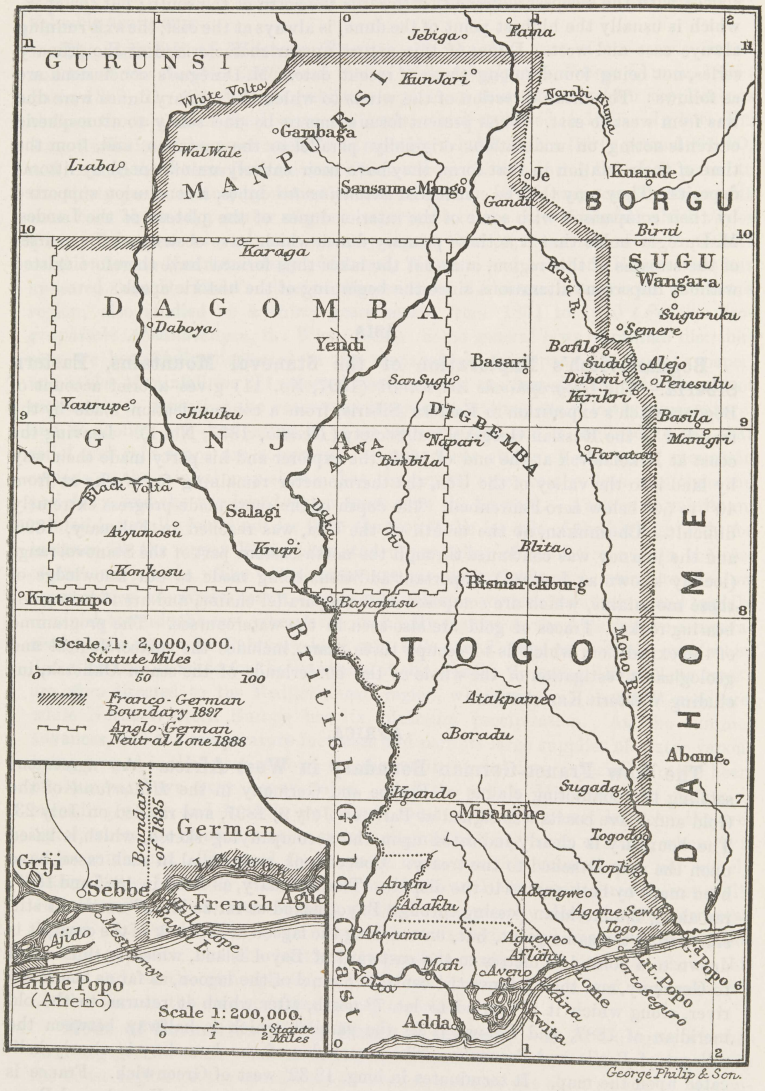
مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

continuous *chains*, the dunes occur in the form of interlacing curves, usually taking the outline of a truncated parabola, and enclosing spaces comparatively level. The one branch of the parabola represented may have its curvature (which corresponds with the steepest slope) either towards the north or the south; but the apex, which is usually the highest point of the dune, is always at the east, the axis running always east and west. Dunes of this nature appear characteristic of the primary series, not being found among those of recent date. M. Durègne's conclusions are as follows: The mean direction of the winds to which the primary dunes were due was from west to east. Their present form seems to be due solely to atmospheric currents acting on undulations originally parallel to the meridian, and, from the time of their fixation in that form, they have been entirely uninfluenced by littoral deposits. They may thus be considered as *continental* dunes, a conclusion supported by their comparison with some of the interior dunes of the plateau of the Landes. M. Durègne holds that it is these primary dunes which have obstructed the courses of the streams of this region, and that the lakes thus formed have therefore existed without important alterations since the beginning of the historic epoch.

ASIA.

Bogdanovitch's Exploration of the Stanovoi Mountains, Eastern Siberia.—The *Geographische Zeitschrift* (1897, No. 11) gives a brief account of Bogdanovitch's expedition in Eastern Siberia, from a communication made by the traveller to the Russian Geographical Society (*Izvestia*, 1897, No. 1). Leaving the coast at Nikolaievsk at the end of 1895, the explorer and his party made their way by land into the valley of the Uda, the thermometer remaining for weeks at from 40° to 50° below zero Fahrenheit. The depth of the snow made progress extremely difficult. Chumukan, at the mouth of the Uda, was reached in February, 1896, and the journey was continued through the north-eastern part of the Stanovoi range (locally known as Jugjuru), important additions being made to our knowledge of these mountains, which are composed of three parallel chains, and are rich in gold-bearing rocks. Traces of gold are also seen in the watercourses. The programme of the expedition, which is to occupy three years, includes the meteorological and geological investigation of the whole of the borderlands of the sea of Okhotsk, including Western Kamchatka.



AFRICA.

The New Franco-German Boundary in West Africa.—An agreement settling the conflicting claims of France and Germany in the *Hinterland* of the Gold and Slave coasts was signed at Paris on July 9, 1897, and ratified on July 23. The boundary is clearly indicated upon the accompanying sketch, which is based upon the map attached to the treaty. Concessions, as is usual in such cases, have been made by both parties to the dispute. The boundary, as fixed in 1885 and 1887, ran along the meridian passing through Bayol island as far as lat. 9° north. It still starts from the same point, but, on reaching the lagoon at the back of the coast, it is drawn to a point 100 metres to the eastward of Bayol island, which is thus ceded to Germany, and then follows the central channel of the lagoon, as far as the Mono river, along which it is carried to lat. 7° north, after which it returns to the old meridian of 1887, and follows it to the parallel, which is halfway between the villages of Basila and Penesulu. The remainder of the boundary is clearly indicated upon the map. It terminates in long. 1° 32′ west of Greenwich. France is permitted, for four years, to make use of the routes connecting Kuande and Pama with Sansanne Mango, and the latter with Gambaga, for the despatch of troops and munitions of war. It will be understood that this agreement merely settles matters

at issue between the contracting governments, and that British claims have been ignored. At the back of the lagoon and to the west of the Mono river, France

surrenders 185 square miles, receiving in compensation 35 square miles to the east of that river. Further north, the French stations of Kirikri and Bafilo, which had at one time been occupied by Germany, were definitely surrendered, as were

BRITISH LIBRARY

also the French claims to Sansanne Mango and Gambaga. All the places mentioned lie outside the "Neutral territory" agreed upon between Great Britain and Germany, in 1888, and distinctly shown on our sketch-map. As to Gambaga and Sansanne Mango, it should be borne in mind that the British claims date back to 1894, if not to an earlier period, whilst the treaties producible in support of French and German claims are not older than 1895. Germany, on her side, surrendered, by implication if not explicitly, all claims to Borgu, Gurma, and Gando.

German-Portuguese Boundary in East Africa.—The third number of the *Mitteilungen aus den Deutschen Schutzgebieten* for the present year contains a map by Dr. F. Stuhlmann, showing the boundary between the German and Portuguese possessions in the neighbourhood of the lower Ruvuma, as laid down by the commission of 1895, together with the country on either side between Tungi bay and the Ruvuma (such, according to Dr. Stuhlmann, is the correct spelling of the name). The boundary leaves the coast at Ras Lipuu, about a mile north of Cape Delgado, running roughly parallel to the northern shore of the Cape Delgado peninsula until it strikes the parallel of 10° 40′ south. This it follows westwards to about 40° 17′ east, but before striking the Ruvuma diverges somewhat to the north, and on again reaching the parallel of 10° 40′ runs parallel to the Ruvuma as far as a point opposite the upper end of Nyenyere island, leaving to Germany a strip 1 kilometre wide on the south bank of the river. Dr. Stuhlmann gives some notes on the general nature of the country traversed by the boundary, which he divides into the coast belt, the plateau, and the Ruvuma valley. The coral reef which fringes the shore at low-water level, he considers to have once formed a raised shore-line, but to have been worn away to its present level by the waves. Dunes now fringe the shore at high-water mark. The plateau, which is mostly covered with impenetrable bush, is of no great elevation, but its well-marked escarpment towards the Ruvuma valley is due to the action of the river in wearing down its bed. Forests occur hardly anywhere but on the plateau-edge and along the banks of the Ruvuma. The Ruvuma plain, which has its principal extension south of the river, is covered with grass of moderate height.

Explorations in the Congo Basin.—Commandant Brasseur, whose explorations on the Lualaba and Luapula rivers have already been alluded to (*Journal*, vol. ix. p. 560), contributes an article on the countries of Urua and Katanga to the *Mouvement Géographique* (1897, Nos. 35–38), accompanied by a map, on which his various itineraries are laid down. In addition to the explorations already mentioned, the geographical work performed by M. Brasseur includes an examination of the whole country lying to the west of the upper Luapula (including the Kundelungu plateau), which he has covered with quite a network of routes. Several tributaries of the Luapula have for the first time been laid down with accuracy, one of them, however—the Lushipuka—having been mentioned by the "Pombeiros" as far back as 1806 (as "Lutipuca"). M. Brasseur's delineation of the southern end of Lake Mweru differs much from that of Mr. Alfred Sharpe and other previous travellers, the mouth of the Luapula being placed far to the south-east of Kilwa island, the shape of which also differs considerably from that given to it by Mr. Blair Watson. The Belgian traveller states that the lake is yearly diminishing in size. The Luapula, after leaving Mweru, seems to bend further to the west than has been previously supposed, the junction with the Lualaba being placed by M. Brasseur some distance to the south-west of the position assigned to it in Captain Hinde's map. Although holding to the view that the Lualaba is the true head-stream of the Congo, he allows that in point both of length of course and volume of water the Luapula has the advantage, and his opinion, based on geological grounds only, can hardly be considered satisfactory from a geographical point of

مكتبة قطر الوطنية
Qatar National Library

view. M. Brasseur, who has twice extended his term of service in Katanga, having first reached that country in 1893, hopes, before returning to Europe, to complete the exploration of the Lubudi, the western tributary of the Lualaba. Minor explorations have also been carried out recently within the great bend of the Ubangi, and several tributaries of that stream in this neighbourhood have been laid down (*Mouvement Géographique*, No. 38, with map). The principal of these seems to be the Lua, which, rising, it is thought, in the neighbourhood of the station of Banzyville, on the upper Ubangi, and flowing across the region comprised within the bend of that river, may possibly supply a means of communication towards the upper posts. The chief tribes of this region, which is very populous, are the Bwaka, the Gobu, and the Banza. Finally, we may briefly note the journey lately made to the capital of the Muata Yanvo (*Mouvement Géographique*, No. 40) by Lieut. Michaux, the first European to visit the central portion of Lunda since Dr. Buchner (1878). The present ruler is the nephew of the chief visited by the German traveller, and his capital is situated on the Luele, a left-bank tributary of the Sankuru, in about 8° S. lat. It is an immense town of 30,000 inhabitants. Lieut. Michaux obtained an audience after some difficulty, and found the Muata Yanvo friendly disposed.

Explorations in the Cameroons.—The third part of the *Mittheilungen aus den Deutschen Schutzgebieten* for the current year contains an account by Lieut. Baron von Stein of the discovery of a small lake named Lungasi, or Ossa, lying to the north of the lower Sanaga, and connected with it by a narrow tortuous channel. The point of junction of this with the main river lies a few miles below the Edea falls, and the idea is entertained by the German officer that the lake may mark the position of a former course of the Sanaga towards the Cameroons estuary, which had on other grounds been supposed to have once existed. Proceeding along the connecting channel, which is deep, but varies in its flow according to the level of the Sanaga, the traveller, after about 3 miles in a direct line, emerged into the most open basin of the lake, which afforded a view of great beauty. The northern, western, and in part the eastern shores are remarkably indented, the tongues of land which project into the water rising steeply from its surface. Towards the south-east the shores are low, which, Baron von Stein thinks, may possibly point to a former connection with the Sanaga in this direction. The water-arms which run towards the north ended in swampy ground overgrown with vegetation, and had the appearance of having once extended further, but, at the present day at any rate, there is no open-water route from the Sanaga to the Cameroons in this direction. The shores of the lake are clothed with thick forest, abounding in elephants, wild pigs, antelopes, etc., while the surface is frequented with an unusual variety of water-birds. The geological formation appeared to be gneiss with a covering of laterite. Among recent journeys in the interior of the country, that by the Imperial governor to the Yaunde station and upper Sanaga deserves mention. An account of it appears in the *Deutsches Kolonialblatt* for June 15 last. The river was struck in the neighbourhood of the Nachtigal falls, and some advance towards the opening up of the route hence to southern Adamawa was made by the defeat of the powerful slave-raiding chief Ngila. A colony of Hausas settled at his town was, at their own request, brought to the Cameroons, where they were settled in a village of their own. The governor was anxious to explore the still unknown country further east, but was obliged to leave the task to Lieut. von Carnap, who was placed in charge of the Yaunde station. This officer is already known for the part he took in Dr. Grüner's expedition in the Togo Hinterland.

The Uchungwe Mountains, German East Africa.—A short description of the Uchungwe mountains, situated in Uhehe, to the east of the lesser Ruaha

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984182.0x00000b

BRITISH LIBRARY

river, is given by Herr von Bruchhausen, in the *Deutsches Kolonialblatt* for October 1, chiefly from the point of view of their suitability for colonization. The writer divides the country surrounding and including the mountains, which forms the part of Uhehe most suitable for settlement, into three zones, viz. (1) That of the grassy treeless plains, with a laterite soil and little humus; (2) that of transition between the grass and the bush; (3) the bush zone with a luxuriant vegetation. Both of these last have an excellent soil; the summits of the hills are chiefly cultivated by the natives, but good alluvial soil is also present in the valleys. The hills are unusually well watered, the numerous ravines and valleys all possessing springs and streams of excellent clear water. The climate is temperate and bracing, and fever is little to be feared. The rainy season proper lasts from November to May, but rain falls in the hills throughout the year. The grass-lands are pre-eminently suited for cattle-rearing, and herds have already been successfully sent down to the coast. With steamers on the Rufiji above and below the Pangani falls, communication with the coast would be easy.

Antidote to African Arrow-poison.—Major Ternan, who commanded the British forces during the late fighting in Uganda, has now arrived in England, and during the course of an interview has described the successful use of an injection of strychnine solution as an antidote to the native arrow-poison. It was tried by Dr. Macpherson during Major Ternan's operations against the Kamasia tribe on the Mau mountains, with the result that the wounded men so treated recovered in a couple of hours, whereas previously people wounded with the poisoned arrows had always died. Should this remedy prove generally successful, one of the chief risks of savage warfare in Africa will have been removed.

AMERICA.

The Jessup Expedition to the North Pacific Coast.—*Science* (October 8) contains a short account of the results of the work performed during the past season by the expedition despatched by Mr. M. K. Jessup for the investigation of the ethnology of the regions bordering on the North Pacific. The field chosen for work during the present year was British Columbia, whither Dr. F. Boas, Mr. L. Farrand, and Mr. H. T. Smith proceeded in May last; Messrs. Teit and Hunt joining the party later. The investigations included the examination of archæological remains—which, though dating from periods preceding the arrival of Europeans, mostly appeared capable of reference to the immediate ancestors of the present inhabitants—the study of the traditions and languages of the Bella Kula and other Indian tribes, and of the physical types of the tribes of British Columbia generally. One hundred casts were obtained, representing four distinct types.

The Geology of the Bermuda Islands.—The Bermudas are still vexed by discussions amongst geologists as to their structure. The latest contributor to the subject is Mr. Ralph S. Tarr, who publishes a paper in the *American Geologist*, reviewing a number of the older arguments in the light of some original observations. The history of the Bermudas, Mr. Tarr concludes, is somewhat as follows: A base rock was at first formed by the waves on the flat volcanic summit by the pounding up of shell fragments on the beach; the shell sand was then consolidated into a dense limestone, eroded in the air, and finally attacked by the waves. This stage would involve elevation and subsequent depression. Next follows the partial covering of this base rock by beach deposits of pebbles and shells: this must have occurred in comparatively recent times, so far as appears from fossils. Then came an uplift, during which land-shells lived on the beach deposits; but these were soon covered by blown sand, and through this sand accumulation the outline of the Bermuda hills was perfected. This action occurred when the land was certainly

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

40 or 50 feet higher than it is at present. The last stage has been one of depression, which has caused much land to disappear and made the outline of the area very irregular. The land has now been carried down very nearly to what it was when the beach was formed and before the sand-dunes were built, and the present excavation of sea-caves and other appearances show that the land is now undergoing little or no change of level. Mr. Tarr discusses the denudation of the base rock, and the unconformity between it and the overlying strata, with some care, and is of opinion that the history of the Bermudas is more complex than has been supposed, extending back into Pleistocene or even Tertiary times.

American Expedition to Patagonia.—The expedition despatched to Patagonia from Princeton University in February, 1896, returned in August last, having been successful in adding considerably to our knowledge, both of the geology and geography of the regions traversed (*Science*, October 8). The expedition landed at Port Gallegos on the east coast of Southern Patagonia, and its field of operations included both the coast region from Sandy point, in the Straits of Magellan, to Port Desire; the little-known interior lake region about the headwaters of the Santa Cruz river; and a quite unknown region of the Cordilleras further north. Many new glaciers and streams were discovered here. Botanical and geological collections and observations were also made in Tierra del Fuego and neighbouring islands.

AUSTRALASIA AND POLYNESIA.

Successful Boring at Funafuti.—The renewed attempt made this year by Prof. David, of Sydney, to carry out a deep boring in the atoll of Funafuti has met with complete success. Telegrams from Sydney early in October announced that a depth of 643 feet had then been obtained, and that the base of the coral rock had not yet been reached. It will be remembered that the object of the boring is to throw light on the vexed question of the origin of coral islands, and the result supplies a striking confirmation of Darwin's theory that such islands occur chiefly in areas of subsidence.

POLAR REGIONS.

Norwegian Andrée Search Expedition.—Owing to a report brought to Norway by shipwrecked sailors that cries of distress had been heard by them when off the Dammands isles, on the west coast of Spitsbergen, the Norwegian Government promptly decided on the despatch of an expedition to investigate the truth of the matter. The s.s. *Victoria* was at once chartered and equipped, and started for Spitsbergen on November 5, the arctic explorer, Paul Bjorvig, accompanying the expedition. The story of the Norwegian sailors, as telegraphed by the German vice-consul in Vardö, is as follows: On September 22 and 23 they were passing the Dammand isles at the mouth of Ice fjord, when they heard a cry for help, but the smallness of their boat and the high sea that was running made it impossible to do anything. Afterwards they proceeded further up the fjord, where they were taken up by the Tromso sloop *Malygen*. On repassing the same spot the cry was again heard, but the Tromso captain was unwilling to search, believing it to be the cry of a bird. The Vardö fishermen declare that on September 23 a driving reddish-brown object, which they took for a capsized ship, was seen, a mile from land, about 8 miles north of Dammands isles, and it is suggested that this may have been Andrée's balloon. Experts are, however, of the opinion that neither this nor the supposed cries of distress can have been in any way connected with Andrée's expedition. The expedition returned to Tromsö on November 20 without success, the examination of the coast of Spitsbergen having revealed no trace of the balloon or of the explorers.

Swedish Polar Expedition determined on.—The persistent efforts of Dr. Nathorst to obtain the despatch of a Swedish polar expedition have now been successful, as sufficient funds have been provided by the king and several private persons to enable the idea to be carried out. Dr. Nathorst himself will be the leader of the expedition. The plans brought forward a year ago by Dr. Nathorst were briefly described in the January number of the *Journal* (vol. ix. p. 95), but it has not yet been stated whether these will be adhered to.

The Belgian Antarctic Expedition.—The *Belgica*, with the antarctic expedition under Commander de Gerlache on board, arrived at Rio de Janeiro on October 22. The explorers were there joined by Dr. Cook, a former companion of Lieut. Peary. The ship was shortly to proceed to Punta Arenas, where the serious work of the expedition may be said to begin. Scientific collections and observations have, however, been made during the voyage out by the scientific staff.

GENERAL.

Geographical Reading for Teachers.—Under the title of 'Hints to Teachers and Students on the Choice of Geographical Books for Reference and Reading, with Classified Lists' (Longmans), Dr. H. R. Mill, the Society's librarian, has compiled a little volume which ought to be of the greatest service in geographical education. Unless a teacher goes beyond his class text-book, his teaching is not likely to bear much fruit. Few teachers have the necessary time or knowledge to discover for themselves the best books to consult on any particular subject. So far as geography is concerned, Dr. Mill has done all that most students and teachers are likely to require. There are two introductory chapters on the Principles of Geography and on the Teaching of Geography, accompanied by a list of books on Methods of Teaching Geography. This is followed by short chapters on the Choice of Text-books, on Atlases and Means of Illustration, and on Works of Reference on Geography, with lists. Then come chapters on Mathematical Geography, Physical Geography, Bio-Geography, and Anthropogeography, followed by sections on the various divisions of the globe, each containing a select list of books. The concluding section is on General Travel and Biography. The hints given are all the result of extensive experience on the part of the author, while the selection of books recommended has evidently been carefully considered. Those interested in the improvement of geographical education will be grateful to Dr. Mill for the service he has rendered.

Portuguese Celebration of the Discovery of the Sea-route to India.—We have received a copy of the programme, drawn up in accordance with a ministerial decree of April 2 last, for the national celebration in Portugal of Vasco da Gama's voyage to India. The main features of the celebration will be those already sketched in the preliminary programme (*Journal*, vol. viii. p. 303), but the dates now fixed for the public rejoicings are the 17th to the 20th of May, 1898. At daybreak on the 17th, all the Portuguese fortresses and war-vessels will fly the national flag and usher in the festivities by a salvo of one hundred guns; the thanksgiving services in the cathedrals and churches will also be held at the same time. Among the varied items of the commemoration will be an exhibition, on the site of which a permanent "maritime and fluvial aquarium" will be built, and a grand naval review, in which both foreign governments and the principal steamship companies and commercial associations throughout the world will be asked to take part. The headquarters of the Central Executive Committee, and the place of meeting of the scientific congresses, etc., are at the new buildings of the Lisbon Geographical Society. The president of the committee is Captain F. J. Ferreira do Amaral, and the secretaries are Senhors L. Cordeiro and E. de Vasconcellos.

Death of A. von Mojsisovics.—The announcement in our last number of the death of E. von Mojsisovics is due to an error on the part of the correspondent by whom the notice was sent to us. That geologist is, we are glad to say, still living and engaged in active work as Vice-Director of the Imperial Geological College in Vienna. The deceased is his brother, the geologist *August* Mojsisovics von Mojsvár, who held the posts of Military Director of the Crown Prince Establishment, Custodian of the Styrian State Museum, and Professor of Zoology at the Technical High School at Gratz.

New Geographical Society at Southampton.—By the exertions of Mr. T. G. Rooper and others, a new geographical society has been set on foot at Southampton, the growing commercial importance of which port renders such a society particularly desirable as a means of disseminating reliable information regarding the foreign countries with which this country has or might have trade relations. The new society will work in close harmony with the Chamber of Commerce, which, its promoters hope, will be able to supply it with much useful information, which otherwise might be lost to the general public. While, however, the commercial aspects of geography will receive particular attention, it is hoped that the society will do good work also in the furtherance of geographical education, a subject in which Mr. Rooper is well qualified to guide the way. It will especially aim at assisting those secondary schools, where any of the scholars are preparing for the Commercial Certificate of the Associated Chambers of Commerce. The formation of a library, especially devoted to the supply of information respecting the British empire, and a collection of lantern slides and maps for loan, will also form items in its programme. The formal inauguration took place on November 16, on which date Sir Clements Markham went to Southampton to deliver an opening address.

OBITUARY.

Sir Rutherford Alcock, K.C.B., D.C.L.

By the death of Sir Rutherford Alcock, at the advanced age of eighty-eight years, yet another name has disappeared from the now scanty list of former Presidents of the Royal Geographical Society, which thus loses one who, during the long period of service on its Council, contributed in no small degree, by his valued advice and co-operation, to the furtherance of the objects for which the Society is constituted. It was only quite recently that Sir Rutherford had been compelled to live in retirement, and had been unable actively to participate in its affairs; but while his health permitted, there were few members whose interest in its proceedings was more constantly maintained.

Born in 1809, Rutherford Alcock was trained for the medical profession at King's College, London, and gained his first experience of service abroad as surgeon in the British forces employed in Spain and Portugal during the stormy times of the Carlist and Miguelite wars, receiving medals and other decorations from the Spanish and Portuguese Governments in recognition of his services in the field. On the disbandment of the Spanish Legion, to which he had been attached as Deputy Inspector-General of Hospitals, he became commissioner for the adjustment of the claims of the British troops on the Governments in whose support they had fought

In 1844 Mr. Alcock was transferred to the East, which was destined to be the scene of the labours with which his name is principally associated. In that year he

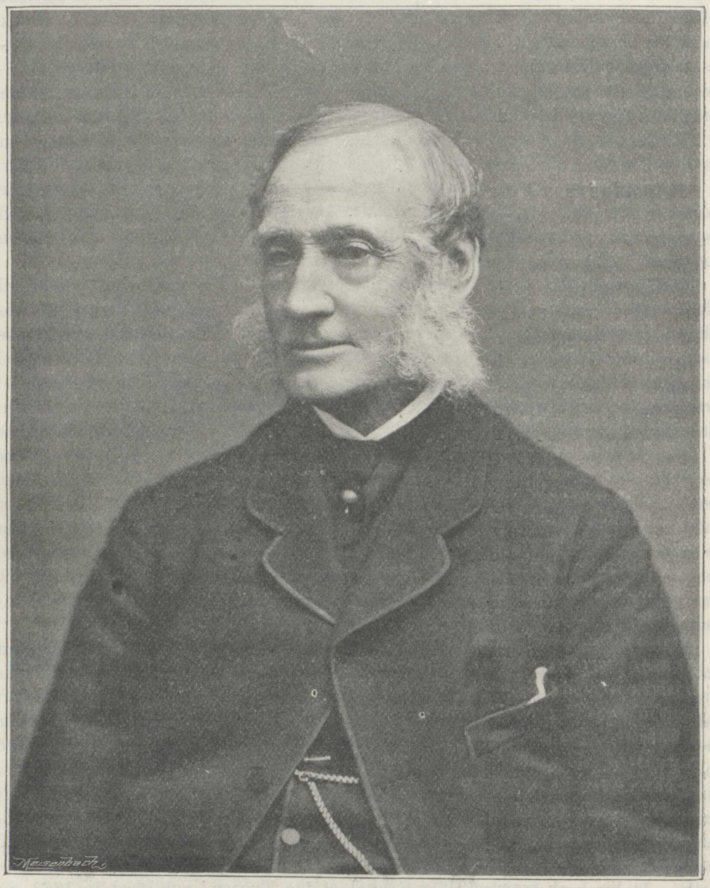
BRITISH LIBRARY

received the appointment of Consul at Fu-chau, one of the ports then lately thrown open to foreign commerce by the treaty of Nan-king. After two years' service there, he was appointed to the same post at the still more important port of Shanghai. Here he remained eight years, the latter of which fell within the troublous times of the Taeping rebellion. A serious rising took place at Shanghai in 1853, and the European settlement was for some time in considerable danger. The energy displayed by Mr. Alcock, however, helped much towards the organization of an efficient defence, and, though the Chinese city fell into the hands of the rebels, no attack was made on the foreign quarter. During his service at Shanghai, he was instrumental both in founding the excellent municipal government of the foreign settlement, and also in establishing the commission for the collection of dues on foreign trade, which afterwards became known far and wide as the Imperial Maritime Customs. In 1854 he was transferred to Canton, where difficulties had already arisen between Sir John Bowring and the Chinese officials with regard to the opening of the city to Europeans, and where the events soon afterwards occurred which led to the second foreign war. In this, however, Mr. Alcock had no part, as he had returned home on leave before the outbreak of hostilities, being succeeded in the Canton Consulate by Mr., afterwards Sir Harry, Parkes.

This closed Mr. Alcock's first period of service in China, for in 1858, Lord Elgin having concluded a treaty of intercourse with the Empire of Japan, he was selected as the first British minister to that country. In this capacity perhaps his most important public services were performed, for Japan was in an unsettled state, and both tact and firmness were needed for the successful maintenance of British influence in the country. The bulk of the people were opposed to foreign intercourse, and the Government itself was anxious to draw back from the course of concession it had already entered upon. Murderous attacks on foreigners were frequent, and on at least two occasions an armed mob attacked the British Legation itself. The minister, however, was firm in his determination to maintain the treaties, and to let no outrage on British subjects go unpunished. It was in this spirit that he more than once took severe measures of retaliation against the perpetrators of such outrages, a course which laid him open to much criticism at home, though he was able ultimately to disarm it, and to secure the general approbation of his countrymen for his services. In 1862 he was made a K.C.B.

Apart from his political services, Sir Rutherford Alcock did much to extend our knowledge both of the country and people of Japan, and may be said to have led the way in the modern exploration of that empire. In the Society's *Journal* he has left valuable records of journeys in the interior of the country, made at a time when that interior was still almost a *terra incognita*. In the volume for 1861 he described one such journey, which included an ascent of the great mountain Fusiyama and a visit to the sulphur baths of Atami; and in the following volume we have the account of a journey from Nagasaki to Yeddo, with a description of the great commercial city of Osaka. Both of these papers contain many details on the natural features of the country, the conditions of life in it, the prospects of trade, and so forth. In his book entitled 'The Capital of the Tycoon,' published in 1863, Sir Rutherford entered more fully into these subjects, and showed clearly the sort of difficulties to be faced in opening up intercourse with the Japanese people. In 1878 he published a work on 'Art and Art Industries in Japan,' a subject in which he took a great interest. It was entirely through his exertions that Japanese arts and industries were represented at the International Exhibition of 1862, in which he was unable to induce either the Japanese Government or people to take part.



In 1865 Sir Rutherford was appointed British Minister at Peking, where his career was less eventful than it had been in Japan. He was for the most part

Qatar National Library

engaged in unostentatious work in the direction of improving the position of Europeans in China. He endeavoured to place the commercial relations of Great Britain with that country on a firmer basis by the negotiation of a new convention, but though such a convention was drawn up, the opposition of British merchants to some of its provisions led to its being withdrawn.

In 1871 Sir Rutherford retired on a pension, and took up his residence in

SIR RUTHERFORD ALCOCK, K.C.B., D.C.L.

London, where, however, he continued to take a deep interest in the affairs of the East, many articles from his pen appearing in reviews and newspapers on subjects connected with it. In particular, he contributed the concluding chapter to the journals of Augustus Margary, who first joined the consular service while Sir Rutherford was minister at Peking, and whose career he had followed throughout with much interest. In 1876 he became President of the Royal Geographical

BRITISH LIBRARY

Society, of which he had been a Fellow since 1862, and during his two years' tenure of the office, as also subsequently as Vice-President, he gave the Society the benefit of his wide experience, frequently taking part in the discussions on papers read at the evening meetings. He was also Chairman of the African Exploration Fund, and thus took part in the labours which resulted in the despatch of Mr. Keith Johnston and Mr. Joseph Thomson to East Africa, and, by bringing the latter into notice, had such important results in the direction of the opening up of that part of the continent. Another important service rendered by him to the British enterprise abroad was that which he performed as first chairman of the British North Borneo Company, in the formation of which he had taken much interest. He remained on the Council of our Society until May, 1893.

Sir Rutherford Alcock was twice married. His first wife—daughter of Mr. Charles Bacon, of London—died during his consulate at Shanghai, and he subsequently, in 1862, married the widow of Mr. Lowder, formerly chaplain at Shanghai.

Dr. Don Agustin Aspiazu.

The recently formed Bolivian Geographical Society has to lament the loss of its distinguished President, Dr. Don Agustin Aspiazu, who died on March 18 last. In Bolivia a scholar, one who desires to acquire more than superficial knowledge, labours under almost insuperable difficulties, and must possess great energy and perseverance, as well as talent. With a fertile imagination and remarkable power of application, young Aspiazu very soon mastered all that could be taught in the university of his native country, and devoted himself to the study of sciences unknown in Bolivia. Except when occasionally occupying official posts, he devoted his whole time to study during fifty years. He also traversed the wildest parts of the Andes to take observations and make scientific investigations. Born in 1827, Dr. Aspiazu was one of the founders of the "Ateneo de Bolivar" when he was a young man only twenty-three years of age, and before many years he was Minister of Instruction and Chancellor of the University of San Andres, frequently representing the city of La Paz in congress. He wrote a course of physics (1852), a paper on the theory of earthquakes (1868), a work of considerable merit entitled "Conocimiento del Tiempo" (1880), almost amounting to a nautical almanac; and since 1889 various papers by Dr. Aspiazu have been communicated to the Geographical Society of La Paz. The most important of these are his memoirs on the plateaus of the Andes, on methods of determining longitude, and on the boundary-line between the Bolivian province of Caupolican and Peru. He left behind him some very useful papers on astronomical geography, with solutions of problems, which have been printed. Mr. Aspiazu was a man of whom his country may well be proud, and his loss will be much felt by the members of the La Paz Geographical Society, to whom, however, he has set an excellent example.

GEOGRAPHICAL LITERATURE OF THE MONTH.

Additions to the Library.

By HUGH ROBERT MILL, D.Sc., *Librarian*, R.G.S.

THE following abbreviations of nouns and the adjectives derived from them are employed to indicate the source of articles from other publications. Geographical names are in each case written in full:—

A. = Academy, Academie, Akademie.
Ann. = Annals, Annales, Annalen.
B. = Bulletin, Bollettino, Boletim.
Com. = Commerce, Commercial.
C. Rd. = Comptes Rendus.
Erdk. = Erdkunde.
G. = Geography, Geographie, Geografia.
Ges. = Gesellschaft.
I. = Institute, Institution.
J. = Journal.
M. = Mitteilungen.
Mag. = Magazine.
P. = Proceedings.
R. = Royal.
Rev. = Review, Revue, Revista.
S. = Society, Société, Selskab.
Sitzb. = Sitzungsbericht.
T. = Transactions.
V. = Verein.
Verh. = Verhandlungen.
W. = Wissenschaft, and compounds.
Z. = Zeitschrift.

On account of the ambiguity of the words *octavo*, *quarto*, etc., the size of books in the list below is denoted by the length and breadth of the cover in inches to the nearest half-inch. The size of the *Journal* is 10 × 6½.

EUROPE.

Alps. **Mader.**

Die höchsten Teile der Seealpen und der Ligurischen Alpen in physiographischer Beziehung. Von Dr. Fritz Mader. Leipzig: G. Fock, 1897. Size 9½ × 6½, pp. 236. *Illustrations.*

Austria—Meteorology. **Frejlach.**

Věstnik Král České Společnosti Náuk. Třida mathematicko-přirodovědecká. 1897. IV. Přispěvek R. poznáni nefometrických poměrů zemi hercynsko-sudetských. Podává Dr. Josef Frejlach. v Praze, 1897. Size 10 × 6½, pp. 24. *Diagrams. Presented by the Author.*

On the cloudiness of the north-western mountain district of the Austrian monarchy.

Europe—Lithuania. *Globus* **71** (1897): 381–384. **Tetzner.**

Das litauische Sprachgebiet. Von Dr. F. Tetzner. *With Map.*

On the Lithuanian-speaking districts of Prussia and Russia.

France and Germany. **Birchall.**

P. Literary and Philosoph. S. Liverpool **50** (1896): 235–262.

Medieval Towns in France and Germany: their Origin and Municipal Development. By James Birchall. *With Map.*

On the economic reasons for the growth of free towns in medieval Europe.

France—Ardèche. *Mém. S. Spéléologie* **1** (10) (1897): 1–40. **Raymond.**

Les Rivières souterraines de la Dragonnière et de Midroï (Ardèche). Par M. le Dr. Paul Raymond. *With Plans and Illustrations.*

France—Capbreton. *Rev. Maritime* **134** (1897): 509–541. **Gabarra.**

L'ancien port de Capbreton. Par M. J.-B. Gabarra.

A history of the port of Capbreton, intimately associated with the geographical problem of the former mouth of the Adour and its relation to the remarkable submarine cañon known as the Capbreton Deep. The question of creating a harbour of refuge at Capbreton is also discussed. The paper, which is written by the curé of Capbreton, is throughout of remarkable interest.

France—Normandy. *C. Rd.* **125** (1897): 380–382. **Bigot.**

Sur les dépôts pléistocènes et actuels du littoral de la basse Normandie. Note de M. A. Bigot.

On the character and movements of the northern coast of France.

France—Provence. *A travers le Monde* (*Tour du Monde*) **3** (1897): 193–196. **Porcher.**

La Sainte-Baume et Saint-Maximin. Par Jacques Porcher. *With Illustrations.*

Germany. *Aus allen Weltteilen* **28** (1897): 601–606, 639–650, 671–684. **Detmer.**
Landschaftsformen des nordwestlichen Deutschlands. Von Dr. W. Detmer.

Germany—Eifel Lakes. *Petermanns M.* **43** (1897): 149–153. **Halbfass.**
Tiefen- und Temperaturverhältnisse der Eifel-maare. Von Dr. Wilhelm Halbfass. *With Map.*

A note on this paper was given in the October *Journal* (*ante*, p. 436).

Germany—Kiel. *Schriften Naturw. V. Schleswig-Holstein* **11** (1897): 187–194. **Weber.**
Die Temperaturschwankungen in Kiel. Von Professor Dr. L. Weber.

Germany—Kiel Bay. **Schück.**
Schriften Naturw. V. Schleswig-Holstein **11** (1897): 149–156.
Magnetische Beobachtungen an der Kieler Föhrde und Eckernförder Bucht, übertragen auf 1895, 5. Von A. Shück.

Germany—Meteorology. **Bezold.**
Bericht über die Thätigkeit des Königlich Preussischen Meteorologischen Instituts im Jahre 1896. Von Wilhelm von Bezold, Direktor. Berlin, 1897. Size 10 × 6½, pp. 30.

Germany—Meteorology. ———
Veröffentlichungen des Königlich Preussischen Meteorologischen Instituts. Herausgegeben durch dessen Direktor Wilhelm von Bezold. Ergebnisse der Beobachtungen an den Stationen II. und III. Ordnung im Jahre 1893 zugleich Deutsches Meteorologisches Jahrbuch für 1893. 1893. Heft III. Berlin: A. Asher & Co., 1897. Size 13½ × 10½, pp. xvi. and 99–291 [192]. *Map.*

Germany—Saxony. ———
Kalender und Statistisches Jahrbuch für das Königreich Sachsen nebst Marktverzeichnissen für Sachsen und die Nachbarstaaten auf das Jahr 1898. Dresden: C. Heinrich, 1897. Size 8 × 5½, pp. 88, x., and 222.

Greece. **Philippson.**
Thessalien und Epirus. Reisen und Forschungen im nördlichen Griechenland. Von Dr. Alfred Philippson. Herausgegeben von der Gesellschaft für Erdkunde zu Berlin. Berlin: W. H. Kühl, 1897. Size 9½ × 6½, pp. x. and 422. *Maps and Plates. Presented by the Gesellschaft für Erdkunde, Berlin.*

This will be further noticed.

Greece. **Sergeant.**
Greece in the Nineteenth Century. A Record of Hellenic Emancipation and Progress: 1821–1897. By Lewis Sergeant. London: T. Fisher Unwin, 1897. Size 9½ × 6, pp. x. and 400. *Map and Illustrations. Price* 10*s.* 6*d. Presented by the Publisher.*

"This volume," says the prefatory note, "is neither a history altogether nor exclusively a plea, but it combines the features of both. It is also an accretion, for it includes as much as seemed to be worth repeating of a volume on 'New Greece,' published in 1878 and republished in 1879." The book is illustrated, and contains a clear large-scale map of Greece.

Italy—Venetia. *Riv. G. Italiana* **4** (1897): 449–453. **Bertolini.**
I fiumi di resorgiva in relazione alle lagune ed al territorio veneto. Nota del Prof. G. L. Bertolini.

Norway—Botany. *G. Tidskrift* **14** (1897): 76–86. **Lange.**
Fra Smaarejser i Norge. Ved cand. mag. Jonathan Lange.

On the plant-life of Norway as observed in summer excursions.

Russia—Botany. *Globus* **72** (1897): 197–200. **Krause.**
Vegetationsskizze Mittelrusslands. Botanische Notizen von der Reise zum internationalen medicinischen Kongress in Moskau. August, 1897. Von Dr. Ernst H. L. Krause.

ASIA.

Arabia—Historical. **Rossi.**
G. B. Rossi. L'Iemen, avanti il profeta. Estratto dalla *Rassegna Nazionale* di Firenze fasc. del 16 Luglio 1897. Firenze, 1897. Size 9 × 6, pp. 14. *Presented by the Author.*

On Yemen before the Mohammedan era, as deduced from inscriptions recently discovered.

Arabia—Makalla. *Globus* **72** (1897): 37–40. **Hirsch.**
Ein Aufenthalt in Makalla (Südarabien). Von Leo Hirsch. *With Illustrations.*

Central Asia. *Rev. Française* **22** (1897): 598–602. **Roborovski.**
Asie Centrale: L'exploration Roborovski. *With Map.*

Central Asia—Pamirs. *Verh. Ges. Erdk. Berlin* **24** (1897): 328-339. **Oluffsen.**
Herr Premier-Lieutenant O. Oluffsen: Ueber die dänische Pamir-Expedition im Jahr 1896. *With Map.*

Central Asia—Pamirs. *G. Tidskrift* **14** (1897): 51–76. **Olufsen.**
Den danske Pamir-Expedition. Ved Premier-løjtnant i Hœren O. Olufsen. *With Map.*
This expedition has been referred to in the *Journal* for November (*ante*, p. 536).

China—Railways. *Oester. Monats. Orient* **23** (1897): 61–72. **Feigl.**
Die Eisenbahnfrage in China. Von Hermann Feigl.

China—Historical. **Groeneveldt.**
Bijd. Taal-, Land- en Volkenk. Ned.-Indië **4** (1898): 1–598.
De Nederlanders in China. Door W. P. Groeneveldt.
This is the first part of a series of records of the early Dutch trade to China, and deals with the traffic to China and the Pescadores between 1601 and 1624.

China—Manchuria. *C. Rd.* **124** (1897): 1402–1404. **Venukoff.**
Sur les résultats d'observations météorologiques faites en Mandchourie et dans les pays limitrophes. Note de M. Michel Venukoff.

Chinese Empire—Tibet. *J. United Service I. India* **26** (1897): 177–198. **Wellby.**
From Leh to Peking across Tibet. By Captain M. S. Wellby. *With Map.*

India—Assam. ———
Report on the River-borne Trade of Assam for the Quarter ending the 31st of December, 1896. Size 13½ × 9, pp. 44.

India—Assam. **Stephen.**
Annual Sanitary Report of the Province of Assam for the year 1896. By Surgeon-Colonel A. Stephen, M.B. Shillong, 1897. Size 13 × 8½, pp. 44, xlviii., and 6. *Map.*

India—Assam, Tea Culture. ———
Report on Tea Culture in Assam for 1896. Shillong, 1897. Size 13½ × 8½, pp. 6 and iv. *Map.*
The output of tea in the province of Assam for 1896 was 109 million lbs., an increase of ten per cent. over the previous year.

India—Bengal. *Miss. Catholiques* **29** (1897): 368, 380, 391, 403, 418, 429, 439. **Gryse.**
Les premiers habitants du Bengale ou les Aborigènes du Chota-Nagpore, de l'Orissa et des Santal-Pergannas. Par le R. P. de Gryse. *With Illustrations.*

India—Burma. **Newland.**
A Practical Hand-book of the Language of the Lais as spoken by the Hakas and other allied tribes of the Chin Hills (commonly the Baungshè Dialect). By Surgeon-Major A. G. E. Newland. Rangoon, 1897. Size 9½ × 6, pp. 688. *Presented by the Author.*

India—Burmese War. *Indian Antiquary* **26** (1897): 40–47. ———
An Unpublished Document relating to the First Burmese War. Preface by Lieut.-Colonel R. C. Temple.
The document in question was a manuscript bound up with a copy of Wilson's "Documents of the Burmese War, 1827," which belonged to Colonel Hopkinson, who took part in the campaign, and was presumably written by him.

India—Hindu Customs. **Nevins.**
P. Literary and Philosoph. S. Liverpool **50** (1896): 263–291.
Hindu Domestic and Religious Customs. By J. Ernest Nevins, M.B.

India—Malabar. *Imp. and Asiatic Quarterly Rev.* (3) **4** (1897): 288–300. **Fawcett.**
The Moplas of Malabar. By F. Fawcett. *With Illustration.*

India—Mergui Archipelago. *Indian Antiquary* **26** (1897): 85–91, 119–126. **Temple.**
Extracts from Official Documents relating to the Selungs of the Mergui Archipelago. By R. C. Temple.

Indo-China. *B.S.G. y Estadistica Rep. Mexicana* (4) 3 (1895): 407–413. **Revilliod.**
Viaje de Saïgon á Bangkok, atravesando el Cambodge y el Siam. Discurso . . . por Mr. John T. Revilliod. Traducción del socio Carlos Roumagnac.

AFRICA.

Africa. *Imp. and Asiatic Quarterly Rev.* (3) 4 (1897): 312–324. **Cust.**
Africa in 1897. By Robert Needham Cust, LL.D.
A presentation of the dark side of African exploration.

Africa—Natives. *Koloniales Jahrb.* 10 (1897): 120–133. **Nachtigal.**
Die Eingeborenen Afrikas, die Kolonial-Regierung und die Mission. Von Missionsprediger A. Nachtigal.

Anthropology—Games. **Culin.**
Mancala, the National Game of Africa. By Stewart Culin.—Annual Report of the Board of Regents of the Smithsonian Institution . . . for the year ending June 30, 1894. Report of the U.S. National Museum, pp. 595–607. Washington, 1896. Size 9½ × 6. *Illustrations. Presented by the Smithsonian Institution.*

British South Africa. *Scottish G. Mag.* 13 (1897): 505–514. **Selous.**
The Economic Value of Rhodesia. By F. C. Selous. *With Map.*
This paper was read to Section E, Geography, of the British Association at the Toronto meeting, a fact which, by inadvertence, is not mentioned when reproducing it. The paper is illustrated by an excellent hypsometrical map of the region described.

Central Africa. **Blaikie.**
Central Africa since the Death of Livingstone. By the Rev. W. Garden Blaikie, D.D., etc. From the *North American Review*, September, 1897. Pp. 318–332. *Presented by the Author.*

Congo State. **Chapaux.**
Albert Chapaux. Le Congo, historique, diplomatique, physique, politique, économique, humanitaire, and colonial. Ouvrage contenant une grande carte en quatre feuilles, tirée en couleurs, 6 cartes, croquis et plans, intercalés dans le texte, 163 portraits, types d'indigènes, vues, etc. Bruxelles: C. Rozez, 1894. Size 11 × 7½, pp. x. and 888. *Price* 15*s.*

Congo State. *B.S.R. Belge G.* 21 (1897): 193–200. **Leclercq.**
Le Congo doit être notre Java. Par Jules Leclercq.

Congo States. *Globus* 72 (1897): 117–121. **Thonner.**
Das Gebiet des Mongalaflusses in Centralafrika (Kongostaat). Nach eigenen Forschungen von Franz Thonner. *With Illustrations.*
On the country bordering the Mongala, one of the northern tributaries of the Congo, and its people.

East Africa—Historical. **Benoit.**
B. Union G. Nord de la France 17 (1896): 97–124, 193–244.
La Côte Orientale d'Afrique au-delà de la Mer Rouge, dans l'antiquité. Par M. François Benoit. *With Maps.*

Egypt—Antinoë. *A travers le Monde, Tour du Monde (n.s.)* 3 (1897): 233–236. **Gayet.**
Les Fouilles d'Antinoë. Par M. A. Gayet. *With Illustrations.*

Egypt—The Sphinx. *Sitzb. K.P.A. W. Berlin* (1897): 752–760. **Borchardt.**

BRITISH LIBRARY

Niger Coast Protectorate—Benin. **Boisragon.**
The Benin Massacre. By Captain Alan Boisragon, one of the two survivors. London: Methuen & Co., 1897. Size 8 × 5½, pp. 190. *Portrait and Sketch-map. Price 3s. 6d. Presented by the Publishers.*

A thrilling narrative of the massacre of British officials by the King of Benin, told with remarkable modesty and free from any suspicion of exaggeration by one of the survivors.

Niger Territories. **Vandeleur.**
Nupe and Ilorin. By Lieut. Seymour Vandeleur. From the *Geographical Journal* for October, 1897. Size 10 × 6½, pp. 26. *Maps, Plans, and Illustrations.*

Réunion. *Rev. Française* **22** (1897): 584–598. **O'Zoux.**
L'Agriculture à la Réunion. Par Léon O'Zoux.

NORTH AMERICA.

Bering Sea—Sealing. **Thompson.**
United States. No. 3 (1897). Report by Prof. D'Arcy Thompson on his Mission to Behring Sea in 1896, dated March 4, 1897. London: Eyre and Spottiswoode, 1897. Size 13½ × 8½, pp. 40. *Diagram. Price 6d.*

Canada.
British Association for the Advancement of Science, Toronto Meeting, 1897. Handbook of Canada. Published by the Publication Committee of the Local Executive, Toronto, 1897. Size 8 × 5½, pp. viii. and 416. *Maps and Diagrams.*

This handbook contains, in part i., chapters on the Physical Geography and Geology of Canada, by Dr. G. M. Dawson; on the Climate, by Prof. Stupart; the Zoology, by Prof. Ramsay Wright; and the Flora, by Prof. Macoun. Part ii. deals with the History and Administration of Canada; and part iii. with Economic Resources, Trade, and Population. There are excellent coloured geological, "surface-features," climatological, and political maps of the Dominion.

Canada—Geological Survey Report.
Geological Survey of Canada. G. M. Dawson, C.M.G., etc., Director. Annual Report (New Series), volume viii. Reports A, D, J, L, R, S. 1895. Ottawa, 1897. Size 10 × 7. *Maps and Plates. Presented by the Survey.*

Canada—New Brunswick. *B. Nat. Hist. S. New Brunswick* **15** (1897): 65–82. **Duff.**
Tidal Phenomena of the St. John River at low summer level. By A. Wilmer Duff, M.A. *With Diagram.*

An important contribution to tidal observations.

Canada—North-West Territory, Klondyke. *Nautical Mag.* **66** (1897): 762–766. **Small.**
Waterways to Klondyke. By H. B. Small.

Canada—North-West Territory, Klondyke. **Wade.**
Fortnightly Rev. **62** (1897): 464–470.
The Clondyke Gold Fields. By Mark S. Wade, M.D. *With Map.*

Mexico. *J. Geology* **5** (1897): 466–478. **Farrington.**
The Eruptive Rocks of Mexico. By Oliver C. Farrington.

Mexico and Central America. *B. American G. S.* **29** (1897): 160–167. **Littlehales.**
Recent Foreign Surveys under the direction of the U.S. Hydrographic Office. By G. W. Littlehales.

Describes the survey of the west coast of Mexico, and of the bay of Honduras.

Mexico—Altitudes. **Felix and Lenk.**
B.S.G. y Estadistica Rep. Mexicana (4) **3** (1894–95): 207–335.
Tabla de alturas tomadas de la obra Estudios complementarios para la Geología y Paleontología de la Republica Mexicana. Por Dr. J. Felix y Dr. H. Lenk. Obra traducida por Ingeniero Isidoro Epstein.

A table of altitudes with authorities, arranged alphabetically in provinces.

Mexico-Guatemala Boundary Question. **Romero.**
B. American G.S. **29** (1897): 123–159.
Settlement of the Mexico-Guatemala Boundary Question. By the Mexican Minister at Washington.

This paper is not only of geographical value, but full of human interest, being in large part an account of incidents in the life of the author, and affording insight into the diplomatic methods of the Latin-American republics.

British Guiana—Gold.

British Guiana. Report of the Council of the Institute of Mines and Forests, on the Gold and Forest Industries of British Guiana, for the year ending June 30, 1897. Demerara, 1897. Size 13 × 8, pp. 12.

The output of gold in British Guiana for 1896–97 was 128,333 ounces, showing a slight increase on the previous year, but still below the average for 1892–95.

British West Indies. *Timehri* **11** (1897): 64–72. **Burnley.**

Tobacco and Cotton Cultivation in the British West India Colonies. By William H. Burnley.

Central America—Canals. **Whiteley.**

The Diplomacy of the United States in regard to Central American Canals. By James Gustavus Whiteley. From the *North American Review*, September, 1897. Pp. 364–378.

AUSTRALASIA AND PACIFIC ISLANDS.

Australasia—Exploration. *Deutsche Rundschau G.* **19** (1897): 448–455. **Greffrath.**

Fortschritte der geographischen Forschungen und Reisen im Jahre 1896. I. Australien und die Südsee. Von Henry Greffrath.

Australia—Discovery. **Macdonald.**

Trans. R.G.S. Australasia (Victoria) **14** (1897): 20–28.

Notes on "The Discovery of the Eastern Coast of New Holland" (Australia), by Captain Cook. By A. C. Macdonald. *With Portrait and Chart.*

Ellice Group—Zoology. **Hedley.**

Australian Museum, Sydney. Memoir III. The Atoll of Funafuti, Ellice Group: its Zoology, Botany, Ethnology, and General Structure, based on collections made by Mr. Charles Hedley. Part 3. Sydney, 1897. Size 10 × 6½, pp. 163–226. *Plates. Presented by the Australian Museum.*

Fiji—Meteorology. **Vaughan.**

Fiji. Meteorological Observations taken at Suva during 1896. By J. D. W. Vaughan. Suva, 1897. Size 13½ × 8½, pp. 16.

The mean temperature of the year was 79°, that of January, February, March, and April (summer) each 83°, and of July, August, September, and October (winter), within a degree of 76°. The absolute minimum was 60° on July 20, the maximum 94° on April 5. Rain fell on 259 days, with a total of 79 inches for the year, February, October, and December being the wettest months, June and August the driest. The wind was east on 145 days, and north-east or south-east on 147. There was only one record of west wind.

New Guinea. *Ann. Hydrographie* **25** (1897): 321–323. **Krieg.**

Hydrographische Beobachtungen während der Rundreise S.M.S. "Falke," Kommandant Korv.-Kapt. Krieg, im Schutzgebiet Neu-Guineas und des Bismarck-Archipels und der Reise von Matupi nach Sydney. Januar-Februar, 1897.

New South Wales. *J. and P.R.S. New South Wales* **30**, 1896 (1897): 214–285. **Curran.**

On the Occurrence of Precious Stones in New South Wales, and the Deposits in which they are found. By Rev. J. Milne Curran. *With Plates.*

POLAR REGIONS.

Antarctic Islands. *Tour du Monde* **3** (1897): 367–408. **Mercié.**

Aux Terres de Kerguelen, îles de St.-Paul et d'Amsterdam. Par M. E. Mercié. *With Map and Illustrations.*

A visit to the islands of the Southern ocean by a French man-of-war in 1892–93.

Arctic Geology. *Nature* **56** (1897): 301–303, 351–352. **Gregory.**

Some Problems of Arctic Geology. I. The Polar Basin; II. Former Arctic Climates. By Dr. J. W. Gregory. *With Sketch-maps.*

Arctic—Glaciers. **Rabot.**

Commission Internationale des Glaciers. Les variations de longueur des Glaciers dans les Régions Arctiques et Boréales. Par M. Charles Rabot. Première partie. Extrait des *Archives des Sciences physiques et naturelles*, t. iii. pp. 163 et 301. Genève: H. Georg & Cie., 1897. Size 9½ × 6½, pp. 86. *Presented by the Author.*

Arctic—Ice-Limits. *Ann. Hydrographie* **25** (1897): 313–316.

Die Eisgrenze zwischen Grönland—Island—Spitzbergen. *With Diagrams.*

Three maps are given, showing the approximate boundaries of sea-ice in the North Atlantic for the respective months of May, June, and July.

Arctic—Nansen's Expedition. *Petermanns M.* **43** (1897): 128–132, 153–163. **Supan.**

Die norwegische Polarexpedition, 1893–96. Von A. Supan.

A detailed review of Dr. Nansen's book, including a critical comparison of some points of difference between the English and German editions.

MATHEMATICAL GEOGRAPHY.

Geodesy—Measures. *C. Rd.* **125** (1897): 199–203. **Wolf.**

Le Gnomon de l'Observatoire et les anciennes Toises; restitution de la Toise de Picard. Note de M. C. Wolf. [Also in *Rev. Scientifique* **8** (1897): 193–195.]

The discovery of a manuscript of J. Cassini, written in 1682, has enabled the hitherto unknown error of the toise of Picard to be determined. It proves to be about one-thousandth part shorter than the toise of Cassini; and thus the meridional arc-measurements of Picard may at last be accurately compared with modern results.

Photographic Surveying. **Rosenmund.**

Untersuchungen über die Anwendung des Photogrammetrischen Verfahrens für Topographische Aufnahmen. Bericht an das eidgenössische topographische Bureau von M. Rosenmund. Bern: Fritz Haller & Co., 1896. Size 9½ × 7, pp. 42. *Illustrations. Price 2s. 6d.*

PHYSICAL AND BIOLOGICAL GEOGRAPHY.

Botanical Maps. *Scottish G. Mag.* **13** (1897): 537–541. **Herbertson.**

The Mapping of Plant Associations. By Andrew J. Herbertson. Also separate copy. Size 10 × 6½, pp. [6]. *Presented by the Author.*

A study of the conditions on which botanical mapping depends, and on the methods of overcoming the difficulties in this kind of representation.

Earth-Pillars. **Kittler.**

Münchener geographische Studien. Herausgegeben von Siegmund Günther. Drittes Stück: Ueber die geographische Verbreitung und Natur der Erdpyramiden. Von Dr. Christian Kittler. München: T. Ackermann, 1897. Size 9½ × 6, pp. 56. *Illustrations.*

This will be referred to in a note.

Glacial Land-forms. *J. Geology* **5** (1897): 421–465. **Taylor.**

Moraines of Recession and their Significance in Glacial Theory. By Frank Bursley Taylor. *With Maps.*

Islands. *B.S.R. Belge G.* **21** (1897): 5-22, 113–132, 201–217. **De Windt.**

Recherches sur la constitution des îles. Par Dr. Jean de Windt.

Meteorology. **Duclaux.**

Smithsonian Contributions to Knowledge. 1034. Hodgkins Fund. Atmospheric Actinometry and the Actinic Constitution of the Atmosphere. By E. Duclaux. Washington: The Smithsonian Institution, 1896. Size 14 × 10, pp. 48.

Meteorology—Föhn. *Sitzb. K.A. W. Wien.* **105** (Abth. II. a.) (1896): 117–137. **Pernter.**

Die allgemeine Luftdruckvertheilung und die Gradienten bei Föhn. Von J. M. Pernter. *With Diagrams.*

On the general conditions of atmospheric pressure during Föhn winds, illustrated by the isobars of Europe for several typical instances.

Meteorology—Temperature. **Arrhenius.**

Bihang K. Svenska Vetens.-A. Handlingar **22** (1896): 1–102.

Ueber den Einfluss des atmosphärischen Kohlensäuregehalts auf die Temperatur der Erdoberfläche. Von Svante Arrhenius.

Oceanography—Currents. *Scottish G. Mag.* **13** (1897): 515–523. **Davis.**

Winds and Ocean Currents. By Prof. W. M. Davis.

This will be specially noticed.

Oceanography—Loch Fyne. **Mill.**

Report on Physical Observations bearing on the Circulation of the Water in Loch Fyne in April and September, 1896. By Hugh Robert Mill, D.Sc. [Part iii. Fifteenth Annual Report of the Fishery Board for Scotland. Pp. 262–279.] Size 10 × 6½. *Presented by the Author.*

The results of this research are summarized in a note.

Oceanography—North Atlantic. *B.S.G. Com. Bordeaux* **20** (1897): 2732–86. **Hautreux.**

Atlantique nord; vents, courants et glaces en 1895-1896. Par A. Hautreux. *With Chart.*

ANTHROPOGEOGRAPHY AND HISTORICAL GEOGRAPHY.

Ancient Symbols. **Wilson.**

The Swastika, the earliest known Symbol, and its Migrations; with Observations on the Migration of Certain Industries in Prehistoric Times. By Thomas Wilson. —Annual Report of the Board of Regents of the Smithsonian Institution . . . for the year ending June 30, 1894. Report of the U.S. National Museum. Pp. 757–1011. Washington, 1896. Size 9½ × 6. *Map and Illustrations.*

A study of the sign of the cross in all lands and at all periods from the prehistoric to the early Christian.

Anthropogeography. *Scottish G. Mag.* **13** (1897): 475–487. **Chisholm.**

On the Relativity of Geographical Advantages. By G. G. Chisholm, M.A., etc.

Colonization. *P. Literary and Philosoph. S. Liverpool* **50** (1896): 1–44. **Nevins.**

Systems of Colonization from Prehistoric Periods and their Results. By J. Birkbeck Nevins, M.D.

This paper passes in brief review the successive colonizations of prehistoric peoples, Phœnicians, Greeks, and Romans, the Teutonic colonization of England, and modern colonization by European nations.

Commercial Geography. *Deutsche Rundschau G.* **20** (1897): 33–34. ——

Begleitworte zur Colonial- und Weltverkehrskarte. *With Map.*

The map, on Mercator's projection with equatorial scale of 1 : 85,000,000, shows the colonial possessions of all European powers by different colours, the most important ocean-routes and telegraph cables, the great trans-continental railways, and the limits of navigation on great rivers.

Historical—Cabot. *B.S.G. Italiana* (3) **10** (1897): 224–235, 270–287. ——

Giovanni Caboto. Quarto centenario della scoperta del continente Nord-Americano. *With Portrait, Map, and Illustration.*

History of Geography. **Philip.**

P. Literary and Philosoph. S. Liverpool **50** (1896): 313–339.

The Enlargement of the Geographical Horizon, as illustrated in the History of Cartography, down to the end of the age of Discovery. By George Philip, Junr.

A concise summary of the history of geographical exploration.

Primitive Travel. **Mason.**

Primitive Travel and Transportation. By Otis Tufton Mason.—Annual Report of the Board of Regents of the Smithsonian Institution . . . for the year ending June 30, 1894. Report of the U.S. National Museum. Pp. 237–593. Washington, 1896. Size 9½ × 6. *Illustrations. Presented by the Smithsonian Institution.*

A remarkable account of the appliances for facilitating travel and transport employed by primitive races, illustrated from specimens in the Smithsonian Museum. The snow-goggles used by Eskimos are amongst the most curious.

Town-sites. *J. School G.* **1** (1897): 225–231. **Semple.**

Some Geographic Causes determining the Location of Cities. By Ellen C. Semple.

BIOGRAPHY.

Benincasa. *Riv. G. Italiana* **4** (1897): 443–448. **Bruzzo.**

Di Grazioso Benincasa e del suo Portolano (una lettera inedita). G. Bruzzo.

An account of Benincasa and his nautical work (1435–45), contained in a hitherto unpublished letter (dated 1770) from Bernadino Noja, vicar-general at Ancona, to the Cardinal Stefano Borgia.

Cabot. *Deutsche Rundschau G.* **20** (1897): 36–40. **Wolkenhauer.**

Giovanni Caboto. Zur Erinnerung an die Entdeckung Nord-Amerikas durch denselben im Sommer 1497. Von Dr. W. Wolkenhauer. *With Portrait.*

Celtis. **Geiger.**

Münchener geographische Studien. Herausgegeben von Siegmund Günther. Zweites Stück: Conrad Celtis in seinen Beziehungen zur Geographie. Von Dr. Theodor Geiger. München: T. Ackermann, 1896. Size 9½ × 6, pp. 40.

Conrad Celtis was born near Würzburg in 1459, and died in 1508. He wrote on the topography of Germany amongst other subjects.

d'Anville. *Deutsche Rundschau G.* **19** (1897): 468–471. **Wolkenhauer.**

J. B. Bourgnignon d'Anville. Von Dr. W. Wolkenhauer. *With Portrait.*

Knox. **Ferguson.**

Captain Robert Knox: The Twenty Years' Captive in Ceylon, and Author of 'An Historical Relation of the Island Ceylon, in the East Indies' (London, 1681). Contributions towards a Biography. By Donald W. Ferguson. Colombo (Ceylon) and Croydon, 1896–97. Size 10 × 7½, pp. 72. *Presented by the Author.*

An interesting biography of a merchant-adventurer of the seventeenth century, whose memory the author believes is not done justice to in the Dictionary of National Biography.

Ralegh. **Hume.**

Sir Walter Ralegh. The British Dominion of the West. By Martin A. S. Hume. (Builders of Greater Britain. Edited by H. F. Wilson, M.A.) London: T. Fisher Unwin, 1897. Size 8 × 5½, pp. xviii. and 432. *Portrait and Maps. Price 5s. Presented by the Publisher.*

This is a notable biography from the geographical point of view, dealing as it does with a great personality engaged in the first colonizing ventures of England. The maps are mere sketches, and there is no attempt to enrich the text with facsimiles of contemporary documents, but the book is well printed and attractive; it should be valuable for reading in schools, combining as it does geography and history with biography.

Thomson. *Nautical Mag.* **66** (1897): 855–857. ——

The Editor's Album: Captain A. S. Thomson, C.B., R.N.R. *With Portrait.*

GENERAL.

Bibliography of Geography. ——

Bibliographie de 1896. 6e Bibliographie annuelle.—Annales de Géographie. No. 29—6e Année. 15 Septembre 1897. Paris: A. Colin et Cie. Size 10 × 6½, pp. 288.

This selected and annotated bibliography fully maintains the high character of the earlier volumes. In many cases the abstracts of the memoirs noted are so full as to make it unnecessary for any except the specialist student to refer to the originals.

British Empire. *Scottish G. Mag.* **13** (1897): 400–419. ——

Notes on Exploration within British Territory during the last Sixty Years.

A sketch of explorations carried out during the Queen's reign in British territory. The summary is classified according to continents.

Church Missionary Society. ——

Proceedings of the Church Missionary Society for Africa and the East. Ninety-eighth Year, 1896–97. London: Church Missionary House, 1897. Size 8½ × 6, pp. lxxx., 454, and (360). *Maps. Presented by the Church Missionary Society.*

Educational—Methods. *Scottish G. Mag.* **13** (1897): 523–530. **Dodge.**

School Geography in the United States. By Prof. Richard E. Dodge.

An excellent statement of the position of geography as a school-subject in the United States, with copious references to the literature of the subject.

Educational—Methods. ——

Education Department. Special Reports on Educational Subjects, 1896–97. London: Eyre & Spottiswoode, 1897. Size 10 × 6½, pp. iv. and 732. *Maps and Illustrations. Price 3s. 4d. Presented by the Education Department.*

The geographical features of this volume will be referred to in a special note.

Educational—Textbook. **Redway.**

The Natural Geographies. Natural Elementary Geography. By Jacques W. Redway. New York, etc., American Book Co. [1897]. Size 10½ × 8½, pp. 144. *Maps and Illustrations. Presented by the Publishers.*

In a circular accompanying this volume, high claims are made for originality and utility. It is really a creditable example of an American text-book on the usual plan; the quarto size, excellent small-scale illustrations in the text, clear but somewhat crude coloured maps, also printed in the text, and effective diagrammatic relief maps are none of them new features. The neglect of countries outside the United States is also an established feature in American geographical books. Canada is called a "minor country of North America," and receives utterly inadequate notice even for the most elementary school. The style is often childish, and the points selected for notice are occasionally trivial.

Geographical Progress. *Scottish G. Mag.* **13** (1897): 449–466. **Keltie.**

Address to the Geographical Section of the British Association. [Toronto, 1897.] By J. Scott-Keltie, LL.D.

Geographical Year-book. **Wagner.**

Geographisches Jahrbuch. XX. Band, 1897 . . . herausgegeben von Hermann Wagner. Erste Hälfte. Gotha: Justus Perthes, 1897. Size 9 × 6, pp. 248. *Price 7s. 6d.*

This issue contains Reports on recent progress in Terrestial Magnetism, by Prof. Karl Schering, of Darmstadt; on the geognostic structure of the Earth's surface, by Prof. Franz Toula, of Vienna; on explorations of Africa, Australia, and America, by various writers; on the progress of Oceanography, by Prof. Krummel, of Kiel; and on the literature of the History of Geography since the Middle Ages, by Prof. Ruge, of Dresden. The second division completing the annual volume is announced for early publication.

German Colonial Literature. **Brose.**

Die Deutsche Kolonialliteratur von 1884–1895. Mit einem Anhang: Verzeichniss von Werken, die sich auf fremdländische Kolonien beziehen und in der Bibliothek der Deutschen Kolonialgesellschaft vorhanden sind. Herausgegeben von der Deutschen Kolonialgesellschaft bearbeitet von Maximilian Brose. Berlin, 1897. Size 9½ × 6½, pp. vi. and 158. *Presented by the Deutsche Kolonialgesellschaft.*

A classified catalogue which bears marks of careful compilation, and appears to be very complete.

Missionary Exploration. *B.S.G. Lyon* **14** (1897): 417–453. **Groffier.**

Explorations et travaux géographiques des Missionnaires Catholiques en 1896. Par M. Valérien Groffier.

The exploring journeys of Roman Catholic missionaries are here recounted for Oceania, America, Europe (Iceland), Africa, and Asia.

Mountains—Definition. *Deutsche Rundschau G.* **19** (1897): 347–356, 406–415. **Neuber.**

Was ist ein Gebirge? Von August Neuber.

Nautical Almanac Office. *Nautical Mag.* **66** (1897): 435–446. **Lord.**

The "Nautical Almanac" Office. By W. B. Lord.

A popular description of the Nautical Almanac Office and the routine of its work.

Navigation. **Cooper.**

A New Theory of the Stability of Ships (with Diagrams). By Alfred J. Cooper. London: J. D. Potter, 1897. Size 10 × 6½, pp. 30. *Price 2s.*

North Africa and Arabia. **Rossi.**

G. B. Rossi. Nei paesi d'Islam in Barberia—in Egitto—il Pellegrino d'Islam—el Yemen. Impressioni e Ricordi. Rocca S. Casciano, L. Cappelli, 1897. Size 9½ × 6½, pp. viii. and 240. *Illustrations and Map. Presented by the Author.*

Account of a journey from Tunis into Tripoli, thence to Egypt, followed by an account of the pilgrimage to Mecca, and a visit to Yemen.

Oriental Literature. **Müller.**

The Sacred Books of the East, translated by various Oriental Scholars, and edited by F. Max Müller. Vol. xxxviii. (pp. 508); vol. xlii. (pp. lxxiv. and 716); vol. xlv. (pp. xlii. and 456); vol. xlvi. (pp. x. and 500). Oxford: the Clarendon Press, 1895–97. Size 9 × 6. *Presented by the Secretary of State for India.*

Oriental Studies. **Schlagintweit.**

Die Berechnung der Lehre. Eine Streitschrift zur Berichtigung der buddhistischen Chronologie verfasst im Jahre 1591 von Sureçamatibhadra. Aus dem Tibetischen übersetzt von Emil Schlagintweit. Aus den Abhandlungen der k. bayer. Akademie der Wiss I. Cl. xx. Bd. iii. Abth. München, 1896. Size 11½ × 9, pp. 82. *Presented by D. W. Freshfield, Esq.*

Pacific Ocean.

Deutsche Seewarte. Segelhandbuch für den Stillen Ozean. Mit einem Atlas von 31 Karten herausgegeben von der Direktion. Hamburg: L. Friederichsen & Co., 1897. Size 11 × 8, pp. xii. and 916. *Diagrams. Presented by Dr. Neumayer.*

This large volume is the outcome of the researches of the German Naval Observatory at Hamburg, and embodies the experience of the masters of German merchant vessels cruising in the Pacific. Nearly half is a scientific treatise on the physical geography of the Pacific ocean, taking account of the oceanographical and meteorological researches of all countries; the other half consists of sailing directions for the principal routes frequented by merchant vessels.

NEW MAPS.

By J. COLES, *Map Curator*, R.G.S.

EUROPE.

England and Wales. **Ordnance Survey.**

Publications issued since October 8, 1897.

1-inch—General Maps (revised):—

ENGLAND AND WALES:—8, 14, 17, 24, 25, 37, 55, 340, 341, engraved in outline. 1*s.* each.

6-inch—County Maps (revised):—

ENGLAND AND WALES:—**Hampshire,** 48 N.E., S.E., 49 N.E., 50 N.W., 51 N.E., S.E., 54 N.W., 55 S.W., 56 S.W., S.E., 57 N.E., S.W., S.E., 58 N.W., S.W., S.E., 59 S.E., 60 N.W., S.W., 67 N.W., N.E. **Hertfordshire,** 41 S.E., 45 S.W., 44 S.E. **Middlesex,** 2 S.E., 5 S.E., 6 S.W., 7 N.E., 9 S.E., 14 N.E., S.E., 15 S.W., 19 N.E., 24 S.E., 25 N.W., 16 N.E. **Northumberland,** 77 N.W. **Wiltshire,** 76 N.W., 77 S.W. **London,** 6 N.E.

25-inch—Parish Maps (revised):—

ENGLAND AND WALES:—**Cheshire,** IV. 3, 4, 6; XXVIII. 12; XXIX. 2, 9, 10, 15; XXXVI. 15; XXXVII. 2, 13; XLIV. 1, 5, 9. **Durham,** III. 8, 12, 16; VI. 4; XLI. 12, 15; XLII. 10, 15, 16; XLIII. 13, 15; XLIV. 13, 15; XLV. 3; XLVI. 6, 8, 10, 11, 15, 16; XLVII. 3, 4, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16; LII. 8; LIII. 1, 2, 3, 6. **Essex,** II. 15; III. 6; V. 12, 14, 15, 16; XII. 1, 5, 6, 9, 13; XIX. 6, 9, 16; XXVI. 1; XXVIII. 3, 4, 7, 11, 15, 16; XXIX. 1, 2, 3, 5, 6, 9, 10, 11, 14; XXXI. 15, 16; XXXVII. 1, 3, 4, 5, 6, 8, 9, 11, 12; XXXVIII. 1, 2, 3, 5, 6, 7, 8, 9, 10, 14, 15, 16; XL. 8, 11, 14; XLVI. 4, 12; XLVII. 5, 6, 7, 8, 9, 10, 11, 13; XLIX. 6, 10; LXXIII. 12, 16; LXXIV. 13; LXXVIII. 14; LXXXII. 2, 3; LXXXIII. 16. **Hampshire,** LXX. 13, 15, 16; LXXI. 11; LXXVI. 9, 10; LXXXVIII. 2, 6, 8, 10, 12; LXXIX. 3, 4, 9, 11, 12; LXXX. 1, 2, 5, 6, 8, 12; LXXXI. 5, 6, 7, 8, 9, 15, 16. **Kent,** II. 11, 14, 15; III. 10, 16; IIIA. 13; IX. 10; XI. 1, 5; XXI. 4, 11; XXII. 1, 3; XXXIII. 3, 4, 5, 6, 7, 8, 9, 12, 16; XLII. 7; XLIII. 1; LIV. 5, 15, 16; LIX. 6; LXIV. 3, 5, 10, 11, 12, 14, 15. **Northumberland,** XXI. 10, 11, 14, 15, 16; XXII. 9, 13, 15; XXIV. 7; XXV. 4, 6, 12, 16; XXVI. 1, 2, 4, 7, 8, 9, 12, 14; XXVII. 1, 2, 3, 5, 6, 7, 8; XXX. 14; XXXI. 3, 7, 10; XXXVIII. 8; XXXIX. 7; XLVI. 4; LXXXVIII. 9; LXXXIX. 15; XCVII. 6. **Surrey,** VI. 12; XIV. 12; XXXVI. 14; XLI. 9; XLII. 12 (XLIV. 16, and XLV. 13). **Sussex,** XIII. 1; XV. 13, 15; XXIV. 16; XXV. 1, 9, 10, 12, 13, 16; XXVI. 1, 2, 3, 6, 11, 12; XXXV. 16; XXXVI. 7, 13; XXXVII. 4; XLVIII. 2, 3, 4, 6, 7, 8, 10, 12, 16; XLIX. 13, 15, 16; L. 2, 10, 13, 15, 16; LI. 1, 4, 5, 10, 13, 16; LXII. 6. 3*s.* each.

(*E. Stanford, Agent.*)

England and Wales. **Bartholomew.**

New Reduced Ordnance Survey of North Northumberland. Scale 1 : 125,000 or 2 stat. miles to an inch. J. Bartholomew & Co., Edinburgh, 1897. *Price 2s. each, mounted on cloth. Presented by the Publishers.*

مكتبة قطر الوطنية
Qatar National Library

Greece. **Philip.**

Philip's Special Map of Greece, illustrating the Greco-Turkish War, and the Cretan Question, with inset maps of the seat of war (on an enlarged scale), the Balkan peninsula, and the Mediterranean sea. Scale 1 : 1,330,560 or 21 stat. miles to an inch. By G. Philip & Son, London, 1897. *Price* 1*s. each. Presented by the Publisher.*

Historical Geography. **Poole.**

Historical Atlas of Modern Europe from the Decline of the Roman Empire; comprising also maps of parts of Asia and of the New World, connected with European History. Edited by Reginald Lane Poole, M.A., PH.D. Lecturer in Diplomatic in the University of Oxford. Part xiii. Oxford: The Clarendon Press; London, Edinburgh and Glasgow: Henry Frowde, M.A.; Edinburgh: W. & A. K. Johnston. 1897. *Price* 3*s.* 6*d. Presented by the Clarendon Press.*

Part xiii. contains: No. 5, Europe at the time of Otto the Great, 962, by the editor; No. 35, Germany under the House of Höhenstaufen, 1138–1254, by the editor; No. 70, The House of Savoy in Italy, by Miss K. Dorothea Ewart. Each of the maps is accompanied by explanatory letterpress by the authors.

Switzerland. **Ravenstein.**

Karte der Schweizer Alpen. Gezeichnet von Hans Ravenstein. Scale 1 : 253,440 or 4 stat. miles to an inch. 2 sheets. L. Ravenstein, Frankfurt, 1897. *Price* 6 *marks.*

This may be regarded as a companion map to Ravenstein's "Karte der Ostalpen," the scale and style of work being precisely similar. It is orographically coloured in fourteen shades, at intervals of 250 metres. In addition to the above, it shows all means of communication, and is an excellent general map for the use of tourists and others.

ASIA.

Indian Government Surveys. **Surveyor-General's Office, Calcutta.**

Indian Atlas, 4 miles to an inch. Sheets: No. 68, districts Etah, Farukhabad, Mainpuri, Etawah, Cawnpore, etc.; No. 80, parts of districts Madura, Tanjore, and Ramnad (Madras Presidency), and Tondiman (Native State); No. 112, parts of districts Darbhanga, Muzaffarpur, Patna, Gaya, Hazaribagh, Monghyr, Bhagalpur, Sonthal Parganas, Dinajpur, Malda, Murshidabad, and Purnea (Bengal); No. 113, parts of districts Birbhum, Burdwan, Bhagalpur, etc. (Bengal). and Sylhet (Assam), Seasons 1855-56 and 1860-62.—Madras Survey, 1 inch to a mile. No. 24 (2nd edit.), parts of districts Shimoga and Chitaldroog (Mysore) and Dharwar (Bombay), Seasons 1882-88 and 1893-94.—Lower Burma Survey, 1 inch to a mile. No. 184, districts Henzada and Bassein, Seasons 1882-85.—Upper Burma Survey, 1 inch to a mile. No. 126, district Minbu, Season 1891-92.—Indus Riverain Survey, 1 inch to a mile. Nos. 33, 18 and 35, 34, 35, 36 (skeletons), district Karachi, Season 1894-95; No. 51 (skeleton), districts Karachi and Hyderabad, Season 1894-95.—District Murshidabad, Lower Provinces, Bengal, 4 miles to an inch, with corrections to February, 1897.—District Garhwal, Seasons 1864-69 and 1872-75, 1 inch to 2 miles.—Punjab, 80 miles to an inch, additions to 1896.—Chota Nagpur Division, 1 inch to 8 miles, 1897.—The North-Western Provinces and Oudh, 16 miles to an inch, 1897.—District Gurdaspur, Punjab, 1 inch to 8 miles, 1897.—District Chanda, 1 inch to 16 miles, Central Provinces, 1897.—District Rawalpindi, Punjab, 1 inch to 8 miles, 1897.—District Gujranwala, Punjab, 1 inch to 8 miles, 1897.—District Darbhanga, Bengal, 1 inch to 8 miles.—District Jalpaiguri, Bengal, 1 inch to 8 miles, 1890.—District Rangpur, Bengal, 1 inch to 8 miles, 1891.—District Saugor, Central Provinces, 1897.—District Jhang, Punjab, 1 inch to 8 miles, 1897.—District Lohardaga, Bengal, 16 miles to an inch, 1894.—District Wardha, Central Provinces, 8 miles to an inch, 1897.—District Saran, Bengal, 8 miles to an inch, 1891.—District of Mandla, 1 inch to 8 miles, 1897.—District Sonthal Parganas, Bengal, 10 miles to an inch, 1891.—North-East Frontier, 4 miles to an inch, country round Myilkyiana (Upper Burma), parts of sheets No. 23 N.W. and N.E.—Map of Wazirstan, 4 miles to an inch, 1897.—Bajaur and adjacent countries, 4 miles to an inch, 1897.—Calcutta and surrounding country (2nd edit.), 1 mile to an inch, 1897.—Index to the Standard Sheets of the Central Provinces, with additions and corrections to 1897.—Index to the Standard Sheets of Bombay Presidency, with additions and corrections up to 1897.—Index to the Standard Sheets of Central India and Rajputana, sheets 1 and 2, with additions and corrections up to 1897.—Conventional signs to be used on topographical maps with additions and corrections to 1897. *Presented by H. M. Secretary of State for India, through the India Office.*

Manchuria. **Russian Ministry of Finance.**

Russian Map of Manchuria. Scale 1 : 3,360,000 or 53·1 stat. miles to an inch. Russian Ministry of Finance, St. Petersburg, 1897.

This map shows the various proposed routes for the extension of the Trans-Siberian railway towards the southern portion of Manchuria. The lettering is in Russian character.

North-West Frontier of India. **Philip.**

Philip's Large-Scale Map of the North-Western Frontier, with a map showing the Overland Routes to India, and a Military Map of the Indian Empire. Scale 1 : 4,000,000 or 63 stat. miles to an inch. G. Philip & Son, London, 1897. *Price* 1*s. each. Presented by the Publisher.*

Persia. **Stahl.**

Geologische-Karte des nördlichen Persien. Nach Originalaufnahmen von A. F. Stahl. Scale 1 : 840,000 or 14·7 stat. miles to an inch. *Petermanns Geographische Mitteilungen*, Ergänzungsheft, No. 122, Blatt 1, 2, 3, 4. Gotha : Justus Perthes, 1897. *Presented by the Publisher.*

AFRICA.

Africa. **Stanford.**

Large-scale map of the Nile from Dongola to Khartum, and of the Desert Route from Suakin to Berber. Scale 1 : 1,140,480 or 18 stat. miles to an inch. By E. Stanford. Stanford's Geographical Establishment, London, 1897. *Presented by the Publisher.*

Algeria. **Service Géographique de l'Armée, Paris.**

Carte d'Algerie. Scale 1 : 50,000 or 0·78 stat. mile to an inch. Sheets: 109, Sidi Madjour; 111, Souagui. Dressé, heliogravé et publié par le Service géographique de l'Armée, Paris. *Price* 1·50 *fr. each sheet.*

Egypt. **Philip.**

Philip's New Map of the Nile Valley and the Approaches to Khartum. Scale 1 : 5,677,056 or 89·6 stat. miles to an inch. G. Philip & Son, London, 1897. *Price* 1*s. each. Presented by the Publisher.*

مكتبة قطر الوطنية
Qatar National Library

Egypt. **Bartholomew.**

Bartholomew's Tourist's Map of Egypt and the Lower Nile. Scale 1 : 1,000,000 or 15·6 stat. miles to an inch. J. Bartholomew & Co., Edinburgh, 1897. *Price 3s. each, mounted on cloth. Presented by the Publishers.*

Transvaal. **Hatch.**

A Geological Map of the Southern Transvaal. By F. H. Hatch, PH.D., F.G.S. Scale 1 : 240,000 or 3·75 stat. miles to an inch. 1897. Edward Stanford, London. *Presented by the Publisher.*

This map is geologically coloured, and is furnished with copious explanatory notes of reference.

Transvaal. **Hatch.**

Map of the Transvaal, showing the physical features and political divisions. By F. H. Hatch, PH.D., F.G.S. Scale 1 : 1,570,000 or 24·7 stat. miles to an inch. 1897. Edward Stanford, London. *Presented by the Publisher.*

West Africa. **Spicq.**

Carte de la Boucle du Niger dressée par le Lieutenant Spicq, de l'infanterie de marine ayant pour base la Carte de M. le Gouverneur Binger et les travaux récents du Capitaine Marchand complétée et mise à jour. Scale 1 : 1,500,000 or 23·5 stat. miles to an inch. Service Géographique des Colonies. Paris, 1897. Maison Andriveau-Goujon. Henry Barrère, Editeur-Géographe.

This map includes all the country between the Niger and the West Coast, and is based on the most recent surveys. The routes followed by numerous explorers, as well as those reported by the natives, are shown. The boundaries up to the date of publication are clearly defined, but in some cases they already require revision. At the present time, owing to disputes as to what nation certain portions of the territory belong, this cannot fail to be an interesting map.

AMERICA.

British North America. **Stanford.**

Stanford's Map showing the position of the Yukon goldfields. Scale 1 : 5,094,144 or 80·4 stat. miles to an inch. E. Stanford, London, 1897. *Presented by the Publisher.*

Peru. **Viellerobe.**

Mapa del Peru. A. F. J. M. Viellerobe. Scale 1 : 2,908,224 or 45·9 stat. miles to an inch. Lima, 1896.

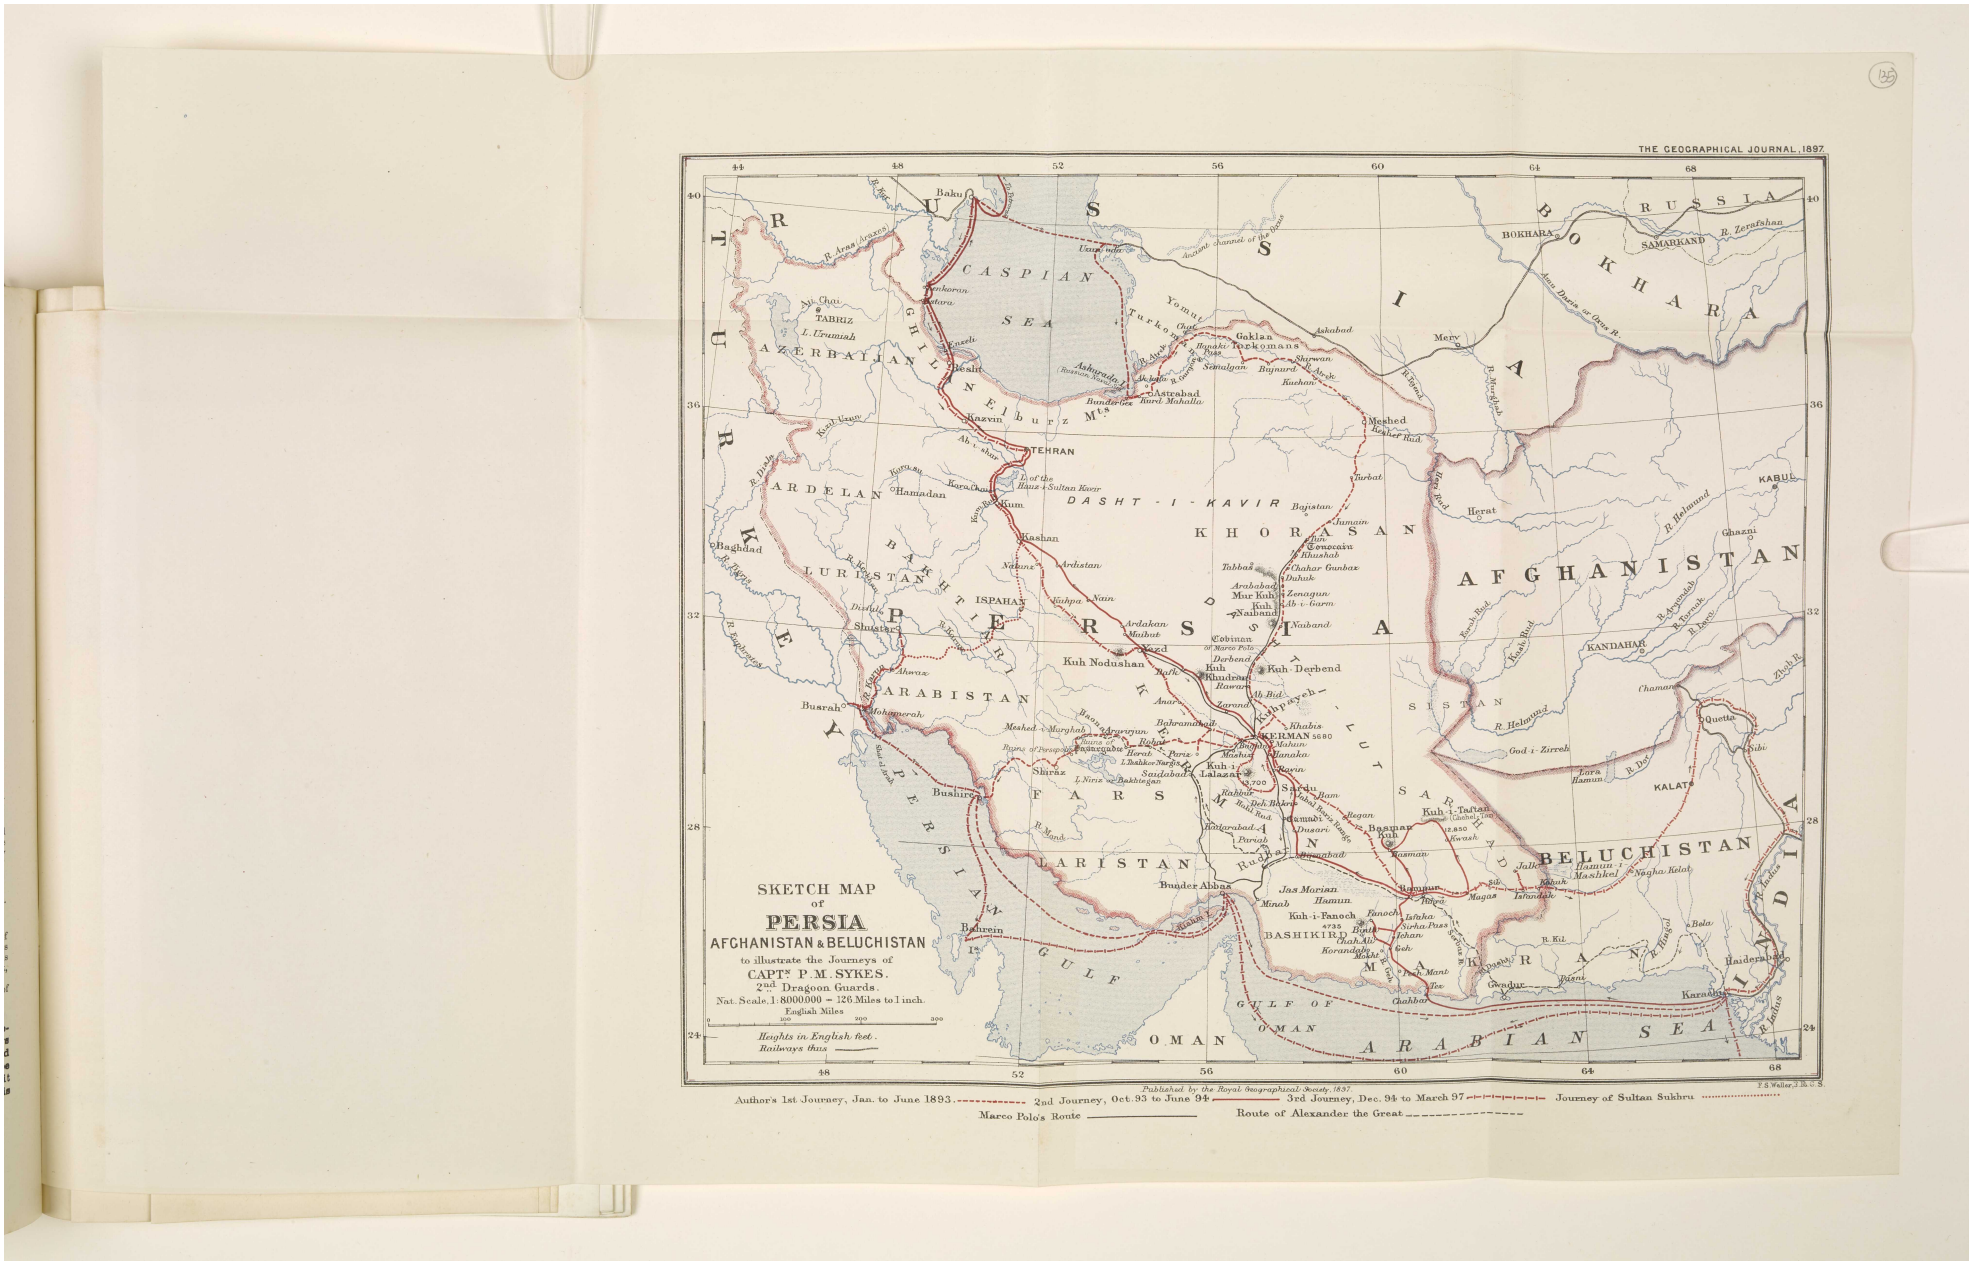
This map, which has been published under the authority of the Government, will be useful for purposes of general reference. All railways and lines of submarine telegraph cables are laid down, and the relative importance of towns is shown by symbols.

PHOTOGRAPHS.

Baluchistan. **Bremner.**

Six photographs of Quetta and surrounding country. Taken from the fort, by F. Bremner, Esq. *Presented by G. P. Tate, Esq.*

These photographs, which have been taken by Mr. F. Bremner, show views of Quetta and the scenery in its vicinity. Four of them form a connected series of views looking towards the east, the remaining two are consecutive pictures looking towards the west. The spot from which they were taken is a commanding position in the fort, and the time of year was the early part of the winter.



The photographs are remarkably good specimens, and convey a very clear idea of the station and its environment.

N.B.—It would greatly add to the value of the collection of Photographs which has been established in the Map Room, if all the Fellows of the Society who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they will be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

CONDITIONS OF FELLOWSHIP, &c.

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that—

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his "admission fee, and £2 as his first annual subscription, or he may compound, "either at his entrance by one payment of £35, or at any subsequent period on the "following basis:—

Fellows of	20	years'	standing	and over	...	£12 10s.
,,	15	,,	,,	and under 20	...	£16
,,	10	,,	,,	,, 15	...	£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the "Society so long as he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's periodical publications. The *Geographical Journal* is forwarded, free of expense, to all Fellows whose addresses are known.

Copies of the Regulations and Candidates' Certificates may be had on application at the Society's House, 1, Savile Row, London, W.

Photographic

TRADE TABLOID MARK

'Tabloids' (B. W. & Co.)

Of all Chemists and Dealers.

PHOTOGRAPHIC 'TABLOIDS' have been used with signal success by travellers and explorers in all parts of the globe. They keep equally well and produce the same excellent results in every climate from that of the Arctic Regions to that of the Tropics. Their compactness has enabled explorers to develop and fix important plates on the spot, so that the risk of keeping undeveloped negatives is avoided. In short, the advantages of Photographic 'Tabloids' are, that they are always ready for instant use, they save trouble and space and prevent disappointment and failure.

List of Photographic 'Tabloids.'

DEVELOPING 'TABLOIDS':—
Eikonogen ... ... in bottles of 15 & 40
,, with Quinol ,, 15 & 40
Paramidophenol ... ,, 12 & 25
Pyro-Developer ... ,, 20 & 55
Pure Pyrogallic Acid, 1 gr. ,, 42 & 100
,, ,, ,, 2 gr. ,, 24 & 55
,, ,, ,, 4 gr. ,, 15 & 36
Pyrogallic Acid with Eikonogen ... ,, 15 & 40
Quinol ... ... in bottles of 20 & 55
Quinol with Pyro. ,, 18 & 45
ACCELERATOR 'TABLOIDS' ,, 30 & 100
RESTRAINER 'TABLOIDS':—
Potassium Bromide, 1 gr. ,, 30 & 100
Ammonium Bromide, 1 gr. ,, 30 & 100
TONING 'TABLOIDS':—
Toning Gold Compound, in tubes containing 3 'Tabloids.'

Burroughs, Wellcome & Co., Snow Hill Buildings, LONDON.

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that,

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his admission fee, and "£2 as his first annual subscription, or he may compound, either at his entrance by one payment of "£35, or at any subsequent period on the following basis:—

Fellows of 20 years' standing and over	...	...	...	£12 10s.
„ 15 „ „	and under 20	...	...	£16
„ 10 „ „	„ 15	...	...	£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the Society so long as "he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's Periodical Publications.

Copies of the Regulations and Candidates' Certificates may be had on application at the Society's Office, 1, Savile Row, London, W.

GABARDINE COMBINATION SPORTING OUTFITS

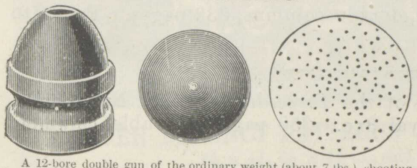
OUTSIDE GABARDINE, INSIDE RAIN-PROOFED TWEEDS (Burberry's Patent).

PROOF AGAINST WAIT-A-BIT THORNS AND SPEAR-GRASS. RAIN, SLEET, OR SNOW. HOT AND COLD WINDS. ANTS AND TROPICAL INSECTS.

(The latter points are of special importance for India and Africa.)

Yet perfectly VENTILATING, very DURABLE, and as COMFORTABLE as ordinary Tweed Garments.

"For lightness combined with strength, nothing has been found to equal the material known as GABARDINE, manufactured by Burberry, of Basingstoke. This substance deserves special recommendation, as one suit will generally outlast three or four made of other and perhaps more expensive cloth."—*The Sportsman in South Africa.*



Write to **T. BURBERRY & SONS,** 30, Haymarket, LONDON, and BASINGSTOKE,

Stating climate required for, and Estimates, Information, and suitable Patterns will be sent free.

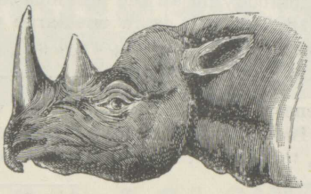
J. & W. TOLLEY'S

"UBIQUE" Ball and Shot Gun.

AN INVALUABLE WEAPON FOR INDIA AND THE COLONIES.

A 12-bore double gun of the ordinary weight (about 7 lbs.), shooting from both barrels shot with the pattern and penetration of a first-class shot-gun, and conical bullets up to 150 yards, with the accuracy of an Express rifle.

PRICE FROM 20 GUINEAS.



Col. PARKER-GILMORE (the eminent author and explorer) writes: "The 'Ubique' is a weapon I should advise all visitors to India or Africa to become possessed of."

From Lieut. H. M. BIDDULPH, Rifle Brigade, Srinagar, Kashmir, India, June 10, 1893: "I must write to thank you for the magnificent gun you made for me. I mean the 'Ubique' 12-bore. I consider it a marvellous weapon, and fully equal to, if not a great deal better than, the various similar weapons in the market. What astonished me is that you do not advertise it to shoot well up to 150 yards. I have made two bulls out of three shots with it at that distance, and on two or three occasions have killed running animals with it at 160 to 180 yards. In a year's shooting trip I have killed more than half my total bag with it. *The shooting at small game was most satisfactory. I brought down two mallard with it at 45 yards. Geese, duck, ramchikor, chikor, sand-grouse, pigeons, snipe, and hares were shot with it. I give you a complete analysis of its doings.*"

From O. J. MORRIS, Esq., Fort Victoria, Mashonaland, S. Africa, May 24, 1893: "Both the weapons ('Ubique' and '577 'Magnum' express rifle) are most satisfactory. J—— shot a fine lioness with the 'Ubique' one early morning. It has demolished various big buck, and one of the biggest Koodoo Bulls I ever saw was killed by J—— with it, and with shot it has kept the camp well supplied with birds. *Game is getting rather scarce about here, and some other waggons travelling with us depend entirely on us for meat.*"

"UBIQUE" GUNS

FOR LARGE GAME SHOOTING.

MADE IN 10 AND 8 BORES.

10-bore firing 8 drs., and 8-bore firing 10 drs., powder. Giving greater penetration than a rifle. Light and handy as a gun.

EXPRESS RIFLES,

·400, ·450, ·500, ·577 BORES. (Semi-smooth bore, non-fouling rifling.)

·303 SPORTING RIFLE,

Firing Split, Nickel-covered, or Solid Bullet and Smokeless Powder.

SINGLE AND DOUBLE

BIG GAME RIFLES.

10, 8, and 4 BORES.

NOTICE.

PHOTOGRAPHS.

ROYAL GEOGRAPHICAL SOCIETY.

It would greatly add to the value of the Collection of Photographs which has been established in the Map Room of the Royal Geographical Society, if all the Fellows who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they would be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

NOTICE.

The "PROCEEDINGS OF THE ROYAL GEOGRAPHICAL SOCIETY," new series, consists of 14 volumes, extending from 1879 to 1892.

Each volume covers on an average 840 pages, the selling price being 18s. per volume.

These volumes not only contain full reports of the papers read at the Royal Geographical Society, by all the great travellers and geographers of the period, but constitute a record of exploration and geographical work in all parts of the world.

Each volume contains numerous maps, all of them original, embodying the results of exploration, and executed in the best style. In the 14 volumes there are some 350 maps, besides numerous illustrations of characteristic scenery in the least-known parts of the world.

It is believed that a complete set of the *Proceedings* would be a valuable addition to public libraries and other institutions, while many private individuals might wish to have the volumes. As it is desired to reduce the stock in hand, the series is now offered, bound in cloth, at £6 per set. Application to be made to the Chief Clerk, Royal Geographical Society, 1, Savile Row, London, W.

In addition to the *Proceedings*, the Society has issued four volumes of "Supplementary Papers," containing a large number of Memoirs and Narratives of considerable length, besides several valuable Bibliographies. These will be sold for half price, £2 for the four volumes. These contain over 30 Maps and numerous Illustrations.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

THE STRUGGLE OF THE NATIONS: EGYPT, SYRIA, AND ASSYRIA. By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. MCCLURE. With Maps, 3 Coloured Plates, and over 400 Illustrations. Demy 4to (approximately), cloth, bevelled boards, 25s. Half morocco, gilt edges (bound by Rivière), 50s.

This is a companion volume to "The Dawn of Civilization," and contains the history of the ancient peoples of the East from the Fourteenth Egyptian Dynasty to the end of the Ramesside period. This interval covers the sojourn of the Israelites in Egypt and their Exodus therefrom. Also the further history of the Hebrews down to the Eighth Century B.C.

THE DAWN OF CIVILIZATION (EGYPT AND CHALDÆA). New and Revised Edition. By Professor MASPERO. Edited by the Rev. Professor SAYCE. Translated by M. L. MCCLURE. With Map and over 470 Illustrations, including three Coloured Plates. Demy 4to (approximately), cloth, bevelled boards, 24s. Half morocco (bound by Rivière), 48s.

Professor Maspero, by using the result of the most recent researches in Egypt and Mesopotamia, has brought this new Edition up to the latest date.

BIBLE PLACES; OR, THE TOPOGRAPHY OF THE HOLY LAND. A succinct account of all the Places, Rivers, and Mountains of the Land of Israel, mentioned in the Bible, so far as they have been identified; together with their modern names and historical references. By the Rev. Canon H. B. TRISTRAM, D.D., LL.D., F.R.S. New Edition brought up to date. With Map. Crown 8vo, half bound, 5s.

"It is now the most recent, the most readable, the most reliable manual of Palestine we possess."—*Expository Times.*

DR. NANSEN: THE MAN AND HIS WORK. By FREDERICK DOLMAN. With Map and Illustrations. Crown 8vo, cloth boards, 1s.

THE ROMANCE OF THE SEA: ITS FICTIONS, FACTS, AND FOLK-LORE. By FRED WHYMPER. With numerous Illustrations. Crown 8vo, cloth boards, 5s.

THE HEROES OF THE ARCTIC, AND THEIR ADVENTURES. By FRED WHYMPER, Author of "The Romance of the Sea," etc. Ninth Edition, Revised and brought up to date, with Illustrations and Map of the Arctic Regions. Crown 8vo, cloth boards, 3s.

THE ROMANCE OF SCIENCE: OUR SECRET FRIENDS AND FOES. By PERCY FARADAY FRANKLAND, Ph.D., B.Sc. (London), F.R.S. Third Edition, Revised and Enlarged. Post 8vo, cloth boards, 3s.

"It is a book which every Clergyman, every Magistrate, every Guardian of the Poor, every Governor of a School ought to possess and master."—*Guardian.*

SIMPLE EXPERIMENTS FOR SCIENCE TEACHING. With numerous Diagrams, including 200 Experiments fully illustrating the Elementary Physics and Chemistry Division in the Evening School Continuation Code. By J. A. BOWER. Crown 8vo, cloth boards, 2s. 6d.

EXPLORING EXPEDITIONS
COMPLETELY EQUIPPED BY
S. W. SILVER & CO., CORNHILL, LONDON.

London, July 16/96

Messrs S. W. Silver & Co.,
Cornhill, E. C.,

Gentlemen,

You may be interested in hearing that during my recent journey to the coast from British Central Africa (Northern Rhodesia) one of the airtight cases furnished by you was at the bottom of a river for fully 20 minutes, and that on recovery the contents were found to be uninjured – a test which establishes the thorough reliability of the article you supply.

Yours faithfully,

J. Shearson Hyland

1897 *ISSUE NOW READY.*

THE STATESMAN'S YEAR-BOOK.

Statistical and Historical Annual of the States of the World, for the Year 1897. Edited by J. Scott Keltie, LL.D., Secretary to the Royal Geographical Society. Thirty-fourth Annual Publication. Revised after Official Returns. Crown 8vo, 10*s.* 6*d.*

In the new Edition for 1897 the whole of the statistical and other information has been thoroughly revised throughout. In many cases fresh matter has been introduced. In the sections dealing with the commerce of the various States of the World information is given with regard to the systems on which the customs tariffs are levied. This information has been kindly supplied by the Governments of the various countries. The sections dealing with the Navies have been thoroughly revised, so that it is possible to see at a glance the actual strength of each of the great Navies. Prefixed to the Year Book are a series of specially prepared maps and tables exhibiting the changes which have taken place during the sixty years of her Majesty's reign, and enabling a comparison to be made under several important heads between the British Empire and the other great States. All the changes made during the past year in political frontiers have been noted. By the publication of this Annual a few weeks after the beginning of the year it is possible, in the case of some of the more important States, to give the statistics of the previous year. This will be found to be the case in the present issue. It is believed that no other Annual is of so much service to the statesman, the politician, the publicist, the statistician, and all who have to do with public affairs, as the Statesman's Year Book.

THE TIMES.—"Few books can be said to be indispensable. But among the limited number to which this praise can be given room must unquestionably be found for the *Statesman's Year-Book*. It fills a place in the reference literature of the world such as no other publication of its kind, in any language, quite occupies. It is not only that it finds an honoured place on the table of every statesman and publicist; but from the fact that the information it contains is largely supplied by the Governments of the different countries, it has attained a sort of official standing, so that its pages are consulted in every quarter of the globe, and its statistics referred to in despatches as entitled to unlimited acceptance. This high reputation has not, it need scarcely be said, been attained in a day or a year, and, if the *Statesman's Year-Book* now stands at the head of the great army of works of reference which each year are poured forth by the Press, it is because its conductors have never rested satisfied with the success they have obtained, but have always shown that every year shall be an improvement on its predecessor."

CLOTHED WITH AIR

CELLULAR UNDERWEAR AND SHIRTS.

THE HEALTHIEST AND MOST ECONOMICAL FOR TRAVELLERS.

Extract from C.T.C. HANDBOOK AND GUIDE, 1896-97, p. 52.

"From the peculiar manner in which CELLULAR CLOTH is woven (forming a network of minute air-cells next the skin), it allows, even more fully than wool, the free evaporation of perspiration on the side next the skin. . . . It is less bulky, and is lighter to carry; it dries much more quickly; it is more easily washed, and its prime cost is much smaller. Last, but not least, it is quite free from that bane of all woollen goods, the liability to shrinkage."

BEST FOR ALL SEASONS AND CLIMATES.
ESTIMATES FOR OUTFITS SUPPLIED ON APPLICATION.
To be obtained in all the principal cities and towns in the United Kingdom, the Colonies, and India.

Illustrated Price List of full range of Cellular goods for Men, Women, and Children, sent Post Free on application.

Full assortment of goods at the following retail houses :—

ROBERT SCOTT, Ltd., 14 and 15, Poultry, London, E.C.

DR. J. COLLIS BROWNE'S CHLORODYNE

ORIGINAL AND GENUINE

IS THE GREAT SPECIFIC FOR CHOLERA,

COUGHS, COLDS, ASTHMA, BRONCHITIS.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Dr. J. C. BROWNE (late Army Medical Staff) DISCOVERED a REMEDY to denote which he coined the word CHLORODYNE. Dr. Browne is the SOLE INVENTOR, and, as the composition of Chlorodyne cannot possibly be discovered by Analysis (organic substances defying elimination), and since the formula has never been published, it is evident that any statement to the effect that a compound is identical with Dr. Browne's Chlorodyne *must be false.*

This Caution is necessary, as many persons deceive purchasers by false representations.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Vice-Chancellor Sir W. PAGE WOOD stated publicly in Court that Dr. J. COLLIS BROWNE was UNDOUBTEDLY the INVENTOR of CHLORODYNE, that the whole story of the defendant Freeman was deliberately untrue, and he regretted to say it had been sworn to."—See *The Times*, July 13th, 1864.

DIARRHŒA, DYSENTERY. GENERAL BOARD of HEALTH, London, REPORT that it ACTS as a CHARM, one dose generally sufficient.

Dr. GIBBON, Army Medical Staff, Calcutta, states: "2 DOSES COMPLETELY CURED ME of DIARRHŒA."

From SYMES & CO., Pharmaceutical Chemists, Simla. *Jan.* 5, 1880.

To J. T. DAVENPORT, London.

DEAR SIR, — We congratulate you upon the widespread reputation this justly-esteemed medicine has earned for itself all over the East. As a remedy of general utility, we much question whether a better is imported, and we shall be glad to hear of its finding a place in every Anglo-Indian home. The other brands, we are happy to say, are now relegated to the native bazaars, and, judging from their sale, we fancy their sojourn there will be but evanescent. We could multiply instances *ad infinitum* of the extraordinary efficacy of DR. COLLIS BROWNE'S CHLORODYNE in Diarrhœa and Dysentery, Spasms, Cramps, Neuralgia, the Vomiting of Pregnancy, and as a general sedative, that have occurred under our personal observation during many years. In Choleraic Diarrhœa, and even in the more terrible forms of Cholera itself, we have witnessed its surprisingly controlling power.

We have never used any other form of this medicine than Collis Browne's, from a firm conviction that it is decidedly the best, and also from a sense of duty we owe to the profession and the public, as we are of opinion that the substitution of any other than Collis Browne's is a deliberate breach of faith on the part of the chemist to prescriber and patient alike.—We are, Sir, faithfully yours, SYMES & CO., *Members of the Pharmaceutical Society of Great Britain, By Excellency the Viceroy's Chemists.*

DR. J. COLLIS BROWNE'S CHLORODYNE is the TRUE PALLIATIVE in NEURALGIA, GOUT, CANCER, TOOTHACHE, RHEUMATISM.

DR. J. COLLIS BROWNE'S CHLORODYNE is a liquid medicine which assuages PAIN of EVERY KIND, affords a calm refreshing sleep WITHOUT HEADACHE, and INVIGORATES the nervous system when exhausted.

DR. J. COLLIS BROWNE'S CHLORODYNE rapidly cuts short all attacks of EPILEPSY, SPASMS, COLIC, PALPITATION, HYSTERIA.

IMPORTANT CAUTION.
The IMMENSE SALE of this REMEDY has given rise to many UNSCRUPULOUS IMITATIONS. Be careful to observe Trade Mark. Of all Chemists, 1s. 1½d., 2s. 9d., and 4s. 6d.

WILLESDEN CANVAS (Green, Rot-Proof),

FOR

TRAVELLERS' TENTS, &c.

TRADE MARK. REGD. 1880.

Used by the Following amongst others—

Awarded Sixteen Gold and Silver Medals.

THE POST OFFICE.
THE ADMIRALTY.
THE INDIA OFFICE.
THE CROWN AGENTS FOR THE COLONIES.
THE EGYPTIAN GOVERNMENT.
THE SOUTH AUSTRALIAN GOVERNMENT.
H.M. THE GERMAN EMPEROR.
MR. HENRY M. STANLEY.
THE JACKSON-HARMSWORTH EXPEDITION.
THE ECLIPSE OF THE SUN EXPEDITION.
MR. THEODORE BENT.
MR. VILLIERS (War Correspondent).

And the Principal Travellers during the last quarter of a century. Used also by all the leading Tent Makers.

NOTE. None genuine unless bearing our Registered Trade Mark as above.

NOTE. Intending users should always order Willesden Canvas.

A FEW OPINIONS OF USERS.

Prof. A. H. Church, M.A., F.R.S.—"Willesden Canvas appears to resist the attack of moisture and of Animal Organisms."

H. M. Stanley, Esq.—"As regards the Tent Canvas which proved so indestructible, it deserves every credit. While the Canvas resisted rot and damp and decay, the twine with which the tent had been sewn gave way several times because it had not been dipped into the preservative. We remedied that in Africa by unravelling some Canvas, and using its threads. No other Canvas is fit for any damp weather. I could say much about it, but all my Officers know its superiority to Canvas unprepared."—*August* 4, 1890.

The Secretary General Post Office, London.—"I have to inform you that the bags have satisfactorily answered the purpose for which they were obtained, namely, that of protecting the parcels, etc., from the surf or heavy rains during disembarkation."—*August* 30, 1895.

Jas. W. Addyman, Esq., Starbeck.—"I have nothing but praise for the Canvas. I have found it weather-proof, wind-proof, and immensely strong."

Theodore Bent, Esq.—"We always travel with green fly Tents with double flaps, the whole made of Willesden Canvas, which does not get mouldy when folded up wet."—*The Album, July* 8, 1895.

SOLE MANUFACTURERS—

TENTS

FOR THE

TRAVELLER

AND

EXPLORER.

Write for our "Red Bound Catalogue" of Tents and Camp Equipment, post free.

THE MOST PERFECT TENT is PIGGOTT BROS. & CO.'S "PROSPECTING TENT." Made double. The inner roof being suspended 12 inches below the ridge, allows of a free circulation of air between the outer and inner roofs. The inner roof has ventilators, protected by mosquito net. *Made from Green Waterproof and Rot-Proof Canvas.*

PIGGOTT BROS. & CO., MANUFACTURERS,
57, 58, 59, Bishopsgate Street Without, LONDON.

EXPLORERS AND TRAVELLERS

Should always include in their food stores a supply of

BOVRIL

Which contains in an easily digestible form the entire nourishment of Prime Ox Beef, obtained from selected cattle reared in Australia and South America.

In Nansen's "Farthest North" a Photograph taken by Dr. Nansen of the "Fram" embedded in the Ice shows packages branded BOVRIL containing our food preparations taken by the gallant explorer.

BOVRIL (British, Foreign, and Colonial) LTD., LONDON,
FOOD SPECIALISTS AND CONTRACTORS TO H.M.'S GOVERNMENT.
Chairman—The Right Hon. LORD PLAYFAIR, G.C.B., LL.D.

The Geographical Journal.

No. 4. APRIL, 1897. Vol. IX.

THE FIRST CROSSING OF SPITSBERGEN.*

By Sir W. MARTIN CONWAY.

On June 17, 1596, Spitsbergen was discovered by the Dutch navigator, William Barents. On the 300th anniversary of that day, by a strange chance—for it was nothing but a chance—the party of which I had the honour to be leader came in sight of the island. During those three centuries its coasts and waters have been more frequently and better studied than any other portion of the Arctic regions; but the interior remained practically unknown, and had only been penetrated by explorers on three occasions. In 1892, Herr Gustav Nordenskjöld crossed the inland ice in three days from Horn sound to Schoonhoven (Recherche bay); in July of the same year he spent four days in the hill country between Advent and Coles bays; lastly, in 1892, Mons. Charles Rabot, with some men from the French man-of-war *La Manche*, landed at Sassen bay, and spent three days marching up the Sassendal, ascending Peak Milne-Edwards, and returning to Sassen bay by the same route.

Our party consisted of Dr. J. W. Gregory, whose book on the 'Great Rift Valley of East Africa' is well known; Mr. A. Trevor-Battye, author of 'Ice-bound on Kolguef;' Mr. E. J. Garwood, an expert mountaineer, geologist, and photographer; and my cousin, Mr. H. E. Conway, artist. We took with us two Norwegian sailors, two Tromsö ponies to draw our sledges, and one whale-boat. After some trouble with the ice that infested the seas to the south and west of Spitsbergen and delayed our entry into Ice fjord, we made a successful landing on Advent point, the spit which protects the mouth of Advent bay. Our steamer was shared with the

* Paper read at the Royal Geographical Society, January 25, 1897. The common spelling of the name Spitzbergen is wrong. The name is Dutch, and should be spelt Spitsbergen (from *spits*, "a point"). Map, p. 472.

proprietors of a wooden inn which was to be erected, and since has been erected, on Advent point. The inn, however, was of no use to us, for it did not come into existence till some weeks after any work we had to do in its neighbourhood had long been finished. The weekly boat, however, that came to bring up tourists was a convenience, for it enabled us to keep in touch with the outer world.

Before sailing from home I read, I believe, everything published about Spitsbergen in the chief European languages and Dutch. The Scandinavian tongues are unknown to me. I also conversed with many persons who had been in Spitsbergen. The result was that I had, as usual, received an entirely false impression of what the interior would be like. We expected to find a series of boggy coast valleys, and a snowy or icy interior. Acting on the best advice we could get, we equipped ourselves with Nansen sledges, and with ponies to draw them. The sledges were utterly unsuited to the work they had to do, and involved us in infinite troubles. The last thing we expected to find was an intricate mountain country, a tangle of ridges and valleys. A German traveller, who in 1891 climbed Mount Lindstrom, and, for a wonder, looked into the interior, described it as an "*unabsehbare weisse Flache.*" It is, however, nothing of the sort. We expected to be able to gain a good general idea of the country by taking two or three lines across it. The moment we actually saw the nature of the ground, it became evident that nothing worth doing could be accomplished in that fashion.

A glance at the map we made will show the kind of country we had to explore, and the nature of the information with regard to its topography that was worth obtaining. The northern and southern parts of Spitsbergen are, in the main, covered with great accumulations of ice, except along the west shore of Wijde bay, where is a relatively fertile area. The middle of the island, west of the main watershed, is a region of boggy valleys, fertile slopes, and mountain ridges, or the remains of a high plateau. The nature and interest of this country can be shown by a few specimen areas. The east shore of Wijde bay is formed by a long and very uniform slope, about 1000 feet high. The ice-sheet almost reaches the edge of this slope, except at a few places where the plateau has been broken down into valleys, whereby tongues of ice reach or approach the sea. Here you have an example of a plateau protected from denudation by ice. Along the north-east side of the Sassendal you have a very similar plateau, from which, however, the ice-sheet has been withdrawn in recent times. Denudation has begun, and the plateau is being cut down by narrow and precipitous cañons, from which it derives the name Colorado Berg. These cañons are not being gradually lowered, but they are gradually creeping back. However short, all are practically of the same depth. It is at their heads that they are formed. Each is eating its way back with considerable rapidity. Here you have the first stage in the formation of a mountain group.

BRITISH LIBRARY

Consider now the whole area west of the Sassendal, between it and Advent bay, bounded on the north by Ice fjord, and on the south by Advent vale. It appears that the ice that once covered it was gradually withdrawn, beginning from the west. As you go westward, then, you come to mountains in a more advanced stage of manufacture. The hills that look down upon the Sassendal are the bluff-fronted remains of a plateau, only a little more cut down than the Colorado Berg. Except in two cases, the valleys that penetrate them from the Sassendal are short. Further west come rounded hills, such as Mount Lusitania. Beyond De Geer valley are maturer peaks, with clearly defined arêtes and faces such as we are familiar with in the general run of mountain regions.

Where mountains are most developed valleys are oldest. Advent vale may be taken as type of these. As the ice retreated eastwards, Advent vale widened and crept back, receiving the drainage of a constantly developing valley-system, whose eastern watershed ran close behind the Sassendal bluffs. Later on the Sassendal tributaries became more active, and ate their way back, stealing one after another of the headwaters of Advent vale. The Esker valley is a good instance of this. It was formerly drained by Advent vale; now it drains in the opposite direction. Brent pass divides the drainages, but will not long continue so to do, for already a small stream, descending almost on to the pass, is in process of being stolen by the Esker. It now divides its waters upon its fan when in flood, one stream going to Advent vale, the other to the Esker. Fulmar valley, which formerly drained into Agardhs (Foul) bay, has been similarly invaded by the Sassendal, and many more instances might be quoted.

The great interest, therefore, of this peculiar island of temperate climate in the midst of Arctic ice-sheets, lies in the fact that here you have one of the very best examples in the world of the processes of mountain and valley manufacture. It was the perception of this fact that altered our plans, and showed that it was a far more important matter to make a fairly detailed examination of one portion (in itself, however, not inconsiderable) of Spitsbergen, than to scamper hurriedly across two or three separate belts. We did, in fact, cross from sea to sea along three different lines; but, instead of selecting them as far as possible from one another, we so arranged them that each should display the flank of the next. We crossed from Advent bay to Klok (Van Mijen) bay, from Klok bay to Sassen bay, and from Sassen bay to Agardhs bay and back, finally returning along the shore of Sassen bay to Hyperite Hat, and completing our work by expeditions into the heart of the important mountain region to which I have already referred. Having thus cleared the way by what I fear you may think a dry geographical disquisition, I may be permitted to approach the more generally interesting account of adventures by the way.

BRITISH LIBRARY

First, however, I must premise that this journey into the interior was not the whole of our work. A portion of our party remained for some time at the coast, and worked there. Mr. Trevor-Battye and my cousin made various boat-expeditions from Advent Point, and spent some time in and about the North fjord; and Mr. Trevor-Battye went up Dickson's bay to its head, landed there, and made a long expedition up a glacier previously unexplored. Dickson's bay has been visited seldom—by Lamont in 1871, by Professor Nathorst in 1882, by Lieut. (now Major) Stjernspetz, who surveyed it in 1883, by Nordenskiöld, and doubtless by a few others; there is no published description of it, except a too brief account by Stjernspetz, who landed at its head, and walked up the north glacier to a pass whence Wijde bay was visible.

Garwood, on our first arrival, climbed the peak at Cape Starashchin, and later on our geologists and artist spent a few days at Green harbour for collecting and sketching purposes. The whole party also made, in the little steamer *Expres* (12 tons net), a voyage of over 1000 miles round the coasts of the island, during which we visited North-East land, the Seven islands, traversed Hinloopen strait twice, closely approached Wiches land, visited Andrée's balloon establishment, and entered every considerable bay in Spitsbergen except Lomme bay, Liefde bay, Cross bay, and Michel Reinier's (Van Keulen's) bay. Finally, whilst I remained at Advent Point to try and obtain a solar observation for the purpose of deducing an important true bearing, Garwood and Trevor-Battye went to Horn sound, and made the first ascent of Mount Hedgehog, or Horn Sunds Tind, the highest measured mountain in Spitsbergen.

All having landed at Advent Point on June 20, Garwood and I made a trial trip inland, and on the 23rd definitely started with the two ponies and sledges. A brief experience manifested that the task we had undertaken was not going to be a light one. The west shore of Advent bay is formed by a low cliff with slopes above it. The sledges had to be dragged across these slopes. They are boggy, though nothing like the bogs we afterwards encountered, and they are cut up by gullies, large and small. Down each gully flows a stream, arched over at this time by snow-beds. The snow was rotten, and here the ponies stuck for the first of a countless number of times. Each time they stuck we had to dig or haul them out, and ourselves lug the sledges over—a fatiguing operation. Beyond the cliffs we descended on to the flat, consisting of soft mossy bogs, rotten snow-beds, torrents from 1 to 2 feet deep, and bogs consisting of an unsupporting mixture of stones and mud. None of these things were so bad near Advent bay as we found them further inland. The worst were near Agardhs bay. The snow-beds were so sodden that the foot trod right through them, making a green hole, which was immediately filled with water. The streams were innumerable at this time of energetic thaw. In one mile near the

BRITISH LIBRARY

head of Advent vale, Gregory counted fifty-two channels which had to be waded, besides a number narrow enough to be jumped. Some streams in the island were 100 yards wide or more. All were rapid; some so deep and swift that they carried us off our legs. Frequently they rolled the sledges over and over, tangling up the traces about the ponies' legs and causing complications. The bogs were just bogs, into which the ponies used to stick fast, so that one had to be used to haul the other out. We were often reduced almost to desperation, but ultimately we always got over, thanks greatly to Garwood's energy and resource. It need scarcely be said that a few miles of this kind of country was a day's march. Our range was limited by the powers of the animals. I may as well state once for all that it generally rained when we were marching.

One of our ponies bolted back to Advent point from our first camp. While he was being fetched, Garwood and I made a double journey onward, and formed a camp at the foot of the range of hills that form the watershed between Advent and Klok bays. We called the place Cairn camp (338 feet), and made it our centre for a few days. Hence one afternoon we climbed by a phenomenally rotten and, in places, very narrow rock ridge to Bunting bluff (2480 feet), where we emerged through the cloud-roof into brilliant sunshine, and found ourselves at the edge of an undulating snowfield. The view was of sparkling brilliancy and indescribable beauty. A two hours' tramp over this snowfield and the ascent of a corniced snow-arête beyond took us to the summit of Fox peak (3180 feet), whence we looked abroad over a region of glaciers and multitudinous peaks. A valley stretched away at our feet, leading to a wider valley, which debouched into Klok bay. Unfortunately, valleys and bay were alike buried beneath a pall of cloud, through which ranges of snow-white peaks jutted up, far as the eye could reach.

The result of this climb (leaving geology out of the question, of which it is not my part to speak) was to give us an insight into the general topography of an intricate region, and to manifest that there was no route to Klok bay practicable for ponies, at all events at this time of year. Accordingly, next day Garwood and I loaded ourselves with food, instruments, photographic apparatus, rope, and so forth, and set out for Klok bay. We went up a side valley, on to and up the glacier at its head, and so to a pass (Fox pass, 2550 feet) adjacent to Fox peak. This gave access to Plough glacier, down which we waded rather than walked, for the snow was deep and soft in the extreme. For a time we even advanced on all-fours, such was the toilsomeness of upright progression. A dense fog did not make the surroundings more cheerful. Below the glacier came a stony area; then a region of mixed ice, snow, and water at the foot of another glacier; and then a boggy and utterly desolate valley. At one point I tumbled into a pool of snow-slush, and was soused to the skin. We

The Geographical Journal(Journal of the Royal Geographical Society): Volume IX, No. 4 [180v] (31/172)

plodded down the valley till we were too tired to go another step, and then we lay down in a hollow between two walls of snow, with nothing but one mackintosh cape to cover our legs. That was a dreary resting-time. Icy rains fell on us at intervals. A few hours were enough.

Going forward again, we soon came out into a very big flat valley, the valley of the Shallow (Ondiepe) river, as the Dutch called it in their time. Only a bog-flat here intervened between us and the waters of Klok bay. Across the valley were some fine mountains, pouring out a great glacier on to the flat. Other glaciers were seen emptying into the valley higher up. We returned by the way we had come, to near the foot of Plough glacier; then, taking another head valley, we crossed the range by a lower and better pass (Bolter pass, 1340 feet), descended over a wide snowy area, in which a large lake of snow-slush had to be circumvented, and ultimately came out into Advent vale close to our first camp. The walk from thence to our tent at Cairn camp was almost more than we could manage.

After this Gregory joined us, and we went forward up Advent Vale for two marches, and encamped close to Brent pass (450 feet). A large glacier debouched on the plain opposite camp, descending from a wide and far-reaching snowy basin. The edge of this glacier was broken into seracs all the way round, and these kept constantly falling with a loud booming crash. To this glacier Garwood returned a few weeks later, when he climbed on to it, and ascended one of the peaks that rise from it. One more march carried us over Brent pass and down the Esker valley to Advent vale, just where the Esker river tumbles over in rather a finely set little waterfall. The descent of the Esker valley was very laborious, for everything was in the worst possible condition—snow deep and slushy, gullies many and all cluttered up with rotten snow, river flooded, bogs numerous and soft.

From Waterfall camp Gregory walked down to Sassen bay, expecting to meet our comrades; but the ice, packing into Ice fjord, made the mouth of the Sassendal inaccessible by water. So Gregory returned, and next day walked from Waterfall camp to Advent bay by the way we came—a really colossal undertaking, which he accomplished in twenty-four hours. When the ice broke up, he and Trevor-Battye came round, and walked up the Sassendal to join us. Trevor-Battye returned to the boat after a day's visit, and went off to Dickson's bay; Gregory came on with us to the east coast. Garwood and I spent these days exploring the neighbourhood, climbing peaks, and investigating valleys. The weather was beautifully fine, the sun shining brightly all twenty-four hours round. It was a joy to live.

Starting on again, we went up the Sassendal to a big side valley, and turned up it, hoping to find a way to Foul (Agardhs) bay; but the appearance of things not being propitious, we returned next day to the Sassendal, and went further up it to a much bigger side valley. This

BRITISH LIBRARY

seemed obviously the right route to take. An endless procession of fulmar petrels, flying up the Sassendal from Ice fjord, all turned up this valley, evidently on their way to the east coast. We named it Fulmar valley, and determined to follow their lead. Mile after mile we advanced, yet never a pass came in sight, nor any sign of an ice-sheet. We began to think we might reach Foul bay without crossing ice at all. Coming to a place where there were old moraines and a change in the aspect of the valley, we pitched camp.

Next day we entered the moraines a short distance beyond camp. They belonged to a set of side glaciers. They formed a hideous chaos of broken rocks, and heaps of mud piled upon ice. The river flowed in an ice gorge, with ice cliffs on either hand and the sloping moraine and ice chaos above. To drag the sledges over this was a terrible job. Once a sledge and pony began sliding down sideways, and were only just arrested at the edge of the ice-cliff. The torrent had to be crossed, various ascents and descents made. Stones were constantly giving way, ponies sprawling about, and almost every accident happened that one can imagine. Ultimately we emerged into an almost level valley, closed at the far end by a wall of ice, which proved to be the side of a great glacier flowing across the valley. The last reach of Fulmar valley was the worst. It was a bog of incredible nastiness. We tried high up, and we tried low down; it was equally bad everywhere. There was always one pony stuck, and often both. How we got through I don't know. At last we did reach the ice-wall, and camped (370 feet) at the foot of it.

While the others were pitching camp, looking after the ponies, and cooking, I went on and climbed the hill to our left of the glacier. An ascent of only 600 feet placed me on the crest of a ridge, which I presently followed for a mile or two to its highest point. The moment I reached the ridge, the great glacier—Ivory glacier—appeared spread out at my feet, pouring down in a wide stream from the inland ice-sheet, whose wide low domes limited the view upwards. Below, it spread out into a vast oval-domed termination, a portion of whose side was the wall that overhung our camp. The whole of this oval-domed end has come down since the year 1871, when Heuglin records the main valley as having been a flat green swamp. In the other direction beyond and above this icy dome I saw Foul bay and Wybe Jans Water, with quantities of ice upon the sea, all glittering in sunshine; and then, on the remote horizon, the snow-decked mountain front of Edges land, supporting a brilliant cushion of white cloud. I yelled the good news to my companions below, and went on up the ridge. A gale of wind blew, making wild music in the crags. On I went, passing shoulder after shoulder, and ever finding another ahead, till the last one came, and I looked abroad over the noble ice-sheet, and beheld it swelling up and up to the hurrying clouds or the blue sky. Sunshine

lay in patches upon the splendid expanse; lakes of sapphire-blue here and there diversified the great glacier's frozen area. It was a gorgeous vista. Unfortunately, I had no camera with me, but only surveying instruments. The cold was intense. I could not remain long on the exposed summit. The descent to camp was a long-drawn-out fight with the opposing gale.

Next day (July 17) Gregory, Garwood, and I returned to my first point of observation and again enjoyed a good view, though not so fine a one as before. We descended on to the glacier, and crossed its wide white foot in about two hours' walking. By a great stroke of luck, we hit off what was perhaps the only point where the ice could be quitted easily on the Foul bay side. For there the glacier ends in an ice-cliff over 100 feet in height, falling to a pile of moraine-hills over 200 feet high. The point where we reached the ice-cliff gave access to a slope down which steps could be cut to a snow-slope not too steep for a glissade. We ran down the moraines, and were at once on the swampy flat that fills the head of Foul (Agardhs) bay. A stream was waded, and we walked far out on to the flat to an amorphous region that was half land, half water. Stranded icebergs in the bay looked down upon us over the mud-flat. We had crossed to the east coast for the first time on record. I leave you to imagine our satisfaction.

The night that followed our return to camp was signalized by a hideous gale, in which the ponies suffered severely. A pool of mud surrounded the tents. Rolling up our loads, and the mud with them, we fought the way down the valley, and in two days reached Waterfall camp, where we divided, Garwood returning to Advent bay over Brent pass, Gregory and I descending the Sassendal to Sassen bay, and there turning along the coast. We camped at two different places, and made expeditions inland, climbing Mount Lusitania (3120 feet), whose summit Garwood and I had attempted but failed to reach from the other side. We also explored the large valley that divides in half the mountain region between the Sassendal and Advent bay. We named it De Geer valley, after the leader of the Swedish expedition, at this time engaged in surveying the coast of Ice fjord. An interesting group of side valleys enter De Geer valley from the west. They contain many small glaciers, and are surrounded by peaks of individual form. Before we could attempt to explore them vile weather returned, and thenceforward these peaks remained buried in clouds as long as we were in Spitsbergen. This area, and a corresponding valley that debouches on Ice fjord near the mouth of Advent bay, were the only portions of this instructive mountain group that we did not actually penetrate, or at least behold from several points of view. We returned to Advent Point thirty-six days after leaving it, and were startled with the changes made in our absence. The tourist inn was built, and was being painted. Other visitors, besides ourselves and the Swedes, had their camps on the spit. Presently

a German tourist steamer came in and emptied its passengers upon the shore. We felt that we had returned from the wilderness to a centre of advanced civilization.

Having thus very briefly related how we accomplished the main purpose of our expedition, I shall now still more briefly describe the second part of our journey. Whilst making the needful preliminary inquiries in England, as to what had been done in Spitsbergen, and what still needed to be done, I fell under the fascination of the varied and peculiar literature that concerns itself with these inhospitable shores, till the study of that literature became, for me, an object in itself, and not merely a means to an end. There is much in it that is topographically obscure; much, too, that depends for its interest upon the undescribed setting of scenery in which recorded events took place. Thus the attainment of some general knowledge of the Spitsbergen coasts from personal observation became a matter of importance to me, little though I expected to fall in with so rare a chance of accomplishing that end as the summer of 1896 afforded.

For this year the ice left the Spitsbergen coasts. While we were crossing the island, a tourist steamer advanced without difficulty or danger to 81° 32′—an amazing record. The sea was open away to the east as far as any vessel explored it. There was no ice in Hinloopen strait or in Wijde bay. When knowledge of these facts came to us, I hastened to hire the little 12-ton steamer *Expres*, which had been taking tourists up to see Andrée's balloon, and, as soon as we could obtain possession of her, away we sailed.

Quitting Advent point on August 5, we ran to Green harbour, picked up our geologizing companions, who had been working there, and steamed northward in dark and heavy weather. Snow and rain besoms swept across the sea one after another in rapid succession, and all the coast hills were hidden in cloud. The only cabin in our boat was no bigger than a grand piano, so that the five of us, having to cook and live in such close quarters, were not easily fitted together. There was no deck to stand on. Every inch of room was occupied by barrels full of coal. We tumbled in this fashion up Keerwyk (or Foreland sound), across the mouth of King's bay, then up the coast, past seven wide glaciers, called the Seven Icebergs, and through the South gat into Dutch bay, on whose western shore once stood Smeerenburg, the blubber-boiling establishment of the Dutch. Over against it, on Danes island, just where the "cookery of Harlingen" used to stand, we found the balloon, which we visited under Herr Andrée's guidance. His skipper sold us more coal, and away we went in the gloomy weather northward to find the ice.

Alas! the edge of the pack had come down more than a degree during the last fortnight. We found it all too soon in 80° 15′, and turned east by south along it for an hour's steaming, then north-east for four hours. The pack now stretched southward, a great cape of ice,

BRITISH LIBRARY

as it proved, coming down upon Verlegen Hook. We feared that our eastward way was to be thus early closed, and our hopes sank rapidly. Between the point of the ice-cape and Verlegen Hook there was, however, a way by which, with tortuous navigation in and out amongst drift ice, we were enabled to reach open water once more. It stretched away to the northward further than we could see, so we steamed on again north-east by north, hoping to get round to the north of the Seven islands. There was a chance, almost a probability, that the pack which was rapidly coming down would beset Verlegen Hook before our return, but we decided to risk it and push forward.

A westward-bound sloop came in sight. We hailed her, and learnt that she had been hunting to the eastward of Outger Reps island, where a fortnight before all had been open water. The pack driving down had forced her to quit that region. Already, her skipper said, the pack was down on the Seven islands. Six hours' steaming carried us to 80° 39′ (Walden bearing east-south-east), where we found the pack again, stretching across to Table island. So we ran for Walden, of whose geological structure nothing had previously been recorded (I believe), and landed on its east side. Our ice-master, Bottolfsen, had served the Wellman expedition in the same capacity. With him we visited the ruins of Wellman's hut. We climbed about the weather-worn rock, and had striking views of the cloud-covered Parry's island and its neighbours, and away to the east as far as Cape Platen. Ice-blink showed all round to the east, and the edge of the pack was visible at no great distance. The sea where Phipps' vessels had so narrow an escape, and where young Nelson encountered the bear, was still quite ice-free. Nothing could exceed the desolation of the view in all directions, but especially to the south, where a heavy pall of cloud lay on the inland ice-sheet of North-East Land.

As it was hopeless, in our little iron boat, to try and push eastward, we ran back to Verlegen Hook, and found that a strong south wind was keeping open water off that important point; so we changed our plans once more, and decided to run down Hinloopen strait and see whether we could circumnavigate the main island. Some writer has told of the fine mountains that border this passage. I wished to see them, and, if possible, to get some record of them. As a matter of fact, they do not exist; there are only wall-faced plateau fronts of rock, in no respect striking till you come close under them, so that the scenery of the strait is tame from end to end, the sides and islands being very low in comparison with the width of the channel.

To us the most interesting object seen was the great glacier front that borders the west side of the strait for over 20 miles from Hecla Hook to Lomme bay. It is the edge of the sheet of ice that covers the New Friesland promontory. A fifteen hours' run, during which we saw hardly any floating ice, except a few pieces fallen from the glaciers,

BRITISH LIBRARY

brought us off Cape Weyprecht, towards which we steamed in hopes to get into Unicorn bay and through Heley's sound. But it was not to be. The bay was full of ice, and Heley's sound was unapproachable. Returning along the edge of the pack, which stretched far out into Olga sea from Barents and Edges Land, we rounded its north point, and then followed along it to the south-east. An ice-blink rising before us extended ever more to the east as we advanced, and finally filled the whole horizon ahead.

The high land of Wiche's Land rose above the horizon, and became more and more definite as we neared it. The pack stretched across to it, and we were strongly drawn to make the land, which no geologist has ever investigated. But neither was this to be. The ice-master refused to linger in these waters in such a tin kettle of a boat under existing conditions, when the ice-pack was, as we had occasion to observe, coming up from the south and would soon be at Cape Torell, where a walrus sloop that we hailed had found it only three days before. All we could do, therefore, was to stay long enough to sketch the outline of the land, and observe the sheet of hyperite that covers its top, and makes a nodding cap to its bold north cape.

The run back to Verlegen Hook presented no new features, save in fresh combinations of clouds, snow-brooms, and barren hills. We rounded the point through drift-ice, and then turned south to explore Wijde bay, again chiefly for the sake of beholding the mountains said to border it. Here we were not to be disappointed. The scenery of Wijde bay is superb. Its level-topped east side, crowned with the edge of the ice-sheet, is broken at three points, where great glaciers descend to the bay between splendid walls of rock. The west coast is lined by a row of mountains, some of grand form, and all together forming an impressive assemblage. A series of deep valleys cut back between them and lead many miles into the interior. The shores at the north end of the bay were buried under snow, and had an exceedingly desolate and arctic appearance, but a little further in a great change of climate became manifest. The snow-line rose to 1000 feet above sea-level; boggy valleys took the place of snow-flats, and such glaciers as there were all descended from high catchment areas of snow.

Having reached Cape Petermann, we made for the west shore of the west fjord, where I landed my companions, and proceeded on alone to the head of the fjord, to see whether it was worth while to land there and make a dash for Dickson's bay and back. The low clouds, however, would have rendered this a valueless exploit, for surveying would have been impossible; so, after sketching and photographing the mountains, I returned for the others, and we steamed back to the north. So strong a south wind (doubtless local) had been blowing for the last two days wherever we were, that we thought it likely Andrée might decide to

Qatar National Library

ascend in his balloon. We hurried off, therefore, to Dutch bay again, where all was still. The south wind had not blown at that point till we came in.

After a few hours' pause, and obtaining some more coal, we ran out through Danes gat, and then for Magdalena bay. The sun was shining brightly for the first time in a fortnight, and we had a gay passage for a while; but just as we entered Magdalena bay, the "pearl of arctic scenery," as it has been called, a heavy cloud-bank came sweeping up with a squall from the south, and we were only just in time to see the beautiful peaks and steep glaciers that surround this blue inlet overwhelmed by the hurrying battalions of the sky. An hour or two later we were running down the coast again, bound for King's bay, which we entered to its head, to gain some idea of the way the inland ice lies in that neighbourhood, the trend of the glacier valleys, and the nature of the famous Three Crowns peaks. The clouds lifted a little and showed us these things for a brief interval, and all was hidden once more.

I had still an important observation to make in the branch of Bell sound, which is wrongly called Van Mijens bay. Its old name is Klok bay; Van Mijens is a little harbour outside Axel island, in the north shore of Bell sound. A straight run carried us to Cape Lyell, where Gregory was left to collect fossil plants. Then we crossed Bell sound to the north end of Axel island, and entered Klok bay through the narrow passage, where the tide was rushing in wild haste, so that the otherwise calm waters boiled about us and carried our boat this way and that like a cork. Once within the entry all was still. I landed the remainder of my companions on Axel island, and ran on alone towards the mouth of the valley of the Shallow river, or Dry fjord, which I visited for the purpose of linking up the rough survey Garwood and I made when crossing from Advent vale. This was no sooner accomplished than the engines broke down, and we had to anchor for three hours whilst repairs were done. I then visited the little-known and falsely charted south-east extension of Klok bay. It runs much further east than the chart indicates, and its enclosed inner harbour would be an excellent point of attack for this part of the interior of the island. Only late in the season, however, is it likely to be found ice-free.

When the others had been fetched from their different resorts, it was discussed whether we should run for Horn sound. But the necessity, under which I considered myself placed, to make all possible endeavours to get an observation for true bearing at Advent point, compelled me to return there at once, seeing that the steamer that was to carry us back to Norway was due within two days. My agent's blunder was the cause of this early return. I had ordered him, and he had contracted to arrange for us to be fetched about the middle of September. We accordingly went to Advent bay, where Gregory, H. E. Conway, and I

were dropped to pack the baggage and make the required observation, whilst Garwood and Trevor-Battye went down to Horn sound and made the first ascent of Hedgehog mountain (or Horn Sunds Tind), whereof an account has been published in the pages of the *Alpine Journal*.

Before the reading of the paper, the PRESIDENT said: There is no occasion to introduce to you our friend Sir Martin Conway, who is so well known for his excellent work in the Karakoram, and I am quite sure he has done equally good work in Spitsbergen.

After the reading of the paper, the following discussion took place:—

Dr. J. W. GREGORY: After the long account Sir Martin Conway has given of the narrative of our expedition, it may be better if I refer for a minute or two to some of the scientific problems we went to study, as these were responsible to a large extent for the fact that we did not cover so much ground as we had hoped when leaving England. We never left the bog-filled valleys for the ice without feeling relief, and we never went from the ice to the valleys without regrets. No doubt it would have been easier and pleasanter to have spent the time scampering over the inland ice rather than working in the valleys and on the margins of the ice-sheet. We soon found that if we wanted to do any serious work we must keep in the valleys and on the margins of the ice-sheet. To take one illustration. In a paper read here two or three years ago, Professor Bonney denied that glaciers can do any important work in the way of erosion. In a paper read shortly afterwards by Admiral Markham, he treated this view as beneath criticism, and suggested it was impossible for any man who has seen the glaciers of Greenland to doubt that they had eroded the valleys in which they lie: accordingly, we wished to settle whether the fjords of Spitsbergen had been formed by glacial erosion or in some other way. In England we thought the most suggestive evidence would be obtained by examination of the watershed at several points at a considerable distance from one another, but we had not arrived a week before we saw we should have to tackle the question in a different way. What was wanted was an accurate map of a belt across the island, and not a sketch-map of the ridges. Sir Martin Conway altered his plans, and has made a map which throws much light on the topography and geography of Spitsbergen, and will serve as a basis for the geological map Mr. Garwood and I hope to work out during the coming summer. We don't bring back, I am afraid, any very startling biological novelties; but this will cause little surprise, as biologists have learned to expect as little from arctic work as the Pharisees expected from Nazareth.

There is little apparent connection between dragging sledges through peat bogs and the ordinary work in a museum; but, as a matter of fact, the knowledge gained and the general idea the journey gave me as to the conditions of life in a high arctic latitude will be of very great help in my daily task of trying to decipher the evidence of fossils as to former geographical changes. We also hoped to get a good deal of information as to the ways of arctic ice, and to detect characters by which to determine whether certain English glacial deposits had been formed by land ice, marine ice, or a central ice-cap. In Spitsbergen we could see these forms working side by side. It gave us information which both Mr. Garwood and I thought threw a flood of light on the ordinary phenomena of English glacial geology.

We often hear very exaggerated stories about the changes of climate that have taken place in the arctic regions. We hear of the shores of the Arctic Ocean having been fringed by coral reefs, while along the shores grew groves of palms; but I am afraid the collections we made do not support these exaggerated and

BRITISH LIBRARY

extreme views, which at one time or another have very considerably influenced geology in England, especially as to changes of climate and their causes. We found the country full of interest and with so many problems to work out that the journey was not wasted. And for this we have to thank Sir Martin Conway for the great amount of trouble he devoted to the equipment and preparations.

The PRESIDENT: We have seen a number of portraits said to represent Mr. Garwood. I have some suspicion that some of them represent Sir Martin Conway himself. I am sure you will be glad to see and welcome Mr. Garwood here, and hear any remarks which he may have to make on the results of the journey.

Mr. GARWOOD: After the very thrilling account Sir Martin Conway has given you of my little adventure, I feel rather an impostor in standing before you to-night, for I ought to be somewhere down that river.

I will not take up your time with any general remarks, but I should like to describe to you, with the help of a few photographs on the screen, some of the most interesting points presented by the glaciers we encountered during our expedition across the island.

But before I do this, I show you a photograph of Sir Martin Conway making a survey at midnight on the top of Fox peak, and I should like to express my intense admiration for the manner in which he executed the map which we hold in our hands to-night. On this particular occasion I shivered for nearly half an hour, while he was absorbed in his work, with the thermometer several degrees below freezing-point, and a cutting wind blowing round us from the inland ice.

Turning to the subject of glaciers, this photograph (Fig. I.) shows very clearly the stratified condition of the moraine which accumulates under the ice. In England we have the problem of the Glacial Period to work out, and we sometimes encounter boulder clays, which, it is said, must have been formed under the sea, because all stratified beds must be formed under water. I just show you that we have in Spitsbergen moraines, which are stratified, being formed 7 or 8 miles from the coast, underneath land-ice.

The next slide (Fig. II.) shows a very interesting example of the action of some of the glaciers in these high latitudes. We have here a glacier composed of several tributary streams united in one valley; the lower portion of the ice-stream has been forced through a narrow channel, and the ice and moraine at the bottom have been bent over at the edges, so that when the ice melts back we shall have a contorted moraine produced. Thus we have examples of both stratified and contorted drift, and both have been formed under land-ice.

In Greenland we have exactly similar examples. I show you these to-night because it is interesting to note that we have the same phenomena occurring in Spitsbergen.

Then we have another perplexing problem of the Glacial Period in Britain—the formation of crescentic moraines. In Spitsbergen we sometimes find tributary glaciers flowing round the sides of mountains down on to the top of larger ice-streams, and as the ends of these melt, they deposit their terminal moraines on the surface of the main glacier; this latter flows down the valley, carrying the terminal moraines with it, and these are melted out and deposited far from the spot where they were formed (Fig. III.).

We had exactly the same thing taking place in England, notably in the neighbourhood of the Pennine range, when glaciers flowed down to the coast round mountain ranges whose summits stood up above the ice, resembling, probably, the Greenland "Nunatakken" of the present day.

Fig. IV. is a photograph to show you the terminal moraine of the Ivory glacier, consisting of rounded water-worn pebbles—an interesting example of a raised beach

BRITISH LIBRARY

which has been caught up and deposited greatly above its original level. As far as we can see, the glaciers in Spitsbergen are for the most part advancing.

As we approach its westerly termination, this great glacier is seen over-riding its old terminal moraine (Fig. V.), whilst Fig. VI., taken further to the west, shows a remnant of the terminal moraine with the ice advancing over it.

An interesting point to notice is the mode of advance of these glaciers; the top layers, shearing over the lower ones, advance more rapidly, until they overhang to such an extent that they break off, forming a "talus" of ice below; over this the glacier advances, finally over-riding the moraine completely (Fig. VII.). Glaciers advancing in this manner do not, therefore, push forward loose material lying in their path, but flow over it; the lower layers of ice, embayed behind this obstacle, are, however, dragged over it by the upper advancing layers, and bring up with them fragments of the raised beach frozen into their under surface. Dr. Gregory and myself found no difficulty in collecting fragments of driftwood, shells, and bones of whales, mixed with pebbles, which had been raised several hundred feet above the original level of the beach in this manner. This fact is of great interest.

I went up that peak of which Sir Martin Conway spoke, to study the advance of Booming glacier. From here you can clearly see the character of the advance; the snout and sides of the glacier are over-riding the old terminal and lateral moraines, leaving a depression in the centre. Looking down on it in this way, it bears a striking resemblance to a large dish of trifle, the sides of which are edged with biscuits, represented here by the shattered pinnacles of ice.

It is interesting to compare the terminal face of Booming glacier with that of its shrunken tributary from the Baldhead, now fast receding into its own valley (Fig. VIII.), the latter showing the retreating snout characteristic of an average Swiss glacier, while in the distance can be seen the old lateral moraine.

The next photograph (Fig. IX.) shows a nearer view of the advancing front of Booming glacier, with its characteristic ice "talus." Figs. X. and XI. are two views, one looking down the glacier, and the other looking up; in both of these the raised edge and depressed centre are noticeable. During our first visit, Dr. Gregory and I attempted to cross the glacier. I succeeded in getting up one side, but we doubted if the descent of the other side would prove feasible, and prudently beat a retreat—a precaution which my subsequent observations completely justified (Fig. IX.).

The last view (Fig. XII.) shows the upper part of the glacier, where the centre is shrinking away from the sides. In both this and the neighbouring valley the shrinkage was plainly visible.

An important point to consider is, "Why is this glacier advancing?" It might be said, "Because the climate is getting colder." I am inclined to think that the advance is due, on the contrary, to an amelioration in the climate. The centre has a shrunken appearance in the upper part of the basin; it is, in fact, being drawn away from the sides of the valley. This would not be the case if the advance were due to an increase in the snowfall, and the fact that the Baldhead glacier, before alluded to (Fig. VIII.), is retreating, although occurring in the same snow-basin, also militates against this hypothesis. We know that a rise in temperature increases the mobility of ice, causing it to move more rapidly, and we must, I think, attribute to this cause the general advance of the Spitsbergen glaciers at the present day, rather than to any refrigeration of the climate.

Sir Martin Conway has told you of the difficulties we had with the sledges drawn by ponies. It has been suggested to me that we did not use the right draught-animal, and, as many of you may wish to go to the district after listening to Sir Martin Conway's very interesting paper to-night, I have brought you an

BRITISH LIBRARY

ideal traveller's equipage. If you harness a polar bear in the shafts, with a reindeer leading, you will, I am convinced, make extremely rapid progress.

The PRESIDENT: Mr. Trevor-Battye requested that he might be called upon last. I have no doubt he was anxious not to take the wind out of anybody else's sails.

Mr. TREVOR-BATTYE: Mr. Trevor-Battye wished to be called upon last in the hope that he might not be called upon at all—a very good reason; and really, after Sir Martin Conway's most charming speech, there is not much for him to say, especially as he is not supported by any views or photographs, although in the next room will be found exhibited his sketches of Dickson's bay, Wijde bay, Hinlopen strait, the Seven Islands, and other places. Frankly, without illustrations it is very hard to be interesting, and therefore, I think, the less I say the better. I will only add to Sir Martin Conway's interesting account, that in Eckman's bay there is a very striking instance of an advancing glacier. This, which I named the "Splendid glacier," is advancing so rapidly that, within the twenty-five years or so that have elapsed since North fjord was surveyed, it has filled up a great part of the head of the fjord, which is put upon the charts as a large branch of the sea, in the middle of which is an island. It has now advanced upon the island, and within a very few years the head of the fjord will be entirely filled up. On the other hand, the most important glacier at the head of Dickson's bay is a retreating glacier, which is dying back very rapidly. It is now so late that I will not ask you to listen to anything more.

The PRESIDENT: I am sure the meeting will agree with me that we have seldom listened to such an interesting paper, and to such interesting speeches as those that followed it. The description given by Sir Martin Conway of the formation of hills and valleys is particularly interesting and instructive because of its general application. I should have wished to have made various remarks on this subject, only I have a sore throat; but I cannot sit down without referring to the way in which Sir Martin Conway has done his work. You already know, from what you have heard, how able he is as a descriptive geographer, and I wish to bear witness to the trouble he took before starting, and to the trouble he is taking now, to inform himself of the former history of Spitsbergen. I say without any hesitation that Sir Martin Conway has a greater knowledge of the literature of Spitsbergen than any other living man. I am sure you will all wish me to return our very sincere and hearty thanks to him for his most interesting description of Spitsbergen, and for his admirable series of photographs, and you will wish me to thank the members of his staff for the valuable information they have given us.

SIR MARTIN CONWAY'S MAP.—The general outline has been taken from the Admiralty charts, but enlarged, and the interior filled in from a sketch-survey made in June, July, and August, 1896. The southern coast-line of Sassen bay is taken from a map made in 1892 by the officers of the French man-of-war *La Manche* (*Bull. de la Soc. de Geographie*, 1894, p. 56). The coast-line of Temple bay and the northern part of Sassen bay are from Prof. A. G. Nathorst's survey made in 1882 (*Ymer*, 1883, p. 134). The position of peak "Milne-Edwards" was determined by M. Charles Rabot in 1892, on the occasion of the visit of *La Manche*. Details of glaciation of the east coast are taken from Dr. W. Kükenthal's map in *Petermanns Geogr. Mitteilungen*, 1890, Plate 5. Dickson's bay is from the survey made in 1883 by Lieut. Stjernspetz, the neighbourhood of the house at Cape Thordsen is from a survey by the same officer. The coast-line of Klaas Billen bay is from Nathorst and De Geer's survey of 1882. Skans bay is from a survey by the officers of *La Manche* in 1892. The corrections and additions at the head of Dickson's bay are from Mr. Trevor-Battye's observations in 1896.

TWO YEARS' TRAVEL IN UGANDA, UNYORO, AND ON THE UPPER NILE.*

By C. F. S. VANDELEUR, D.S.O., Lieut. Scots Guards.

STARTING from Mombasa on September 7, 1894, with Mr. Jackson and Captain Ashburnham, and a large caravan of about four hundred men, carrying arms and ammunition, we reached Port Alice on Lake Victoria at the end of November, after a most successful march under the leadership of Mr. Jackson, during which only two men died. After a short stay in Uganda, I started with Major Cunningham for Unyoro and the Nile. We followed the road leading by Singo and across the river Kafu at Baranwa, and eventually arrived at the headquarters, Fort Hoima, on January 1, 1895, where Major Cunningham took over the command from Captain Thruston, who was returning home. We were delighted to get our ponies safely across the very bad swamps, and they were the first animals to reach this country from the East Coast. Halting here for five days, we marched to Kibero on the 7th. The country becomes more open on nearing the Albert Nyanza, and rocky in places, until all of a sudden the edge of an enormous escarpment is reached, 1200 feet below which lies the great lake, as a rule covered by a white haze which obscures the horizon and the mountains on the western shore. Our home for the next three weeks was to be a steel boat about 20 feet long, into which we packed ourselves with a crew of sixteen men, consisting of eight Sudanese, most of whom had been on Emin Pasha's old steamers, and eight Zanzibaris, including our own servants. They were certainly the worst rowers I have ever seen. The two races were also always accusing each other of doing no work. Besides them, we had a friendly Wanyoro chief called Keyser, who spoke the Lure language.

We entered the Nile on the second day, and, on nearing Wadelai, found the river narrowed considerably, with a very strong current, which we found it difficult to make way against on our return journey. We camped one mile further on, at Emin Pasha's old fort of Wadelai, which was then completely overgrown. We set fire to all the grass round, as much to diminish the myriads of mosquitoes as to give us a clear field of fire in case of surprise, the natives appearing very hostile. The mosquitoes throughout the journey, at night and in the early morning, made life miserable, and it was a penance to take observations for latitude and longitude at night. After Wadelai, we glided rapidly past narrow channels formed through the floating vegetation and papyrus, stopping sometimes near the villages on the banks to ask for news, which was very unreliable, some of the natives even stating that the Dervishes were close in front. Our guide, crouching down in the

* Paper read at the Royal Geographical Society, November 23, 1896. Map, p. 472.

مكتبة قطر الوطنية
Qatar National Library

bows of the boat, frequently invoked Allah after this, and comforted himself with a long pipe. The further we went from Wadelai, the more friendly the natives seemed to become. They are continually fighting among themselves, and lead a precarious existence. Beyond Bora, an old Egyptian fort on the right bank, the river is very broad—about 1½ mile—though the actual channel through the sud is only about 500 yards in width. There is a large village at Unigwe, under a chief called Abu Suma. The banks between here and Dufile seemed well populated, though the country did not look very inviting. Villages were hidden away among the high rocks and boulders on small hills close to the river, and there was a certain amount of mtama and dhurra cultivation. We could see the high hills behind Dufile in the distance, and late in the afternoon of January 14 we reached the old fort, situated close to the water's edge at a bend of the river on the left bank. The parapet and ditch were still very distinct, and there were some mud-brick houses, some lemon and cotton trees, the only signs remaining of the Egyptian occupation. It was a relief to get on shore, after sitting cramped up on one's tent and baggage, together with a maxim gun, in the stern for no less than ten or twelve hours. We also felt the heat very much after the climate of the Lake districts.

I believe we were the first white men to have reached Dufile, since the abandonment of the place in November, 1888. We walked across from a village called Karas to a bend of the river below the head of the rapids. Here the river was only about 40 yards broad, the banks wooded, and strewn with enormous boulders of rock. The river makes a great bend where it forces its way through the hills, and shortly afterwards dashes down over the Fola cataracts, where, of course, navigation is impossible. The Madi natives are a fine, strong-looking race, and with them we met a representative of Abu Sulla, an important chief living one day's march below Dufile, on the right bank. He was dressed in white cloth, which was probably obtained from the Arabs or Mahdists to the north.

Our return journey to the Albert Nyanza was rather tedious, owing to the strong stream. Near Unigwe we saw hartebeest and some other antelope with short curved horns. There were plenty of water-buck, and an enormous quantity of hippos, especially just above the rapids, where we at first mistook them for rocks. On the eastern shore, up to the Victoria Nile, we could see a fine open grass plain, with scattered bushes, along which some stately giraffe were walking, also some Senegal hartebeest and other antelope. It is difficult to make out the entrance of the Victoria Nile, and there is always a mirage on the horizon. There is a good deal of sud, and many floating islands at the mouth of it. On a second journey on Lake Albert, I visited the fort at Mswa and the west coast up to Mahagi. The lake seems certainly unhealthy to people coming from the high ground, and on returning to Fort Hoima, the

whole of the escort—twelve men—who had been left at Kibero, were very ill with fever. One man died in consequence. I myself was down with fever; the men had indulged in hot sulphur baths while at Kibero, and must have taken a chill afterwards from the cold wind off the lake, which would account for their being so ill.

The people on the west of the Albert Nyanza used to pay tribute to Kabba Rega, but that of course is at an end now. They fight among themselves a good deal. The Shulis in the angle contained by the two Niles are inclined to be friendly. With steamers on the lake, and the railway to the Victoria Nyanza, a large extent of country would be opened for trade, and there is no limit at present to the ivory to be

VIEW OF LAKE VICTORIA FROM MIRAN, NANDI COUNTRY.

obtained from the countries bordering the Albert. There is no hindrance to navigation down to Dufile.

Soon after our return at the end of January, it was found that Kabba Rega had broken the truce concluded in December, that his envoy had run away, and that he had raided the country south near Toru, killing friendly chiefs, so that hostilities broke out again. I accompanied three expeditions during the next seven months, and I was enabled to survey the whole of Northern Unyoro, including the course of the Victoria Nile from Lake Ibrahim to the Murchison falls; also a part of the Lango or Wakedi country. The surveying was carried out under a certain amount of difficulty, as the country was hostile, and one always had to have an escort.

On our return we heard that Mr. Jackson was now the acting commissioner, in place of Colonel Colvile, who had been very ill, and started home.

The most notable landmark in Unyoro is Mount Fumbi, which is

BRITISH LIBRARY

three-quarters of a mile long, and about 150 to 80 yards in breadth at the top; it has precipitous sides, covered with grass, low trees, and shrubs, and is 762 feet above Masindi fort, the present headquarters, and 4640 feet above the sea. It can be seen distinctly from most parts of the country, even from close to the Murchison falls. From the top of it one has a magnificent view over the country, which, however, looks decidedly disappointing; the dull green of the swamps preponderates, bits of yellow here and there mark the mtama cultivation, intermingled with banana groves, especially to the west and north-west, which is very thickly populated. Close to the east, between the Kisoga line of hills, lies a small lake fringed with papyrus, from which rises the river Kata-gurakwa, that flows through a narrow gorge in the hills, and across a flat plain covered with low trees to the Kafu river. Far to the north-west several hills stand out, among which the Gisi peak is the most noticeable. The ground slopes gradually down towards the lake in gentle undulations. The valleys, in the immediate vicinity of Mount Fumbi, are very fertile, and covered with quantities of Indian corn, dhurra, mtama, tobacco, semsem oil, and bananas plantations. The castor-oil tree is also often found. This hill is used as a refuge in time of war, and we found some tusks of ivory hidden away on the top, one of them weighing no less than 164 lbs. Kabba Rega is still supposed to have a quantity of ivory concealed in the swamps and rivers.

In the first expedition we left the high ground to our left, and found the road as far as Kangara hill very bad indeed; we had to cross two deep swamps, one called the river Tabashari. After this the country became more open, and covered with nice short grass. The road appeared very well used, and led along the base of the ridge, running north-east from Katonezi to the gorge at Kisoga, where there was a very well posted ambush of Wanyoro. This district was under a chief called Mbogo, who with Irata, another important chief, have now retired with their king into exile in the Lango country. We marched away over the waterless plain round Kaduku hill, another very prominent landmark to the Nile, which we joined near Kunguru island. The country here is very flat and open, and dotted about with lovely Borassus palms. It was hard to believe that the Nile was really in front of us—it looked far more like a great papyrus swamp; and, indeed, it was not till reaching Magia hill that one was enabled to see the water, and get a view of this magnificent river, over 1000 yards broad, and truly, as Speke described it, "a giant at its birth." Here we met Captain Dunning, D.S.O., and Captain Ashburnham, who had made their way with another column by a very good road along the river Kafu *viâ* Mruli. The former gallant soldier and best of comrades died afterwards, to our great sorrow, whilst we were transporting him and also Major Cunningham, both severely wounded, to our nearest station. I do not think Sir Samuel and Lady

Qatar National Library

Baker could have execrated the fœtid swamps and dense overgrowth more than we did whilst striving to get the stretchers over and across these obstacles.

The river Titi runs into the Nile close to Magia hill, and in rain is quite impassable. In the second expedition we travelled by a higher and much better road *viâ* Kibugumia and Katonezi, through the same gorge at Kisoga, and across the level dried-up plain to Mruli, where a column with Captain Teruan, D.S.O., and Lieut. Madocks joined us from Uganda.

The road through the hills was the main road to the old capital at Ruampara, and Kabba Rega's subjects were certainly obliged to keep the roads in very good order; the old bridges across the swamps, made of palm trees, were still standing. We found a small village called Chagwe in the plain, where the water was very bad and scarce.

Mruli used to be the old capital in King Khamrasi's time, in 1864, and has always had a certain importance from being on the main road to Uganda. This was the most southern post occupied by Gen. Gordon, and I saw the site of the old fort on the right bank of the Kafu. It is low and unhealthy, and there is a great deal of sud along the banks of the Nile here, which is also continually blocking up the mouth of the Kafu, only about 30 yards broad. A few miles up the Kafu there is a fine grass plain on both sides, where there are to be found elephant, kobus kob, Jackson's hartebeest, also smaller antelope. The river there is a nice running stream between steep banks, and several villages and banana plantations are scattered about in the distance.

The Nile at Mruli is about 900 yards broad, and had distinctly risen since I was there in February, and one was able to see the water over the papyrus. We heard afterwards that Lake Victoria had risen considerably, which would have accounted for it; in fact, the pier built by Colonel Colvile at Port Alice was completely covered with water.

After considerable opposition, the passage of the Nile was forced at Mruli, and the force crossed to the other bank, which is pretty steep, and at first gives one the impression of being an island. Canoes had been brought overland all the way from Lake Victoria, in sections, and the ribs were then sewn together. The Wanyoro do not understand making these canoes themselves, and only use dug-outs, made principally of the palm trees. Mr. Grant brought some canoes down the river from Namionjwa, one of which was called the flag-ship. It was hewn out of a single tree, and held easily fifty men, with a maxim gun in the bows.

We were now in the unknown Wakedi country, and made our way along the right bank of the Nile. The country was thickly wooded with very fine trees, and 10 miles to the east lay some high hills

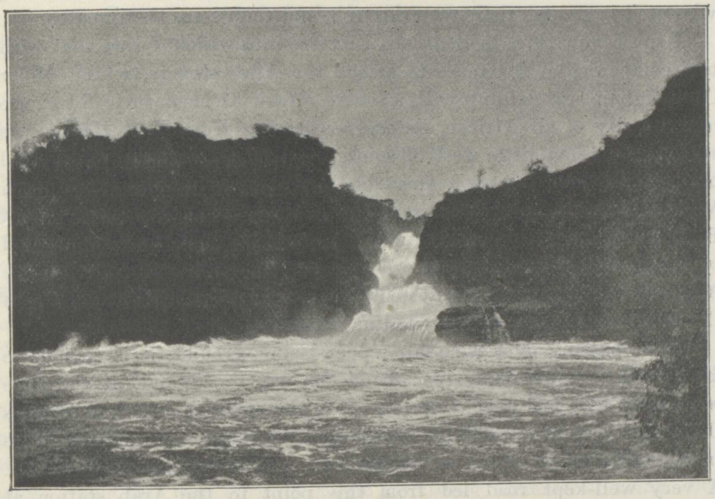
مكتبة قطر الوطنية
Qatar National Library



between Kalengary hill and the high Mahorsi ridge. I noticed several traps for hippos formed by upright poles with weighted spear-point arranged so as to drop on the animal. There was a lovely bit of country at Kitao, opposite Kajumbura island, covered with Borassus palms and shady trees, with a green lawn stretching down to the water's edge. The remains of Kabba Rega's residence, which he had well chosen, were still to be seen, and on the rising ground among the trees about a mile off were some Wakedi villages. Our troubles were now to begin, and between here and Foweira we had to cross deep swamps and rivers running into the Nile. No less than seven men were frightfully bitten by crocodiles, two of them about 100 yards behind me. Three succumbed to their wounds later on from blood-poisoning. A crocodile scare occurred very easily after this, and it was alarming to see the great mass of people swaying from side to side in the deep water in their endeavours to get out of the way of the supposed crocodile. Our next camp, Kosoka, was situated between the river and a curious hill called Kibuze, on the top of which are strewn large blocks of granite. This hill can be seen from Lake Kioja. On reaching Niamabare, I followed the course of the river Lenga for some way on a flying column with Lieut. Madocks. This is a large river, which, according to a Wakedi prisoner, extends for a long way inland. We passed through several large villages, which consisted of a quantity of big cone-shaped huts, with a curious entrance forming a porch about 3 feet in diameter. The interior of the huts was in some cases painted white, and ornamented with rough patterns. They had no protection in the form of a fence round, and apparently the people live in peace with each other, although they do not owe allegiance to any one man, and each village is quite independent of the other. This fact would make it rather difficult for any expedition entering the country, as, although some villages might be friendly, the others could not be depended upon. The people grow large quantities of mtama, dhurra, sweet potatoes, semsem oil, tobacco, beans, etc., and have plenty of honey. They possess few cattle or sheep, but a great quantity of dogs, usually about the size of a fox-terrier, and a yellow colour. The country is covered with low trees and bushes, and grass about 3 feet high. The people, as can be gleaned from their name, Wa Kedi, which means naked people, wear absolutely no clothes. They are a small race; the men have the centre teeth of the lower jaw taken out, and some have beads sewn on to a tuft of hair at the back of the head. They are a formidable race armed with spears and poisoned arrows, and are fond of attacking at night. Some days to the north-east along the Lenga is a country said to be full of camels, donkeys, and ponies, and a people wearing gold ornaments in their ears. The people north of the river Dukhi seem to be quite different, and have walled villages. This river runs into the Nile at Foweira; the current is very rapid,

and a large Waganda canoe was upset when trying to cross it, which resulted in the drowning of a very nice chief and about ten men.

We recrossed the Victoria Nile at Foweira, about where Sir Samuel Baker crossed in 1872, and although the river is about 500 yards broad in the open, and there is a strong stream, nearly all our two thousand cattle captured from Kabba Rega swam safely over. Navigation ends soon after this, when the Nile begins to dash down over the Karuma falls in a succession of rapids to the Albert Nyanza. In the angle contained by the Nile here the vegetation is very thick, and there is dense grass about 14 feet high, also what may be described as thin forest. A most wonderful old woman, wife of Khamrasi, the former

MURCHISON FALLS, VICTORIA NILE.

king of Unyoro, and mother of Kabba Rega, was captured on this expedition, with several members of the royal family, by Captain Ashburnham. She had escaped being thrown with the remainder of Khamrasi's wives into his grave as described by Baker. She is enormously fat and unwieldy, and is always carried about on an angareb (bedstead). She is reported to be very bloodthirsty, and used to think nothing of ordering fifty people to have their heads cut off in her own district, which used to extend south from Hoima to Bugoma. The royal family will not eat potatoes or bananas, and as women in Unyoro will not eat chickens or sheep, she is rather difficult to feed. However, as long as she gets plenty of pombe, which is the intoxicating spirit made from bananas, and plenty of milk, she is quite happy. It was curious to see in what awe the Waganda people seemed to be of her, and

BRITISH LIBRARY

I have heard the chiefs say that not one of them would dare to touch Kabba Rega even if they came up with him. We marched back from here to Masindi, where a strong fort was built, about $1\frac{1}{2}$ mile due west of Mount Fumbi, and a little east of Baker's old fort. It is exactly in the same latitude as Kibero, namely, 1° 41′ N., and Mruli is in 1° 39′ N. This is our most northern line of occupation; the whole of Unyoro has now been definitely declared to be in the Protectorate.

On our return to Hoima, we found that they had been having exciting times there with lions, which had carried off several people. The natives all said they had never heard of lions there before; they fortunately went away from Hoima after this, but took some women and children from Kitanwa in July. The grass huts proved little obstacles to the lions, who used to scratch their way through, and then seize the inmates.

I must now turn to Southern Unyoro, into which I was sent with two companies of Sudanese to attack the Arab slavers, whilst Major Cunningham was laid up with a severe attack of hæmaturic fever, the most deadly of all African diseases. Starting from Fort Hoima, we steered at first a little west of south on Msaga Ncasi, a high conical hill, round which there is a great deal of cultivation, and then through Misriandura, past the left of some high hills, which form the gate of Bugoma. This latitude, 1° 13′ N., was the most southern point reached by Baker in his route from Mruli to Vacovia, when he discovered the Albert Nyanza. We then crossed two big swamps, the headwaters of the Kafu, which can be seen winding away in the distance.

After passing over some fairly open rising ground, it is curious to find, 5 miles further on, a river about 30 yards broad, and, at the time we crossed it, 4 feet deep, running off in the opposite direction towards the Albert Nyanza. This river is called the Ravasanja, and would be impassable during the rains; it rises in the same swamps as the Kafu. A very well-kept road led from this point to the Arab station at Mwenda's, which we had the good fortune to surprise and capture, and where many slaves were found; also a quantity of gunpowder, arms, ivory, and a great quantity of cloth. I may mention that these Arabs had been in the country for some years, and it was on them Kabba Rega depended for his supply of gunpowder and guns in exchange for slaves and ivory. One woman told me she had been sold for three goats, with one goat extra for her child.

The country between Mwenda's and Kisimba is very fertile, and covered with banana plantations and cultivation. After crossing a deep swamp and river called Embaya, the country alters entirely, and one enters a line of rugged hills, covered with blocks of granite in curious and fantastic shapes. Streams rise in these hills, which rapidly become papyrus swamps. Passing through a gap in the hills, we gradually ascended to a high mountainous plateau, where there is a big village called Bianja. Further on we reached the Msisi river, which

BRITISH LIBRARY

flows to the west, turning and twisting through the high rocky hills on each side of it. We could see the Nakabimba fort, just built on a high hill south of the Msisi by Mr. Foaker; and to my delight and astonishment, who should come down to meet me but my former adjutant and brother officer, Captain Pulteney, whom I certainly did not expect to meet in this wild part of Central Africa. Mr. Foaker said he had seen the snow on Ruwenzori three times during the six weeks he had been there, but I was unlucky enough not to get a good view of it.

The fort is in latitude 38′ 24″ north of the Equator, and is 4582 feet above the sea, and it was naturally much colder and fresher. It is a wild and rugged country, but there are a good many Wanyoro living in the valleys among the hills. The Msisi in rain is very deep; it is crossed by means of a causeway made by bundles of papyrus heaped one over the other. I returned by a different route as far as Mwenda's for the purpose of surveying, leaving the granite hills at Bwyaga. Here we were almost on the watershed, and the ground sloped down to the Albert Nyanza on the west and north-west.

The territory between Hoima and the Msisi river used to be under the chiefs Rabadongo, Chikakule, Abaswese, and Mwenda, who have been hostile so long; they have all come in to make peace now, and the two former were at Kampala at the beginning of this year. The people have settled down, and are making roads and cultivating their fields. They are not so civilized as the Waganda, and their huts and villages are not nearly so neat. They make the same bark cloth, and dye it black by putting it into the mud of a swamp for one day, and then leaving it in the sun. Their musical instruments consist of primitive stringed instruments, drums, horns, and whistles. They believe in a god called Rubanga, to whom they sacrifice goats, chickens, etc., in case of severe illness or at the time of war, and there are medicine men called Ubandwa, who perform magic by killing animals, or using the leaves of plants. They used to try and bring disaster upon us by burying a sheep with its throat cut and head just out of the ground, also by leaving a chicken in an earthenware pot on the pathway; the Sudanese were always chary of going near these. After a funeral, the relations of the dead man sacrifice a goat, and are supposed to remain in the house for a period of seven days; and when a king died, there used to be a general slaughter for one day, when most of the inhabitants hid themselves as far away as possible. The men and the women are great smokers, and make very good earthenware pipes, also very good pottery.

The jiggers were a perfect plague in this country, though they are now making their way towards the East Coast of Africa. Besides various kinds of grain, beans, sweet potatoes, bananas, yams, etc., sugar-cane is grown in some places. Locusts form a certain food-supply, and white ants are eagerly sought after. The natives prepare coverings of straw on the hillocks where they are to be found, and capture them by means

BRITISH LIBRARY

of fire at the period of their transformation into winged insects. During a long night march we undertook to surprise Rabadongo, the king's katikiro, at Misriandura, and a force of Wanyoro and some Arabs, we were astonished about 1 a.m. at seeing fires in all directions, and at once concluded that our column had been detected, and that these were watch-fires to announce our approach. The country was hilly and thickly populated, and these fires made a very weird effect. It turned out afterwards that they were only the fires made to capture the white ants.

The climate of the uplands of Unyoro is a fairly good one, and is, I think, drier than that of Uganda. The maximum temperature registered at Fort Hoima, during the time I was there, was 89°, and the minimum 49°; as a rule, the thermometer did not go below 60° at night. The rains are very variable. In September, October, and November there is usually most rain; and July was the coolest month. There will be a great demand in this country for cloth, European clothing of all sorts, boots, shoes, etc.

In September I received orders to proceed to Uganda with a company of Sudanese from the Unyoro garrison, to take part in the expedition against the Nandi tribe east of Lake Victoria, who had been cutting up caravans on the main road to Uganda, and had also treacherously murdered a trader named West. I returned by a different and most excellent road by Mruli, and along the Victoria Nile to Lake Kioja.

On arriving in Uganda, I found that Mr. Berkeley had become commissioner, and was now at Port Alice. Kampala, under the charge of Mr. George Wilson, was in a very flourishing condition; the size of the town had increased, and was increasing daily, all the people seeming very happy and contented. An interesting event happened while I was there, which was the arrival of Bishop Tucker's large caravan, with which were five missionary ladies, the first who have ever reached Uganda, and I am glad to say that they all arrived in good health after their arduous march. There was great excitement among the people, who went in crowds to meet them. Bishop Hanlon and the English Roman Catholic mission had also arrived lately, after an adventurous march, and have established themselves on one of the high hills of which Mengo is composed.

We started from Kampala with the troops for the Nandi expedition on October 14, and marched round the lake, through Usoga and Kavirondo, crossing the Victoria Nile at Jinga. After a few days' delay at Mumia's to make the necessary preparations, we marched along the usual caravan road as far as Kabras before entering the country. There is a small depôt here, garrisoned by Sudanese, which has to supply the Guaso Masa fort with food. The great obstacle to transport has been the total absence of food between Kikuya and Kabras, a distance of

BRITISH LIBRARY

twenty-two days for a loaded caravan going up country, with the exception of the Eldoma station, which has only been made latterly, and is unable to supply caravans with food. In addition to this, the difficulties had been increased by the Wa Nandi being hostile, and waylaying caravans on the main route between the top of the Mau escarpment and Kabras, in consequence of which the Guaso Masa post had been established.

We could get very little information about the Nandi country, and had to trust principally to two Wa Kwavi, who had been in the country years before; to a Zanzibari porter, the sole survivor of West's party;

MOSINDI FORT, UNYORO, MOUNT FUMBI.

and a Nandi woman, who had fallen in love with him, and helped him to escape. He had been sent into the country by West for the purpose of trading, and was away at the time of the massacre; he was then taken before the Laibon, or head medicine man, and kept a prisoner, until this woman left her own husband, children, and country, and assisted him to escape. The man had picked up the language in a very short time.

From where we turned off the caravan road, a high black wall of mountains could be seen in front of us, running from north to south, when it becomes less perceptible. The upper slopes were covered with dense forest, which in some cases extended a little way down the escarpment. We soon left the last Kabras villages, in one of which the

BRITISH LIBRARY

Nandi had killed nine people two nights before, notwithstanding their high mud wall and deep ditch. Two of the Kabras natives came with us a short way to show us the path, but none of them would venture to accompany us far into the dreaded Nandi country. After passing through a small belt of forest, and then between some small hills covered with boulders of granite, we reached the place where West and his men were murdered—a gruesome spot, with several skulls lying about, also his table and chair. He had evidently been in no fear of a surprise, and had placed his camp near the edge of a thick wood, and close to a lovely stream of running water, which forms really the head-waters of the Narogare or Lusumo river. There was no zareeba round it, and at the time of the attack the men's guns had been put away in his tent, so that they were powerless to defend themselves.

We afterwards crossed the Anoldamwe and Katumbi rivers, and camped under a high rocky hill known as Kamobir, which is 2 miles distant from the escarpment. These rivers flow to the south, and finally form the Ichuko river.

Our camp was 5260 feet above the sea, and the country to the south-west was undulating and covered with short grass. Here and there were large clumps of forest, in which there are said to be a few buffalo. We saw tracks of these animals close to one of the streams. We marched along the escarpment the next day, where we discovered some small huts and patches of mtama cultivation, the first signs of the Wa Nandi. After several ineffectual attempts to get up, we found a very steep path, which led to an open grass-covered space close to the top, and we camped here at a height of 6332 feet. The column consisted of 250 men, about 300 followers, and 4 Europeans—Major Cunningham, Captain Pulteney, Dr. Mackinnon, and myself, and we used to pack into a thorn zareeba about 80 to 90 yards square. The officers' tents were together in the middle, and the men used to build small grass huts all round. This night, as I was visiting the sentries at midnight, a fire suddenly broke out among the huts of No. 9 company, and spread with the greatest rapidity, doing much damage, fanned by the strong wind that was blowing. The wind increased to a gale, and when morning broke it was intensely cold. The Zanzibaris and Lendu porters were stiff with cold, and could with difficulty carry their loads. Fortunately, they are the most light-hearted people, and soon became good-humoured, and began to chaff each other. It was found impossible to get through the thick forest in front of us, and we had, with disgust, to retrace our steps and make our way right down to the bottom of the steep hills again, and ascend by another route. This time we found a native track through the forest, and, passing over an altitude of 6850 feet, reached some scattered houses at a place called Samwiti. We then made our way in a northerly direction, through several belts of forest, and over swampy streams to Kimong, and from there east along a grassy spur to

BRITISH LIBRARY

Alagabiet hill, which is one of the main features of the country. Small clusters of huts were hidden away in openings in the forest, and the last village occupied by the Wa Nandi was near Kimong.

We had not seen many of the natives as yet, though poisoned arrows had been fired at us in the forest. I made the height of Alagabiet hill 7128 feet, and from the top of it one had a very good view over the valley of the Guaso Masa river, and across a very open country to the eastward, which is uninhabited. Hartebeest, water-buck, and oribi are to be found there. The country immediately south of Alagabiet is very swampy, which is caused by the streams running down this way from the forest, and we had to retrace our steps along our old road to

WANYORO CHIEF AND FOLLOWERS.

Samwiti. Captain Sitwell and Mr. Foaker were with another column, working in this direction, which, however, unfortunately missed us, and passed along the lower ground towards Kabras, down south to Kitolo's.

From Samwiti we steered straight for a high bluff called Usun, to the right of which there appeared to be a gap in the long line of hills in the far distance. The villages were now becoming more numerous, and there were cattle-tracks in all directions. There was still a good deal of forest about, belts of which run out from the main forest to the south-west. The weather was usually dull and cloudy, and there were occasional showers of rain in the afternoon and night. The natives first tried conclusions with us on the open ground east of the river Kimonde, which is about 6 feet deep, and crossed by a native bridge. There were two large bodies of them, from four to five hundred strong,

armed with big spears and shields, similar to the Masai. They seemed excellently organized, and, formed in three sides of a square, charged with tremendous dash almost on to the Sudanese, who received them with a very heavy fire. It was a critical moment, but luckily the Sudanese stood firm. Several of our men were killed this day, whom we could ill afford to lose.

The Nandi are a fine-looking race, very black, strong, and muscular. They dress their hair like the Masai, and are fond of covering it with red grease, also their bodies. The warriors wear big head-dresses made of monkey or goat skins, ornamented with cowries, and sometimes a sort of leather cape slung over the shoulder. They are great workers in iron, and we passed a very large smelting-furnace near the Kimonde river. Their huts are small and circular, lined with clay, and are scattered about the country without any protection whatever, showing that they have never had anything to fear from their neighbours. The women resemble the Masai very much, and distort the lobes of their ears, as a rule, with large pieces of wood. They wear a great many iron wire rings round the arms and legs. The spears are not so well finished, and the shields are not so finely ornamented, as the Masai ones; the latter are very heavy, and painted a dull red colour, as also are in some instances the spears.

About 8 miles beyond the Kimonde river we crossed the Amai river. After crossing the river, we reached a fine open country with rolling hills covered with many huts. The district is called Kiture, and is a very populous one. There is fine pasturage for cattle, sheep, and goats, of which there were many tracks along the paths leading down to the river. Further on we crossed two channels of the river Kaimeen by means of native bridges. The latter are made with big trees, and are quite the best I have seen made by natives, and our cattle, etc., were able to cross by them. My faithful companion, the pony, was still with me, and did better in this country than in any other. When suffering from jiggers in Unyoro, I do not know how I should have got on without him, though I could not take him with me always. There was a piece of bloodstained cloth hanging on the bridge, which was probably meant as a defiance. Several bodies of armed natives showed in front and on the flanks, and the column closed up and advanced very carefully to prevent the large crowd of porters and Sudanese followers, which are such an encumbrance, from being charged. Away to the north-east there extended a bare open plain, uninhabited, and with hardly a tree on it. We had been gradually ascending from 6627 feet at Samwiti to over 7000 feet, until we came to the end of the plateau, where there was a precipitous drop of nearly 1000 feet into the valley beneath. The blue waters of Lake Victoria could be seen to the south-west, beyond the plain which runs down to Ugowe bay, and to the south again the country appeared hilly and mountainous.

From a high hill called Teito the view was magnificent, and I was able to fix the position in longitude very accurately by bearings on Alagabiet hill and Eldalat hill, which bore 345½ and 350° respectively; I also took observations for variation of the compass. A good path led down to the valley, and it was quite like going from winter into summer. There was a great quantity of cultivation, principally mtama, which was ripe, and also a few sweet potatoes, which we had not yet found in this country. We ascended gradually again up the valley towards the gap, until the high bluff called Usun was close to our left. On reaching this point, which is called Kabarer, or Kamwentowe, we found a deep ravine in front of us, and on the far side there were what looked like a series of buttresses jutting out from the Mau escarpment, and the country looked very rugged and mountainous. Below us lay the Sagane river, which works its way almost from the very edge of the mountains through a lovely valley, completely enclosed by enormous hills, to the north called Engoroboby, and to the south Tinderait.

We descended by a steep path under a cliff, and some natives amused themselves by throwing down rocks, which came hurtling over the heads of the caravan. Fortunately only a few were thrown, and only three men were injured by splinters. We reached the Sagane river in one hour, at a point 5352 feet above the sea; it flows through a gap in the hills to Ugowe bay. There were a good many Nandi living in this valley and on the hills around. At the head of it we commenced the ascent of Mau by a native track through the forest, which commences almost immediately. We got among the bamboos near the top, and eventually camped at an altitude of 8900 feet, in an open space surrounded by clamps of bamboo forest. The difference between this point and our camp in the Sagane valley was 2860 feet, and it was a hard climb for loaded porters. The top of Mau consists of an undulating plateau, broken up in places by deep ravines, covered with short grass, and in places by clumps of forest. There are no inhabitants on the top of Mau, except some occasional Wanderobbo hunters, and the few tracks we saw were the paths used by Nandi raiding-parties. Although at this height, we were not safe from the Nandi, who hung round the column, and one woman was killed and another wounded, when going out a short way to draw water. It was very cold, and wretched for the men, and we usually had a cold sleet driving in our faces when on the march, also accompanied by a dense mist. We entered a series of small valleys, and had to cross several swampy streams, passing also a small lake. Some Jackson's hartebeest were seen, and there were also a very few tracks of buffalo, rhinoceros, and elephant. Our highest camp was 9100 feet above the sea, and from here we had to cut our way down through thick forest to reach the Uganda-Mombasa road. We spent nine hours cutting continuously, and I never was so glad as when we emerged on to the caravan road at a point called Campy ya Mwiba, or by the Masai Ngare

Lekonge, about 7 miles north-west of Eldoma ravine station. At this time I had fifty men with me, and was much hampered by having to carry two sick men on stretchers. It was nearly dark, and the prospect of having to spend the night in the forest without water was not a nice one. There was great delight among the Zanzibaris when they recognized the spot, as I think they had long given up the idea of ever reaching the road.

We reached Eldoma the next day, November 24, where Mr. Martin had built a very strong fort, situated on a hill not far from the ravine, from which, on a fine day, Lake Baringo can be seen flashing in the sunlight, and a lovely view obtained across to the Leikipia range. There is a very fine waterfall at the east end of the ravine, which divides into two channels. This was the furthest point the soldiers had yet been from their native country. This district is now under Mr. Jackson, who was for so long acting commissioner after Colonel Colvile left. A great quantity of food has been planted, and Masai are being induced to settle round. The opening up of the Nandi country will make a great difference to this station, as it is only two days to the fertile Sagane valley, where quantities of food can be obtained. The headquarters of a company of Sudanese are stationed here, under Hussein Aga. Our return journey was much easier, owing to the road being cut through the forest, and I was soon able to rejoin the main column at Mitele, to the joy of my men, who were glad to leave the bleak and inhospitable Mau plateau and bask in the sunshine again. Just before the descent the sun came out, and a lovely panorama unfolded itself. Looking down over the dark green forest, which extends and becomes thicker to the south, the different valleys could be distinctly traced leading to the great plain; the rugged hills near Usun showed up plainly in the foreground, and over them again the waters of the Victoria Nyanza. The next day we climbed up to the top of the range of hills known as Tinderait, and travelled across an open and very hilly country inhabited by the Wa Nandi. We were much delayed by small streams and rivers running down from the mountains, and we eventually camped on the third day close under the Endubo mountain, on a range running down towards the valley of the Nyando river, called by the Masai Kedowa, or Merto. There were a few people living on the mountains close, but this is about their limit, and there were no houses in the plain south or towards the lake. It is 59 miles from here to Lake Nakuro, and the Masai with us said there was a fairly good track over the mountains, and that it was open until the descent through forest on the further side. I fancy this track would bring one out close to the Guaso Masai river, and of course, if it could be used, it would shorten the route from the East Coast to Lake Victoria very considerably, as there is no difficulty in going along the Nyando valley to Ugowe bay, where there is a harbour.

We marched in a westerly direction from here into the big plain at a level of 4000 feet, which is covered with short grass, and a few thorn bushes and small trees. There are no inhabitants until one approaches the lake, when there are several villages belonging to a chief called Kitoto. Towering over the plain to the west rises the great Nandi escarpment, which runs right down to Ugowe bay, and then round by the Wa Tiriki and Maragotia hills. It was very hot and steamy in the plain, and there were thunderstorms in the evening and night. We crossed the river Enolgotwe, flowing between steep banks, and 4 miles further on reached the base of the hills, where we found a very well-marked road, evidently used by the Nandi to drive their cattle and

GUASO MASO FORT, NANDI COUNTRY.

flocks down to graze. We climbed up to the top of the plateau again, over 2000 feet, along a small watercourse, and on arriving there found the hills covered with boulders of granite, and very bare. There was a dense mist most of the day, and it was very cold and damp. The country reminded me exactly of Mr. Rider Haggard's description of the unknown country in his book 'The Children of the Mist,' excepting that we failed to find the beautiful princess, and were received with poisoned arrows instead. The poison did not have much effect when the arrows were taken out at once, and, under the skilful treatment of Dr. Mackinnon, the patients nearly all recovered.

About 9 miles from the edge of the plateau the forest begins. We travelled along it for some way before entering it, which we did by a very bad path, frightfully muddy and steep in places. This road brought

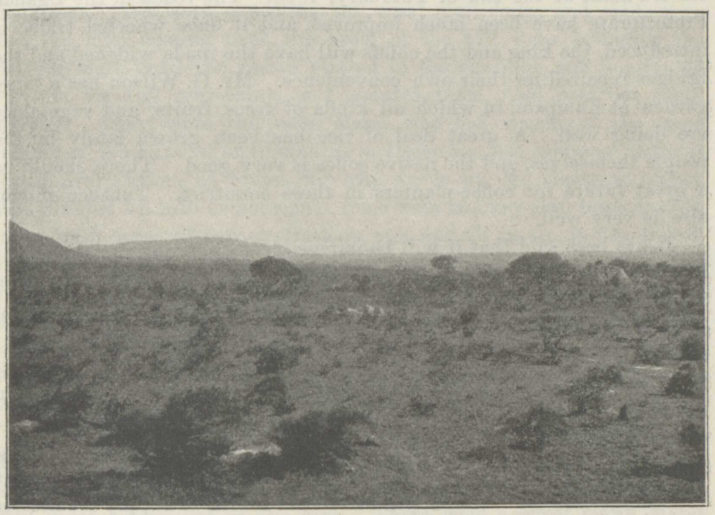
Qatar National Library

us out at a place called Kavaren, 6000 feet high, where we camped on rising ground near some small hills covered with blocks of granite. There were still a good many Nandi here. A belt of forest about 5 miles broad separates them from a large Kavirondo tribe called the Kabalusia, and it was curious to emerge from the forest into this populous and most fertile district, inhabited by an entirely different type of natives, thick lipped, curly hair, and very ugly. On all sides there extended fields of mtama, telebone, potatoes, and banana plantations. The people wear small skins, and I noticed an old Kavirondo woman with a stone fixed in her chin by way of an ornament. The people had a good many cattle and sheep, and must pay a large tribute to the Nandi. Between these people and the Kakamega, another section of the Wa Kavirondo, we crossed the river Rukus, or Rukuse, a very fine river 25 to 30 yards broad, which flows through a gap in the Nandi escarpment, after it has received the Kimonde, Amai, and Kaimin rivers, and flows into Lake Victoria. We did not arrive among the usual walled villages of Kavirondo until we reached the Asori people, not far from Mumia's. The whole country between Nandi and Mumia's, where we arrived back on December 9, is densely populated, and very fertile. The caravan took four hours to cross the Lusumo river by means of a creeper bridge. There was a very strong stream, but the cattle and donkeys managed to swim across further up. One of the donkeys was swept past us down the rapids, being tossed about among the rocks, and we were astonished and pleased to find him alive at the lower end of them. The river is full of crocodiles, and one of the people from the fort was carried off in the act of drawing water at the crossing. At Mumia's we joined forces with another column under Captain Sitwell, and on December 14 started into the country again by a route a little north of the one previously taken.

The Nandi are ruled by a medicine man called the Laibon, who lives near Moran, close to the edge of the plateau. Under him there are several Leigunanis, or leaders of bands. The people consult the Laibon in everything, and he advises them as regards their expeditions and war-parties. I am afraid he has rather lost his reputation since we entered the country, and the last news was that he had been obliged to leave the country hurriedly. He told his people that they had got nothing to fear from us, as the powder would soon get damp, and then our cartridges would not go off. The Nandi war-parties have been in the habit of raiding the country far to the north, and, similar to the Masai, their custom is to attack at night. The people speak the same language as the Sotik, Lumbwa, and Kamasia peoples, and intermarry with them. They are also friends with the Kabalusia, Kakamega, and Wa Tiriki people.



The Nandi country lies at an average height of over 6000 feet above the sea, and is excellently adapted for colonists. There is perfect grazing

BRITISH LIBRARY

ground, and the people have large numbers of cattle, sheep, and goats. I had my pony with me the whole time, and he was never sick or sorry. The soil is very fertile, except in the northern portion beyond Alagabiet, where it is stony and barren. The climate is a very good one; it is cold at nights on the high ground, and the thermometer rarely went over 80°. There was a good deal of rain at night when we were there. I am glad to say that before our departure the Nandi had made peace, and sent in presents of ivory. What surprised them more than anything was the fact of the Sudanese women accompanying their husbands on the war-path. It would be a great shortening of distance if the road, or even the railway, could be run through the Nandi country to Mumia's,

VIEW OF NANDI COUNTRY SOUTH FROM GUASO MASO FORT.

after the ascent of the Mau mountains has been made by the usual route past the Eldoma station. At a point on the top of the escarpment the ground slopes gradually down towards the Rukus valley; it is an open slightly undulating plain, until the Nandi villages are reached. A belt of thick forest, from 8 to 10 miles in width, forms rather an obstacle, but after this Kavirondo and a fine open country is reached. Instead of passing through an uninhabited desert as at present, a cultivated track would be reached very soon, and the district between Nandi and Mumia's is the most food-producing centre of this part of Africa. With a railway from the coast, and steamers on the Victoria Nyanza, timber and fuel will be in great demand, and this Nandi forest will be of inestimable value. Some of the trees are very fine ones, and the supply would last for a great number of years. As will be seen from the map, the forest

The Geographical Journal(Journal of the Royal Geographical Society): Volume IX, No. 4 [200v] (71/172)

stretches a long way from north to south, and the edge of it is not far from Ugowe bay. In Kavirondo, with the exception of Kikelelwa's forest, hardly a tree is visible, and great difficulty is experienced in getting wood. No one realizes what Captain Lugard did for our rule in Central Africa, by going over to the west of Lake Albert, and enlisting these former soldiers of Emin Pasha's in our service. Needless to say that without them it would have been almost impossible to have held the country.

On our return to Uganda, we marched along the right bank of the Nzoia, and through the Wanifa country to the Maandi hills, and on to Port Victoria at Berkeley bay. After a short time spent in Uganda, I started home at the end of February, 1896. The roads in the Uganda Protectorate have been much improved, and if once wheeled traffic is introduced, the king and the chiefs will have the roads widened and the bridges repaired for their own convenience. Mr. G. Wilson has a large garden at Kampala, in which all kinds of trees, fruits, and vegetables are doing well. A great deal of rice has been grown lately by the people themselves, and the native coffee is very good. There should be a great future for coffee-planters in these countries. Tobacco should also do very well.

It has been said that it will be impossible to get native labour, but I can only say that at present in Uganda itself the people have been induced to carry loads in the Protectorate, and perform a certain amount of work; numbers of natives bring in timber for Mr. Hobley at Mumia; until the outbreak of Masai, hundreds of Wa Kikuyu were carrying loads to Eldoma; and at Machakos they have been induced to work in the fields. Owing to the administration of the country, a cessation of war, and internal strife, the population of Uganda and the surrounding countries is increasing largely. As they become more civilized their wants will increase, and they will be forced to work to supply themselves with the necessities of life. Wonders have been done by the missionaries, and no end of the people are able to read and write. One still sometimes meets horrible objects in the streets without hands, noses, ears, or lips—awful proofs of the old barbarities.

A regular post has been established, which the chiefs avail themselves of to write to each other.

On my way home, I was sorry to see the ravages caused by the locusts in the magnificent banana plantations of Usoga. All the leaves were eaten off the trees, and the people had given up driving them off in despair.

One result of the railway will be that horses and donkeys will be transported rapidly through the belt of country infested by the tsetse fly, lying between the Tsavo and Kibwezi, and ought to reach Uganda in good condition. Animals do well there, if properly looked after, though dangers exist in snakes, and bad grass met with in places. It

is a great pity that a determined effort has not been made to capture young zebra, and to tame and train them for transport purposes. Even in Uganda itself there are zebra, near Lake Isolt, in the province of Singo, also in Buddu and Chagwe. The rinderpest, which killed so many cattle and buffalo, seems to have died out. Small herds of buffalo have been seen lately by government officials in various parts of the Protectorate.

A silver currency has already been introduced, several loads of rupees having been sent up from the coast, and the days of beads and cowries are numbered. An interesting event, on the way down to the coast, was the meeting of a Masai war-party while crossing the Mau mountains. We were expecting the coast mail daily, and made sure that the men coming over the brow of the hill were bringing the precious mail, until the spears glinted in the sunlight, and finally 487 warriors, in full war-paint, as I counted them, filed past our small caravan. They were the same Masai who had massacred the large number of Wa Kikuyu and Swahilis in December, not, however, without strong provocation, as found out afterwards by Mr. Jackson. They were divided up into detachments, some with monkey-skin head-dresses, others with capes of ostrich feathers, etc., and all in single file, travelling very rapidly. Some cattle and goats were being driven after them, to provide them with food on the journey to Ingoboto, east of Mount Elgon, to raid the Kimariongo tribe. We congratulated ourselves on their being friendly, and, after a talk with the leaders, who were very anxious for us to go with them, passed on our way. At Naivasha we met Captain Sclater and Captain Smith of the Royal Engineers, with a party making the waggon-road from Kikuya to the lake. Their carts had reached this point from the coast. The road down the Kedong escarpment was nearly completed, having been cut with great labour out of the rock. There were a great many Masai kraals between the Gilgil river and Naivashe, and I met the great chief Terary with his old father, who weighed 20 stone.

On arriving at the coast, we found a great change had taken place in Mombasa, owing to the railway, work on which had just been begun. A hotel had been started, and shops of all sorts; also a Cook's Agency, which I trust will soon be advertising tours to Lake Victoria and Uganda.

In conclusion, I wish to pay a tribute to my commanding officer, Major Cunningham, who conducted all the expeditions I have mentioned with such skill and success, and who gave me every facility for mapping and taking observations. He is, I suppose, a unique instance of a white man in Africa who does not grumble and become ill tempered when he has fever, and I feel lucky to have had the good fortune to serve under him.

BRITISH LIBRARY

Before the reading of the paper, the PRESIDENT said: This evening we are to listen to a most interesting paper by Lieut. Vandeleur, who has been for the last two years in Uganda and Unyoro, and who not only has visited the localities rendered famous by Speke, Grant, Baker, and Gordon, but has also explored a great deal of most interesting country previously unknown. I will now call upon Lieut. Vandeleur to read his paper.

After the reading of the paper, the following discussion took place:—

The PRESIDENT: We have the pleasure of welcoming here to-night Major Cunningham, Lieut. Vandeleur's commanding officer, and I am sure the meeting will be very pleased if he will kindly address a few words to us upon the subject of the paper.

Major CUNNINGHAM: I should like to say how carefully the map has been compiled by the lecturer. It is not an ordinary sketch, but it is made by observations of latitude and longitude, very often effected under great difficulties; having to watch for any particular star with the mosquitoes round about you is really difficult work. One of the points in the lecture I shall have to draw attention to is about labour in Uganda. They do labour now a good deal, but it is not quite free labour; it is obtained, of course, from the chiefs, and we don't quite know how much pressure is brought to bear upon the peasantry by the chiefs in order to bring them to the scratch. The Masai, although a source of trouble outside, are quite quiet in our own territory; but they are in the habit of going raiding in the territories which will some day come under our administration. They have seen our expeditions go out to punish people for murder and that kind of thing, and the usual way to punish a native tribe is to take away their cattle; they have, therefore, come to the conclusion that we are cattle-raiders. The result was, that when we met this party going out for a raid, after we had refused to go with them, they asked us to tell them where the cattle were. The Nandi country could undoubtedly be colonized by Europeans, who could live there and rear their children there—more than could be said for a good many of these countries. A great obstacle to the peaceful settlement of Uganda and Unyoro is now removed, as Kabarega now lives on the other side of the country, and nearly all of his people have come back, and will gradually settle down. In conclusion, I will say how well supported I was by my officers and men, the Sudanese especially, and there is no doubt Captain Lugard did a very good stroke when he secured the services of these men from the other side.

Dr. J. W. GREGORY: Considering the number of times that Unyoro has been traversed by Europeans, it is surprising how difficult it has been to get any precise cartographic information about it, and many questions of geographical importance await solution until we have a correct map of that district. I should say, from the numerous traverses made by Lieut. Vandeleur, that when his map is published, it will help materially in the study of that district. We have all listened to the paper with great interest, as Unyoro has always been regarded as a political dependency of Uganda; and if Uganda is to be made the key to the upper Nile valley, it is absolutely necessary to get a clear and safe road through Unyoro. In the campaign for the establishment of British supremacy there Lieut. Vandeleur played a very conspicuous part. I am sure every Fellow of this Society will have been pleased to hear Lieut. Vandeleur's tribute to the wisdom of Captain Lugard in introducing the Sudanese into Uganda, as they enabled us to maintain our hold over that country.

The PRESIDENT: Sir Harry Johnston is such a very old friend of ours, and we are always so pleased to hear him, that we shall be glad if he will address us to-night, as I think it is likely that, with his knowledge of Africa, some fresh geographical ideas may have occurred to him while listening to this interesting paper.

BRITISH LIBRARY

Sir HARRY JOHNSTON: I won't detain you, at this late time in the evening, with any remarks more than to say how much interested I have been in this paper, because, of course, the greater part of Buganda and, I should say, Bunyoro belong to what may be called Bantu Africa—that is to say, to that portion of Central Africa inhabited by races speaking tongues allied to the Bantu stock. I am particularly interested in the Baganda, as they are generally called in their own country, from the fact that so many have followed me in almost all my expeditions in Eastern and Central Africa. In 1884, when starting for Kilimanjaro, Sir John Kirk entrusted to the late Mr. Stokes the organization of my caravan, having great confidence in his judgment of men, and Mr. Stokes picked out some Baganda who had in some way or other found their way down to Zanzibar, and a few of them are to-day serving the British Government in the British Central Africa Protectorate, having remained with me ever since; they are now settled in Nyasaland, and will probably remain there for all time, still maintaining their Luganda speech between themselves. There is a great community of feeling all along the great lakes, as the people are of kindred origin and not much separated from the parent stock. The language spoken in Bunyoro and Buganda belong to the most archaic forms, almost being the Sanscrit or Lithuanian of the Bantu family. It is to be hoped that, in organizing this Protectorate, we shall endeavour to compile vocabularies of these languages before they are too absolutely corrupted by Swahili, because it would be an immense help in throwing light on the structure of the Bantu group. I almost take for granted that in Buganda and Bunyoro, Swahili, the language of Zanzibar, is becoming the universal language of the country. It is inevitable, as it is, of course, impossible for Europeans to attempt to learn every single dialect. We must have some common language, as in India, where Hindustani is the medium of expressing our thoughts to the natives in such a simple fashion as to be understood, and I should say Swahili is in every way fitted to be that medium, and it is to be hoped—and it is a hope expressed for some years past—that we may before long possess a chair at either one or other of our universities for the teaching of Swahili in a scientific manner, so that officials may arrive with some knowledge of the language, which will enable them to make themselves understood almost anywhere between the Equator and the Zambezi.

The PRESIDENT: We have to thank Lieut. Vandeleur for more things, I think, than the paper read to us this evening. Lieut. Vandeleur has been well known to us for some time as a good observer. I remember being astonished at the accuracy of his route survey, made with very small means, when shooting lions in Somaliland. He has now done much bigger work, and I feel he is of the stuff of which our gold medallists are made, a man despising dangers and hardships, an ardent sportsman, conciliatory to the natives, and a good scientific explorer. In his paper he has pleased us, first of all, by bringing to our minds the memories of our great explorers of former days, and describing some of the scenes which they visited—of Speke and Grant, of Baker and Gordon. I remember, now many years ago, that Dr. Norton Shaw came to my house with a young officer, who said he believed he had discovered the lake source of the Nile, asking me to go with him to Sir Roderick Murchison, and induce our President to undertake an expedition. Well, that expedition was undertaken at the joint expense of the Royal Geographical Society and her Majesty's Government, which I submit is a most excellent precedent. We heard from time to time from men who went up the Nile hoping to obtain news of Speke and Grant. At length the great explorers themselves arrived, and almost entranced us with the importance of their discoveries and the charming way they described them. We then had equally fascinating accounts of the routes of Sir Samuel and Lady Baker and Gordon. Lieut. Vandeleur

BRITISH LIBRARY

has brought all these things to our minds by visiting the same places. The two most interesting of his photographs were those of the Murchison falls. He has done a great deal more than this, for he has explored countries hitherto quite unknown, especially the highlands beyond the Victoria Nile and other upland countries further to the eastward. We also have to thank him for his interesting photographs, and especially for that magnificent display, the results of his rifle, which has been arranged in the other room—as fine a show of heads as I have ever seen. It is a great pleasure to us all to know that the Queen has commanded both Major Cunningham and Lieut. Vandeleur to proceed to Windsor Castle to-morrow, to receive from her Majesty's hands those distinctions which they fully merit and have so nobly won.

It is for us on this occasion to return our warmest thanks for what they have done in exploring work, and to Lieut. Vandeleur our hearty thanks for the interesting paper he has read to us.

LIEUT. VANDELEUR'S MAP.—The map has been reduced from Lieut. Vandeleur's original drawing. The route from Kampala to Munia is the same as the railway route surveyed by Captain Pringle, and published by the Intelligence Department (see *Journal*, vol. ii., 1893, p. 112). Other additions have been made from Dr. B. Hassenstein's maps, published in 1892 and 1895 in *Petermanns Mitteilungen*.

THE SOUTHERN BORDERLANDS OF AFGHANISTAN.*

By Captain A. H. McMAHON, C.I.E.

I AM going to take you along the southern border of Afghanistan from the Gomal river to the Persian frontier, and will endeavour to describe the country which forms the southern portion of Afghanistan and the northern portion of what is commonly known as Baluchistan.

I purpose to confine myself chiefly to a brief geographical description of the countries traversed by the Baluch-Afghan Boundary Commission, which, as one of the results of the Durand Mission to Cabul in 1893, recently delimitated and demarcated the boundary between the territory belonging to the Amir of Afghanistan and that under the government of India, from Domandi, a place on the Gomal river, to Koh-i-Malik-Siah, on the Persian border. The Koh-i-Malik-Siah mountain marks the southernmost point of the boundary between Afghanistan and Persia, as agreed upon by those two governments, after the Seistan Mission of 1872, when General Sir Frederic Goldsmid, assisted by General Sir Richard Pollock, acted as arbitrator between those governments.

The Baluch-Afghan Boundary Commission started in March, 1894, and by June, 1896, succeeded in laying down the boundary-line to Persia. The length of this line from the Gomal to Persia is over 800 miles, and it took us nearly two full years to complete it. To give a detailed description of over 800 miles of country, or of the varied personal incidents of the two years' wanderings of the mission in that

BRITISH LIBRARY

country, is impossible in the small compass of this paper; and I can only give the general characteristics of the country, with a few remarks here and there on places of more than ordinary interest. In our wanderings we traversed many tracts of country hitherto seen by only a very few Europeans, and again large tracts hitherto unvisited by any Europeans at all.

The general characteristics of the whole country we traversed are, I may say, barren dryness—barren hills and mountain ranges and vast open plains, where, in most cases, either want of water or the unsettled state of the people has prevented the cultivation of the soil. Rocks and stones, varying from the size of the huge gigantic boulders on the mountain-sides to that of the small pebbles and shingle of the strands of the dry torrent beds, cover the greater portion of the surface of the country, while another large portion is given up to deserts of deep soft sand. Throw in here and there springs of water of widely varying medicinal properties and every degree of saltness, and you have a rough general idea of the country I am describing. To those who indulge in varied mineral waters, and would like to test the varying effects of petroleum, sulphur, ammonia, potassium, either mixed or by themselves, I can recommend them to pay a visit to that country. But they must remember that, unfortunately, none of the springs are labelled, and so you don't know until afterwards what you are drinking.

However, I must not lead you for a moment to suppose that this country has no redeeming features. Refreshing green oases here and there, sometimes in the form of green wooded valleys with rippling streams of pure water, sometimes in forest lands along the high mountain-tops, sometimes in the form of extensive tracts of rich cultivation in wide valleys and plains, break the monotony of the vast wastes around, and afford a relief to the eye and a pleasure to the senses which none but travellers in that country can fully realize. Then, again, the clear, dry, sparkling atmosphere, the deep blue cloudless skies of the greater part of the year, and the almost boundless horizons produce feelings of exhilaration and a sense of freedom which go far to make up for the shortcomings of the country in other respects. Last, but not least, we find the inhabitants a fine manly race, whose love of independence is as rugged as their hills, and whose stubborn bravery is unquestionable. With fair complexions and splendid physique, they form for the most part a magnificent race of men.

On April 5, 1894, our mission reached Domandi, a dreary uninhabited spot 3500 feet above sea-level, at the junction of the Gomal and Kundar rivers, the starting-point of the boundary-line which we were to lay down. Our party consisted of six British officers: Captain R. J. Mackenzie, R.E., was the survey officer; Captain C. Griffiths, 16th Bengal Cavalry, and Captain F. G. Fowler, 1st Baluches, commanded the cavalry and infantry escort; Surgeon-Captain F. W. Gee was our

BRITISH LIBRARY

medical officer; and Lieut. R. A. E. Benn came as intelligence officer. We had an escort of 150 infantry and 60 cavalry. Our whole party, including escort, survey party, office establishment, and tribal chiefs and followers, amounted to about 1000 men and 600 animals, *i.e.* camels, horses, and ponies. The Afghan commissioner, who subsequently joined us, brought an escort and camp following amounting to much the same number as ours. The Afghan commissioner was Sardar Gul Mahommad Khan, a near relation of the Amir of Afghanistan.

Domandi deserves a few words of mention. Here the Gomal and Kundar rivers meet and form one stream under the name of the Gomal,

KHORASSAN PLAINS, LOOKING TOWARDS DOCHINA AND KATAWAZ.

which, some 80 miles below Domandi, after cutting its way through narrow gorges through the Suleiman range, issues out on to the Derajat plains of the Punjab. The Gomal has for many ages been a great trade route between Afghanistan and India. The Ghilzai and Lohani tribes, both of whom are commonly known under the name of Powindahs, come down in their thousands year by year in the autumn from the highlands of Afghanistan by this route to India, bringing with them their women and children, and huge herds of camels, sheep, and goats. Over 70,000 camels are sometimes known to be thus brought down in one season. The various tribes which compose the great Ghilzai and Lohani clans, *i.e.* the Suleiman Khels, Nasirs, Kharotis, Mian Khels, and others, after the manner of Afghan tribes, are mostly at feud one with another, and so they find it more convenient to avoid each other on their march up

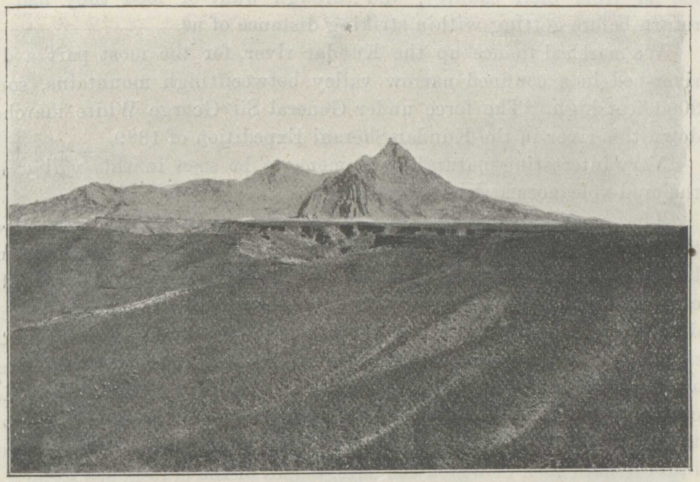
مكتبة قطر الوطنية
Qatar National Library

and down the Gomal. They have, therefore, a regular order of going fixed by long-established custom, and according to this order they move down tribe by tribe each autumn from the highlands of Afghanistan to the plains of India. When the heat of the Indian spring sets in, they all turn their faces homewards, and tribe by tribe, in the old-established order, they wend their way up the Gomal again to the cooler regions of their summer highlands, which they know by the general name of Khorassan. Above Domandi, about half of them continue up the Gomal river, and the other half takes the more western route along the Kundar river. Lieut. Broadfoot, in 1839, travelled in disguise from Ghazni with a Powindah Kafila to India, and an account of his adventurous journey is to be found in the earlier records of this Society. He is the only European who had ever been along the Gomal route above Domandi.

The journey of these Powindahs is not a peaceful one by any means. The Waziri tribe, whose country fringes the Gomal route from the plains as far as Domandi, have from time immemorial laid in wait for these passing caravans, or kafilas, as they are called, and year by year have exacted their tribute of blood and loot from any caravan that, from inferior numbers or want of precautions, may have offered an opening to their ever-watchful enemies.



At the time of our stay at Domandi in 1894, the Waziris were making themselves particularly objectionable. The yearly exodus of the Powindah tribes from India to Afghanistan was at its height, and kafila after kafila of these tribes used to pass our camp, all with the same tale of woe—so many men killed and wounded at one place on the road, and so many camels carried away at some other place by the hated Waziris. To see these large kafilas passing, as we did, day after day for many weeks, was a very interesting sight. First of all came their advance party of fighting men, armed to the teeth with guns, pistols, swords, and shields, those on horseback often armed with a long lance in addition to their other martial equipment. With these march their musicians with drums and sirinais, which are a rather pleasing kind of reed instrument. Every now and then one of the footmen breaks into a dance, singing at the top of his voice, and spins round and round waving his sword and rifle; another and another join in, and they dance madly round until exhausted or the rough nature of the ground makes further dancing impossible. On approaching the place where they intend to camp, music and dancing are renewed with redoubled vigour, and often continued until the ladies of their household, who are following behind, have arrived, and have erected the tents and arranged the belongings of their lords and masters. After the fighting men come long strings and strings of camels, donkeys, and cattle, sheep and goats, accompanied by more fighting men, and crowds of women and children. All except the men are laden with something—the camels with heavy loads of merchandize or household belongings, others with gaudier trappings carrying

BRITISH LIBRARY

the women folk of the wealthier men; and you see women staggering along, one with a child on her back, another with a lame sheep under her arm; children carrying smaller children or kids or lambs. Then come the donkeys and bullocks, some with loads, others with children and babies roped face upwards on their backs. One by one, as they reach the camping-ground, the women and children unpack their belongings and set up their tents; the latter is not a difficult process, as it only consists of setting up four sticks and draping coarse black goathair blankets on the top and round the sides. Then the boys and a guard of well-armed men drive off the camels and flocks to graze on the adjacent mountain-

ZARMELAN PLAIN AT DOMANDI.

sides, while the remainder lie down in the shelter of trees and rocks and lazily watch their women folk laboriously fetching water and cooking the mid-day meal.

There is one feature about the Powindahs' return journey to Afghanistan which makes it preferable, if you have the choice, to march with them on their autumn march to India rather than with them, as we did, on their return march to Afghanistan. What I mean is this, that all those who die on the march down or during their winter stay are buried, but many of them are dug up again on the return journey and carried home to be interred in Afghanistan. If you see a camel coming along with long suspicious-looking boxes on his back, you know they contain some defunct Powindah making his final journey to his last resting-place.

We stayed at Domandi some three weeks, and while there our presence ensured the protection of the passing kafilas, and we ourselves

مكتبة قطر الوطنية
Qatar National Library

were fortunately left alone by the marauding Waziris, who were too busily and more profitably employed in attacking and looting the Powindah kafilas further down the Gomal river. In this we were fortunate, as our small camp would have fared ill in a fierce, sudden night attack of the nature which was made on the brigade under General Turner a few months afterwards at Wano, a place only some 30 miles from Domandi, during the subsequent Waziri expedition, when a force was sent into their country. The Waziris did, it is true, some while after our departure from Domandi, send, as a sort of after-thought, a large picked raiding-party after us; but we had by then got too far from their country, and through want of food they had to return before getting within striking distance of us.

We marched thence up the Kundar river, for the most part a dry river-bed in a confined narrow valley between high mountains, some 9000 feet high. The force under General Sir George White marched down this river in the Kundar Sherani Expedition of 1889.

Very interesting natural phenomena to be seen in this valley are the mud volcanoes at Khut Kanda.

These curious volcanoes are situated on a neck of high ground on the south bank of the Kundar river. We saw some ten or more craters, large and small, in activity, and all round were a large number of dry craters of inactive volcanoes. These craters vary from 2 to 30 feet in diameter inside. It appears that, while the active craters are constantly drying up and become inactive, new active ones suddenly make their appearance close by. These volcanoes are of a thick liquid mud, which comes bubbling up from below, and every now and again surges over the crests of the craters. The mud deposited by this overflow forms into the hard rock of which the outer slopes of the craters are formed.

After some two months in the Kundar valley, where the heat and bad water seriously affected the health of our camps, we gradually proceeded onwards up the Kundil and Sharan Toi rivers, ascending into higher and higher levels until, by the end of June, we reached the highlands of Khorassan.* Here we found ourselves in country hitherto unvisited by Europeans, up in high open sandy plains varying from 6000 to 7000 feet above the sea—in the summer grazing-grounds of the Ghilzai Kakar tribes.

These wide plains are intersected here and there by long mountain ranges of no great height above the level of the plains, but some 8000 to 9000 feet above sea-level. Here hill and plain alike are covered thickly with a small bushy plant about 2 feet high, called by natives tirkha, and known to botanists as southernwood, or artimisia. Its pleasant perfume pervades everything, and its forms the staple grazing

* Major Ivar MacIvor, C.I.E., Political Agent, Zhob, traversed a portion of this tract as far as Tirwa in 1892.

food of the huge flocks of camels and sheep which the Ghilzais and Kakars bring up here in the summer months.

We have now reached a tract of more than ordinary interest, as we have ascended to the western watershed of India—I mean the watershed which divides the drainage flowing into India on the south and east from the drainage flowing into Afghanistan on the north and west. You will see, from the map, that all the water that flows from here to the north and west flows into Afghan lakes and rivers, while that to the south and east eventually, by the Gomal and other rivers, joins the great river Indus.

Both these river systems differ widely in character one from the

LORA RIVER AT ITS JUNCTION WITH THE SHIRTO RIVER.

other, and both present very remarkable features seldom to be found elsewhere. If you look at the rivers flowing towards India, you will see that their general direction is at right angles to the lines of mountain ranges which separate them from India, and which they have had to cut through one by one before reaching the lower levels of the Indian plains. In cutting through these ranges these streams have formed deep, narrow gorges, which, in each successive range, become deeper and deeper as the level of the river-bed sinks lower and lower below the level of the crest of the range. Thus, when we come to the last range of mountains, which are commonly known as the Suleiman range, we find the drainage flowing through narrow gorges of almost

مكتبة قطر الوطنية
Qatar National Library

stupendous depth. It is hard to imagine anything finer than some of these gorges. Some of them, such as those in the Vihowa and Kaha rivers, and especially those in the streams known as the Chuhar Khel, Zao and Gat Dhanas, are really marvellous gorges, wild and gloomy in the extreme. They are so narrow at the bottom that you can often touch both sides with your hands. Their walls of massive limestone rock rise perpendicularly upwards for several thousand feet. In places the sky is seen through a small slit, as it were, overhead; in other places, the walls overhang and so nearly meet overhead, that the sky is invisible from below. It is naturally impossible to give any real idea of one of these stupendous gorges in a photograph, but I will now show you a photograph of a very much smaller one, from which you can perhaps form your own impressions of the many other infinitely finer ones I have referred to. Notwithstanding the high mountain ranges which have stood in their way, these rivers reach the plains, and eventually find their way by the Indus to the ocean.

Now let us look at the other river system—I mean the rivers flowing into Afghanistan. You will see that they have not had the same difficulties to contend with in finding their way to lower levels, as they flow parallel, and not at right angles, to the mountain ranges. So far all has gone well with them, but not for long. All well-conducted rivers should reach the sea; none of these ever do. Those to the north get no further than the Ab-i-Stada lake, a wide sheet of water over 7000 feet above sea-level. Others meet a similar fate, but at a lower level, in the Lora Hamun; while the greater number join the Helmand, which, after a long journey, deserving a better ending, comes at last to a standstill in the lakes and swamps of Seistan. All these lakes are as salt as salt can be, and many of them, like the Ab-i-Stada and God-i-zirreh, are enclosed in wide margins of solid dry salt.

To revert to the highlands of Khorassan. We reached there in June, 1894, and thoroughly enjoyed the pleasing change of these cool breezy plains after the heat of the deep confined valleys we had been in. By the end of September, however, we began to find that the pleasant coolness of the summer had changed to severe cold. Our nomad friends the Kakars and Ghilzais had all departed east and west towards their warmer winter quarters, and none but the few resident Lowanas were left, and we ourselves were glad to leave. The winter cold in these parts is very severe, and the wide plains are swept by a cold wind, which, if the natives are to be believed, is death to the unwary traveller who may be caught by it away from shelter. The large heaps of whitened bones we found here and there near the marks of old Lowana encampments marked the places where whole flocks of sheep and goats had been frozen to death during the exceptionally severe snowfall of the preceding winter.

Descending from these highlands by various deep river valleys, and

BRITISH LIBRARY

passing from the country of the Ghilzais and Kakars into that of the Atchakzai and other Durani tribes, we got into the Kadanai valley. It was now late in December, the cold was very severe, and our thermometers registered as low as 8° below zero. It became a serious question whether we would be able to get over the high Toba mountains which lay between us and the Chaman plain before the heavy winter snow set in, and snowed us up for the winter. As it was, we ran it rather fine, for we only succeeded in getting our camp over the high Kanjasu pass the evening before heavy snow set in and entirely closed the passes we had just used. The following night, although we were encamped in a deep, narrow sheltered valley, the cold was intense, and no less than eight of our baggage camels were frozen to death. This hastened our movements, and we lost no time in getting down into the plain north of Chaman.

We reached the little frontier cantonment of Chaman on Christmas Eve, 1894, where we saw the first new white faces we had seen for exactly nine months. Needless to say, our Christmas was made a very pleasant one by the kind hospitality of the Chaman garrison.

Those who visit Chaman generally think they have reached the end of the world, and can hardly realize the feelings with which we viewed that dreary little station. To us it seemed, after our wanderings in the wilds, a veritable metropolis of civilization.

The Afghan commissioner, Sardar Gul Mahommad Khan, was now succeeded by Sardar Mahommad Umar Khan, the chief of the great Nurzai Durani tribe.

Proceeding southwards from Chaman, we completed boundary demarcation by June, 1895, as far as Ghwazha. From Domandi to Ghwazha a boundary-line of some 360 miles had now been demarcated.

The summer heat put a stop to any attempt to do further boundary work in the deserts beyond. Work was suspended, and the mission temporarily dispersed. We met again in the following January, 1896. Many changes had taken place in the composition of the British mission, and our party now consisted of Captain H. F. Walters (24th Baluches) and Lieut. F. C. Webb Ware (7th Bombay Lancers), who were in command of the infantry and cavalry portions respectively of our escort. Surgeon-Captain F. F. Maynard came as our medical officer, zoologist, geologist, botanist, and meteorologist. Mr. G. P. Tate, a Fellow of this Society, took Captain Mackenzie's place as survey officer. With survey establishment's escort, tribal headmen, and followers, we numbered altogether some 650 men, with 750 camels and 100 horses. The Afghan commissioner and his camp were the same in numbers and composition as before.

By the end of February, notwithstanding a heavy snowfall on the mountains, we had finished boundary work along the Khwaja Amran and Sarlat ranges to the south of Shorawak, and entered near Nushki

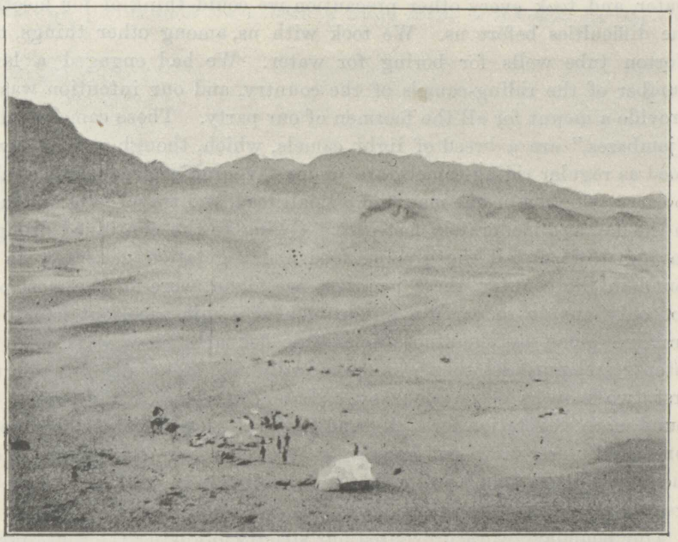
BRITISH LIBRARY

the vast plain which fringes the Baluchistan desert. As far as this point from Domandi, the tribes concerned on both sides of our boundary-line had been Pathan and Afghan tribes. Beyond this point the tribes on both sides are Baluches and Brahuis. Before going further, I must say a few words about a very curious physical feature in this neighbourhood, which may be of interest to you. To explain it, I must refer to a severe earthquake shock which, on December 20, 1892, was felt over a large area of Baluchistan, during which the railway line between Quetta and Chaman, at a place near the Chaman end of the great Khojak tunnel, but fortunately outside that tunnel, was very curiously damaged. The rails were distorted, and, to put the matter briefly, the distance between Chaman and Quetta was lessened by no less than 2½ feet. A fissure in the ground was found to run across the railway line at this place, and this fissure, running along a depression in the ground along the foot of the Khwaja Arman range, was then traced to a short distance on either side of the railway line.



It so happened that, when our boundary work made us more carefully examine this country, we found that a well-marked line of depression or indentation in the ground was traceable at the edge of the plain near Murghachaman, some 18 miles north of Chaman. Following this line, or, as I may call it, this earthquake crack, we found it to run some 18 miles in a well-defined line to the very place where the earthquake fissure had damaged the railway line in 1892. Thence it ran on, gradually ascending diagonally the slopes of the Khwaja Amran range until it actually cut the crest of the main range near its highest peak. Descending again into the Spintizha valley, it began again to ascend diagonally the slopes of a continuation of the Khwaja Amran range. Cutting this range in a similar manner, it descended to the Lora river, and, crossing that river, ran along the whole length of the foot of the Sarlat range to Nushki. Beyond this point we were unable to follow it. The total length of this wonderful earthquake crack, which we carefully surveyed, was no less than 120 miles. It is a well-defined broad line of deep indentation, in places as clearly defined as a deep railway cutting. Along the whole course of it are to be found springs of water, cropping up here and there. Both from the presence of water and from its forming a short cut across mountain spurs, this crack is largely used as a thoroughfare. We found that the old greybeards of the tribes residing in the neighbourhood all knew of its existence. They told us that during their lifetime, on some three occasions after severe earthquake shocks, deep fissures had appeared along this line, and that they had had similar accounts handed down to them by their fathers. After one of these occurrences, the water-supply of the springs along the crack had, they said, largely increased. I have roughly marked the position of this crack on the sketch-map. I may note that if the tunnel through the Khwaja Amran range had been bored, as first proposed,

BRITISH LIBRARY

at a point considerably south of the Khojak, this earthquake crack would have cut through it near the centre, thus enabling many valuable but possibly expensive observations to be made. This crack seems to mark the line of a gigantic geological fault. All the rocks on the east appear to be sedimentary, while those on the west appear to be igneous. In fact, as far as the Persian border on the west of it, we found nothing but igneous rocks. I am told the length of this fault-line exceeds that of any fault-line as yet discovered on this Earth. Whatever it may be, this earthquake crack or fault-line, whichever you prefer to call it, is a very

SAND DESERT NEAR AMIR SHOH.

remarkable phenomenon, and deserves the serious notice of geologists and seismologists.

As I have mentioned before, we found ourselves at the end of February, 1896, near Nushki, with the vast Baluchistan desert before us. The prospect was not reassuring. It was difficult to obtain any reliable recent information about the country before us, and the only opinion we could get from natives who pretended to know something of the country, was that it was late in the year to attempt to cross the desert, and that there was even less water there than usual owing to the total absence of rain for upwards of a year and a half. The Afghan Boundary Commission which delimitated the Russian Afghan boundary, had marched from Nushki in 1884 by the route shown in the small sketch-map to the Helmand river *viâ* Kani and Galichah, and a portion of that mission had also returned by much the same route in

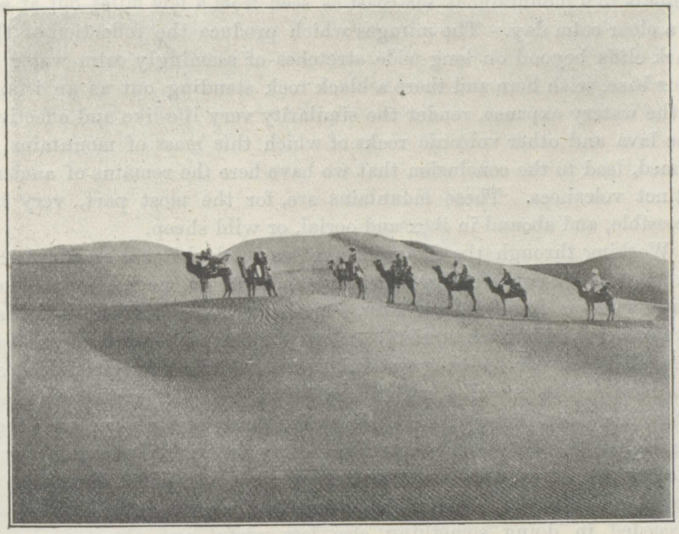
1885.* We had, therefore, information not altogether of a reassuring nature of that particular route; but on both the former occasions the journey had been done in the winter months, and it was possible, as we indeed sometimes found to be the case, that such information was not to be relied upon as applicable in the hot weather. Regarding the country west of the route taken by that mission, we had little or no information, as the greater portion of the actual country the boundary-line runs through had never before been traversed by Europeans. We had supplied ourselves with a large number of leather skins for carrying water, and took every other precaution we could think of for meeting the difficulties before us. We took with us, among other things, two Norton tube wells for boring for water. We had engaged a large number of the riding-camels of the country, and our intention was to provide a mount for all the footmen of our party. These camels, called "jambazes," are a breed of light camels, which, though not nearly so good as regular riding-camels, are under favourable circumstances able to carry two men or one man and a small load, and travel long distances in the day at a moderately fast pace. Owing to the continued drought having dried up all the grazing food and vegetation generally to be found in the country, these jambazes, we found, were for the most part not only unable to carry a single man at a fair pace, but had to be dragged along by their nose-ropes unloaded at a slow walk. To all intents and purposes they were practically useless, at any rate for the first two months of our journey. Later on, on nearing Persia, we found more vegetation for them, and they rallied sufficiently to give us some slight assistance on the way home. The mortality among them and our baggage camels in the desert was very great, and often gave us great cause of serious anxiety.

Our boundary work prevented our strictly following the route taken by the Afghan Boundary Commission of 1884, and we made our way across the desert to Robat as best we could to suit the exigencies of boundary work, marching from one set of known wells to another. As a rule we used to find, on arrival, the wells either filled up with sand or full of a filthy black odoriferous liquid, which had to be first emptied out. However, by digging wells close by existing ones, we used to find water at a moderate depth of from 6 to 10 feet. Chemical analysis often showed this water to be anything but desirable for drinking purposes; but we had to take what we could get, and be thankful. I may as well say here that we made many attempts to use our Norton tube wells, but never with success, as the tubes and pump invariably got choked with fine sand, which prevented them drawing up water.

Let me say a few words about the desert, from Nushki to Robat.



* Surgeon-Major O. T. Duke had also left on record some interesting and valuable information of the country between Nushki and Chagai, collected many years ago when he was a political officer in Baluchistan.

Somehow one generally connects the word "desert" with a flat level country, but it is obviously wrong to suppose that a desert consists of only plains. From Nushki to Chagai we do find a vast level plain, and a plain, moreover, of alluvial soil. You will see that all the drainage from the mountainous country to the east of it, as far as Quetta and Peshin, flows out into this plain by the Lora and other rivers, and that these rivers find their terminus in the Lora Hamun. In flood-time this Hamun is a wide sheet of shallow water, but it soon evaporates, and for most part of the year is like it was when we saw it, a large sheet of dry salt. In old days this whole plain, including all the flat Shorawak plain, must have been a huge lake, to account for all this

MARCHING IN SANDHILLS.

vast expanse of level alluvial soil. All along the north of it stretches the wide sand desert called Registan, a vast sea of billows and billows of sand upwards of 200 feet high, which is slowly but surely advancing year by year, and burying the flat alluvial plains south and east of them. This wilderness of sand stretches northwards as far as the Helmand.

You find on the level plains stunted shrubs of sorts, and all over the sandy portions abundance of a species of tamarisk known as the white tamarisk, and called by the natives taghaz. It grows to some size, but always looks a bleak, starving, neglected sort of tree. It assumes a weird and ghost-like appearance in the moonlight, and somehow always seems to impress a sad, mute protest at the howling sandy wilderness around it.

West of Chagai the character of the desert changes; instead of plains we have lofty ranges of desert mountains, upwards of 8000 feet high, and stretching westwards for some hundred miles. North again of these, as far as the Helmand, lie deserts of sandhills interspersed with flat plains of black gravel.

Briefly speaking, we marched along the southern fringe of the sandy Registan desert to the foot of the massive range of mountains west of Chagai. As one first approaches these mountains from the east, they stand out in a grand, high, rugged black mass with jagged peaks, several of which are over 7000 feet high. Crossing the level plains towards them, one cannot fail to be struck with the likeness the scene presents to a mountainous sea-coast as seen from a few miles out at sea on a clear calm day. The mirages which produce the reflection of the black cliffs beyond on long wide stretches of seemingly calm water at their base, with here and there a black rock standing out as an island in the watery expanse, render the similarity very life-like and effective. The lava and other volcanic rocks of which this mass of mountains is formed, lead to the conclusion that we have here the remains of ancient extinct volcanoes. These mountains are, for the most part, very inaccessible, and abound in ibex and oorial, or wild sheep.

Working through the Chagai range, we reached Robat on March 21. Our camels by now were getting very knocked up, not so much from heavy work as from want of food, and the mortality among them had given us cause for much anxiety. The abundant camel-grazing we had been led to expect by every authority who had previously reported on this country had proved a sad failure, as the land was suffering from a severe prolonged drought. All the vegetation was dried up, and even the taghaz, or white tamarisk, which grows all over the country, was dried up even more than usual, and useless as camel food. The warmth of spring had as yet failed to renovate the parched vegetation, but had succeeded in doing something else less useful and pleasant, *i.e.* in bringing out in vast numbers snakes, lizards, spiders, and scorpions of every kind. We used to secure large numbers of specimens daily. These and the ibex and the wild hill sheep appeared to be the only living inhabitants of the country. The few natives of these parts, whether from fear of strangers or from absence of food for their flocks, had fled and deserted the country. We had scoured the country round for miles to find natives, in order to procure sheep and goats from them for food, but without success. This was not reassuring, more especially as we knew that at Robat the real difficulties of the country were only beginning.

As I said before, the Afghan Boundary Commission had traversed the desert as far as Robat in 1884, and the adventurous traveller, Captain Christie, had used much the same route as that mission as far back as 1810. The only two Europeans, however, who had ever visited

BRITISH LIBRARY

the deserts west of Robat, were the late Sir Charles MacGregor and Captain Lockwood, who got as far as Godar-i-Shah in the cold weather of 1877, by the route shown in the hand-map issued to-night. The information they then obtained was the only source of reliable information we had to go upon, and it was a serious question whether we would find water in the places where they had found it to exist nineteen years before.

Beyond Robat the desert becomes practically almost a waterless one, and we found that it would be suicidal to attempt to take on our large camps with such feeble camels beyond that place. The British main camp remained at Robat, where there was a good supply of spring water; and the Afghan main camp withdrew to the Helmand river,

RUIN AT GODAR-I-SHAH.

while the Afghan commissioner and myself proceeded onwards along the boundary with a small party of picked men and animals. Our party consisted of Dr. Maynard, Mr. Tate, and myself, with a camp of some hundred and fifty men and two hundred camels. The Afghan party came to about half those numbers. We left Robat on March 26. From near Robat the boundary-line runs for nearly 200 miles in an absolutely waterless desert, without water on or near it. We therefore had to make wide *détours* to obtain water, and had to march, on occasions, from 50 to 70 miles from one watering-place to the next. This meant carrying a water-supply for two or three days for our whole camp with us. The camels, poor creatures, on these occasions had to do without. Even at the watering-places we often found the

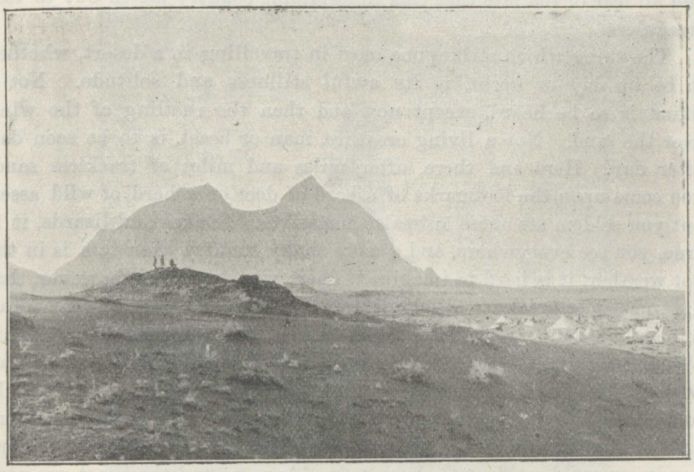
مكتبة قطر الوطنية
Qatar National Library

supply, after much hard work in digging new wells, very scanty. It would sometimes take the whole day to water our camp, as the small wells soon were emptied, and took a long time to fill up again. At night the water-skins for carrying on with us used to be filled, and it sometimes took two or three nights to fill up all that were required for the next waterless stage.

Marching *viâ* Darband and Amir Chah, we kept to the north of the Koh-i-Sultan, Damodim, and other mountain ranges. At times our journey lay through wide open level plains covered with black gravel, at others we floundered our weary way through broad expanses of deep sandhills which, near Amir Chah and other places, assumed the proportions of formidable sand-mountains. All the mountains we passed were apparently volcanic; some, such as Damodim, retain their crater form more than others. Lava, pumice-stone, and lava ash abound plentifully everywhere. These volcanoes have evidently long been inactive, but some 90 miles to the south-west of them, and within the Persian border, is a still active volcano, the Koh-i-Taftan, 12,600 feet high, of which we occasionally caught glimpses on clear days. These mountains are all being gradually covered up and buried in the sand, which is relentlessly creeping further and further up their sides. Many are already completely buried, and a high mountain of sand marks their burial-place. Others have their black peaks just appearing out of the white expanse of sand-slopes. Here and there a loftier mass still towers with its black crags high above the devouring waste around, but the sand banked up on their sides in places sometimes 1000 or 2000 feet above the level of their base, foretells a similar fate in store for them. The general effect of the scene they present is weird and unnatural in the extreme.



We experienced great difficulty from want of guides. Those few we had were not all good. It is hard to realize the difficulty of finding one's way in a sandy desert even with experienced guides. Even in the vast open stretches of flat plain the same difficulty exists; mirages appear and lure one off the direction one should follow. It is not uncommon for a guide to sit down on the march and refuse to go a foot further, saying he sees nothing but water and trees all round, and that his head is spinning round. At another time a sand-storm may get up, and earth and sky become one moving mass of flying sand. It fares ill at such times with any one who struggle even a few yards from the line of march. Five minutes of a sand-storm would obliterate the deep tracks of an army corps. Some of our party had narrow escapes. On one occasion three of our men were lost in a sand-storm. Two were found in a critical condition after wandering about for two days without water, and the third was found after being three days without food. At another time one of our native surveyors, with a party of seven men, failed to find our camp, and started off in a wrong direction, and their guide deserted them. They fortunately hit upon water, and killed one

Qatar National Library

of their camels for food, but had to live on leaves and roots for five days before they found us again.

The heat had by this time become very severe. The thermometer used to record up to 116° Fahr. inside our tents, and our solar radiation thermometer used to register outside on cloudless days a sun-heat of 205° Fahr. by nine o'clock in the morning. It was not made to register higher than that, or we might have obtained still higher records. As it was, it used to register in places a temperature in the sun equal to that of boiling water at the same place. At any rate, we found it quite hot enough for ordinary comfort, and the heat, combined with a strong hot wind and sand-storm, often made rest during the daytime impossible.

ROBAT, WITH THE MABITE DOKH AND MOUNT.

To those travellers who are tired of the cold of the arctic regions or the damp swamps of Africa, I can thoroughly recommend the genial dry warmth of summer in these deserts as a pleasing change. Owing to the heat, we always had, of course, to make our marches at night. We used to strike camp about sunset, and as a general rule march on by moonlight or starlight all night, arriving at our next halting-place before light in the early morning. At other times, should a sand-storm get up, or the night be an exceptionally dark one, we used to have to come to a stop and lie down wherever we happened to be, until either the moon rose or the day broke, and we could see sufficiently to pick our way. On those occasions we used sometimes to be overtaken by the light and heat of the following day, and then the want of water used to be cruelly felt. On one occasion I remember we got, on a dark night, into a labyrinth of deep ravines, and, after stumbling about

مكتبة قطر الوطنية
Qatar National Library

nearly all night with incompetent guides, found ourselves at daylight near a place we thought we had passed early the evening before. We did not reach water till the afternoon, and did not get to our intended halting-place till the second morning. Such are the delights of night-marching in unknown country. With a long straggling line of men and transport animals like ours, many precautions had, of course, to be taken to prevent those behind losing their way. Beacon fires used to be lit wherever fuel was available on the march, and a strong rear-guard formed to see that no men or animals were left behind on the road. No amount of severity sufficed to prevent men falling down asleep on the road. Fatigue and drowsiness obliterated all thought of punishment and all fear of the fate that this inhospitable country metes out to lost stragglers.

The thing which strikes one most in travelling in a desert, whether it be by day or night, is its awful stillness and solitude. Not a sound is to be heard, except now and then the rustling of the wind over the sand. Not a living creature, man or beast, is to be seen day after day. Here and there, after miles and miles of trackless sand, you come upon the footmarks of a herd of deer or a herd of wild asses, but you seldom see those animals themselves. Snakes and lizards, it is true, you see everywhere, and a more snaky country than this is in the hot weather, it is hard to imagine. There was one sound, however, that did sometimes break the dead stillness of a night march, and that in an unpleasant manner—that was the deep hiss of the horned viper. This pleasing reptile, of which we came across many, lies during the day with only its head showing above the sand, and it is almost impossible to distinguish it from the sand. At night, however, it used to sit up and hiss loudly whenever any one approached it. If we had a lantern handy, or could set fire to a bush to enable us to find the beast, we used to dismount and kill it; but at other times we all used to make a wide *détour*, and leave it hissing a proud defiance at us as we passed away in the distance.

Some of our party had very narrow escapes from venomous snakes, but fortunately we had no casualties from that cause. One night I saw a venomous snake, an *Echis carinata*, actually strike one of my men on the hand as he was pulling up a small bush to throw on a beacon fire. Luckily, the shot was a bad one, for the snake's head glanced off his hand sideways without the fangs piercing the man's skin. On another occasion, one early morning a very fine specimen of the same viper came out of a small hole in the ground over which I had just been sleeping. A few minutes before he might have caught me napping, but as it was he got up too late, and went to join our zoological collection. We generally looked for a clear spot to lie down and sleep on, but as often as not we were too sleepy and tired on our night marches to bother much about it. One night, as he threw himself

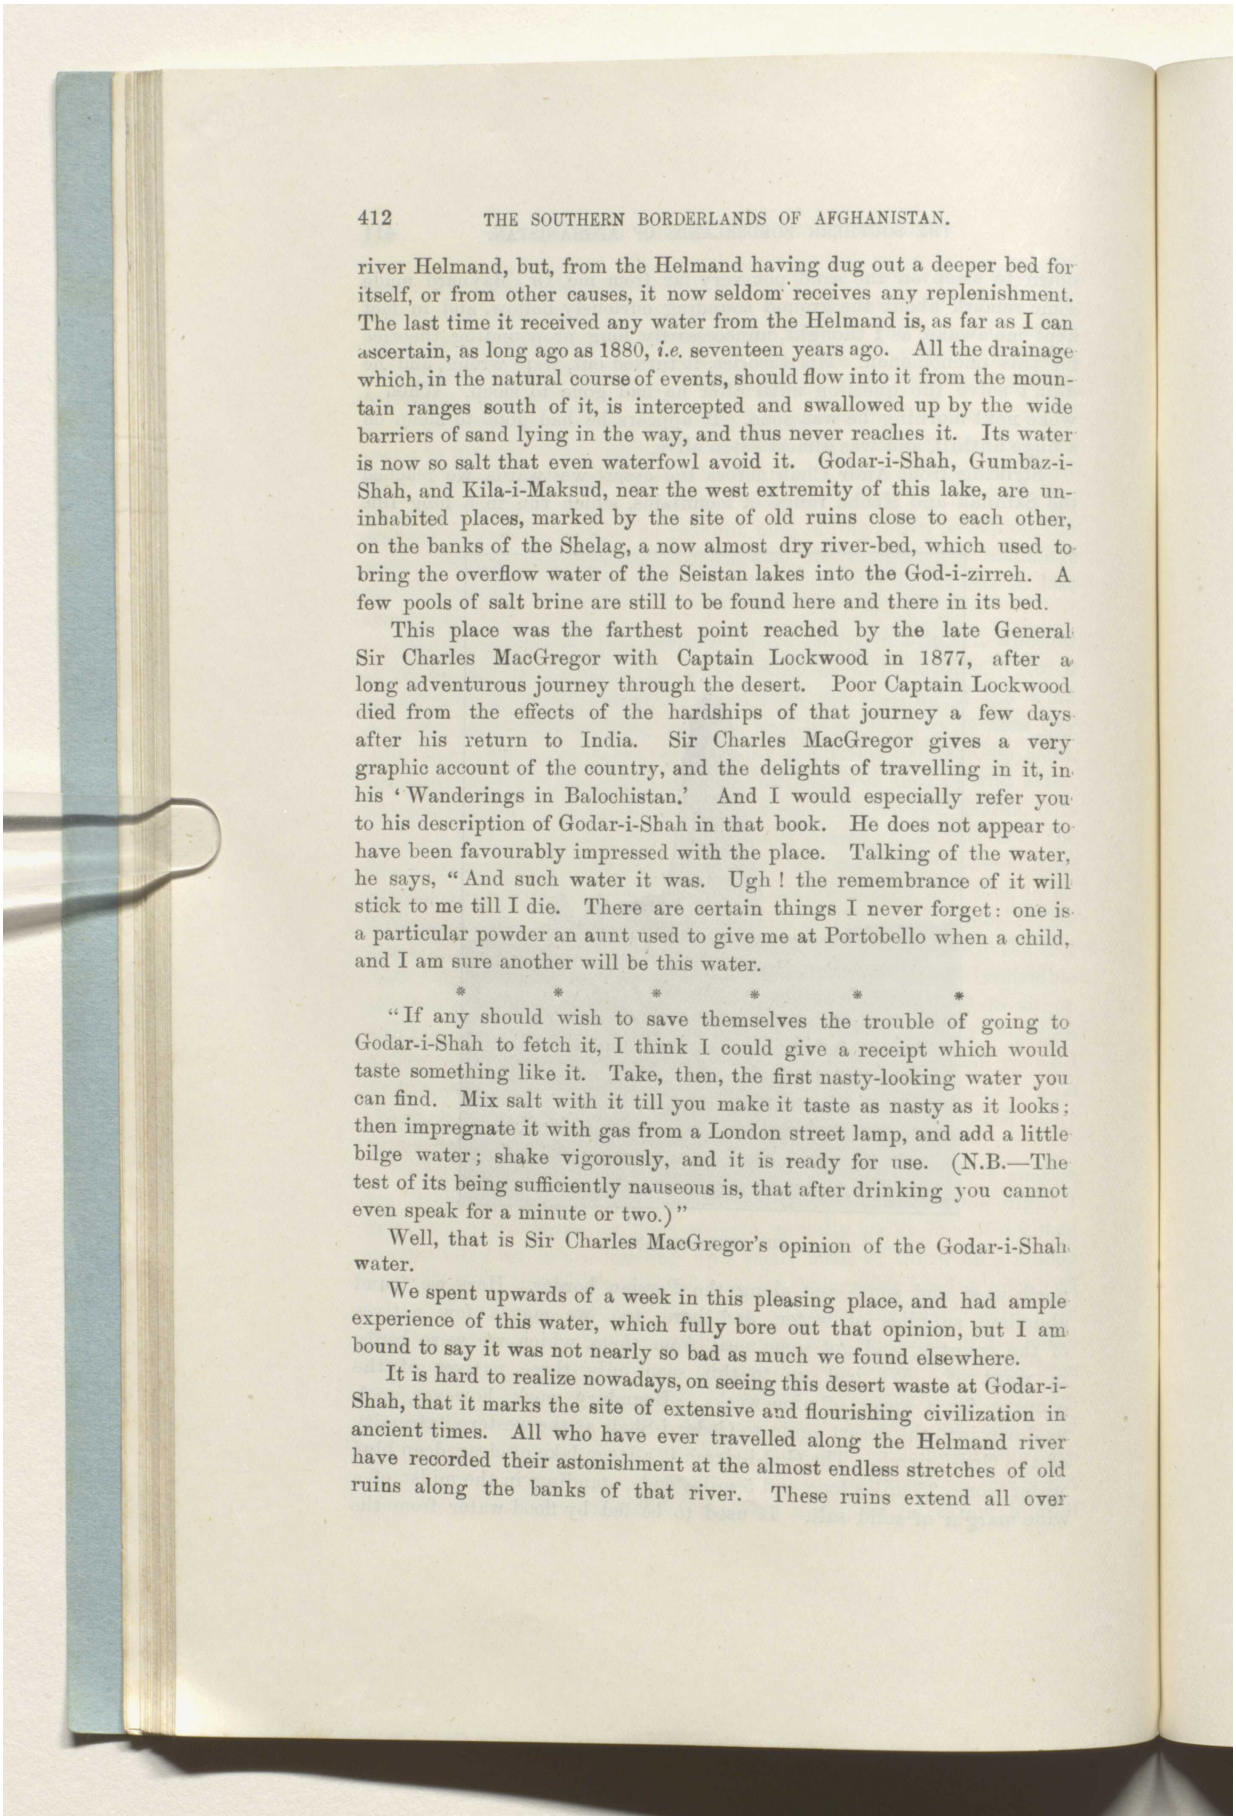
BRITISH LIBRARY

down to sleep on the sand not very far from me, Dr. Maynard made some remark about the ground sounding curiously hollow, and in fact kept me awake, as I thought, unnecessarily long propounding theories for this phenomenon. His theories, it turned out, were wrong, and he didn't solve the question until after he had gone to sleep. When I woke next morning he was gone. It appears he had gone to sleep on a huge anthill, and was almost eaten alive.

Striking from Amir Chah across the desert westwards, we reached the Saindak and Kacha range of mountains, which run in a long line



THE NEZA-I-SULTAN.

north-west and south-east along the Persian border. Here we found abundant supplies of water, and here, too, we met a few natives of the country, and got some meat from them, which we were badly in want of. We had up to this seen only three natives of the country for a space of nine weeks. Boundary work, however, took us down into the desert again to Godar-i-Shah, at the western extremity of the God-i-zirreh. The God-i-zirreh is a large lake of clear, deep blue water, some 25 miles long and 5 miles wide, standing in the midst of a wide margin of solid salt. It used to be fed by flood-water from the

BRITISH LIBRARY

river Helmand, but, from the Helmand having dug out a deeper bed for itself, or from other causes, it now seldom receives any replenishment. The last time it received any water from the Helmand is, as far as I can ascertain, as long ago as 1880, *i.e.* seventeen years ago. All the drainage which, in the natural course of events, should flow into it from the mountain ranges south of it, is intercepted and swallowed up by the wide barriers of sand lying in the way, and thus never reaches it. Its water is now so salt that even waterfowl avoid it. Godar-i-Shah, Gumbaz-i-Shah, and Kila-i-Maksud, near the west extremity of this lake, are uninhabited places, marked by the site of old ruins close to each other, on the banks of the Shelag, a now almost dry river-bed, which used to bring the overflow water of the Seistan lakes into the God-i-zirreh. A few pools of salt brine are still to be found here and there in its bed.

This place was the farthest point reached by the late General Sir Charles MacGregor with Captain Lockwood in 1877, after a long adventurous journey through the desert. Poor Captain Lockwood died from the effects of the hardships of that journey a few days after his return to India. Sir Charles MacGregor gives a very graphic account of the country, and the delights of travelling in it, in his 'Wanderings in Balochistan.' And I would especially refer you to his description of Godar-i-Shah in that book. He does not appear to have been favourably impressed with the place. Talking of the water, he says, "And such water it was. Ugh! the remembrance of it will stick to me till I die. There are certain things I never forget: one is a particular powder an aunt used to give me at Portobello when a child, and I am sure another will be this water.

* * * * * *

"If any should wish to save themselves the trouble of going to Godar-i-Shah to fetch it, I think I could give a receipt which would taste something like it. Take, then, the first nasty-looking water you can find. Mix salt with it till you make it taste as nasty as it looks; then impregnate it with gas from a London street lamp, and add a little bilge water; shake vigorously, and it is ready for use. (N.B.—The test of its being sufficiently nauseous is, that after drinking you cannot even speak for a minute or two.)"

Well, that is Sir Charles MacGregor's opinion of the Godar-i-Shah water.

We spent upwards of a week in this pleasing place, and had ample experience of this water, which fully bore out that opinion, but I am bound to say it was not nearly so bad as much we found elsewhere.

It is hard to realize nowadays, on seeing this desert waste at Godar-i-Shah, that it marks the site of extensive and flourishing civilization in ancient times. All who have ever travelled along the Helmand river have recorded their astonishment at the almost endless stretches of old ruins along the banks of that river. These ruins extend all over

BRITISH LIBRARY

Seistan, and here right away down at the very south of Seistan, at Godar-i-Shah, we still find them. They mark the remains of old flourishing towns and cities of past times, and, together with the numerous traces of old canals leading from the Helmand river, prove the existence in some past age of extensive civilization and of a very large population. Who built those cities, and who cultivated this once rich country, one cannot now say. The past history of the country is buried in obscurity. Several have offered opinions on the subject, but only to be contradicted by others. We know that Alexander the Great marched through this country, and found there cities and a civilized people. Zirreh is said to be the modern form of the old name Zarenj, which was the capital of the Zarangae or Darangae tribe mentioned by Arrian. Persian tradition has, again, made Seistan famous as the home of the great Persian hero Rustam. We also know that the Kayani kings ruled in Seistan and the Helmand valley until their final overthrow and extirpation by the Persian Nadir Shah at the beginning of the eighteenth century. Whether the old ruins now existing mark the towns mentioned by the writers of Alexander's times, whether they are connected with the age of Rustam, or as recent only as the latter days of the Kayani kingdom, it is now hard to say. We must leave it to archæologists to decide. They will find this country well worth studying, and it is to be hoped that at some future date careful archæological investigation, which has been impossible up to now, will throw light on the history of what must have been a numerous and civilized people.

Since Sir Charles MacGregor's visit, Godar-i-Shah has been visited by Captain Hon. H. D. Napier and Mr. Merk, C.S.I., but both came there from the Persian side.

We were not sorry to leave Godar-i-Shah, as the heat there was very severe. Proceeding westwards, we reached the foot of the Koh-i-Malik Siah range, and on April 16—a red-letter day in our mission records—we erected our last boundary pillar on the top of Koh-i-Malik Siah, a peak 5500 feet above sea-level, to mark the end of our long boundary-line between Afghanistan and Baluchistan. From this point northwards runs the boundary settled between Persia and Afghanistan by Sir Frederick Goldsmid; and from this same point southwards runs the boundary-line between Persia and Baluchistan, just laid down by Colonel Holdich. The massive stone cairn, some 20 feet high, which we built at the top of this mountain, now marks the point "where three empires meet," for here, at one point, British, Persian, and Afghan territories join. As soon as our camp, both men and animals, had had a few days' rest, and had recruited their strength with the good water we found there and with the food supplies we had obtained from Persian Seistan, we started homewards. The Afghans had had enough of the desert, and preferred to strike across Afghan Seistan to the Helmand, and thence along that river, while we returned to Robat across the desert by much

the same route we had come. We agreed to meet each other once more to draw up final deeds, etc., at Robat on May 5.

On the return journey we took the opportunity of exploring the Koh-i-Sultan range, which we had passed on the south of our route on coming. On passing as we did to the north of this range, we were greatly struck by the queer, grotesque shapes of its numerous sharp peaks. And more especially by the appearance of what, as we saw it from a distance, looked like a huge masonry pillar erected on the crest line of the range. This pillar is known as the Neza-i-Sultan, *i.e.* the spear of Sultan. Sir Charles MacGregor saw these mountains from a distance in 1877, and he speaks of them as the oddest-looking mountains he had ever seen. He was greatly struck with the appearance of the Neza-i-Sultan, but neither he nor any other European had ever yet been close up to it. On entering the range our trouble was well rewarded, for a more extraordinary mass of mountains it is almost impossible to conceive. As we rode along in the bright moonlight, we saw high pointed pinnacles and minarets all round us, and here and there steep masses of conglomerate, which formed the peaks, looked exactly like old Gothic cathedrals and churches. Nor did this resemblance fade away in the daylight. The Neza-i-Sultan we found a truly marvellous feature. It is a perpendicular column of hard conglomerate, with straight precipitous sides. The fissures made by rain and weather action down its sides give it a fluted appearance from a distance. We expected to find a high natural pillar, but were not prepared for the stupendous size of the reality. Judging from its width at the base, which is over 100 yards in diameter, the height must be no less than from 500 to 800 feet. You can, therefore, realize the effect of this gigantic column when seen from below. The name Neza-i-Sultan means the spear of Sultan. This Sultan, who also has given his name to the whole range, is an ancient mythical celebrity who is said to have been buried in the vicinity. His full name is Sultan-i-Pir-Khaisar, and he is the patron saint of Baluch robbers. This may account for the Koh-i-Sultan having a very bad reputation as a robber resort. These mountains abound in the assafœtida plant, and in the summer months traders come in numbers from Afghanistan to collect it.

Well, I must hurry on. We reached our main camp at Robat on May 1, and were glad to find them all well and flourishing. We had been nearly six weeks away from them, and, as we had not been able to keep up communication with each other during that time, we found a most welcome supply of letters and news awaiting us. On May 5 the Afghan Commission arrived, and by May 14 our final agreements and maps were prepared and signed, and we were able at last to start homewards. The Afghans returned to the Helmand *en route* for Kandahar, while we followed, as far as Nushki, much the same route as that by which we had come. It was a trying journey, as the heat was very

مكتبة قطر الوطنية
Qatar National Library

severe, registering 116° Fahr. in our tents. We marched as before, always at night, and now were able to get little or no rest by day, for the "Bad-i-sad-o-bistroz," *i.e.* the wind of 120 days, had now sprung up, and blew with hurricane violence day after day the whole day long, blowing down our tents, and smothering us in sand. This charming wind gets up every year about May, and blows without ceasing from the north-west for four months. While it lasts, it makes life along the Helmand valley and the deserts on either side a perfect purgatory. Right glad were we to at last reach the edge of the desert at Nushki, and ascend out of the hot wind-swept plain into the cool, refreshing air of the high mountains west of Quetta. We reached Quetta safely on May 29, 1896, and there our troubles ceased.

Boundary delimitation and demarcation work was the sole object and aim of the mission whose wanderings I have now described, but in the course of it our energetic survey officers, *i.e.* Captain R. J. Mackenzie, R.E., during the first year, and G. P. Tate, Esq., during the second year of the mission, and their staff, besides carrying out the actual survey work required for boundary delimitation purposes, took excellent advantage of the opportunities afforded of making a careful survey of the whole country through which we passed, on a scale of 2 miles and 4 miles to the inch. I have not the actual figures to refer to, but I believe considerably over 30,000 square miles of country were thus carefully surveyed, much of which was, to all intents and purposes, new country. Much valuable ethnological information was collected, and our scientific work included careful meteorological records, and also large zoological, geological, and botanical collections. Our zoological collection, thanks to the energy of Surgeon-Captain Maynard, is a very large one, including several thousand specimens. As might be expected, from the countless reptiles the desert abounds in, our zoological collection was largely of reptiles. Among them are many rare species and many quite new to science. Our old friend, the horned viper,* turned out to be not only a new species, but a new genus. The zoological and other collections are now being carefully worked out by the officers of the Calcutta and British museums. Besides a few taken by myself, the photographs with which this paper has been illustrated were taken by the following gentlemen, to whom I am much indebted for the loan of them, *i.e.* Lieut. R. A. E. Benn, 5th Bombay Cavalry, for those of the country between Domandi and Chaman, and G. P. Tate, Esq., for those of the country between Chaman and Persia.†

* This snake has been named the *Eristicophis Macmahonii*.

† May I be permitted to mention my Dachshund Donnie, who figured in several of the photographs with which the paper was illustrated. He not only accompanied his owner throughout the wanderings of the Baluch-Afghan Boundary Commission, but also accompanied him in 1893 to Cabul with the Durand mission. He has traversed most of Baluchistan, and almost every portion of India.

THE PERSO-BALUCH BOUNDARY.*

By Colonel T. H. HOLDICH, R.E., C.B.

South-west and south of the district with which Captain McMahon has been dealing, lies a somewhat remarkable country which has long been a riddle to geographers and ethnographers alike, the mysteries of which have lately been unravelled in connection with boundary demarcation. Captain McMahon has described the watershed which traverses the desert south of the Helmand, shutting off that great river system from the Mashkel lake, or Hamun, district further south. This great basin of Mashkel covers a very large area of varied country, and includes the drainage from those mountains to the west which now form the Persian frontier, as well as that of other mountains to the south, which form the northern outposts of Makrán. About the edge of the Hamun (which is a salt swamp in dry weather and a shoreless sea in times of flood), on the western side of it, are a few scattered date groves, inadequately cultivated, ragged, and unproductive, which from time immemorial have been a bone of contention between the wild and lawless Damani tribes of Eastern Persia and the desert-bred Rekis of Baluchistan. Raids and reprisals, blood feuds, and wayside murders have been hatched and bred in those wretched date-groves, until matters had reached an acute fighting stage, when our Government stepped in and decided to have a Persian boundary as well as an Afghan boundary. Besides the date groves there were other political matters of dispute which had stood over since the historic days of the Seistan Boundary Commission, a quarter of a century ago, and which had proved at the time to be nuts too hard for that Commission to crack. Thus it fell out that whilst Captain McMahon was busy with a section of the Afghan boundary south of the Helmand, I was acting as her Majesty's Commissioner within a few days' ride of him on another and totally distinct Commission, the basis of which was a treaty between the late Shah and our English Foreign Office.

In connection with this treaty there were about 300 miles of boundary to be defined, extending from the Malik Siah Koh in a south-easterly direction to Kohuk, on the Mashkel river, and there were but two or three months in which to define them. The season was well advanced before political negotiations were closed, and it was, in fact, on this very day, February 22, exactly a year ago, that the British and Persian Commissions met on the banks of the Mashkel river, after having travelled, the one from Karachi by sea to Gwadur, and thence across the backbone of Makrán to the Mashkel; and the other from far-off Teheran in the north-west of Persia, in the space of about one month.

* Read at the Royal Geographical Society, February 22, 1897.

Now you must not allow the desolate blankness of the map of those regions to mislead you. For many years, whilst acting as superintendent of the Baluchistan Surveys, my attention had been directed to this corner of Asia; and chiefly by the agency of well-trained native assistants, not only all Makrán and the borderland in dispute, but very much of Eastern Persia too, had been well reconnoitred and fairly surveyed. I should emphasize the word surveyed. I do not mean that individuals had merely passed along a line of country, contenting themselves with leaving a red trail over a blank white space as the map-record of their travels, but that sound square mapping, with no detail of importance omitted within its limits, was rendered up at the end of the season's work. Thus it happened that we possessed excellent geographical mapping based on triangulation of the whole of this region, and that it was with completed maps in our hands that we entered on boundary negotiations. In my Persian colleague I found a gentleman whose previous connection with the Seistan Commission had given him a most reasonable and delightful confidence in the accuracy of British surveyors. Thus we were able to get the 300 miles of boundary settled and demarcated without any waiting on preliminary survey processes, and by the beginning of May, ere the hot-weather blasts had made that sun-stricken land unbearable, and before the death of the late Shah, we were back again in India with our work complete.

Of the incidents and the strange experiences of that remote commission there is no time now to speak at length; I can only say that the race hatred which exists between the desert-born Baluch and the Persian "gujjer" (as they call him) was strong enough to give us a bad quarter of an hour occasionally, and one could not but feel that the rapid conclusion of negotiations was a merciful dispensation of Providence. One can only look back to the history of the weary Seistan boundary struggle twenty-five years ago, or to the well-remembered experience of the yet more protracted boundary proceedings that were rendered famous at Panjdeh, and note with satisfaction the changes that time has wrought in demarcation procedure—and wrought chiefly by the aid of a better official appreciation of the advantage of correct geographical knowledge.

You will at least understand that my survey assistant, Colonel Wahab (who only very lately had been associated with me in a successful struggle to carry the triangulation of India across the Himalayas into the Pamirs, and thus effected the first scientific junction between Russia and India), found no such scientific achievement ready to his hand in this remote Baluch wilderness. We gathered in little new geography; yet, as the geography of this region is a comparative blank in our maps and must be new to many of you, I will say a few words about it. I must pass over the strange conformation of these western hills, along the watershed of which the Persian boundary now runs, and from which a

BRITISH LIBRARY

complicated drainage falls into the Mashkel swamps; and I must leave the interest that attaches itself to the gigantic snow-capped volcanic mountain system which flanks these mountains to another day. It may be that Captain Sykes (who, with Captain Kemball, was one of my political assistants) will some day tell you of his first ascent of that extraordinary peak, 13,000 feet high. So remarkable a volcano in so remote a region is a geographical feature strange enough to require a chapter to itself; and you are taking your geography to-night too much compressed for casual descriptions. I will only draw your attention to the general geographical character of those districts which by this recent demarcation now fall within the sphere of British Indian influence, and to their relation both to East and West.

You will see that, flanked as it is by great stretches of desert to the north, and by the sea to the south, this remote Makrán region, in which lately so much of general scientific interest has arisen, forms a natural geographical gateway between Persia and India. This is, indeed, precisely the *rôle* which Makrán has filled in past historic ages; and if it filled that position now, there would be yet this interest to add to all others, that the country would possess great military significance. The key of this gateway has, however, always been held by the predominant power in the Eastern seas; and ever since three small British ships issued out of Pasni harbour, and defeated the last Portuguese squadron that sailed the Arabian sea, that key has been held by us. Before that period (so long before that history does not hold the record) we know now that Dravidian races, driven out of Mesopotamia by Semitic invaders, swarmed through this country to India, leaving behind them curious records in stone of their occupation of the country, and a considerable remnant of their people besides. Then we hear of Alexander's reckless march through this same land three hundred years B.C., when he attempted to force his way by an impossible shore route to Persia, and lost two-thirds of his army in the vain endeavour to support his fleet with his land forces. The description of that retreat, as told by the historian Arrian, is so complete and so graphic, that not only is it comparatively easy to trace out the route followed by Alexander, but from it you may gather a very fair idea of the nature of the country as it exists to-day.

About a thousand years later the Arabs swept through from Syria, and not only conquered all the Indus valley, but set to work to establish a system of roads and irrigation which maintained enormous cities, and turned this Makrán wilderness into a world-famed commercial centre. With Arab reminiscences—the remains of these cities and the remnants of gigantic irrigation schemes—the whole country teems; but the Arabs themselves are only now represented by a powerful confederation of tribes who, indeed, represent the typical Baluch of to-day, but who have hardly a word of Arabic in their language. Then came the great

BRITISH LIBRARY

discovery of a sea route to India and the turn of the Portuguese, and with it the extinction of Makrán as a highway to India, and its lapse into a phase of darkness so profound that twenty years ago about as much was known of it as we know of the darkest forests of Africa. Now again the light has broken on those rugged hills and palm-covered valleys, and most of its dark places have been made plain.

The narrow fringe of sandy unprofitable shore which sets a northern limit to the Arabian sea, is broken here and there by gigantic headlands stretching seawards, and is backed by mountains for its entire length until you approach the Dasht river, where the mountain system becomes broken and recedes northwards. Here is the point where routes into Persia strike inland. Here and there we find harbours formed by the outlying headlands, which give protection to the fishing craft of the coast, and support small townlets which are usually stations of the Persian Gulf telegraph service, and do a considerable trade in dried and salted fish. Of the townlets Gwadur (which is an Arab possession, owning the Sultan of Muskat as sovereign) is the principal; and from Gwadur salt fish is exported to the west coast of India and sharks' fins to China. How such a trade can pay I do not pretend to say.

The fish industry which pervades the coast pervades the atmosphere also. All the Makrán coast stinks of fish, and all the Makráni people live on fish. Dogs, cats, cattle, and even camels, eat fish. The old Ichthyophagai of the Greeks are offensively predominant throughout the coast districts; and, strange to say, after all these centuries, the old mystery of enchantment hangs over that coast still. I have been taken to the enchanted island of Astola, where, even now, there dwells a lovely, but most pernicious, mermaid, who turns men into fish, and where, no doubt, most excellent use has been made of the mysterious envelopment of the island by the pirate Meds, who used to bring the crews of captured vessels here and murder them wholesale.

The roads from the coast inland are few and far between. They are not good roads when you find them, for as they trend northward they cross the axis of all chief ranges and ridges of the country. The hill conformation is very peculiar, though closely allied to that which exists on the frontier from the north-west of India (*i.e* south of Waziristan) to the Arabian sea, and which continues again from Makrán to Western Persia. Close-packed, narrow, knife-edged ridges run parallel to each other and to the coast, sometimes swelling into well-defined mountain systems, sometimes dwindling into a mere display of sharp points, emanating like sharks' fins from the billowy plain, but always offering the sharpest, stoniest, and most aggressive obstruction to the traveller bound northward. It follows that between these ridges running east and west, or following the trend of the coast as the coast itself shapes a new course, there are long narrow valleys offering means of communication as good as that which crosses them is bad.

Qatar National Library

It is in these valleys that the wealth of Makrán lies, and it is wealth not to be despised even in these days. Thick groves of date palms occasionally fill up the landscape like a sea, with the white towers of village forts rising above them, as islands break the surface of an inlet; rank luxuriance of cultivation lies under the palms, where wheat-fields enclose fruit orchards, and fair-sized streams are diverted into a network of irrigation channels. There are districts in Makrán where the fierce heat of early spring forbids the existence of any form of life whatsoever, and there are also sweet, well-shaded valleys, the beauty of which is hardly surpassed even in Kashmir. In amongst them all lie the remains of an ancient civilization, such as may be seen in the ruins of old cities, of old forts, of roads, and of canals. These tell a tale which we may hope ere long fairly to unravel.

Old as this Asiatic world may be, it is yet a new world to much of scientific inquiry. Its geography is fairly solved, but its ethnography is still a riddle, and its history, when research and investigation shall unfold it, will fill up many a gap in the stories of the nations, if it can never claim a national character itself. I deeply regret that I have neither photographs nor sketches to illustrate some of the more remarkable corners of this No man's land. It is not that I have neglected to secure such records, but that they are in India, whilst I am here. I can only hope that in calling your attention to this long-forgotten country I have claimed your interest in succeeding records when perchance there may be leisure and opportunity to tell a completer tale.

Before the reading of the paper, the Chairman, Admiral WHARTON, said: I am sorry that Mr. Curzon, who was to have presided here to-night, has been prevented by his public duties. We can understand that at present he has not much time to spare. I am particularly sorry, because I feel a sailor is out of place in the chair when talking about the borders of Afghanistan, of which I know nothing and Mr. Curzon a great deal. I do not think I need do more than introduce to you the lecturer, Captain McMahon, who will now read his paper.

After Captain McMahon's paper, Admiral WHARTON said: While Captain McMahon was tracing his boundary, Colonel Holdich was tracing another boundary, and he has kindly consented to give us a short account of his experiences.

After the reading of the papers, the following discussion took place:—

Admiral WHARTON: I am sorry Sir Frederic Goldsmid is not here; I had a letter this morning from him to say he is unfortunately laid up. He conducted the former delimitation commission between Afghanistan and Persia, and brought it up to the point where Colonel Holdich and Captain McMahon took their surveys. Also Colonel Woodthorpe wished to be here, but I am sorry he has not been able to come. Would Mr. Alcock say something of the collections Captain McMahon brought back?

Mr. ALCOCK: There is very little of general interest I can say about the collections brought back by Captain McMahon and Dr. Maynard. As Captain McMahon has said, its chief interest is reptiles; in fact, judging from that collection, one is quite prepared to understand that Baluchistan is a land of reptiles. Another feature of the collection is the large number of scorpions, spiders, and venomous

BRITISH LIBRARY

spider-like creatures. I worked it out and examined the reptiles carefully; there are a good many species, including the viper Captain McMahon spoke of. It is a most interesting form, and we have christened it *Eristicophis*,* on account of its pugnacity: though all vipers are excessively pugnacious. I have not been able to examine the collection of scorpions and spiders and venomous spider-like creatures, which is large and interesting, but I have arranged with Mr. Pocock, of the British Museum, to examine and report on them.

Mr. BLANFORD: Captain McMahon has traversed a tract of Baluchistan quite different from that I crossed with Sir Oliver St. John in 1872. It is exceedingly interesting to hear, both from him and from Colonel Holdich, that the country, previously unknown, has at length been opened up. I can entirely confirm Captain McMahon's account of the abundance of reptile life, as that is exactly what I found in going through the same country.

Sir HENRY BRACKENBURY: I am afraid I can add nothing useful to the geographical aspects of the question which has been brought before you to-night, and certainly nothing as to the geological aspect, and my knowledge of Baluchistan is but very small, for, though I visited Domandi with Captain McMahon when first he saw it, in the winter of 1891, and galloped over the plain of Zarmelan, and visited Chaman with him, I know little of the country in its rougher aspect. But there is one point I should like to say a word on, and that is what may be called the personal aspect of this work, the work as done by the man. I was a member of the Government of India which ordered these boundary expeditions, these delimitation expeditions, and we knew that there was a difficult task before those who had to conduct them. I think Captain McMahon's modesty—one of his characteristics—made very light of these difficulties; he has told us something and left us to gather something of the nature of that country, how most of it is an arid desert. Do you know how the people themselves describe it? They say that the Almighty, when making the world, used all the water, and grass, and flowers, and trees to make other beautiful countries, and when He had used all these, and had nothing left but a heap of rubbish, He threw that down and made Baluchistan; and I have heard others comment upon that and say, "We cannot understand, when He had made Baluchistan, that He took the trouble to make any other hell." That is the country in which Captain McMahon conducted that boundary expedition, a country infinitely desolate, infinitely arid, infinitely drear, and he had not only the difficulties of intense heat and want of water to contend with, but he also had to contend with that human difficulty which few know now so well as he does—the difficulty of dealing with the Afghan. I think it is only those who have dealt with the Afghan that can really know how obstructive a human being can be. Captain McMahon has shown a very charming photograph of his Afghan colleague, and spoke of his winning smile, and told us they didn't often smile both on the same day. From what I know of Captain McMahon, there was a subdued smile on Captain McMahon's face even when an open smile was on the face of his colleague, a smile which occasionally changed to the wrong side of his colleague's face. For these difficulties which Captain McMahon had to contend with were enormous; it is in the nature of Orientals, especially Afghans, to create difficulty in every matter connected with diplomacy. Here a boundary had to be defined. It was apparently a simple thing, because it had been traced upon the map and agreed to by Sir Mortimer Durand and by the Amir at the time of the mission to Kabul, of which Captain McMahon was a member; but it is one thing to trace a boundary on a map, and another thing on the ground. And there were special difficulties connected with such a question, such as watercourses

* ἐριστικός = lover of fighting.

and irrigation, to whom the rights belonged; these give rise, when both parties are not anxious for a speedy issue, to endless delays and difficulties. Captain McMahon had to contend, first of all, with great physical difficulties; secondly, with these human difficulties, and by neither one nor the other was he ever discouraged; he had that characteristic which is absolutely necessary in dealing with these Eastern peoples, not only perfect courage, but absolutely infinite patience, and it was by these two combined qualities, courage and patience, that these boundary commissions were brought to their thoroughly successful ends. Sir, I think it is a matter of great pride to us as Englishmen, it must be a matter of great pride and constant self-congratulation, that there are always to be found men, young men, possessing these great and these grand qualities—men who, like Captain McMahon and Colonel Holdich, will continue to do for this empire the class of work they have done, and will continue to keep this great empire what it is.

Admiral Wharton: The very eloquent and moving words you have just heard from Sir Henry Brackenbury leave me very little to say. I think, reading between the lines of Captain McMahon's story, we can see there were all these difficulties which Sir Henry has mentioned, of which Captain McMahon said nothing, and the stories we have heard to-night give us an idea of the sort of work that goes on throughout our empire from year to year in a quiet way, in the course of business that no song is made about, that make us proud we are Englishmen. I am sure we shall be only speaking your sentiments in offering our hearty thanks to Captain McMahon and Colonel Holdich for their extremely interesting papers.

Captain McMahon's Map.—This sketch-map was compiled from the Survey of India map of Afghanistan of 1889; from the map published in the *Geographical Journal*, 1896, illustrating Colonel T. H. Holdich's paper on "Ancient and Mediæval Makran;" together with slight additions and alterations made by Colonel T. H. Holdich and Captain A. H. McMahon. The coast-line has been taken from the Admiralty charts.

THE RIVER ODER.*

Amongst the many geographical advantages enjoyed by these islands, one of the least considered is our comparative immunity from great floods. The historical works of Lauder and others, and the later chronicles of the daily newspapers, do indeed contain accounts of destruction done by total inundations, but at the worst the total damage is rarely considerable, and there are few inhabitants of the United Kingdom who regard any of its rivers as a source of real and imminent danger to themselves or their property. Under these circumstances, as might have been expected, we know little about the hydrography of this country in detail, and the production of a work like that before us is impossible.

The Imperial Decree of February 28, 1892, placed two questions before the German Commission charged with the investigation of the

* Der Oderstrom, sein Stromgebiet und seine Wichtigsten Nebenflüsse; herausgegeben vom Bureau des Ausschusses zur Untersuchung der Wasserverhältnisse in den der Ueberschwemmungsgefahr besonders ausgesetzten Fluss-gebieten. Berlin: Dietrich Reimer.

BRITISH LIBRARY

hydrographic conditions existing in regions liable to inundation: (A) What are the causes of the floods of recent years; is the system of regulation and canalization of the Prussian rivers responsible for the increased danger arising from floods in those regions, and, if so, what changes are to be recommended? (B) What further steps can be taken to diminish the risk to life and property in the future? With a view to answering these questions, the Commission set itself to collect and arrange all the existing observations concerning the physical and economical conditions of the different river-systems, and to fill up the numerous deficiencies by new observations, so as to complete a general survey of the hydrography of each system, and of the river interests and rights which might be affected by any proposed scheme of regulation. This vast undertaking was, in the first place, restricted to the basins of the Oder, the Elbe, and the Vistula, and the work now published forms the report on the first-named. It consists of three substantial volumes of text, a quarto volume of tables and statistics, and an atlas of thirty-six plates. The first volume treats of the general form of the Oder basin, its position, climatic relations, geology, etc.; the second describes in detail the separate secondary basins; and the third is devoted to a careful discussion of the actual streams of the main river and its chief tributaries.

The most important point to be borne in mind, in arriving at a clear understanding of the geographical relations of the rivers of Northern Germany, is the fact that the mountains and high ground forming the water-partings approach nearest to the sea-coast towards the west, while as we go eastwards they recede inland till the triangular North German plain merges almost insensibly into the great Russian depression. The southern border of the Oder basin touches on one side the division of the Carpathians known as the Western Beskids, and on the other the Sudetic mountains, whose north-eastern slope drains to the Oder throughout its whole length. Only the western part of the highland of Poland drains into the Oder—the plateau of Poland and Upper Silesia. But the peculiar distribution of the higher ground makes itself felt far into the plain, for the Bober and the Lausitzer Neisse join the main stream not far above the point where its volume is doubled by the Warthe and Netze, and it is to the latter that the immense area of low-lying plain in the Oder basin chiefly owes its existence; they traverse the belt of depression which extends over into the Vistula basin as far as the Rokitno marshes, and forms the true connecting link between the great Russian plain, with its extreme continental climate, and the diversified surface of Western Europe, where a broken coast-line carries the milder influences of the sea far inland. Hence the Oder occupies, as it were, an intermediate position, the lower parts of its course being subject to conditions similar to those characteristic of Western Europe, though to a modified degree, while the upper basin is in a continental

مكتبة قطر الوطنية
Qatar National Library

region, the continental characteristics being, however, again modified as compared with such rivers as the Vistula. These circumstances of position, together with the greater elevation of the southern part, give to the Oder basin a climate almost uniform throughout its length.

A remarkable feature of the Oder basin is the absence of the expansion and contraction observed in many rivers. The shape is in effect a somewhat distorted rectangle, the north-western side standing perpendicular to the south-western base-line, and the south-western side forming an acute angle with it. The length of the base is approximately 304 miles, and of the opposite side 245 miles, giving a mean length of 274 miles; the perpendicular distance between these sides is 166 miles. The "centre of gravity" of this figure lies east of Lissa, almost on the watershed between the Bartsch and Obra, and on the line dividing the German and Polish languages. The lowest point of the main watershed is at the Mährische-Pforte, between Bölten and Weisskirchen, where the Oder is separated from the Danube, and the Atlantic from the Mediterranean, by a pass only 1000 feet above sea-level. From the Mährische-Pforte the watershed extends westwards for 682 miles, eastwards for 920 miles; 354 miles in the former case, and 103 miles in the latter, traversing mountains. The eastern part runs through the plateau of Poland and Upper Silesia for 217 miles, and the remaining 328 miles on the left of the main stream, and 600 miles on the right cross the low plains—amounting to 928 miles, 58 per cent. of the whole.

The great extension of the plains of North Germany and Poland towards the east gives the eastern sides of the river-systems an almost independent character: a general south-to-north direction is combined with an east-to-west stream draining the southern side of the rising ground near the coast, and the joint flow carries the waters of the whole eastern and north-eastern plain in each basin towards some point on the lower course of the main stream. Thus the Warthe and Netze in the Oder basin correspond to the Bug and Narew in the Vistula, the Havel and Spree in the Elbe, and the Aller and Leine in the Weser. The eastern tributaries are, therefore, for the most part rivers of the plain, in contrast to those received higher up on the opposite side, which are more frequently rapid mountain streams.

The point of junction with the Warthe accordingly forms, in the case of the Oder, an obvious division between the lower and upper courses of the river. A further division of the upper river is, however, desirable; and between the Warthe and Breslau may be called the middle Oder, the term upper Oder being kept for the part between Breslau and the source. This arrangement has many advantages from the point of view of commerce and navigation, but the formation of the river-valley gives a more scientific division at a point somewhat below Breslau, near the confluence of the Lohe, Weistritz, and Weide with the

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

main stream, where it is first deflected from its normal west-north-west direction by a ridge running east and west. The "middle Oder" is itself divided into upper and lower courses at its junction with the Obrzycko, where it enters the great Warsaw-Berlin valley. The upper Oder proper begins at its junction with the Olsa, where the four streams forming the original feeders unite and enter the Silesian plateau. This is also divided into upper and lower courses at the entrance of the Neisse.

Politically, 79 per cent. of the Oder basin lies in Germany, only 0·5 per cent. outside Prussia. The sources of the main stream lie in Austria, and of the Warthe in Russia, giving 6 per cent. of the whole basin to the former country, and 15 per cent. to the latter.

These facts, as stated in the introduction to this report, indicate the nature and extent of the area to be surveyed, and suggest the lines followed in the inquiry itself. Space does not admit of our even naming the thirty-five separate river-basins, each minutely described in the second volume under the five headings, configuration, soil, water-system, cultivation, and forest; still less can we follow the third volume through the detailed accounts of the Oder itself and its main tributaries. This volume is divided into three, the first section describing the bed and the valley of each part of the Oder corresponding to the natural divisions described above, the movements of water and ice in each, and the "Wasserwirthschaft," or artificial element introduced by dams, bridges, and the like. Section II. of this volume deals in a similar manner with the most important tributaries, excepting the Warthe, which, for geographical reasons already mentioned, has a whole division, section III., to itself. Every part of the work has been executed with the most laborious minuteness, and the facts discussed are constantly supported by the statistical tables, and illustrated by the innumerable maps, plans, and sections.

The general geographical interest of the report, apart from its value as a work of reference, centres round the papers on the climate and geology of the Oder basin, in the first volume. The first of these, by Prof. Dr. Kremser, discusses the interesting transitional climate of the region from the data of air-temperature and rainfall, with a sort of appendix on the other less widely observed elements. The variation of temperature with height is rightly regarded as an important factor in the temperature investigations, and special care has been taken in the comparison of the differences of temperature at such pairs of stations as Eichberg and Schneekoppe (1145 and 5260 feet above sea-level), and Eichberg and Wang (2864 feet), under varying conditions of clear and cloudy weather, and the abnormal conditions of the Föhn wind. The mean correction for height for the year comes out about 1° Fahr. in 330 feet, somewhat less than might have been expected, but easily accounted for by the frequent reversal of the temperature gradient in the colder seasons.

Where a river is concerned, the occurrence and duration of frost is naturally of special importance, and the comparison of Breslau and Stettin gives interesting results. On a mean of forty winters, frosts of less than ten days' duration occur with almost equal frequency, but for longer periods Breslau is higher, continuous frosts of over a month occurring there twice as often as at Stettin. Nevertheless, the longest frost on record (December 17, 1870, to February 16, 1871) lasted exactly the same time at both places. The lustral averages of nine stations for the forty years 1851–90 show temperatures below the general mean from 1851–55 to 1861–65, above it from 1866–70 to 1881–85, and again below it from 1886–90.

The geological work was placed in the hands of Dr. Dathe, who is responsible for the hill and mountain districts, and of Prof. Dr. Wahnschaffe, who surveyed the low-lying plains, the two regions being practically separated by the contour-line of 650 feet (200 metres). No part of the Oder basin rises above the snow-line, so the term "mountain region" is used in the same sense as in the geography of this country, and includes everything more than 1700 to 2000 feet above sea-level, leaving the 600 to 1700 feet belt as "hill country." For geological purposes, the two arrange themselves into (1) the Sudetic mountains, and (2) their subsidiary ranges, (3) the Beskids, and (4) the Upper Silesian plateau; but the Sudetic mountains are understood to extend only from the Lausitzen Pforte to the Mährische Pforte, and to include the Riesengebirge, Eulengebirge, and Altvater groups, characterized by a bed of crystalline schist, which, although the oldest formation here, overlies most of the more recent strata. Special interest attaches to the northern diluvium, which here, as elsewhere in North Germany, occurs up to about 1600 feet above sea-level. The distribution of this deposit has been found to extend over a much wider area in the Sudetic range than was supposed, a point of much importance on account of the different permeability of the soil, and consequent change in the amount of drainage which may be expected to find its way to the various feeding streams.

The low plains of the Oder basin are almost entirely covered with quaternary deposits, but here and there these are so thin that the tertiary strata have become exposed, and the river itself has of course made a number of sections. The tertiary rocks appear most frequently in the neighbourhood of Brieg, to the north of Breslau, south of Liegnitz, and round Posen, but especially in the basin of the Warthe, and they consist chiefly of middle and upper Oligocene and Miocene beds. The quaternary deposits are the diluvium and the alluvium, the former the work of the Russo-Scandinavian ice-sheet, which is now known to have overspread North Germany twice, with an inter-glacial period interpolated, and the latter the result of agencies at work since the total disappearance of the ice-sheet.

THE TEACHING OF GEOGRAPHY IN RELATION TO HISTORY.*

By A. W. ANDREWS.

Much has been written about the teaching of geography, but, unfortunately, the improvement in English schools of this subject has been most disappointing. Its educational importance is, however, so great that I may perhaps venture to make a few practical suggestions on a side of the subject which has been somewhat neglected. It is only by systematizing the teaching of geography, especially in its early stages, that we can hope to train future geographers, and obtain for geography in English education the honoured and important position that it holds on the continent.

At present, in most English schools some time is devoted to the teaching of history, and in a few there is a systematized teaching of geography; but, unfortunately, the two subjects are taught in almost complete isolation. At first it seems almost inconceivable that this should be so, and certainly it is not from any lack of theory on the subject. To quote merely one or two names: Ratzel expressly declares that geography is by no means a Hilfswissenschaft, or subordinate branch of history, but that the two sciences need one another and cannot be separated. Herder, again, in an inimitable definition, tells us that history is geography set in motion; and Michelet goes so far as to say, "L'Histoire est d'abord toute Géographie." Finally, to quote Sir A. Geikie, whose admirable book on the teaching of geography should be in the hands of every teacher. "Few observant teachers will refuse to confess that the historical side of political geography is generally in this country either neglected altogether at school or is treated in the most meagre and perfunctory way. . . . The present political limits of a state are too often supposed to have the same kind of stability as if they had been boundaries fixed by nature. When France of the fifteenth century is spoken of, what proportion of readers has any notion of the difference between what *was called France then and what is France now?* Yet surely history cannot be intelligently understood unless such distinctions as this are kept in view.

"It is hardly possible to exaggerate the importance, in geographical teaching, of connecting the present aspect of the country and the present political boundaries and social conditions with those that preceded them, and out of which they have gradually grown. It is only in proportion as we realize what has been that we can properly appreciate what is. And yet how constantly do we see geography taught as if the existing state of things had always been maintained; as if, for instance, the modern limits of countries had the same persistence and fundamental character as geological boundary-lines. Obviously the study of the present must come first, but we should never forget that the result must necessarily be superficial and imperfect, until it has been connected with an inquiry into the past."

One would fancy that a practical people like ourselves would have utilized some of the abundant theory and material that lies within easy reach, but, unfortunately, there is nothing in which we are more conservative than education. Mathew Arnold's famous lines in 'Empedocles' or 'Etna' might have been specially written for educationalists:

> "And so they rubbed through yesterday
> In the hereditary way;
> And they will rub through, if they can,
> To-morrow on the selfsame plan."

* Paper read at the Royal Geographical Society, February 18, 1897.

The fact is that all practical teachers are, and rightly so, in great fear of fads and faddists, but it is obviously absurd to carry this conservative and precautious attitude too far. There can be little doubt that, without any radical change, and with a slight addition to the time at present spent on history alone, the study of history and geography in connection with each other would, in the hands of capable teachers, produce a result of almost tenfold value to education. To obtain this, the study of the physical geography of a country must precede and be coextensive with the study of its history.

I think it will be generally admitted that the ideal of history teaching in English schools should be to teach the student to reverence the great deeds of his ancestors, to understand his responsibilities as a citizen of a great empire, and, above all, to appreciate the causes which have contributed to the making of England and Greater Britain. As taught at present, even by the most able teachers, there is what one may call a lack of perspective in the teaching of English history, owing to the neglect of physical geography. It is true that good historians and teachers of history have all, consciously or unconsciously, been geographers. It is perhaps sufficient to allude here to Green's admirable geographical work, especially on the 'Influence of the Forests in checking Invasions,' and they have themselves appreciated the importance of physical factors; but they are apt to forget that the student has not done so, and they consequently relegate what I may call the physical side of history to special text-books or special lessons. There is, therefore, this great difficulty to start with, in trying to obtain an adequate recognition of the place of geography in the teaching of history, that there are no convenient text-books to which the teacher of, for example, English history can refer for information as to the geographical side of his work. He can, of course, obtain this information from geographical text-books, but unless he deliberately takes this trouble—which, unfortunately, seems to most teachers to lead them to work quite outside their province—and can also induce his pupils to study geography, he will of necessity almost entirely neglect the geographical side. Unless the teaching and reading are systematic, they can be of little use.

The few isolated allusions to the physical geography of a country made by history-teachers, or scattered through text-books, are, as a rule, of little practical value, because the student has not sufficient knowledge of the subject to understand their importance. It would be quite as unreasonable to expect any one to have a clear idea of the relative position of peaks in a mountain range of which he has only caught fleeting glimpses through the mist.

It may, perhaps, be objected that historical atlases—and what could be more geographical than an atlas?—are always used by all good teachers in the teaching of history. But if you examine what are usually called historical geographies and historical atlases, you will find that they are almost entirely topographical; that is to say, they deal with the distribution of names and the changes of political boundaries. Some, such as 'Gardiner's Student's Atlas of English History,' are of immense value for the teaching of history, and I can imagine nothing more instructive than to compare the maps of England of about 1400 with those of the present day, and observe how few of the modern manufacturing towns of Lancashire were even marked at the earlier period. But teachers are apt to forget that a topographical map is merely a diagrammatic method of showing statistics referring to the relative positions of names.

It is true that a physical map is also a diagrammatic method of showing the distribution of rivers, mountains, etc., and that it can be used equally badly, but fortunately hardly any student attempts to learn a physical map by heart. To know where places are and their distance apart has a distinct value in the

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

intercourse of everyday life, but no one as a rule wishes to know the exact shape of mountain ranges or the position of contour-lines for their own sake, but only for the information given by these symbols with regard to the country. A student, therefore, does not attempt to commit a physical map to memory any more than he does a landscape, but only attends to and remembers those details which help to illustrate his line of thought.

To take a concrete instance: a boy, looking at a topographical map of England, remembers the positions of London and Liverpool from the picture imprinted on his mind of the names London and Liverpool, written in a certain type at opposite corners of the map. He has now got all he wants from the map; that is, the relative positions of the two names representing the towns London and Liverpool, in much the same way and with as little reasoning as he has learnt the position of two benches in his schoolroom. But he can hardly look at a map of India and see the Himalayas with the plain of the Ganges below, or of Switzerland and see the plain of Lombardy between the Alps and Apennines, without thinking of what these lines and dots represent, and reasoning somewhat as to how these mountains and this plain must affect the people who live there.

The above example of the misuse of a topographical atlas is particularly fruitful, because it illustrates an unfortunate tendency to make English history a mere verbal record of statistics, in the way that a topographical atlas is a diagrammatic record of statistics. To understand history, the student should be able to have in his mind at any one epoch (for example, 1380 in English history, at the time of Chaucer), a picture of the state of England, as clear as the student who has studied the present geography of the British Isles has of the whole British Isles and the relation of the different parts to the life of the whole.

But, as a rule, even the best student has no such clear view. He may have studied the growth of English institutions, and be able to understand the development of our complex system of law and custom; or he may know the history of parliament or the foreign policy of different reigns and epochs, or possess a connected idea of the development of English literature and manufacture; but, however thoroughly he may understand each branch (and it must be remembered that I mean a knowledge of English history far more complete than a mere acquaintance with dates and genealogies and great events), he is apt to become confused when he tries to put these different streams together and form a clear picture of life in England at any one time.

In the study of history there must be constant comparison and contrast, and the student has usually no clear idea of any one epoch with which he can constantly compare and contrast others. If, however, he knew something of the present physical geography of the British Isles in conjunction with some of the main ideas of the history of our own times, a knowledge that he would be able *to continually expand from his own experience*, he would possess something certain with which he could compare other epochs.

One of the strongest reasons, therefore, for the study of geography in connection with history, is that it would give the student a firm standpoint. It may also be added that, as the pressure of other subjects in schools often makes it impossible for a student to gain any but a disconnected knowledge of certain periods of history—I know many people who have never got beyond the reign of Queen Anne—if he began with geography, he would at any rate possess some certain and valuable knowledge, in addition to a training in what is, as every one must admit, one method of understanding history, *i.e.* from the geographical side. He would probably in this way make far more use of any scraps of historical information that came in his way in after-life.

As an example of how one of these epochs might be studied, and how enormously the early training in physical geography would help the student, I will take the times of Chaucer (about 1380). I must first, however, explain what geographical knowledge the student should bring to the study of this epoch. It would, perhaps, be well at this point to answer a possible objection to the study of geography in connection with history, namely, that geography is a science, and should take its place among the sciences. It is quite possible that one of the obstacles that have hindered its introduction into schools has been that the teaching of geography has been confounded with that of the sciences from which it draws its materials, and that in consequence the teaching of geography is considered as simply an extension of science-teaching. It is obviously far more important, to take an instance, that a boy should understand the part that Vienna played in history as one of the outposts of civilization, than that he should know the rainfall of Vienna, and I can understand a teacher who regards geography in this way failing to appreciate its importance for history.

But it must not be forgotten that geography gives us the causes which made Vienna what it was, and that the rainfall was only one, and possibly the least important, of the factors. There is, therefore, a real danger to be avoided in the teaching of geography in English schools, which lies in the manifolding of statistics, whether these consist in diagram maps or lantern slides. This, however, is simply due to a bad selection of the materials, and need not prejudice geographical teaching.

I might here point out, with regard to the admirable lantern-slide maps which have been and are being prepared by the Geographical Association for use in schools, that they are not, as some teachers have thought them, a royal road to geography, but simply a convenient diagrammatic form of showing statistics. It would seem unnecessary to mention this, if I did not know that many teachers have actually shown a series of these maps, comprising population, rainfall, language, physical features, etc., just as they would have shown a series of views. Lantern-slide maps are, however, if properly used, of immense value, as they can be seen by large audiences, and save great labour in the preparation of wall maps.

To return to the consideration of the preliminary study of physical geography in connection with history. This should in no way differ from the training in *observation* which has so often been described by numerous authorities; I need only refer here to "Geographical Education," by A. J. Herbertson, in the *Scottish Geographical Magazine* for August, 1896, and other months. The early training in geography must be partly scientific, and in connection with the sciences, such as meteorology, geology, botany, chemistry, etc.; that is to say, a boy must first be taught to observe the laws of nature and physical conditions that determine the environment of his school and home. It is not, however, necessary for the special purpose in view—the geographical training necessary to understand history—to carry this too far. To take an instance, it is not necessary to be a meteorologist to understand the influence that climate has exerted in the past and does exert in the present on the history of life and race, in Ireland and the west of the British Isles, any more than it is necessary to be a statistician to know something, in the ordinary study of English history, about the increase of population at different epochs. Unfortunately, this training stops short, as a rule, with *observation*, but to be of any use it must go much further, and lead on to the comparison and contrast of the district he knows with the rest of the British Isles, and, in less detail, with Europe and the British Colonies.

The geography of the world must, of course, not be neglected, but it should only come after the study of the countries which are in more intimate relation with his home. In fact, both in the early training in physical geography and

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

subsequently, the student should be taught to look out for the relations which subsist between different towns, districts, and countries. These are obviously not determined by distance, *e.g.* if you post luggage from Grindelwald to Brigue in the Rhone valley, a few miles distant, it goes about 60 miles round by Berne, because it can be sent by rail round the great mountain basins. They are even not determined entirely by facilities of communication, as Manchester discovered, when it hoped to tap the ocean trade directly by the ship canal, without unloading at Liverpool. There are many reasons, such as custom, interest, etc., which often bind two towns, districts, or countries together between which the facilities of communication are far less than between either of them and a third.

I have mentioned this because there is a danger, in the teaching of geography, to imagine that it should be taught—in spite of the repeated assertions of many eminent authorities, that to proceed by political divisions, township, country, etc., is to violate the fundamental idea of home geography—beginning from the Home, or Heimatkunde, in the order in which places or districts lie on the map, or even, as some one has pointed out, in the order in which maps are bound in an atlas! I have known many a boy who has studied the geography of North America, and has then been taught South America because it came next, and consequently has never reached India at all. It is surely, however, as unreasonable for any one to do this in geography as it would be in history for an English boy to study first some country like China, whose story is least intimately bound up with that of the British Isles. If, however, geography and history are taught in connection, the order of study presents no difficulty, as the countries of Europe, United States, India, and the colonies will naturally be studied *first*, in connection with the main points of their history.

With this preliminary knowledge of geography, the student would possess a firm standpoint with which to compare and contrast such an epoch as the times of Chaucer (1350 to 1400). I will take three headings, which of course are in no way exhaustive, for the study of that epoch from the geographical side.

A. Causes which led Population to centralize at Different Points.

I will confine myself to one instance.

I. *Point of Exit. Harbours of England.*—This gives an opportunity for a most instructive comparison.

There happens, in the year 1347, to be a record of the number of ships supplied by the different ports to the Calais expedition.

The Cinque Ports supplied about one-seventh of the whole number of ships and men, and the largest vessels were contributed by Yarmouth, Dartmouth, London, Bristol, and Southampton, which is sufficient to show that the populous centres of England were mainly in the south-east and south-west. If the student compares this with the present position of British ports, with which he is already acquainted, he will be able to appreciate the influence of geographical conditions in history, and to understand how the modern port of Liverpool, which sent on that occasion a bark and six men, was able, as the outlet of great coal, iron, and salt mines and populous manufacturing towns, to triumph even over Bristol with its exceptional tidal advantages, its central position and easy communication with the Trent and Thames, and its proximity to the metalliferous ores of Cornwall and the coalfields of Wales.

The history of the Cinque Ports, which were even then past their prime in consequence of the decay of their harbours, presents an exceptionally good object-lesson of the way in which a change of physical conditions has influenced history. The causes which led to the destruction of the harbours of Romney, Rye, Winchelsea,

مكتبة قطر الوطنية
Qatar National Library

and Sandwich, to take the most striking instances, were twofold. Sandwich is particularly worthy of notice, as it was originally one of the old ports of London on the river Wantsum, which separated the Isle of Thanet from Kent; it is also mentioned in Domesday Book as the most useful national port for defence; its importance is further shown by the fact that it was the headquarters of the Danish fleet when they invaded England. The waste of sand which now separates it from the sea was due both to the influence of physical conditions and the influence of man. The physical causes were the south-west winds and flood-tides, which carried with them the sand and gravel procured from the old sea-beaches and from the masses of material washed down from Sussex valleys to the sea, and left them in places where eddies were produced by the meeting of the tides and the consequent slackening of their pace.

This was greatly accelerated by the influence of man, which was shown in the "inning of the marshes," or reclamation of the waste land covered by the tide. In this way the mouths of the rivers and the harbours were gradually choked up by the accumulation of sand which had formerly been spread over a larger area.

The physical changes that have influenced history should be continually kept in mind by the student.

I cannot do more here than mention one or two towns and districts whose position has been completely altered in historical times.

The old Roman port of Rutupiæ, which in Saxon times bore the name of Richborough, was deserted by the sea, and gave place to Sandwich.

Reculvers, or Regulbiæ, the old capital of the Saxon kingdom, was originally at some distance from the sea. The tide, however, has at that point eaten so deeply into the soft cliffs, that it was found necessary to protect the church, which served as a landmark to sailors, by constructing a sea-wall.

Lastly, I might mention the coasts of Norfolk and Suffolk, where the sea gains incessantly from 6 to 15 feet per year, and where churches, as at Eccles by the sea, have been actually buried in the sand. To give one striking instance abroad, the town of Adria, which gave its name to the Adriatic, is now 14 miles from the sea.

I think there can be no doubt that a student, who at this epoch (1350–1400) had some knowledge of the chief physical causes that had influenced and were influencing the growth or decay of towns and populous centres, would be in a far better position to understand history. There would certainly be some difficulty in obtaining what I may call diagrammatic material, for except with regard to political geography, none exists at least in an accessible form.

There exist, however, sufficient details for the preparation of rough maps illustrating the following points at this epoch, to take a few instances, which should be compared and contrasted with similar maps of the present day—

Maps and Diagrams (1350–1400).

A. Causes which led People to centralize at Different Points.

1. The population of the British Isles.
2. The proportion of people in town and country.
3. The British Isles, showing, say in red, where physical changes have taken place from 1350 to the present day, and in blue from our earliest historical records up to 1400.
4. The agricultural, fishing, grazing, and industrial districts.
5. Distribution of forests and swamps and unreclaimed land.
6. Harbours, showing depth and capacity, and arranged in classes according to

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984184.0x000001

مكتبة قطر الوطنية
Qatar National Library

their relative value. In this case 1, 2, 3 should correspond to a similar enumeration at the present day; a first-class harbour at both epochs being marked with 1.

7. The towns which were of most importance at that epoch.

8. The distribution of monasteries, fairs, and the sites to which pilgrimages were made, *e.g.* Walsingham, Norfolk.

I can imagine no more instructive course of study than to take the main towns of importance at this epoch, such as Bristol, York, Yarmouth, etc., and show how their history has been influenced by physical conditions. How far it would be possible to deal with this, except in its broad outline, in teaching the physical geography of the British Isles at the present day would naturally depend on the pupil. At any rate, he should know the physical conditions which have determined the growth or decay of towns in his own neighbourhood, and the meaning of those topographical names which are a clue to the early geography of the district. It may be said that this will entail more work than a student can possibly do, but I think that if the information were systematically arranged in a diagrammatic form for some dozen epochs in English history, separated by from fifty to one hundred years, each of which might be studied in some three or four lessons, that it would give the student a firmer framework on which to build up history than a mere knowledge of dates and great events.

B. My second heading is "Means of Communication." It is difficult to realize the life of a time when goods were brought into London by barges or on a pack-horse by the narrow footway of old London Bridge with its shops on both sides, or the old roads, which were often so bad in winter that Parliament was unable to meet because members were detained a few miles out of London. The student will, however, see this more clearly if he is able to compare that time with the present, with its railways and steamships and canals and all the modern facilities of communication. Under this heading it will be useful to group the main lines of communication of the time both with the British Isles and with other countries; *e.g.* it should be mentioned that, as the Cape route had not yet been discovered, the trade from the East passed largely through the Mediterranean, and was controlled by Venice and other Italian cities, and not by English merchants. I think it must be clear that a knowledge of the main lines and facilities of transport at that epoch and comparison with the present would help enormously to understand its history.

Maps and Diagrams (1350–1400).

B. Means of Communication.

1. Roads and bridges (the maintenance of which was a matter of national importance).

2. Navigable rivers.

3. Sea routes and overland routes of Europe, showing the course of trade, the influence of the Hanseatic league, Venice, etc., and the position of British navigation.

C. The Influence of Geography on Thought.

As a third heading, it would be interesting to take such a subject as the influence of geography on thought, which really embraces two different ideas: (*a*) The influence of geographical knowledge on thought; (*b*) the influence of geographical conditions on thought.

Maps and diagrams under this heading might perhaps consist of—

1. The geographical knowledge of an educated man, such as Chaucer, who had

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984184.0x000067

مكتبة قطر الوطنية
Qatar National Library

been on a campaign to France and a diplomatic mission to Genoa, and whose characters in the 'Canterbury Tales,' such as the Wife of Bath, who had been in Palestine, and the Knight in Lithuania, fighting against the pagans, prove that their author possessed a considerable knowledge of European geography. It is in this way that we can approximately estimate the knowledge of foreign countries possessed by the man who acted as Foreign Minister, a consideration of enormous importance in considering the foreign policy of England.

2. It would be interesting, though not so important and more problematical, to estimate the geographical knowledge of the different classes of society who are represented by the characters in Chaucer's 'Canterbury Tales.' I may here mention that the student would already possess maps of the probable geographical knowledge at at least two epochs between 1066 and 1350, showing the influence of the conquest, and the Crusades. Chaucer's Knight must have had many opportunities of seeing foreign lands—

"At Alexandre * he was when it was won;
Full often time he had the board begun †
Aboven allè natïons in Prusse."

It was the custom for knights in the fourteenth century to fight in Prussia for the Teutonic Order against the heathens. He had also been in Lithuania, Russia; in Granada, at the siege of Algezir (1344); in Africa; at Layas in Armenia, and Satalie, the ancient Atalia, both taken by the King of Cyprus, the former in 1367, the latter in 1352; also in the "Greatè Sea" (the Mediterranean), in Anatolia, and in Turkey. Chaucer's Shipman represented the class of sailors and traders who were laying the foundation of England's future greatness. "He was the best pilot from Hull to Carthage," which shows that at least the west of the Mediterranean was open to bold and enterprising mariners—

"He knew well all the havens as they were,
From *Scotland* to the Cape of Finisterre;
And every creek in Bretagne and in Spain."

Scotland is in some editions Gothland. In any case, his range was over the whole of the North Sea and the Atlantic seaboard. In this way it is also possible to connect geography and literature.

In Chaucer we have actual contemporary material, but when that is not available it is quite easy to find modern writings that refer to ancient times, *e.g.* Macaulay's 'Armada,' which should be read in conjunction with a map showing where the places mentioned are situated.

Chaucer's Wife of Bath had been a great traveller; besides that—

"Of cloth-making, she haddè such a haunt (custom),
She passèd them of Ipres and Ghent."

This is most interesting as showing the native woollen manufacture.

"Thriès had she been at Jerusalem
. . . . .
At Rome had she been, and at Bologne,
At Galice, at St. James, and at Cologne."

Other headings might be—

3. The influence of geography on literature.

* Alexandria taken in 1365 by Pierre de Lusignan, King of Cyprus.
† Begun (sat at the head of the table).

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

4. The distribution of languages and dialects.

5. The proportion of foreigners in England and of Englishmen abroad; the knowledge of foreign languages in England, and of English by foreigners.

6. The influence of geography on education.

7. The distribution of religious beliefs.

8. Districts of Europe possessing the closest relations with English life, especially the main towns of the Netherlands, *e.g.* Middleburg of Chaucer's merchant: "He would the sea were kept for anything between Middleburg and Orewell." Orewell was the port of Ipswich, and the trade was considerable between these places. Also of France, *e.g.* Bordeaux, which belonged to England, Chaucer's Shipman: "Full many a draught of wine he haddè drawn, from Bordeaux wood while that the chapman sleep."

In this connection it is important to notice that the history of Europe should be studied in its broad outlines at each of these epochs, such as 1350–1400, so far as it is necessary to understand the relations of Europe and the British Isles. The events in the history of France, for instance, which affected the British Isles at that date should be studied at the time when the student is considering the history and geography of that epoch of the British Isles, and not, as is the case now, omitted or left for some future time when he may study the history of France. It will be remembered that this will not entail any great additional work, as the student will already have some knowledge of the geography of France and the main points of its present history. It would, of course, be difficult and even unnecessary to put all these points in a diagrammatic form, but I think that the attempt to do so would give them clearness, and open a student's eyes to many new and instructive problems.

It will possibly be objected that the history of the English people must necessarily be studied as the history of their gradual evolution, and that these periods will overlap so much as to make it difficult to obtain any concise and definite idea of their position at one epoch. If, however, we take the illustration of a child growing up to manhood, we always find change and progress, and yet it is possible to take a photograph or draw a character at one definite epoch in that evolution. Possibly, like the conventional picture of the trotting horse, it may never be *exactly* true, but it will be sufficiently so for ordinary purposes. These periods or epochs selected may be considered as a series of photographs of the life of the English people at different ages, intended to add vividness to the study of history.

A consideration, therefore, of the geographical conditions at this epoch would undoubtedly give the student a standpoint from which to obtain a clear view of the different streams—such as literature, trade, social life, etc.—which make up the history of that time. Every one of them, he will find, was influenced by the geographical conditions, and geography will therefore be seen to form a common bond which unites the threads of history. It is difficult to understand why history and geography have not always been taught in connection, but it may perhaps be due in England to the fact that we have no great physical features that absolutely force themselves on our attention. In countries such as Switzerland the forces of nature are so overwhelming that geography naturally takes an important place; but in England teachers seem to think that a few platitudes—such as our insular position and the influence of the Gulf Stream—constitute all that there is of importance for history. It is, however, only possible for a student to really appreciate history when he understands the great truth, that the widening of the horizon of thought has been, in the main, coextensive with the widening of geographical knowledge.

Consider for a moment the great geographical discoveries of the two centuries that followed 1400: the discovery of the route round the Cape of Good Hope and of America, which led the way to further explorations, out of which has grown our colonial empire. Take the great invention of the fifteenth century—printing. Would it have exercised the same world-wide influence or thought, at any rate with the same rapidity, if it had not occurred simultaneously with the extension of geographical knowledge? Imagine for a moment the infinite extension of thought that would result by the spread of geographical knowledge in China, if it were only possible to substitute a training in history and geography for the maxims of Confucius. It might be difficult to break through those traditions, which have been the outcome of geographical conditions and centuries of isolation —we know from experience how little the Chinaman abroad differs from the Chinaman at home—but it would certainly, in time, produce an enormous change in the destinies of the East.

In concluding this short paper, in which I have endeavoured rather to enunciate a principle than to set forth a method of teaching geography, I should like to call attention to three of the main advantages of teaching geography in connection with history.

I. A study of the physical geography of the British Isles and of Europe would give the student a firm standpoint for the comparison of the present and past in English history, and for the appreciation of the main lines of the history of Europe which affect the British Isles.

II. It would assist a student to visualize history, *i.e.* to call up in his mind pictures of places and scenes, for he would be learning the history of a country he knew as a whole, not, as at present, of a country of which he knows next to nothing. It might be said without exaggeration that the majority of English boys know as little of the geography of England *as a whole* as they know of France, and, if they were set to learn the history of France instead of England, could hardly be more unfamiliar with the country they were studying.

III. It is the one factor of history that it is impossible to teach in a cut-and-dried method. To take merely the instance of the geographical position of towns, a student who appreciated that such cities as Geneva and Basle were founded on the cross-roads followed by ancient migrations; or like Toulouse, where a river became navigable; or like London, on the limit of a tidal estuary; or Guildford and Dorking, founded at the passes through the northern Downs; or Turin, as the warden town of a valley flanked by the Alps,—could hardly fail to *think*, and so fulfil what is, after all, the main aim of education.

Provisional list of epochs and maps desirable for their study—

1. The home district.

2. The geography and history of the present in its main outlines, especially of the British Isles and Europe.

(This is to be built up from the student's personal observation in the home district, progressing from the known to the unknown.)

3. Epochs of English history and geography.

(To be built up from 2.)

A. Roman Period.

1. B.C. 55. Invasion.

The British Isles.

(1) Tribal divisions and languages.

(2) Degrees of civilization.

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984183.0x00008f

مكتبة قطر الوطنية
Qatar National Library

(3) Towns founded before 55 B.C., and names that existed before the Roman conquest. Of Celtic names, Thames, Severn, Tamar, Kent.
(4) Population.
(5) Proportion of people in town and country.
(6) Agriculture, pasture, etc.
(7) Distribution of forests.
(8) Harbours and navigable rivers.
(9) Communication with continent.
(10) Physical map, showing changes before 55 B.C.; after 55 B.C. to 1896.
(11) Geographical knowledge of the time.
(12) Europe.

II. A.D. 100 } Administration.
A.D. 410 } Abandonment.

Most of the above maps should be repeated for this period, to show the effect of the Roman period. To them might be added—

(1) Roman divisions of Britain.
(2) Roman roads and bridges.
(3) Roman stations.
(4) Roman walls.
(5) Areas of resistance to Roman influence.
(6) Population, Roman and native compared.
(7) Roman towns and names in Great Britain, etc.

(These maps can, of course, be added to or omitted. It is advisable that each diagrammatic map should only show *one* set of statistics.)

The teacher will, of course, have to make his own rough maps, as the only easily available map of the period is the first in Gardiner's 'School Atlas of English History.' This is the only map in the atlas which is not solely political. It contains the roads, walls, and Roman stations, and shows the fens, Romney marsh, and the Anderida Silva. It is, therefore, of great value so far as it goes, as it shows the kind of map desirable.

B. The Saxon Period.

A.D. 410–832.

C. The Period of Danish Invasion and Rule.

A.D. 832–1066.

D. The Norman Conquest.

A.D. 1066–1154.

E. A.D. 1154–1327.

F. 1327–1415 A.D. *Times of Chaucer.*

G. 1415–1558 A.D. (Invention of printing, gunpowder, fall of Constantinople, discovery of Cape route, etc.)

H. 1558–1616 A.D. *Shakespeare and discovery.*

I. 1616–1689.

J. 1689–1750.

K. A.D. 1750–1832. (Manufactures.)

L. 1832. (Beginning of railways.)

No stress is laid on any of these periods or dates, because it is strongly inadvisable to attempt to divide history too strictly into periods, each necessarily overlapping the next. There is, however, no doubt that a dozen *photographs* of the geography of the British Isles, in the form of diagrammatic maps, taken for one

BRITISH LIBRARY

year in these or similar periods, would be of enormous help to the student, as they could be studied backward as well as forward, and continually compared and contrasted with the present.

Before the reading of the paper, the Chairman (Lieut.-General R. STRACHEY, Vice-President) said: The paper about to be read to you is on a branch of education than which nothing can be more important. Of the many branches of study and education, for the purposes of which a knowledge of geography is desirable, none in which its importance is so great as history. You may say that, for the proper treatment of history, a knowledge of geography is not only desirable but essential. I am not going to give you a lecture on the subject myself, but merely say that I am much impressed with the importance of the subject. I have no doubt it will be well treated of by Mr. Andrews.

After the reading of the paper, the following discussion took place:—

Mr. G. G. CHISHOLM: I came here this evening without any intention of saying anything at all on the subject, but I have listened with great interest, and have not the slightest hesitation in seconding, in the very strongest possible manner, the general views expressed. Of the importance of teaching the physical features of a country with reference to the study of history, I think there can be no doubt whatever. The proper study of physical features is essential in all geography, whether it is studied with a view to history, or commerce, or strategy, or any other purpose, and we are indebted to Mr. Andrews for having brought the matter before us, because, while it is the case that it is highly important that physical geography should be made the basis of all rational teaching of geography, it is equally true, and lamentably true, that it is to a large extent neglected, and I admit that the neglect is peculiarly glaring in the case of historical atlases. Why it should be so, I am unable to say, but, as a matter of fact, the historical atlases usually published contain no physical features whatever, or very scanty features. I will say nothing at all about the interesting illustrations Mr. Andrews has furnished, but I would only add that, while it is very important that in the teaching of history, its relations to geography, the effect geography has had upon it should be clearly brought out, there may be a tendency to go a little too far, and to give, especially young pupils, a feeling that all history may be explained as a deduction from physical features. Of course that is not the case, as Mr. Andrews is very well aware. At all times political and economic, as well as other conditions must be taken into account. Of the importance of keeping political considerations in view, a very good illustration is afforded by the seaport of Antwerp. No one, looking at Antwerp in the best physical map, will be able to understand why it was that Antwerp was so late in becoming an important rival of such places as Bruges, and one cannot understand it without seeing a map of the Low Countries as they existed in past times. But even after the physical conditions had come to tell in favour of Antwerp, the geographical value of that port was entirely destroyed for centuries by political conditions. Before sitting down, if I have not trespassed too much on the time of the audience, I would like to mention one thing in connection with one of Mr. Andrews' last suggestions—that it would be a good thing to have some kind of map giving an idea of what distances were with regard to time in the past. Well, that is a very interesting suggestion, and the French, with their usual ingenuity, which I think they often show, particularly in the construction of diagrams, have illustrated this point by means of concentric maps of their own country. The outermost map shows the time taken, say, one or two hundred years ago, to travel from Paris to Marseilles or Calais, while the

BRITISH LIBRARY

innermost is on a scale proportioned to the time taken at the present day. They are, I believe, official maps, but the example I have seen is in a book by M. Dubois.*

Mr. J. R. Robinson: I do not know that I can add much to what the lecturer has said. I have long held strong opinions as to the effect of geographical features on the history of a country. Taking the country I know most about—Ireland—the great central plain enabled the Ard Righ, or high king who had his seat at Tara, in the neighbourhood of the district Mr. Andrews has marked as "The Pale," to dominate the sub-kingdoms in the mountainous districts round the coasts; and these mountainous districts prevented the complete conquest of these sub-kingdoms. Even at the present day the physical features affect the politics of districts in Ulster. For example, the only district in County Down which returns a Nationalist is that surrounding the Mourne mountains, where the old race found a refuge. The importance of Belfast arises from its position at the mouth of the river Lagan, where a sandbank (from which Belfast takes its name) allowed communication by a ford between the portions of the old kingdom of Dalraida. We must not, however, carry the influence of geographical features too far. In the case of Belfast, part of its prosperity arose from the fact that in the last century, the Earls of Donegall, who owned Belfast, being in want of money, were compelled to give leases for ever at nominal rents on payment of heavy fines. To show how this acted, a firm of manufacturers, wishing to establish a factory at Lisburn, were unable to obtain a lease of sufficient land there from the Marquis of Hertford except for a short period, and consequently established their works at Belfast, where conditions were more favourable. One important consideration deserves notice: How are we to teach the teachers? The teaching of history lies chiefly in the hands of classical masters, most of whom have a contempt of geography, and, in my experience, strongly advise their boys not to attend any special class in geography. Such teachers cannot appreciate the influence of geographical conditions on history, and unless we can succeed in enlightening them, the teaching of history cannot be effective. I think Mr. Andrews has done a great service to geography by pointing out the absolute necessity of physical geography to the study of history, since it is impossible to properly understand history without it.

Mr. Vaughan Cornish: I hope that in recommending increased attention to the teaching of geography in connection with history, the recommendation will be, in the first place, to the universities and to the colleges which train teachers rather than to the schools, because a great many of the points which Mr. Andrews has mentioned are quite beyond the knowledge of most of the gentlemen who are entrusted with the teaching of history in schools, and I think that more harm than good would be done by inducing this physical teaching of history by the setting of questions at examinations for schools, where the men now in charge of the subject have not an adequate knowledge of physical science. I will illustrate my meaning by one particular case which Mr. Andrews himself has referred to in his address, in order to show how very special is the knowledge required for dealing properly with this subject. If you will look at Map 6, by Liverpool, you will see two curious indentations of the coast, one of which leads up to the formerly important port of Chester, and the other to Liverpool. Now, you will notice that the Chester estuary is a funnel-shaped estuary, the Liverpool estuary bottle-shaped, with the neck next the sea at the mouth. Anciently, of course, Chester was the important town; now Liverpool is the important town. Mr. Andrews referred to the importance of Liverpool as being due

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

to its position with reference to the plain behind it; that would not explain the change in the relative importance of Chester and of Liverpool. That, I think, is due rather to the circumstance that the Chester estuary has silted up, and the channel at Liverpool has been kept open, owing to the fact that the estuary in one case is funnel-shaped, so that the ebbing tide loses strength as it flows out, whereas in the other case, the estuary being bottle-shaped, the ebb-tide gathers power as it goes, and clears out the channel, as Professor Lodge has pointed out. Now, matters such as that are beyond the physical science which is at the disposal of the average teacher of history in schools, even the highest schools, and until the gentlemen entrusted with the teaching of history (whose education is mainly literary) have received an adequate training in physical science, I think it would be better not to press for any very great development of physical geography in connection with the teaching of history.

Mr. ANDREWS: I am obliged for your kind attention to my paper. I think we have struck the practical question that present historical atlases have not any reference to physical geography. Because we may go too far, because we have not competent men who can teach this, are we for that reason to neglect any opportunity of improving the teaching of geography and history? Is it not rather to be studied by beginning with the most simple things? There are in geography many simple points, such as a knowledge of distances and areas, and the obvious influence of physical factors, such as rivers, mountains, and climate, which are absolutely essential for the appreciation of history, and are not beyond the powers of any teacher. The problem we have before us is to encourage the use of good physical maps in the illustration of history. If we do this, teachers will gradually learn to make a fuller use of their materials, and we shall secure a certain though possibly slow advance. If we consider the excellent atlases used in French schools, and the thorough teaching of, at any rate, the geography of France, I think we shall feel that we are wanting in our duty as citizens of a great empire, if we do not do all we can to help boys and girls to know that empire, and learn the resources and extent of the heritage they will have to maintain.

Lieut.-General STRACHEY: I am sure you will be prepared to express your thanks to Mr. Andrews for his very useful paper. For myself, I, as perhaps you may know, have tried my hand at producing an exposition of the view that should be taken of geography in connection with education in its broadest point of view, and I would say, generally, as regards the remarks that have been made by Mr. Andrews and the other gentlemen who have spoken, that there is no subject larger in its scope than geography. It comes into contact with not only every branch of science, but with every portion of history, going back to the very farthest to which anybody would propose to extend the designation history. The fact is, that the human race essentially depends upon the Earth, on which it has been developed under the influence of the features of its surface and the climate, and, as Mr. Andrews has, I think, usefully pointed out, the physical features of the different countries of the Earth have had most prominent and important effects on all that has happened in the past. As to deciding whether any particular mode of teaching is better than another, I am disposed to say, let each man try to do his best; there are many ways of teaching the subject, and the way to obtain progress in this, as in everything else, is for everybody to do his best to follow the road which to him appears most likely to lead to the result desired.

You will all join with me in thanking Mr. Andrews for his very useful communication.

THE MONTHLY RECORD.

EUROPE.

Local Geographical Work in Scotland.—No country in Europe has been less studied from the geographical standpoint than the United Kingdom, and the idea is widely prevalent that geography has no concern with the home country. Any intelligent study of local geographical peculiarities is worthy of being encouraged, and on this account we draw attention to three short papers recently presented to the library of the Society by Mr. David B. Morris, of Stirling, on the Raised Beaches, the Travelled Boulders, and the Glaciation of the Forth Valley. These are not mere compilations from existing writings, but, while recapitulating many facts previously known, they afford evidence of careful study in the field by the author. His point of view is rather geological than geographical, but the facts dealt with are common to the two sciences. It is interesting to note that the author turned his attention to the physical geography of his neighbourhood as a result of the stimulus afforded by a course of University Extension lectures on physiography.

Bibliography of Spain and Portugal.—M. R. Foulché-Delbosc has published (*Revue Hispanique*, 1896) a bibliography of travels in the Iberian peninsula of remarkable completeness and very thorough workmanship. On the principle that no document should be neglected in endeavouring to form a picture of the state of a country at any given time, he has aimed at completeness, not selection. He claims for the records of journeys a more vivid and picturesque truthfulness than is usually to be found in academic works, the labour of years during which primitive impressions have grown dull and facts have often been altered to correspond with new conditions. Thus, while conceding that part of the collected travels is useless, the bibliographer contends that the remainder is of incontestible utility. The numbered bibliography contains the records of 858 journeys from the second century down to 1895, but the editions and translations of these travels which are enumerated amount to 1730. The wideness of research is shown in a table giving the languages of the original editions, all of which, except about 60, were actually seen by the compiler. In French there were 313, in English 229, in German 123, in Spanish 107, in Italian 30, in Portuguese 11, and in ten other languages there were smaller numbers. In addition to a transcript of the title-page of each edition referred to, there are frequently short and interesting personal notes on the author or translator, and in almost every case an itinerary giving the names of the towns visited and the order in which they were passed through. In his preface M. Foulché-Delbosc mentions that he has compelled himself to identify all the place-names which in the originals are almost unrecognizable; he says nothing of the difficulty of the task he thus set himself, or of the great value to geographers and historians studying the past conditions of the peninsula of the assistance thus rendered. Articles in journals are included, as well as independent books. A full index of authors completes the work, to which we are tempted to wish that an index of place-names had also been added. This list must take a high place amongst geographical bibliographies.

ASIA.

A New Work on Mongolia.*—Although Mongolia lies close to the Russian frontier, and there is no lack in Russia of persons well acquainted with the

BRITISH LIBRARY

Mongolian dialects, our knowledge of the inner organization of this wide country and the life of its inhabitants remains still very imperfect. The gaps in what is known about Mongolia were especially evident to such a specialist as the St. Petersburg Professor of Mongolian, A. Pozdnéeff, who has spent two years in Mongolia, in 1874–75, with M. Pyasetsky, and has been since teaching the Mongolian language and literature at St. Petersburg, publishing during that time a considerable number of monographs on the history, religious beliefs, and present condition of the Mongols. Consequently, Prof. Pozdnéeff was sent out again, in 1892, to Mongolia, where he spent two more years, visiting Urga, Khobdo, Ulyasutai, Kalgan, Khukhu-khoto, and a great number of monasteries on his way, and studying the inner administrative organization of the Mongolian *khoshuns*, the religion of the Mongols, and their customs and manners of life. He was accompanied during this journey by his wife, Mme. Olga Pozdnéeff, who aided him greatly in collecting all sorts of ethnographical materials, and a young photographer, M. Zedoroff. The Russian Geographical Society proposes now to publish the results of this expedition in seven large quarto volumes, of which the first, containing the diary of the expedition for the year 1892, is now before us. The second volume will contain the diary for the year 1893. The next two volumes, being the results of studies in Chinese archives and Lamaite monasteries, will be given to the administrative organization of Mongolia and Lamaism under its dogmatic and moral aspects. The law which was issued in 1818, for the government of Mongolia, has been entirely modified since under the demands of the Mongolian common law; and as to Buddhism, it also has undergone in Mongolia a deep transformation, so as to totally differ from the Buddhism of Sakia-muni and the "Makhayana," which have lately been so much studied by West European specialists in Eastern Asia. The next two volumes will be given to ethnographical data and to information about Russian trade in Mongolia; and the seventh volume will contain the history of the princely families in Mongolia. The whole work will be illustrated by a great number of very interesting photo-engravings. Starting from Kyakhta, the small party went first to Urga, calling on the way at the Amur-bayaskhulantu monastery, which is situated aside from the highway, and therefore was little known. The stay in Urga, the town of the lamas, permitted M. Pozdnéeff to give a detailed description of the different parts and institutions of this interesting town, where no less than 13,850 lamas are living in the monastery, divided into twenty-nine *aimaks*, their numbers continually increasing (they were 13,200 in 1877). The temples of Urga, one of which has the colossal idol Máidari, 51 feet high, the shops, the lama part of the city, and its Chinese trading part, the beggars, and so on, are described in succession. From Urga the party went to Ulyasutai, and then to Khobdo, and the diary contains all sort of minute information about the organization of the posting-stations and the inner administration of Khalkha and Mongolia, as well as these two cities, which every year acquire more and more importance for trade. Good photographs illustrate the text, and the photographs of the old cemeteries and their stone monuments—especially the so-called "stag stones," that is, stones bearing some sort of wave and circle linear tracings in the stone—are full of interest. From Khobdo the party returned to Urga, visiting the monasteries of Tsain-khuré and Erdeni-tsu, where Prof. Radloff has discovered, as is known, and copied most interesting old Mongolian inscriptions. Khoboo is said to have been founded in 1585, and has witnessed all the chief events—insurrections and grand religious ceremonies—of the history of Khalka Mongolia. Every hillock, every flag-staff, and every temple or chapel of this monastery reminds the Mongol of some event in his country's history, and Prof. Pozdnéeff truly describes it as the Moscow of Mongolia, while Urga—the residence of the representative of Buddhist deity,

BRITISH LIBRARY

the khutukhta, and the seat of the lamas' administration—may be compared to St. Petersburg. The chapter of this volume which will most interest the reader is undoubtedly the chapter given to the subsequent incarnations (*khubilgans*) of the grand priest of Mongolia—the incarnated deity for all the Lamaites—the Urga *Khutukhta*. After having undergone on our planet only fifteen incarnations since Sakia-muni's times (2596 years), the *Khubilgan* began to reappear in Khalkha Mongolia since the year 1635, which was fifty years after the acceptance of Lamaite religion in Northern Mongolia. At the present time, each new *khubilgan* takes place, as is known, in Tibet. After the death of the Urga, *khutukhta* has been duly reported to Pekin, an order is received from the Chinese emperor, enjoining "to elect the new *khubilgan* out of Tibet boys." The election takes place at Budala, in Tibet, in the presence of the Dalai-lama, the Banchen-bogdo, the Khan of Tibet, and a functionary who is sent for that purpose from Pekin. Twelve boys are chosen for that purpose, and out of them three are definitely selected, not without all sorts of intrigues on behalf of their parents and relatives taking place. Their names are written on pieces of paper, which are put in an urn—the three representing a new reappearance of the *bodisatva* in spirit, in word, and in body. The boy upon whose name it falls to represent the re-incarnation of the spirit is sent to be *khutukhta* in Mongolia, while the two others are also consecrated as lamas, but remain in Tibet. Later on, a deputation, which makes a caravan of a thousand camels at the least, and costs Mongolia no less than about 450,000 lans in silver (about £50,000), is dispatched to Tibet to bring home the new divinity. The present *khutukhta* is twenty-two years old, whose photograph and a by no means flattering description are given in the present volume. After a month's stay in Urga, the party continued their journey to Southern Mongolia, and went to Kalgan. This second part of the journey will be described in the next volume.

The Submarine Earthquake of Kamaishi on June 15, 1896.—Prof. Rein, of Bonn, contributes to the February number of *Petermanns Mitteilungen* an account of the effects of this earthquake on the coasts of Japan, based on an official report, on private communications from friends in Japan, and his own knowledge of the scene of the occurrence. The great wave that followed the shock advanced inland at the height of from 20 to 30 feet, in places even 50 feet, and in a few minutes caused the loss of life of about 27,000 human beings, besides injuring 5000 others and destroying about 7600 houses in the kens of Miyáge, Iwáte, and Aómori, the chief centre of destruction being round the bay of Kámaïshi, on the east coast of Honshiu, in 39° 16′ N. Within five minutes this town was almost entirely swept away. At various places some marvellous escapes are recorded. In one case some persons were found alive on an island about 6 miles distant from the point on the coast whence they had been carried away by a wave. A large schooner of more than 200 tons burden was hurled 500 yards from its anchorage and deposited almost uninjured on a field of wheat. On the plate accompanying this communication, containing a map from Hassenstein's atlas of Japan of the region affected, Prof. Rein has added the chart of the self-registering tide-gauge at Ayukawa, a station about 70 miles south of Kámaïshi, for the twenty-four hours from noon on June 15 to noon on June 16, 1896. This shows that wide and rapid oscillations began at that station before half-past eight on June 15, and about noon the next day were beginning to die away. Outside of Japan effects of this shock have been observed at the harbour of Keauhu, in Hawaii, and at the mouth of the Rogue river in Oregon, but on this subject Prof. Rein proposes to send another communication, and asks for information of any unusual marine disturbances on the coasts of the Pacific Ocean between June 15 and 17, 1896.

Ancient Trading Centres of the Persian Gulf.—It should have been stated that the author of the paper in the March Number is Captain A. W. Stiffe.

AFRICA.

Lieut. Hourst's Journey down the Niger.—The full report of Lieut. Hourst's journey has been published in the *Comptes Rendus* of the Paris Geographical Society, 1897, pp. 24 *et seq.* As we have already noted the general outlines of the journey (*ante*, p. 220), it is unnecessary to do more than to refer to some of its more important results in relation to the questions of the present political condition of the countries traversed, and the possibilities of navigation on the middle Niger. The countries of the Tuareg confederation extend over the whole left bank of the Niger from a little east of Timbuktu to Sansan-Aussa, north of Say. The Igwadaren, the first tribe reached from the north-west, inspired little confidence, being inveterate pillagers; but the Awellimiden, under their powerful chief Madidu, proved much easier to deal with. The influence of this chief was constantly manifested until the southern limits of the Tuareg countries were reached, and his friendship for the travellers smoothed over many difficulties. Although showing many defects, the Tuareg, according to Lieut. Hourst, possess two great virtues: they are absolutely true to their word, and they are never thieves (as distinguished from open plunderers). They are devoted to freedom, and in case of attack Madidu could place twenty-five to thirty thousand men in the field, so that the attempt to bring them under direct French control is not to be recommended. The only section of the race whose influence is to be compared with that of Madidu is the tribe of the Kel-es-Suk, who possess a certain religious and intellectual ascendency. The Tuareg tribes are divided into two great classes—the Ihaggaren, resembling the feudal chiefs of the Middle Ages; and the Imrad, who, while occupying a lower rank, are often wealthy and influential. The domestic slaves, captives taken in war, are called Bellate, and form part of the family of their owners. The Aarma, like the Sonrai, are a subject Negro race, and serve as beasts of burden to their masters, but are well treated. Of the Tuareg towns, Gao, with neighbouring villages, has a population of four to five thousand inhabitants; while Sansan Aussa, on the southern frontier of the Tuareg country, is one of the principal markets on the Niger, though lately its trade has declined. South of the Tuareg countries, the empire of Rabba, who has taken Kano, is strong and well organized. Near the Niger a sentiment of independence is spreading, and Ahmadu, now established near Say, has not acquired much influence, albeit he has designs against Sokoto. The difficulties in the way of navigation on the Niger occur in two principal sections, the one extending for some distance above Say, the other occupied by the Bussa rapids. The former may be considered to begin below Gao, at Ansongo, in the territory of the Kel-es-Suk, near which four rocks bar the stream and mark the limit of regular navigation from above. Below this is a succession of rocks and rapids, which were all passed successfully by the expedition, but some with great danger. At the most difficult passage the navigable channel was little over 15 yards wide, with a current of about 8 knots an hour, and even this was partially barred, as it proved, by a concealed rock. The Bussa rapids begin below the town of that name. The river flows through several rocky passes—one of them little over 150 yards wide—with tremendous velocity. The same marvellous fortune which attended the travellers throughout was, however, experienced here, and all were passed in safety.

Mr. Weatherley's Visit to Lake Bangweolo.—The *British Central Africa Gazette* for January 15 contains some further details respecting Mr. Weatherley's journey to Lake Bangweolo (*ante*, p. 325). Owing to the rapid current of the

مكتبة قطر الوطنية
Qatar National Library

Luapula, progress by boat was so slow that the traveller left his crew to pole the *Vigilant* up the stream, and did the greater part of the journey to the lake on foot. The chief Chinyama proved suspicious, and rumours of an impending attack by Mieri-Mieri were circulated, but by showing a firm front this danger was averted, and threats of desertion by the men likewise came to nothing. Bangweolo was circumnavigated in the *Vigilant* with a crew of twenty-five men. Regarding the lake, Mr. Weatherley says, "The existing map is very much out, and the long adjoining lake, Chifunanti, is not inserted at all. A narrow sand embankment, say 400 yards in width, separates the two. . . . I fancy Bemba, or Bangweolo, is a good deal smaller than it is made out to be in maps. It *looks* enormous—a vast expanse of water, looking at it from the east or west coasts, as the land is so low." The character of the lake is that of an overflowing of the country at the base of the Tanganyika plateau by water from the latter. Nowhere was a greater depth than 13 feet and a few inches obtained. No shells were seen. The Chambezi is a small river, the marsh along its course being impassable for even small canoes in the dry season. The whole east side of Bangweolo is nothing but a sea of papyrus. Mr. Weatherley found that the Luongo river, which Mr. Sharpe considered as possibly identical with a channel entering the Luapula in 10° 11′ S., really joins the latter above the Johnston falls.

Johannesburg.—A census of the town and district of Johannesburg was held on July 15 of last year, and the principal results are given in the table below :—

	Europeans and other whites.	Malays.	Indian coolies and Chinese.	Kaffirs.	Mixed races.	Total.	Males.	Females.
Town proper	35,868	500	2098	8,635	1230	**48,331**	34,103	14,228
Sanitary board area ...	39,454	948	4556	14,195	2139	**61,292**	43,729	17,563
Area of enumeration (28 square miles) ...	50,907	952	4807	42,533	2879	**102,078**	79,315	22,763

The town was founded on September 20, 1886; in April, 1887, had a population of 3000; and in January, 1890, 26,300. At the census of 1896, 63 per cent. of the population were between the ages of fifteen and thirty, only 21 per cent. above thirty. The disproportion of the sexes is not so great in the white as in the Kaffir population, 37 per cent. of the whites, only 4 per cent. of the Kaffirs, having been females. The origin of the white population within the area of enumeration, according to the place of birth, is shown in the following table :—

British Empire	34,020	Brought forward	47,556
United Kingdom ...	*16,265*	Netherlands	819
Cape Colony	*15,162*	France	402
Other British possessions	*2,593*	Scandinavia	311
Transvaal	6,205	Italy	206
Orange Free State	1,734	Rest of Europe	889
Russia	3,335	United States	616
Germany	2,262	Other countries	108
Carried forward	47,556	Total ...	50,907

The British element thus made up 67 per cent. of the total. Of the blacks, only 754 were natives of the Transvaal, 27,468 were from British South Africa, 14,085 from Portuguese territories. Of the total population, 93 per cent. was of foreign origin.

Geography of Africa.*—The latest volume of Macmillan's Geographical Series is a compact little treatise on the geography of Africa by Mr. E. Heawood, whose long study of the geographical literature of Africa specially fits him for the work. While promising to be of great utility as a school-book for the higher forms, it may also serve as a handy summary of the main features of African geography for general reference. It is planned scientifically, so as to treat the continent from the fundamental physical conditions progressively to the present state of each of its great political units. The first chapter is a general survey of the physical geography, and it is followed by chapters on the Races of Man in Africa, Exploration treated historically, and Present Political Relations. The following ten chapters are devoted to the natural regions of the continent, and are treated in the same order as the general part, the physical features and people being first considered, then the political subdivisions and the progress of exploration and commerce, showing how means of communication and town sites have been determined, and the present condition of the country. The importance of such manuals on the continents, written by specialists who have mastered all trustworthy sources of information, cannot be over-estimated.

AMERICA.

The Outline of Cape Cod.—The latest volume (N.S. vol. xxiii.) of the *Proceedings* of the American Academy of Arts and Sciences contains an essay by Prof. W. M. Davis, in which he reconstructs the original outline of Cape Cod by reversing the processes at work on the present outline. He endeavours to trace these processes, and the changes that they have produced, backward to their beginning. A review of previous accounts of the cape is given, a general consideration of the development of seashores is outlined, and the conclusions reached are applied to the problem under consideration. It is thus estimated that the land here once extended at most two or more miles into the sea on the east, and that perhaps three or four thousand years have been required for the retreat of the shore-line to its present position. This period cannot, however, be taken as a full measure of the time since the glacial deposits of the cape were formed, for there is reason to believe that the land stood higher than it is now for an unknown interval between the building of the cape and the assumption of its present altitude with respect to sea-level. The chief interest in the problem discussed turns on the growth of the great sand-spit of the "Provincelands" northwestward from the "mainland" of the cape, and on the protection thus afforded to the old cliffs of High head. A brief account is given of the growth and waste of the Provincelands, and of the changes of the western shore-lines. The essay closes with some practical suggestions regarding the protection of Provincetown harbour, and some speculations concerning the future change of the cape. The encroachment of the sea on the back of the cape is undoubtedly destined to continue until the Truro mainland is all consumed north of Orleans, the "elbow" of the bended arm, which at the present rate of recession will probably require eight or ten thousand years.

Documents relating to the Venezuela and British Guiana Boundary Question.—The courtesy of the Capuchin Fathers at Rome has enabled the Rev. Joseph Strickland, S.J., to publish a series of documents and maps from the archives of that order, which supplement the information given in the English Blue Books on the subject of the extent of territory occupied by the Capuchin missions in Guiana in the eighteenth century. Whilst the general conclusions to be derived

مكتبة قطر الوطنية
Qatar National Library

from the new documents merely confirm those already arrived at in the Blue Books, their publication is of value as throwing additional light on the details of the history of the missions, and on the general character of the Spanish colonization in Guiana at the period in question. Of the maps published, the most interesting is No. 3, which gives, by a dotted line, the Spanish view of the limits of the Dutch colony of Essequibo. It was drawn in about 1779 by Friar Carlos de Barcellona, and, although based on the information of men known to be little favourable to the territorial claims of the Dutch, gives to the latter the greater part of the basin of the Essequibo, the frontier cutting the Cuyuni at an almost equal distance from its source and from its mouth. As the line drawn on D'Anville's map may be taken to represent the extreme Dutch claim, Father Strickland points out that the tract between these two lines is the only part of the territory about which there can be any dispute from an historical point of view. In a brief summary of the question, he arrives at the conclusion that, while the ownership of parts of this intervening tract is historically clear—*e.g.* the Dutch unquestionably occupied the whole coast strip between the Orinoco and the Essequibo—there are other parts about which little or nothing can be said from the evidence available.

The Peruvian Territory in the Amazon Basin.—Dr. Sievers contributes to the February number of *Petermanns Mitteilungen* an abstract of a paper on this region read before the Geographical Society of Lima by the prefect of the departments of Loreto and Amazonas. According to it, Iquitos had, in 1893, a population of 5000; Nauta, 500. The latter place is gradually recovering its lost trade. On the Ucayali there are no towns or villages. The inhabitants, about 20,000 in number, live in scattered families on the banks of the river. The mission settlements, even Sarayácu, have disappeared. On the Amazon above the mouth of the Huallaga, Barranquitas has a population of about 200 Indians, engaged in collecting indiarubber. San Antonio is only a trading factory. On the Huallaga, Yurimaguas, the principal trading centre after Iquitos, seat of a sub-prefect, and in the neighbourhood of the richest cattle-pastures, has a population of like number. Moyobamba, with a population of 7000, engaged in the cultivation of coffee, and to a less extent cacao and sugar-cane, lies in a spot quite inaccessible to men on horseback. Tarapoto has 6000 inhabitants, chiefly devoted to the cultivation of tobacco. The population of the region is composed of three sections—natives who live a wandering life in the forests, and who exchange boats, young *slaves*, indiarubber, and copal for firearms, agricultural implements, and spirits; settled Christianized natives; and people of mixed Spanish or other foreign and native Indian origin. The ruling class consciously or unconsciously plunder the natives, and render them completely subject. With the help of the wandering Indians, a path, used chiefly by indiarubber collectors, has been made between the sources of the Rio Tigre and those of the Pastaza. The cacao tree is found growing in immense quantity, especially on the banks of the Rio Cahuapanas, and it is doubtful whether these are indigenous thickets or deserted plantations. Indiarubber trees grow in enormous numbers on the river-banks, and get rapidly replaced when destroyed; but the author believes that better results would be obtained from a rational plantation system than from the present wasteful method of getting the sap from trees growing wild. Steamers take eighteen days to ascend from Pará to Borja, on the Pongo de Manseriche.

The Region round the Headwaters of the Xingú.—The expedition to this region under Dr. Hermann Meyer has proved completely successful, so that the geographical and ethnographical exploration of this river may now be considered as completed in its main points. On his first Xingú expedition Dr. v. d. Steinen had discovered and ascended the middle headwater, the Batovy, and he

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence

مكتبة قطر الوطنية
Qatar National Library

intended to explore the two others, the Kuluene to the east, and the Ronuro to the west, in his second expedition. Through the ignorance of his guide, however, the expedition was led to a western tributary of the Kuluene, called the Kuliseu. This was explored along with the lower Kuluene, but want of time and provisions prevented the completion of the entire programme. This is what has now been done by Dr. Meyer. On May 11, 1896, he and his companion, Dr. Ranke, started from Cuyabá, and, following with few deviations the route of the first Xingú expedition, reached the Paranatinga, one of the higher tributaries of the Tapajoz, and descended it for a certain distance. The expedition then turned east, and after a three weeks' land journey reached the Ronuro, the western headwater of the Xingú, and ascended and descended it to the confluence with the Batovy, and that with the Kuluene, and made a survey of its course. The Kuluene was now attempted, but its rapid current compelled them to abandon the boat journey; but the whole district between the Kuliseu and the Kuluene was explored during a three weeks' march. The Kuluene proved to be much less important than the Ronuro, which latter is accordingly regarded by the travellers as the true source of the Xingú. The expedition reached Cuyabá again in December, with rich ethnographical and natural history collections and careful topographical surveys.—*Petermanns Mitteilungen*, February, 1897.

The Bolivian Rubber Industry.—A useful summary of the history and present prospects of the Bolivian rubber industry has been published in pamphlet form by Manual V. Ballivian, of La Paz, being a reprint of articles which originally appeared in the journal *El Telégrafo*. As the writer held an official position in the mission sent by the Bolivian government to the north-east territories and the department of Beni, in which the industry is carried on, he is entitled to speak with authority on the subject. He first traces the development of the rubber trade from its small beginnings during the palmy days of the export of chinchona, when the voyages of the bark-collectors into Brazil for the disposal of that commodity first called their attention to the flourishing rubber industry of the Brazilian provinces. This was in about 1864, when the first serious attempt at rubber exploitation in Bolivia was made by Don Santos Mercado, but for some years little success was attained, owing to the superior advantages possessed by the Brazilians, which led to an exodus of population from the Beni into the rubber forests of Brazil. The great impetus to the Bolivian industry was given by the explorations of Dr. Edwin Heath (*Proceedings R.G.S.*, 1883, No. 6) in 1880, which threw open a wider area of rubber-producing country, and led to a rush to the Beni, comparable to that to the Californian goldfields. One of the most enterprising pioneers was Dr. Antonio Vaca Diez, whose writings, together with the information collected by the above-mentioned Don Santos Mercado, have furnished some of the most reliable details on the subject. At the present day, the chief hindrances to the development of the industry arise, firstly, from a want of sufficient organization in the work of collecting the rubber, the population being scanty, and the means of subsistence inadequately provided; and, secondly, from the obstacles to navigation, which make transport difficult. Both these points have received the attention of the Bolivian government, and the road past the cataracts of the Madeira, which has taken the place of the old railway project, was, in 1896, approaching completion. The second part of the pamphlet gives details respecting the mode of collecting the rubber, and statistics of the present state of the industry.

Volcanoes of Salvador and South Eastern Guatemala.—To the January number of *Petermanns Mitteilungen* Dr. K. Sapper contributes an account of the results of his observations in this region in the beginning of 1895, accompanying

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence
View on the Qatar Digital Library: http://www.qdl.qa/en/archive/81055/vdc_100179984187.0x000057

مكتبة قطر الوطنية
Qatar National Library

his account with a map. These observations he regards as only preliminary, for he hopes to continue his studies in future years; but he considers that the journey he has already made is sufficient to make it clear that the volcanic phenomena of the region in question are much less simple than they have hitherto been thought to be. He points out that, while it is established that the main fissure to which recent volcanoes of Central America belong runs through Salvador (as well as Guatemala) in a direction nearly parallel to the Pacific coast, there is a considerable number of recent volcanoes in Salvador and South-Eastern Guatemala which do not belong to this fissure, being well-preserved simple cones, and in that respect different from the other primary volcanoes not belonging to the main fissure, which have been extensively worn away, and belong accordingly to a period geologically remote.

AUSTRALASIA AND OCEANIC ISLANDS.

Sir William Macgregor's Journey across New Guinea.—We have received a copy of the official report of Sir W. Macgregor, dated "Port Moresby, November 2, 1896," which contains the account of his recent journey across New Guinea from the mouth of the Mambare to that of the Vanapa. It acquires additional interest as giving information respecting the gold-mining operations in the upper Mambare district, the scene of the recent massacre by the natives. The Lieutenant-Governor had been preceded in his ascent of the Mambare by the miners, the most enterprising of whom, Mr. Simpson, had cut a good road, with great labour and difficulty, on the north side of the river as far as the junction of its two main branches at the foot of Mount Scratchley. The start was made from Mambare bay on August 6, in two boats towed by a small steam-launch. The river was unusually low at the time, and navigation was difficult in places. After reaching the government station on the Mambare, the journey was continued by land through thick forest, three large tributaries of the main stream being passed. On March 14 "Simpson's Store" on Mount Otovia was reached, 1500 to 1600 feet above the river. Mount Otovia is the Mount Gillies of Sir W. Macgregor's former map (*Proceedings*, 1890, p. 256), the native name for Mount Parkes being Ajula-kujula. The neighbourhood of these mountains, between which the Mambare flows in a deep narrow bed, is exceedingly moist, the trunks of the trees being covered with moss everywhere over 1000 feet, whereas on the Owen Stanley range it is only met with at 5000 to 6000 feet. Game is hardly found at all, and there are no traces of clearings or of native occupation of any kind. The two head streams of the Mambare, the Chirima and Yodda, are separated by the great mass of Mount Scratchley, the Yodda, which is much the larger, coming from the east and south of the mountain. Several miners were found still at work at the foot of Mount Scratchley, but work was about to cease on account of the rains. On the west side of the northern spur of the mountain is the village of Neneba, the chief of whom had visited the north coast, and was returning with Sir W. Macgregor. Numerous details are given with respect to the physical characteristics and habits of the people of Neneba, which are especially interesting on account of the great isolation in which they appear to live. Their colour is a dark bronze, and their hair is without exception frizzled. They showed themselves amiable and peaceable, and the state of their arms indicated that they had not been engaged in any warlike undertaking for years. The route led up to the ridge of Mount Scratchley, a road having to be cut the whole way. The rain, which had begun earlier on the lower grounds, gradually ascended to the higher levels, reaching the highest summits last of all. The highest part of Mount Scratchley, as of the other high peaks, consists of grassy country, broken by bare rocks and clumps

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

of trees. The highest peak reaches a height of about 12,850 feet. Sir W. Macgregor thinks that this mountain-top would be a good centre for prospecting operations. It is connected with Mount Albert Edward to the north-west (13,100 feet) by a high range (named Wharton chain by the explorers), and an easy road leads also to the Owen Stanley range. This was the direction taken by the travellers. Mount Victoria was ascended (the party suffering severely from cold), and the route thence to the coast did not deviate to any great extent from that followed in 1889, the old track still existing in places. The natives were most friendly. Latitudes were taken throughout the journey by astronomical observations, and the place of longitudes was supplied by accurate bearings of Mount Victoria and other peaks. Sir W. Macgregor insists on the importance, at least from a surveyor's point of view, of the use of a distinguishing name for the highest summit of the Owen Stanley range.

Mr. Collingridge on the Discovery of Australia.*—Mr. George Collingridge, who for some years has given his attention to the subject of the discovery of Australia, has published a volume in which he brings together the results of his investigations, largely concerned with the evidence supplied by early maps. The fact of his residence in Australia, with few facilities for consulting original records, has placed him somewhat at a disadvantage, and many of the facts recorded are derived from previously published works on historical geography. But as the difficult subject of Australian discovery has never been exhaustively treated, and much new material has been collected since Mr. R. H. Major published his collection of documents for the Hakluyt Society, the mere bringing together from various sources of so large a body of facts will be of use to those interested in the subject. The text is accompanied by numerous copies of early maps by Mr. Collingridge's own hand, and, though wanting the exactness of photographic reproductions, they are apparently faithful representations both of the style and subject-matter of the originals. The conclusions arrived at by the author are in many cases little likely to meet with general acceptance. Without formulating any distinct theory, the general tenor of the book is to suggest that Australia was known to the rest of the world at a much earlier date than has been supposed. The old belief that the circumfluent ocean occupied the equatorial regions, may account, Mr. Collingridge thinks, for portions of the southern hemisphere being wrongly drawn by the ancient geographers *north* of the equator. He holds that Marco Polo's name "Java Major," applied to the modern Java as distinguished from Sumatra (Java Minor), indicates that the Venetian traveller was aware of the existence of a vast land in those regions. He states that in the time of Nicolo de Conti the western coasts of Australia *were known*, though without supporting the statement by argument. And when dealing with the class of maps of which Behaim's globe is one of the best known examples, he deduces a knowledge of the west coast of Australia from the exaggerated southward extension of the Malay peninsula, which happens to fall within the latitudes really occupied by Australia. The numerous representations of a great southern continent in maps subsequent to Magellan's voyage, with their enigmatical legends "Regio Patalis," "Psittacorum terra," etc., are of course dealt with, and a statement of one of them (the Paris wooden globe of about 1535) is adduced as indicating a southern discovery in 1499. With regard to the "Dauphin" map and others of its class, from which the probability of a Portuguese discovery of Australia early in the sixteenth century has been deduced, Mr. Collingridge claims to have proved conclusively, from a study of their nomenclature,

* 'The Discovery of Australia.' By George Collingridge. Sydney: Hayes Brothers. 1895.

that they are of Portuguese and Spanish origin. He explains the northward extension of Australia on these maps by a desire, for purposes of policy, to represent the seaway as blocked by land in those parts, and quotes a statement of Barros in support of this theory. Perhaps the most useful feature in the book is the facility which it gives for tracing the course of evolution of early maps, although the author's conclusions in this respect too will not always be accepted by the reader.

GENERAL.

Wagner's Geographical Year-book.—The nineteenth volume of this standard work has been published. Following the usual custom, only a portion of the departments into which the survey of geography is divided is dealt with each year. The present issue includes a list of the latitude, longitude, and height above sea-level of 237 astronomical observatories brought together by A. Anwers, and reports of the progress of geography in the department of cartography by Prof. E. Hammer, plant-distribution by Prof. O. Drude, and ethnological research by Prof. G. Gerland. The recent works on the geography of Europe are dealt with by different authorities, the British Isles being reported on by Dr. H. G. Schlichter, but that of Russia is relegated to the next volume. Dr. E. Oberhummer gives a report on the progress of our knowledge of the geography of the ancient world, and Dr. Wolkenhauer contributes a geographical necrology for the years 1893–1895. Prof. Wagner gives a list of professorial chairs of geography, Hauptmann Kollm has compiled a list of geographical societies and serials, while a series of map-indexes of the official surveys shows the present state of publication of the official maps of Europe and India. From the information given, it appears that there are 150 professors or lecturers on geography in 96 universities or colleges, as compared with 126 and 82 in 1891. The greatest progress made during the five years has been in Russia, where geographical professorships have been created in the universities of Kief, Moscow, and Odessa; and in Switzerland, where professors have been elected in the universities of Freiburg, Neuchatel, and Zürich. The list of geographical societies has been corrected by the omission of some purely commercial or political associations formerly included, the deletion of a few that have ceased to exist, and the addition of some new ones. The total number in 1896 was 107 societies, with 38 branches, shared by 22 countries, and situated in 137 towns. The French geographical societies had, together, 16,500 members, the British over 8000, and the German over 6000; the greatest membership is that of the Royal Geographical Society, the Paris Geographical Society coming next with 2000 members. The number of geographical serial publications in 1896 was 153, of which 125 were published by societies. With regard to language, 48 of these are printed in French, 42 in German, and only 15 in English.

The Twelfth German Geographical Congress.—The details of this Congress, which will meet at Jena, as previously announced, in Easter week, have now been arranged. At the first meeting on Wednesday, April 21, Dr. Neumayer will present his report on Antarctic exploration, and papers will be read upon travels in Brazil and Asia-Minor. The afternoon will be devoted to considering the question of geography in schools. On April 22, geophysics, especially the study of earthquakes, will be discussed. On April 23, biological geography, and the report of the committee for the scientific geographical description of Germany, will occupy the time of the meeting. Social gatherings will take place each evening, and geographical excursions to Weimar and also to the Saalthal have been arranged.

A Journal of School Geography.—Mr. Richard E. Dodge, of New York, has commenced with January, 1897, the publication of a new geographical serial of

BRITISH LIBRARY

unpretentious appearance, but of considerable promise. It is entitled *The Journal of School Geography*, and in its preparation the editor is associated with Prof. W. M. Davis and other practical geographers and teachers. Its aim is to advance the cause of good geography-teaching in schools; in order to do this, special care is to be devoted to the testing of all information before publication, and to the avoidance of "circumlocutions and flowery language." The new journal is stated to be independent of all schools of geography, institutions of learning, and publishers. It should thus be able to perform very important functions in directing the attention of teachers to books and maps which are of real value. The first two numbers show that the editors are able to give effect to their principles. The articles are all short, practical, and to the point; the book notices are critical and impartial; and the notes are well selected, although not free from misprints. These are not, perhaps, very serious, and will doubtless become rarer as time goes on. "The British Steamer Penquin" stands for "H.M.S. *Penguin*;" Dr. Nansen's Christian name is spelt Fridthof, the *London Geographical Journal* is referred to, and some of the transliterations of Russian names are defective. The new paper deserves success, and ought to be found useful by teachers outside the United States as well as inside, The subscription is only one dollar a year, and it is published at 41, North Queen Street, Lancaster, Pennsylvania.

Honours to Dr. Nansen.—The Honorary Degree of Doctor in Science was conferred on Dr. Nansen by the University of Cambridge on March 16. The following is the speech delivered by the Public Orator (Mr. J. E. Sandys) on the occasion: "Scandinaviæ filium intrepidum, oceani septentrionalis exploratorem indefessum, post tot pericula terra marique per tres annos fortiter tolerata, salvum et sospitem reducem salutamus. Quid referam viri indomiti iuventutem primam disciplina severa assidue exercitam, et rerum naturæ studiis feliciter dedicatam? Quid itinera per priora animi et corporis patientiam et fortitudinem spectatam probatamque? Quid itinere in ultimo, adiutoris optimi auxilio, tot observationes sive magneticas sive meteorologicas e regione prius ignota reportatas? Quid dicam de bene ominati nominis nave illa, quae glaciei solidæ in mediis molibus, velut Symplegadum novarum in amplexu, constricta et compressa, ductoris tamen providi vota non fefellit, sed, mobili in glacie immobilis inhærens, ad ulteriora sensim delata est? Navem illam, navisque rectorem, ipsum Vergilium prædixisse crediderim:—

'alter erit tum Tiphys et altera quæ vehat Argo
delectos heroas.'

Quis autem pro rei dignitate laudare poterit par nobile illud comitum, qui, nave ipsa relicta, glaciei asperrimæ per solitudines immensas audacter progressi, in regionem tandem pervenerunt orbis terrarum vertici septentrionali proximam, quo ex ipsa mundi origine nulla hominum vestigia prius umquam penetraverant? Etiam arctoi pelagi tum demum patefacti de navita primo Horati verba licet usurpare:

'illi robur et æs triplex
circa pectus erat qui fragilem truci
commisit pelago ratem.'

Talium virorum exemplo admoniti discimus nihil magnum, nihil memorabile, nisi labore longo curaque infinita posse perfici. Talium virorum in orbe terrarum explorando providentia et fortitudine verba poetæ Romani futura vaticinantis denuo vera reddita sunt:—

'venient annis sæcula seris
quibus oceanus vincula rerum
laxet et ingens pateat tellus,
Tethysque novos detegat orbes
nec sit terris ultima Thule.'

Duco ad vos FRIDTJOF NANSEN." On March 18, the Honorary Degree of D.C.L. was conferred on Dr. Nansen by the University of Oxford. On that occasion the Regius Professor of Civil Law (Dr. Goudy) presented Dr. Nansen to the Vice-Chancellor in the following speech: "Insignissime Vice-Cancellarie, vosque egregii Procuratores! Præsento vobis virum egregium e gente Septentrionali oriundum, nautarum matre fœcundissimâ, nautam ipsum impavidum. Præcipuâ vero voluptate consalutare libet ejus generis alumnum quod olim, 'si prima domus repetatur origo,' felicissimo quodam fœdere patriam nostram, oceani potentem, progenie sua ditaverit. Hic vir, juvenili adhuc ætate, per terram illam cui nomen est Greenland—terram vere horrificam qua nusquam diffugiunt nives neque gramina ulla redeunt campis, qua 'semper hiems semper spirantes frigora Cauri'—ab Oriente usque ad mare Occidentale, ingenti labore viam patefecit. Res præclaras ab illo nuperrime sub axe Boreo gestas quisnam ex vobis ignorat, quis non admiratione prosequitur? Patrio ardore instigatus et scientiæ amore rudem et adhuc intentatam Amphitritem imbuere, monstris scatentem pontum irrumpere, glacies, noctem illam longam et intempestivam, ignotas vias, tempestates, Jovem iniquum, animo lætanti pertulit. De quo cum poeta licet dicere 'Solus Hyperboreas glacies, Tanaimque nivalem, Arvaque Rhipæis nunquam viduata pruinis, Lustravit.' Modestiâ singulari, fidelitate in socios, constantiâ mirâ notus est; neque Fortuna audaciæ defuit. Idoneus igitur videtur ille atque adeo dignissimus qui rectis oculis splendores pallidos noctis Septentrionalis aspexerit, qui Oceani Artici profundum tentaverit, jam ad has sapientiæ ædes, periculorum expertem, accedere atque Isidis fontes more tranquillo haurire. Faxit Deus optimus maximus, cui terræ cui maria curæ, ut nobiscum familiaritatis vinculo arctissimo conjunctus regionum ignotarum se exploratorem assiduum præbeat nostramque insulam, tanquam patriam alteram, habere dignetur, unde fructus pulcherrimi ad ipsius simul nostramque gloriam redundent. Hunc igitur præsento

FRIDTJOF NANSEN

philosophiæ doctorem, necnon inter Cantabrigienses scientiæ doctorem honoris causâ nominatum, necnon Societatis Regiæ Geographicæ laureâ ornatum, ut admittatur ad gradum doctoris in jure civili honoris causâ."

OBITUARY.

Sir Thomas Elder, G.C.M.G.

EARLY in March a telegram from Adelaide announced the death of Sir Thomas Elder, the munificent patron of Australian exploration, who, though not himself an explorer, has within the last thirty years done more, perhaps, than any one man to reduce the blank spaces on the map of Australia. The son of Mr. George Elder, of Kirkcaldy, Fifeshire, Sir Thomas Elder was born in 1818. In 1854 he emigrated to South Australia, which thenceforward became his home, although in 1890 he paid a lengthened visit to his native Scotland. Devoting himself to mercantile pursuits, he became in time the senior partner of the firm of Elder, Smith and Co., wool and stock agents, of London and Adelaide. In 1863–68, and again in 1871–78, he was a member of the Legislative Council of South Australia; and in 1874 he contributed a munificent sum towards the endowment of the Adelaide University. He paid special attention to the introduction into the colony of improved breeds of

cattle, sheep, and horses, from which Australia as a whole has derived much benefit. One of his most important services to Australian exploration was the encouragement which he gave to the introduction of camels into that continent. Although these animals had already been used on exploring expeditions (*e.g.* that of Burke and Wills in 1846), the experiment had met with small success, until in 1861–66 Sir Thomas Elder imported a fresh supply, and a few years later proved their value to explorers during the expedition under Colonel Warburton, of which he was one of the promoters. The important journeys of Ernest Giles were also supported by Sir Thomas, and camels were again used with success. Finally, the great "Elder Exploring Expedition" was fitted out by him in 1891, with a view to removing from the maps the last blank space of any importance on the Australian continent, and although untoward events prevented the expedition from attaining the full measure of success which had been anticipated, it did good work in throwing new light on portions of the interior of West Australia. Sir Thomas Elder joined our Society in 1878. In the same year he received the honour of knighthood, and he became G.C.M.G. in 1887.

CORRESPONDENCE.

On the Formation of Sand-dunes.

In the current month's number of the *Geographical Journal*, I observe that, during the discussion of an elaborate and instructive paper under the above heading, allusion is made to a "curious sound made by certain sandhills" in the desert north of the Helmund.

On referring to my diary of March 21, 1872, I find that my fellow employés in the Perso-Afghan Mission and I, returning from Sistan westwards, passed, on our march of that date, a hill called *Rig-i-Rawán*, or the "moving sand," where our Afghan friends performed *Ziyárat*, or rites of pilgrimage. Should you think the circumstance of the sounds there heard worth recalling, in connection with the recently read paper, it might be well to reprint Major Evan Smith's description given at pp. 327, 328 of 'Eastern Persia,' vol. i. (Macmillan: 1876).

"From Kala'h-i-Kah to the Hárut-Rud there is a distance of 16 miles in a due westerly direction, and at the fifth mile the famous Ziárat of Imam Záïd is passed on the right of the road. This Ziárat, which is called the Rig-i-rawán, or moving sand, is most remarkable and singular. At the extreme west of the range of hills which has been described as lying in a straight line due north of the Kala'h-i-Kah district, is a hill some 600 feet high and half a mile long. The southern face of this hill, to the very summit, is covered with a drift of fine and very deep sand, which has evidently been there for ages, as testified by the number of large plants growing on its surface. None of the adjacent hills have any traces whatever of sand-drift, and the surface of the surrounding desert is hard and pebbly. The westernmost portion of this elevated ground contains the Ziárat, and the natives say, and with reason and truth, that at times the hill gives out a strange startling noise, which they compare to the rolling of drums. Captain Lovett, who was fortunate enough to hear it, describes its effect upon him as like the wailing of an æolian harp, or the sound occasioned by the vibration of several telegraph wires—very fine at first, but increasing every moment in volume and intensity, and the secret strain is said sometimes to last as long as an hour at a time. The face of

BRITISH LIBRARY

the hill is concave, its cavity is filled with the sand, and underneath there appears to be a hard limestone surface. It would be useless, after a summary inspection, to hazard an opinion as to the cause of the remarkable sounds that proceed from the hill; but it is noticeable that they may be produced by any large number of men, at the top, putting the sand in motion. It should be remarked at the same time that the noise is often heard in perfectly still weather, and when nobody is near the hill; and it is singular, also, that the limit of the sand at the bottom seems never to be encroached upon by falling sand from the summit, though the face of the hill and sand-drift is very steep. On watching the sand this morning, at the time he heard the sound, Captain Lovett observed that its vibrations and the movements of the pilgrims who had gone to the summit of the drift, occurred at the same moment. The natives, of course, ascribe miraculous properties to the hill. It is believed to be the grave of the Imam Záïd, the grandson of Husain, the son of Ali. Tradition says that, being pursued by his enemies, he came to this hill for refuge, was covered one night by the miraculous sand-drift, and has never been seen again. They say that the sand, thus miraculously brought by heavenly aid, could be removed by no earthly power, and that were any one impious enough to try it, the sand would return of its own accord. They believe the hill, like the ancient oracles, to give out warning when anything important is going to happen in the district. Thus, in the time when the Túrkmans used to make their forays as far south as this, the hill always gave warning the night before their arrival; and we are assured that the arrival of our mission was heralded by the same sounds. The head of the district told us that the noise could be heard in still weather at a distance of 10 miles; and Sáiyid Núr Muhammad Shah declares he heard it distinctly last night at our camp 5 miles off. Shia'hs and Súnnis alike, unable to contend against the evidence of their ears, come to worship at this miraculous spot, and here find a common ground on which they can meet in amity. Obese Muhammadans do not generally subject themselves to so severe a trial of faith as that of visiting this particular *Ziárat-gáh*. It is a very steep climb for them to the commencement of the band of sand, about 200 feet broad and nearly perpendicular, and as they sink up to the thighs in this at every step, often must they regret that the Imám could not have hid himself in a more accessible spot. The tomb is situated at the top of the sand-ridge, and it is in their descent that the faithful are generally rewarded for the trouble they have voluntarily undergone by hearing the miraculous noise. Sardar Ahmad Khan, all his attendants, and a great number of stalwart Afghans went up the hill, and we observed that they were more than half an hour getting across the sand; our more effeminate Tehran servants did not seem to care to make the attempt. The base of the hill is surrounded by graves of the faithful, who, it is to be hoped, are not disturbed in their last sleep by the unearthly warnings of the object of their devotion. It is probable, after all, that science could give a very simple explanation of the phenomena; but he would be a bold man who tried to explain the same by natural causes within 100 miles of its influence." Another description of the *Rig-i-Rawán* will be found at p. 285 of Dr. Bellew's 'From the Indus to the Tigris' (Trübner: 1874).

MEETINGS OF THE ROYAL GEOGRAPHICAL SOCIETY, SESSION 1896–1897.

Seventh Ordinary Meeting, February 22, 1897.—Admiral W. J. L. Wharton, C.B., F.R.S., Vice-President, in the Chair.

Elections.—*George Lowe Alward; Colonel R. S. S. Baden-Powell, 13th Hussars; Victor Bryce; William Arthur Boord; James William Brooks; Lieut. James Blackburn Bedford; Hon. William E. Cavendish; Wilson Crewdson; John Ernest Cochraine; Charles Calmady Collier; John Talbot Clifton; John E. Champney; Andrew Drummond; Edward Davis; Peter Robert Denny; Harry Ellis; Viscount Encombe; John Scott Fraser; William Henry Forbes; John Halliday; J. Fitzgerald Mahon; Commander Frederic R. W. Morgan, R.N.; Walter Mercer; J. Y. W. MacAlister; Daniel Nicholson; Hon. Seymour Ormsby-Gore; Rev. Edward G. C. Parr; Claud Frederick William Russell; Arthur Henry Sharp; Captain Edward Mabbott Woodward, Leicester Regiment.*

The Paper read was:—

"The Southern Border of Afghanistan." By Captain A. H. McMahon. With "Note on the Perso-Baluch Boundary." By Colonel T. H. Holdich, R.E., C.B.

Eighth Ordinary Meeting, March 8, 1897.—Admiral W. J. L. Wharton, C.B., F.R.S., Vice-President, in the Chair.

Elections.—*Charles George Arbuthnot; Henry Thomas Ashby; Alfred Fowell Buxton; John Cordeaux; J. Law Crawford; Captain The Hon. Asselton Curzon-Howe, C.B., C.M.G., R.N.; Major Neil Douglas Findlay, R.A.; Thomas George Hobbs; Thomas Davies Jones; C. C. Macrae; Frederick William Marten; Richard Ponsonby Maxwell; Norman P. M. de Condray Tronson, late 10th Hussars; Ernest Dent Vaisey; Admiral Thomas Lett Ward.*

The Paper read was:—

"Recent Discoveries South of Hudson Bay." By Dr. Robert Bell, of the Canadian Survey.

GEOGRAPHICAL LITERATURE OF THE MONTH.

Additions to the Library.

By HUGH ROBERT MILL, D.Sc., *Librarian*, R.G.S.

The following abbreviations of nouns and the adjectives derived from them are employed to indicate the source of articles from other publications. Geographical names are in each case written in full:—

A. = Academy, Academie, Akademie.	Mag. = Magazine.
Ann. = Annals, Annales, Annalen.	P. = Proceedings.
B. = Bulletin, Bollettino, Boletim.	R. = Royal.
Com. = Commerce, Commercial.	Rev. = Review, Revue, Revista.
C. Rd. = Comptes Rendus.	S. = Society, Société, Selskab.
Erdk. = Erdkunde.	Sitzb. = Sitzungsbericht.
G. = Geography, Geographie, Geografia.	T. = Transactions.
Ges. = Gesellschaft.	V. = Verein.
I. = Institute, Institution.	Verh. = Verhandlungen.
J. = Journal.	W. = Wissenschaft, and compounds.
M. = Mitteilungen.	Z. = Zeitschrift.

On account of the ambiguity of the words *octavo*, *quarto*, etc., the size of books in the list below is denoted by the length and breadth of the cover in inches to the nearest half-inch. The size of the *Journal* is 10 × 6½.

EUROPE.

Alps. *Z. Deutsch. u. Österr. Alpenvereins* **27** (1896): 171–211. **Blodig and Purtscheller.**
Aus den Bergen der Maurienne und der Tarentaise. (Schluss zum Aufsatz in der "Zeitschrift" 1895.) Von Dr. Karl Blodig und L. Purtscheller. *With Illustrations.*

Alps. *Z. Deutsch. u. Österr. Alpenvereins* **27** (1896): 212–233. **Enzensperger.**
Die Höfats im Algäu. Von Joseph Enzensperger. *With Map and Illustrations.*

Alps. *Z. Deutsch. u. Österr. Alpenvereins* **27** (1896): 234–276. **Becker.**
Der Gurgler Kamm. Von Gustav Becker. *With Map and Illustrations.*

Alps. *Z. Deutsch. u. Österr. Alpenvereins* **27** (1896): 277–319. **Schuster.**
Die Langkofelgruppe. Von Oscar Schuster. *With Illustrations.*

Alps. *Z. Deutsch. u. Österr. Alpenvereins* **27** (1896): 320–361. **Hess.**
Wandertage in den Steiner Alpen. Von Heinrich Hess. *With Illustrations.*

Alps. *Z. Deutsch. u. Österr. Alpenvereins* **27** (1896): 140–170. **Euringer.**
Berg- und Gletscherfahrten in der Montblanc-Kette. Von Gustav Euringer. *With Plate.*

Alps—Fluchthorn. *Alpine J.* **18** (1897): 307–324. **Coolidge.**
The Fluchthorn and its Neighbours By W. A. B. Coolidge.

Austria—Bosnia. *Rev. Française* **22** (1897): 87–95. **Kœtschet.**
Les progrès de la Bosnie. Par le Dr. Kœtschet.

Austria—Bukowina. *Aus allen Weltteilen* **28** (1897): 293–298. **Kaindl.**
Die Herkunft der Deutschen in der Bukowina. Von Professor Dr. Raimund Friedrich Kaindl.

Denmark. **Paulsen.**
Institut Météorologique de Danemark. Annales de l'Observatoire Magnétique de Copenhague publiées par Adam Paulsen. Années 1893–94. Livraison I. Copenhague: G.-E.-C. Gad, 1896. Size 13 × 8, pp. 50.

France. **Kerviler.**
Le Canal des Deux-Mers; Mémoire présenté au nom de M. Kerviler par M. Gallet. Congrès National des Sociétés Françaises de Géographie, 16e Session. Bordeaux, Août 1895. Compte Rendu. Bordeaux, 1896. Size 10 × 6½, pp. 208–225.
On the proposed ship canal from the Gironde to the Mediterranean.

France—Census. *Rev. Française* **22** (1897): 96–103. **Lasalle.**
Le recensement Français de 1896 et ses conséquences. Par C. de Lasalle.

France—The Loire. *Ann. G.* **6** (1897): 45–60. **Gallouédec.**
La Loire navigable. Par M. L. Gallouédec.

Holland. *Tijds. R. Ned. Aard. Genoots. Amsterdam* **(2) 13** (1896): 493–507. **Hoekstra.**
De bevolking van de groote middelpunten van bevolking in Nederland op 1 Januari 1890 en 1 Januari 1896. Door Dr. J. F. Hoekstra.
Comparison of the population of the principal towns in Holland at the censuses of 1890 and 1896.

Hungary. **Jekelfalussy.**
The Millennium of Hungary and its People. Issued under the authority of the Royal Hungarian Minister of Commerce, as President of the Millennial National Exhibition Commission. Edited by Dr. Joseph de Jekelfalussy. Budapest, 1897. Size 9½ × 6, pp. vi. and 672. *Presented by the Author.*
An account of the geography, history, and actual conditions of the Hungarian monarchy.

Iceland and Scandinavia. **Houette and Morache.**

Ann. Hydrographiques (2) (1896): 49–70.

Mission magnétique en Islande et en Scandinavie (1895) de l'aviso-transport La *Manche*. Par M. Houette et M. Morache. *With Diagrams.*

The Bureau de Longitudes having undertaken the production of a map of magnetic conditions over the Earth from French sources for the great exhibition of 1900, the expedition described in this paper was one of those despatched for the purpose of completing observations of the three elements of terrestrial magnetic force.

Italy. *G.Z.* **3** (1897): 1–14. **Hassert.**

Die Abruzzen. Von Kurt Hassert.

Mediterranean—Karpathos. **Stefani, etc.**

Karpathos. Etude géologique, paléontologique et botanique. Par le Professeur Carto de Stefani, le Docteur C. J. Forsyth Major et William Barbey. Avec treize planches par Ch. Cuisin et deux planches en phototypie. Lausanne: G. Bridel & Cie., 1895. Size 13 × 10, pp. 180. *Presented by Dr. C. J. Forsyth-Major.*

A monograph on the plants and palæontology of Karpathos, including a bibliography of the island by Dr. Forsyth-Major. The book contains no map.

Meuse river. *Mouvement G.* **14** (1897): 73–76, 97–99. **Rutot.**

Le cours de la Meuse à travers les âges géologiques d'après une communication faite par M. A. Rutot, à la Société belge de géologie. *With Maps.*

Monaco. *Deutsche Rundschau G.* **19** (1897): 208–215. **March.**

Die kleinsten Staaten der Erde. Eine geographische Plauderei. Von Richard March. *With Illustrations.*

Portugal—Oporto. ———

Relatorio da direcção da Associação Commercial do Porto no Anno de 1896 apresentado á Assembleia Geral, em Sessão de 18 de Janeiro de 1897. Porto, 1897. Size 9 × 6, pp. 170, and 252.

Russia—Riga. *Aus allen Weltteilen* **28** (1897): 307–315. **Schubert.**

Riga. Ein deutsches Städtebild. Von Karl Schubert.

Russia—Runö. *Globus* **71** (1897): 101–107. **Bielenstein.**

Eine Fahrt nach Runö im Rigaschen Meerbusen. Von Dr. A. Bielenstein. Doblén. *With Illustrations.*

Spain—Pyrenees. **Saint-Sand.**

Note sur la cartographie des Pyrénées espagnoles en 1895. Par M. le comte d'Arlot de Saint-Sand.—Congrès National des Sociétés Françaises de Géographie. 16e Session. Bordeaux, Août 1895. Compte Rendu. Bordeaux, 1896. Size 10 × 6½, pp. 315–325.

Spain—Sierra Nevada. *B.S.G. Madrid* **38** (1896): 177–209. **Marin.**

La Suiza andaluza. Crónica de una excursión a la Sierra Nevada. Por Diego Marín.

Sweden—Meteorological Observations. ———

Observations météorologiques suédoises publiées par l'Academie Royale des Sciences de Suéde, exécutées et rédigées sous la direction de l'Institut Central de Météorologie. Vol. 33. 2ième série; vol. 19, 1891. Stockholm, 1895. Size 12½ × 10, pp. viii. and 156.

United Kingdom—England. *P. Philosoph. S. Glasgow* **27** (1896): 57–69. **Lodge.**

Why has England become a Great Manufacturing, Commercial, and Colonizing Country? By Richard Lodge, M.A.

This will be specially noticed.

United Kingdom—England—Yorkshire. **Baddeley.**

Thorough Guide Series. Yorkshire (Part i.), the East Coast, York, and the country between the N.E. Main Line and the Sea, also the Cathedral and Castle of Durham (pp. xvi. and 136); (Part ii.) West and part of North Ridings and all parts of the country west of the N.E. Main Line, also Barnard Castle and Teesdale. By M. J. B. Baddeley, B.A. Second Edition, revised. London: Dulau & Co., 1893. Size 6½ × 4½, pp. xvi. and 148. *Maps and Plans. Price* (two parts in one vol.) 5*s*. *Presented by the Publishers.*

United Kingdom—Ireland. *P.R. Irish A.* (3) **4** (1896): 74–111. **Browne.**

The Ethnography of Ballycroy, co. Mayo. By Charles R. Browne, M.D. *With Plates.*

مكتبة قطر الوطنية
Qatar National Library

United Kingdom—Ireland. *P.R. Irish A.* (3) 4 (1896): 112–118. **McArdle.**
Additions to the Hepaticæ of the Hill of Howth, with a Table showing the Geographical Distribution of all the Species known to grow there. By David McArdle.

United Kingdom—Ireland. **Martel.**
Irlande et Cavernes Anglaises. Par E.-A. Martel. Paris: C. Delagrave, 1897. Size 9 × 6, pp. 404. *Plans and Illustrations. Presented by the Author.*
M. Martel writes this book, he says, partly to describe his underground campaign in the caves of England and Ireland, and partly to give expression to his admiration of the natural beauties of Ireland. The work is admirably done, and the illustrations reveal scenery of a kind which few in this country had previously seen.

United Kingdom—Ireland. *P.R. Irish A.* (3) 4 (1896): 30–54. **Praeger.**
Report upon the Raised Beaches of the North-East of Ireland, with special reference to their Fauna. By R. Lloyd Praeger. *With Plate.*

United Kingdom—Ireland. *P.R. Irish A.* (3) 4 (1896): 55–60. **Westropp.**
Magh Adhair, co. Clare, the Place of Inauguration of the Dalcassian Kings. By Thomas Johnson Westropp, B.A. *With Plate.*

United Kingdom—Scotland. **Morris.**
The Raised Beaches of the Forth Valley. By David B. Morris, Stirling. Read to the Stirling Natural History and Archæological Society, November 15, 1892. (Reprinted from the *Stirling Journal and Advertiser*, 1892.) Size 7½ × 5, pp. 34.
The Glaciation of the Forth Valley. By David B. Morris, Stirling. Read to the Stirling Natural History and Archæological Society, February 20, 1894. (Reprinted from the *Stirling Journal and Advertiser*, 1894.) Size 7½ × 5, pp. 18.
The Travelled Boulders of the Forth Valley. By David B. Morris, Stirling. Read to the Stirling Natural History and Archæological Society, November 19, 1895. (Reprinted from the *Stirling Journal and Advertiser*, 1896.) Size 7½ × 5, pp. 18. *Presented by the Author.*

ASIA.

Annam. *Spelunca* 2 (1896): 125–132. **Dégoutin.**
Les Grottes de marbre de Tourane (Annam). Par M. Dégoutin. *With Illustrations.*

Arabia. **Hirsch.**
Leo Hirsch. Reisen in Süd-Arabien, Mahra-Land und Hadramüt. Leiden: E. J. Brill, 1897. Size 10 × 6½, pp. xii. and 332. *Map and Plates. Price* 9*s.*

Asia-Minor—Phrygia. **Ramsay.**
The Cities and Bishopries of Phrygia, being an Essay of the Local History of Phrygia from the Earliest Times to the Turkish Conquest. By W. M. Ramsay, D.C.L., LL.D. Vol. i. Part ii West and West-Central Phrygia. Oxford: The Clarendon Press, 1897. Size 10 × 7, pp. xvi. and 353–792. *Price* 21*s. Presented by the Delegates of the Clarendon Press.*
This important work will be noticed in the *Journal.*

Central Asia—Pamirs. **Poncins.**
Chasses et Explorations dans la Région des Pamirs. Par le Vicomte Edmond de Poncins. Paris: A. Challamel, 1897. Size 10 × 6½, pp. 260. *Map and Illustrations. Presented by the Author.*
A well-illustrated account of M. de Poncins' sporting expedition in the Pamirs.

China. **Ehlers.**
Im Osten Asiens. Von Otto E. Ehlers. Dritte Auflage. Berlin: Allgemeiner Verein für Deutsche Litteratur, 1896. Size 9 × 6½, pp. viii. and 392. *Maps and Illustrations. Price* 6*s.*
This book describes visits to Hongkong, Macao, Canton, various journeys in the interior of China, including a trip into Mongolia, and the narrative of a month's residence in Korea.

China—Mongolia. *P.R. Artillery J.* 24 (1897): 49–59. **Buzzard.**
A two months' trip into Mongolia. By Lieut. C. N. Buzzard.

Eastern Asia. *Contemporary Rev.* 71 (1897): 153–171. **Norman.**
Russia and England: "Down the Long Avenue." By Henry Norman. *With Map.*
Treats of the new Manchurian railway.

India. **Chattopadhyaya.**

Descriptive Geography of India, with a Detailed Account of Bengal for the use of Schools and Pathasalas. Compiled by Sasi Bhusan Chattopadhyaya. Twentieth Edition. [In Bengali.] Calcutta: B. L. Chakravarti, 1893. Size 7 × 4½. *Maps. Presented by the Author.*

India. *J.S. Arts* **45** (1897): 161–178. **Lee-Warner.**

Moral Advance of the Peoples of India during the Reign of Queen Victoria. By William Lee-Warner, M.A., C.S.I.

India. **Co·ta.**

Quarto Centenario do Descobrimento da India. Contribuições da Sociedade de Geographia de Lisboa. A Viagem da India. Poemeto em dois cantos. Por Fernandes Costa. Lisboa: Imp. Nacional, 1896. Size 10 × 6½, pp. 42.

India—Madras. ———

Report of the Condition and Progress of the G. V. Juggarow Observatory, Vizagapatam. Including the Results of Observations for the year 1895. Published by the General Committee, G. V. Juggarow Observatory, Vizagapatam. Calcutta, 1896. Size 9½ × 6½, pp. 50.

India—Wrecks. **Creagh.**

Return of Wrecks and Casualties in Indian Waters for the year 1895, together with a Chart showing the positions in which they occurred, and a Diagram showing comparative number of the reported maritime casualties, etc., the total tonnage, and the number of lives lost, for the past twenty years. Prepared by B. P. Creagh, Commander R.I.M. Calcutta, 1896. Size 13½ × 8½, pp. 66.

Japan. **Siebold.**

Nippon. Archiv zur Beschreibung von Japan und dessen Neben- und Schutzländern Jezo mit den südlichen Kurilen, Sachalin, Korea und den Liukiu-Inseln. Von Ph. Fr. von Siebold. Herausgegeben von seinen Söhnen. Erster Band. Zweite Auflage. Würzburg und Leipzig: Leo Woerl, 1897. Size 11 × 7½, pp. xxxvi. and 422. *Map and Illustrations. Price* 10*s.*

This re-publication of the standard work describing the state of Japan in the second quarter of the present century, before its opening to European influence, is appropriately prefaced by a short biography of the author.

Japan—Earthquake. *Quarterly J. Geolog. S.* **53** (1897): 1–15. **Davison.**

On the Distribution in Space of the Accessory Shocks of the Great Japanese Earthquake of 1891. By Charles Davison, Sc.D. *With Illustrations.*

Japan—Earthquake at Sea. *Petermanns M.* **43** (1897): 34–37. **Rein.**

Das Seebeben von Kámaïshi am 15 Juni 1896. Von Prof. Dr. J. Rein. *With Map.*

Une éruption volcanique au Japon. Par M. D. Lièvre. *With Maps and Illustrations.*

An account of the eruption of Higashi Kirishima in Kiushiu which occurred on March 15, 1896, at the moment when the author was on the edge of the crater. His guide was killed, and he himself barely escaped with his life. The description of the actual eruption is very graphic.

Japan—Kuril Islands. **Snow.**

Notes on the Kuril Islands. By Captain H. J. Snow. London: John Murray, 1897. Size 8½ × 6, pp. 92. *Charts. Price to Fellows of the Society,* 2*s.*; *to non-Fellows,* 4*s.*

Captain H. J. Snow embodies in this little volume (which is one of the extra publications of the R.G.S.) a vast amount of personal observation on the little-known group of the Kuril islands. The charts are of very great value. They show the correct positions of many of the islands for the first time, and also contain the position of many harbours, rocks, shoals, tide-rips, etc., which had not previously been charted. Prof. John Milne concludes a brief prefatory note thus: "In short, after shipwrecks, risks, and dangers, the escapes from which have often seemed incredible, independently

of the geological, natural history, and general scientific notes which have been collected, Captain H. J. Snow, whilst sacrificing by his publications his own professional interests as a hunter, has entitled himself to recognition from all who navigate and patrol the fog-bound shores of the rocky Kurils."

Káfiristán. *Blackwood's Mag.* **161** (1897): 359–366. **Broadfoot.**

Káfiristán and the Káfirs. By Major W. Broadfoot.

This article gives references to the main sources of information regarding Kafiristan from the earliest legends down to Sir George Robertson's book.

Kafiristan. **Robertson.**

The Káfirs of the Hindu-Kush. By Sir George Scott Robertson, K.C.S.I., British Agent, Gilgit. Illustrated by A. D. McCormick. London: Lawrence & Bullen, 1896. Size 10 × 7, pp. xx. and 658. *Map and Illustrations. Price* 31*s.* 6*d.*

A note on this book appeared in the March *Journal*, vol. ix. p. 320.

Malay Archipelago—Bali and Lombok. **Carpenter.**

J R.G.S. Australasia (Sydney) **6** (1896): 45–71.

Islands of Bali and Lombock, Malay Archipelago. By Captain J. B. Carpenter.

Descriptions of the islands, with special reference to the manners and customs of the people. The author is personally acquainted with all the islands of the Malay Archipelago, and his article is consequently valuable.

Malay Archipelago—Borneo. *Rev. G.* **40** (1897): 117–123. **d'Estrey.**

Sambas. Division occidentale de Bornéo. Exploitation des mines d'or. Cultures. Par le Dr. H. Meyners d'Estrey.

Malay Archipelago—Java. *G.Z.* **3** (1897): 79–88. **Kronecker.**

Einiges über die Ursachen und die Verbreitung der Malaria auf der Insel Java. Eine tropenhygienische Studie. Von Dr. med. Franz Kronecker.

Russia—Caucasus. **Hahn.**

Kaukasische Reisen und Studien. Neue Beiträge zur Kenntnis des Kaukasischen Landes. Von C. Hahn. Leipzig: Duncker & Humblot, 1896. Size 9 × 6, pp. 300. *Price* 6*s.*

A special note will be given on this book.

Russia—Transcaspian. *Petermanns M.* **43** (1897): 25–34. **Andrussow.**

Der Adschi-darja- oder Karabugas-Busen. Von Prof. Nik. Andrussow. *With Map.*

Turkey—Babylon. *Norske G. Selsk. Aarb.* **7** (1896): 1–10. **Sundberg.**

Babylonien af Dr. med. John C. Sundberg. *With Illustrations.*

AFRICA.

British East Africa—Uganda. *J. Manchester G.S.* **12** (1896): 65–73. **Smith.**

Uganda. By the Rev. F. C. Smith, B.A.

British South and East Africa. **Lucas.**

A Historical Geography of the British Colonies. By C. P. Lucas, B.A. Vol. iv. South and East Africa. Part i. Historical (pp. 350); part ii. Geographical. Oxford: The Clarendon Press, 1897. Size 8 × 5½, pp. 156. *Maps. Price, Part I.,* 6*s.* 6*d.*; *Part II.,* 3*s.* 6*d. Presented by the Delegates of the Press.*

This volume is published in two parts—the first mainly historical, the second mainly geographical. They deal in the graceful and thorough manner characteristic of the work of Mr. Lucas with the chain of events which led to the acquisition and development of the South and East African possessions of the British Crown. A

thoroughly impartial standpoint is occupied throughout. The maps, although in the same style which proved satisfactory for the small and rarely mapped island-colonies treated of in earlier volumes, appear rough and poor when compared with the fine large-scale maps of South Africa to which the public has grown accustomed.

Congo State. *Mouvement G.* **14** (1897): 61–63.

Le pays des Wamfumus entre le Pool, le Kassaï et le Kwango. *With Map.*

Congo State. **Cornet.**

Observations sur la géologie du Congo occidental. Par J. Cornet. (Extrait du Bulletin de la Société Belge de Géologie, de Paléontologie et d'Hydrologie, Bruxelles.) 1896. Size 10 × 6½, pp. 10. *Presented by the Author.*

Congo State. *B.S. d'Études colon.* **3** (1896): 187–250. **Pourbaix.**

Le Commerce de l'État indépendant du Congo. Par V. Pourbaix.

Congo State. *Mouvement G.* **14** (1897): 49–53. **Romans.**

La mission Versepuy au lac Albert-Édouard et dans le bassin de l'Aruwimi. Par B. de Romans. *With Illustration.*

Congo State. *Norske G. Selsk. Aarb.* **7** (1896): 40–72. **Scharffenberg.**

Congo af ingeniør Johannes Scharffenberg.

Congo State—Lomami. *Mouvement G.* **13** (1896): 421–424. **Wauters.**

Le Lomami. Par A.-J. Wauters. *With Map.*

Egypt—Sudan. **Knight.**

Letters from the Sudan. By the Special Correspondent of the *Times* (E. F. Knight). Reprinted from the *Times* of April to October, 1896. London: Macmillan & Co., 1897. Size 9½ × 6, pp. 326. *Maps and Illustrations. Price* 8*s.* 6*d. nett. Presented by the Publishers.*

These letters are illustrated by several clear maps and plans and some excellent pictures. They describe the whole course of the last Sudan expedition, from the departure from Assuan to the capture of Dongola.

Egypt—Upper Nile. *Ann. G.* **5** (1896): 506–521; **6** (1897): 61–70. **Martonne.**

La vie des peuples du Haut Nil. Explication de trois cartes anthropogéographiques. Par M. E. de Martonne. *With Maps.*

French West Africa. **Allemann.**

A travers le Monde, Tour du Monde (n.s.) **2** (1896): 321–324.

Souvenirs du Cayor. Par M. Émile Allemann. *With Illustrations.*

Cayor is situated between Senegal and Cape Verde.

Madagascar. *M.G. Ges. (für Thüringen) Jena* **15** (1897): 21–41. **Nilsen-Lund.**

Reisen norwegischer Missionare in Madagaskar. Von G. Kurze. III. Missionar P. Nilsen-Lund's Reise durch das südliche Menabe.

Sahara. **Foureau.**

Fernand Foureau. Au Sahara. Mes deux missions de 1892 et 1893. Le Gassi Touil et le Grand Erg, l'Oudje sud et le Tinghert, Hassi Messeguem et Hassi Imoulay. Réédition du Rapport de Mission publié en juillet 1893. Paris: A. Challamel, 1897. Size 10 × 6½, pp. 192. *Map. Price* 5*s.* 6*d.*

This will be specially referred to.

Somaliland. *Petermanns M.* **43** (1897): 7–15. **Smith.**

Dr. A. Donaldson Smith's Expedition durch das Somâl- und Galla-Land zum Rudolf-See in den Jahren 1894 und 1895. Nebst Bemerkungen zur Karte von Dr. B. Hassenstein. *With Map.*

South Africa. **Worsfold.**

South Africa, a Study in Colonial Administration and Development. By W. Basil Worsfold, M.A. Second Edition, Revised. London: Methuen & Co., 1897. Size 8 × 5½, pp. xii. and 308. *Map. Price* 6*s. Presented by the Publishers.*

This book has been revised and enlarged by the addition of chapters on recent events in South Africa. The map shows the most recent railway advances.

South Africa. **Foa.**

A travers l'Afrique Centrale. Du Cap au Lac Nyassa. Par Edouard Foa. Paris: E. Plon, Nourrit & Co., 1897. Size 7½ × 5, pp. viii. and 382. *Map and Illustrations. Presented by the Author.*

An interesting popular account of a journey from Cape Town to Lake Nyasa, with good illustrations.

BRITISH LIBRARY

Victoria. *J.R. Colonial I.* **28** (1896): 46–51. **Dyer.**
The Colony of Victoria: some of its Industries. By E. Jerome Dyer.

POLAR REGIONS.

Ancient Knowledge. *G.Z.* **3** (1897): 88–92. **Berger.**
Die Entstehung der Lehre von den Polarzonen. Von H. Berger.

The growth of knowledge of the polar regions amongst the ancient Greeks is briefly stated.

Antarctic. *Norske G. Selsk. Aarb.* **7** (1896): 11–25. **Borchgrevink and Bull.**
Den sidste antarctiske reise og foreløbig plan for en ny expedition af C. E. Borchgrevink.

Et par billeder med text af Kaptein H. L. Bull.

Arctic. *Blackwood's Mag.* **161** (1897): 238–256. ——
Franklin and the Arctic.

Arctic. *Nineteenth Century* **41** (1897): 250–269. **Kropotkin.**
Recent Science. By Prince Kropotkin.

In pp. 259–269 Prince Kropotkin discusses the voyage of the *Fram* and the geography of the North Polar area.

Arctic—Baffin Land. *J. Geology* **5** (1897): 17–33. **Watson.**
Evidences of Recent Elevation of the Southern Coast of Baffin Land. By Thomas L. Watson.

The results here described were referred to in the *Journal* for December, 1896 (vol. viii. p 643).

Arctic ballooning. *Rev. Scientifique* (4) **7** (1897): 269–271. **Graffigny.**
Les expéditions aérostatiques au Pôle Nord. Par M. Henry de Graffigny.

Arctic—Peary's Expedition. *Science (n.s.)* **5** (1897): 308–310. **Barton.**
Lieutenant Peary's Expedition. By George H. Barton.
A separate copy has been sent by the author.

Greenland. **Douglas.**
Across Greenland's Ice-Fields. The Adventures of Nansen and Peary on the Great Ice-Cap. By M. Douglas. London: T. Nelson & Sons, 1897. Size 7½ × 5½, pp. 218. *Portraits and Illustrations. Presented by the Author.*

Sir Clements Markham writes the preface to Miss Douglas' book, and considers that it is likely to prove "most useful as a means of preserving an interest among us in the exploration of the unknown parts of our globe, and of arousing that spirit of emulation which in the years that are gone built up the greatness of our country."

Greenland. *J. Geology* **4** (1896): 769–810. **Salisbury.**
Salient Points concerning the Glacial Geology of North Greenland. By Rollin D. Salisbury. *With Illustrations.*

Greenland, Northern. **Astrup.**
Eivind Astrup. Blandt Nordpolens Naboer. Med illustrationer af Th. Holmboe, samt Fotografier og Karter. Folkeudgave. Kristiania: H. Aschehong & Co., 1896. Size 9½ × 6½, pp. 208. *Presented by Dr. J. Russell-Jeaffreson.*

PHYSICAL AND BIOLOGICAL GEOGRAPHY.

Barometric Measurement of Height. **Fowler.**
P.R.S. Victoria (n.s.) **8** (1896): 169–179.

Observations with Aneroid and Mercurial Barometers and Boiling Point Thermometers. By Thomas Walker Fowler.

A series of readings made at a fixed station with a standard mercurial barometer, a "mountain mercurial," three different aneroids, and a boiling-point thermometer. The aneroids behaved in a very capricious manner; the mountain mercurial and the thermometer showed nearly constant errors.

Meteorology. *Meteorolog. Z* **14** (1897): 1–8. **Mohn.**
Meteorologische Beobachtungen in Norwegen während der Sonnenfinsterniss am 9 August 1896. Von Professor H. Mohn aus Christiania.

The data for the temperature of the air during the eclipse of August, 1896, are those obtained at Bugönes by Prof. Mohn, South Varanger, Koutokeino, Vadsö, Vardö, Havningberg, and Bodö by other observers.

Meteorology—Waterspouts. Köppen.
Ann. Hydrographie **24** (1896): 445–458, 493–508, 541–556.
Die Windhose vom 5 Juli 1890 bei Oldenburg und die Gewitterböe vom 10 Juli 1896 in Ostholstein. (Beiträge zur Kenntniss der Böen und Gewitterstürme, vierte Abhandlung.) Von Dr. W. Köppen. *With Maps and Illustrations.*

Mountain-ranges. *Rev. Scientifique* (4) **7** (1897): 264–269. Meunier.
Progrès récents dans l'histoire des chaines de montagnes. Par Stanislas Meunier.

North Atlantic—Soundings. Poncelet and Schwerer.
Ann. Hydrographiques (1896): 301–380.
Sondages effectués par la *Drôme* dans l'Atlantique Nord sous la direction de M. Poncelet. Rapport d'ensemble dressé par MM. les Lieutenants de Vaisseau Poncelet et Schwerer.
Account of the work of sounding for a new French cable between Brest and Cape Cod, with a complete table of soundings.

Ocean Currents. *B.S.G. Lima* **5** (1896): 457–461. Pezet.
La contra-corriente "El Niño," en la costa Norte del Perú. Por Federico Alfonso Pezet.
The Spanish original of the paper published in the Report of the Sixth International Geographical Congress.

Soil Temperature. *Trans. R.S. Canada* (2) **1** (1895): 63–74. Callendar.
Preliminary Results of Observations of Soil Temperatures with Electrical Resistance Thermometers, made at the McDonald Physics Building, McGill University, Montreal. By Hugh L. Callendar, M.A., F.R.S. *With Diagrams.*
Records experiments made down to 9 feet of depth by a series of electric-resistance thermometers, with diagrams showing the march of temperature at various depths.

ANTHROPOGEOGRAPHY AND HISTORICAL GEOGRAPHY.

Colonization. *Aus allen Weltteilen* **28** (1897): 221–228 Hahn.
Siedelungs-kolonien, Plantagenkolonien und Faktorei-Kolonien. Von Dr. Ed. Hahn.

Europeans and Native Races. Viterbo.
Sousa Viterbo. Os Portugueses e o Gentio. Coimbra, 1896. Size 10 × 7, pp. 32.
On the relations maintained by the Portuguese towards native races during the period of great explorations in the fifteenth and sixteenth centuries.

Historical—Atlases. *Z. Ges. Erdk. Berlin* **31** (1896): 352–368. Kretschmer.
Die Atlanten des Battista Agnese. Von Dr. K. Kretschmer.

Historical—Cabot. Winsor.
The Cabot Controversies and the right of England to North America. By Justin Winsor. Reprinted from the *Proceedings of the Massachusetts Historical Society*, 1896. Cambridge: John Wilson & Son, 1896. Size 10 × 6½, pp. 16. *Presented by the Author.*

Historical—Cabot. Winsor.
Cabot and the Transmission of English Power in North America. An Address delivered before the New York Historical Society on its Ninety-second Anniversary, Wednesday, November 18, 1896. By Justin Winsor, LL.D. New York, 1896. Size 10 × 6½, pp. 38.

Historical—Maps of Herodotus. Myres.
An Attempt to reconstruct the Maps used by Herodotus. By John L. Myres, M.A. From the *Geographical Journal* for December, 1896. Size 10 × 6½, pp. [28]. *Maps.*

Historical—Portuguese in India. Cordeiro.
Quarto Centenario do Descobrimento da India. Contribuições da Sociedade de Geographia de Lisboa. Batalhas da India. Como se perdeu ormuz. Processo inedito do seculo XVII. Por Luciano Cordeiro. Lisboa: Imp. Nacional, 1896. Size 10 × 6½, pp. xvi. and 296.

BIOGRAPHY.

Andrée. *Deutsche Rundschau G.* **19** (1897): 231–233. ———

Astrup. *Norske G. Selsk. Aarb.* **7** (1896): 117–120. **Welhaven.**
Eivind Astrup. Hj. Welhaven. *With Portrait and Illustration.*
A picture is given of the granite obelisk erected in memory of Astrup, on which is carved a large map of Greenland, showing the north coast along which he travelled.

Dupleix. *Rev. Française* **22** (1897): 65–72. **Bonvalot.**
Le deuxième centenaire de Dupleix à la Sorbonne: Discours de M. G. Bonvalot.

Hale. *Science (n.s.)* **5** (1897): 216–217. **Brinton.**
Horatio Hale. By D. G. Brinton.
Mr. Hale was a student of American Ethnography.

Hay. ———
A Memoir of Sir John Drummond Hay, P.C., K.C.B., G.C.M.G., sometime Minister at the Court of Morocco, based on his Journals and Correspondence. With a Preface by Sir Francis W. De Winton, K.C.M.G. London: John Murray, 1896. Size 9½ × 6, pp. xviii. and 408. *Portraits and Illustrations. Price* 16*s. Presented by the Publisher.*
This will be specially noticed.

Hodgson. **Hunter.**
Life of Brian Houghton Hodgson, British Resident at the Court of Nepal. By Sir William Wilson Hunter, K.C.S.I., etc. London: John Murray, 1896. Size 9½ × 6, pp. x. and 390. *Portraits and Illustrations. Price* 14*s. Presented by Mrs. Brian Hodgson.*
This will be referred to in the *Journal.*

Jonge. *Rev. Trim. I. Hist. e G. Brazileiro* **58** (1895): 237–319. **Hygino.**
Relatorios e cartas de Gedeon Morris de Jonge no tempo do dominio Holandez no Brazil. José Hygino.

Knight-Bruce. *Mission Field* **42** (1897): 46-54. ———
Bishop Knight-Bruce. *With Portrait, Maps, and Illustrations.*

Krueger. *Deutsche Rundschau G.* **19** (1896): 134, 135. ———
Adalbert Krueger. *With Portrait.*
Dr. Krueger was the director of the Royal Observatory at Kiel, and died on April 21, 1896. The notice is based on an article in *Himmel und Erde*, viii. (1896), Part 9.

Maler. *Deutsche Rundschau G.* **19** (1896): 85–88. ———
Theobert Maler. *With Portrait.*

Marco Polo. **Cordier.**
Bibliothèque de Voyages Anciens. Centenaire de Marco Polo. Conférence faite à la Société d'Études Italiennes le mercredi 18 décembre 1895 à la Sorbonne. Par Henri Cordier. Paris: E. Leroux, 1896. Size 8½ × 6, pp. 114. *Illustrations. Presented by the Author.*
A paper written on the sixth centenary of the return of the Polos to Venice. It concludes an important bibliography, including editions of Marco Polo's 'Book' in eleven languages, biographies, and geographical commentaries, 156 entries in all.

Mueller. *J.R.G.S. Australasia (Sydney)* **6** (1896): 72–74. ———
Baron von Mueller.

Nansen. ———
Fridtjof Nansen. Leipzig: K. F. Koehler; Kristiania: H. Bigler [1896]. Size 16½ × 13, pp. [16]. *Map, Portraits, and Illustrations.*
The German edition of a handsomely illustrated paper issued at Christiana shortly after the return of the *Fram.*

Necrology of 1893–1895. **Wolkenhauer.**
Geographische Nekrologie für die Jahre 1893, 1894, and 1895. Von Dr. W. Wolkenhauer in Bremen. From *Geographisches Jahrbuch*, xix. Bd. 1897. Pp. [38]. Size 8½ × 6.

Palmieri. *Deutsche Rundschau G.* **19** (1896): 88–89. **Wolkenhauer.**
Luigi Palmieri. Von W. Wolkenhauer. *With Portrait and Illustration.*

Rebeur-Paschwitz. **Gerland.**
Ernst Ludwig August v. Rebeur-Paschwitz. Von G. Gerland.—Beiträge zur Geophysik. Herausgegeben von Prof. Dr. Georg Gerland. III. Band. 1 Heft. Pp. 16–18. Leipzig: W. Engelmann, 1896. Size 9½ × 6.

Richards. *P.R.S.* **60** (1897): xxxii–xxxv.
Sir George Henry Richards, K.C.B.

GENERAL.

Bibliography—Geology.
Geological Literature added to the Geological Society's Library during the year ended December 31, 1896. Compiled by the Assistant-Librarian and Edited by the Assistant-Secretary. London: Geological Society, 1897. Size 9 × 6, pp. 208. *Price* 2*s*.

Bibliography—Government Publications.
List of Works published on account of Her Majesty's Stationery Office, by Eyre and Spottiswoode; John Menzies & Co.; and Hodges, Figgis & Co., Limited, Dublin, except the Admiralty Hydrographic Publications, which are sold by J. D. Potter, and the Geological and Ordnance Survey Maps, for which E. Stanford is the Agent for England and Wales. January 31, 1896. London, 1896. Size 10½ × 7½, pp. 286.

British Colonial Empire. *J.S. Arts* **45** (1897): 195–210. **Dilke.**
The Progress of the British Colonial Empire during the past Sixty Years of Her Majesty's Reign. By the Right Hon. Sir Charles W. Dilke, Bart., M.P.

Commercial Geography. **Jones.**
The "Shipping World" Year Book: a Desk Manual in Trade, Commerce, and Navigation. Edited by Evan Rowland Jones. With New Map specially prepared by J. G. Bartholomew. 1897. London: "Shipping World" Office, 1897. Size 7½ × 5, pp. 1014. *Presented by the Publishers.*
An invaluable book of reference for details as to all the seaports of the world. Taken in conjunction with the elaborate route-map accompanying the volume, it forms a manual of practical commercial geography of very high value. Full particulars of the tariffs of all countries are included, as well as separate alphabetical lists of British and foreign harbours.

Commercial Geography.
Klassen-Eintheilung des deutschen Exportmusterlagers zu Berlin S. Dresdener-Strasse 34/35. Luisenhof. Berlin: H. Walter, 1897. Size 9½ × 6½, pp. xxxii. *Plate.*

Commercial Geography. **Jannasch.**
Das deutsche Exportmusterlager zu Berlin S. Von Dr. R. Jannasch. Berlin: H. Walter, 1896. Size 9½ × 6½, pp. 30.
On a proposed museum of German industrial products suitable for export.

Educational. *G.Z.* **3** (1897): 14–27. **Geistbeck.**
Ueber Kulturgeographie im Unterrichte. Von Dr. Alois Geistbeck.
On the historical, political, or human side of geography in education.

Educational—Text-book. **Chattopadhyaya.**
Student's Modern Geography in Bengali, with Plates, Diagrams, and Coloured Maps, for the use of Schools. By Sasi Bhusan Chattopadhyaya. Thirteenth Edition. Calcutta: B. L. Chakravarti, 1894. Size 7 × 4½. *Presented by the Author.*

Educational—Text-book. **Chattopadhyaya.**
The Intermediate Modern Geography in Bengali, with Plates, Diagrams, and Coloured Maps. By Sasi Bhusan Chattopadhyaya. Twelfth Edition. Calcutta: B. L. Chakravarti, 1896. Size 7½ × 4½. *Presented by the Author.*

NEW MAPS.

By J. Coles, *Map Curator*, R.G.S.

EUROPE.

England and Wales. **Ordnance Survey.**
Publications issued since February 8, 1897.
1-inch—General Maps:—

Egyptian Sudan. — **Istituto Cartografico Italiano.**

Carta del Teatro della Guerra nel Sudan Egiziano, tratta dalle migliori e più recenti carte militari inglesi per cura dell' Istituto Cartografico Italiano. Scale 1 : 2,000,000 or 31·8 stat. miles to an inch. *Presented by the Istituto Cartografico Italiano.*

GENERAL.

The World. — **Peucker.**

Atlas für Handelsschulen, gezeichnet und redigiert von Dr. K. Peucker. Fachmännisch bearbeitet von Dr. Th. Cicalek, Professor an der Wiener Handels-Akademie, J. G. Rothang. Fachlehrer a/d. Weiss'schen u. Beamtenschuloer-Handelsschule und Dr. Karl Zehden, k. k. Regierungsrath, Professor an der Wiener Handelsakademie. Wien, 1896. Verlag von Artaria & Co. *Price* 3.75 *fl. Presented by the Publishers.*

All the principal maps in this atlas are orographically coloured, and numerous diagrams are given illustrating the wealth and trade of the several countries. Communications by land and sea are laid down, and at the end of the atlas plans of the principal cities of the world are given.

The World. — **Philip.**

Philip's New Handy General Atlas of the World—a series of 60 plates, containing over 120 maps and plans, illustrating physical, political, and commercial geography. Edited by George Philip, Junr., F.R.G.S. With a complete Index of over 100,000 names. London: George Philip & Son, 1897. *Price* £1 10*s.*

Several maps have been added to the present edition of this atlas, and those requiring correction have been revised. It now contains 120 maps and plans, and is a good useful atlas for general reference.

CHARTS.

United States Charts. — **U.S. Hydrographic Office.**

Pilot Charts of the North Atlantic and North Pacific Oceans for February, 1897. U.S. Department of the Navy, Bureau of Navigation. Published at Washington, D.C., December, 1896, at the Hydrographic Office. Charles D. Sigsbee, commander U.S.N., Hydrographer. *Presented by the U.S. Hydrographic Office.*

PHOTOGRAPHS.

Sandwich Islands, Samoa, etc. — **Swinton.**

Fourteen Photographs of Hawaii, Samoa, and St. Helena, taken by Colonel A. Swinton, R.A. *Presented by Colonel A. Swinton, R.A.*

The set of photographs contains eleven views illustrating the scenery of the Sandwich Islands, and a portrait of a native schoolmistress, one view taken on the island of St. Helena, and one of a Samoan hut.

South Africa. — **Wootton Isaacson.**

Fifty-eight Photographs of South-East Africa, including scenes in Capetown, Natal, Transvaal, Zululand, East Coast Ports, and Suez, taken by F. J. Wootton Isaacson, Esq. *Presented by F. J. Wootton Isaacson, Esq.*

This is an interesting series of photographs taken by Mr. Wootton Isaacson during his travels in South and East Africa. There are many characteristic views of the scenery of the country adjacent to the coast, and the different towns in the Cape Colony, Natal, the Transvaal, and East Africa.

South Central Africa. — **Gibbons.**

Forty-one Photographs of the Marotse Country, Victoria Falls, Mashikolumbwe Country, etc., taken by Captain A. St. H. Gibbons, 1895–96. *Presented by Captain A. St. H. Gibbons.*

The photographs, taken by Captain Gibbons during his recent travels in Africa, form a valuable addition to the Society's collection. Among them are some of the Mashikolumwi country and people, which are of great interest.

N.B.—It would greatly add to the value of the collection of Photographs which has been established in the Map Room, if all the Fellows of the Society who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they will be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

SOME BOOKS OF TRAVEL.

New Edition. Profusely Illustrated.

THE WESTERN AVERNUS.

TOIL AND TRAVEL IN FURTHER NORTH AMERICA.

By MORLEY ROBERTS.

Crown 8vo, cloth gilt, with Illustrations by A. D. McCormick, and from Photographs, 7*s.* 6*d.* net.

Second Edition. Large Demy 8vo. Price One Guinea net.

THE ALPS FROM END TO END.

By Sir WILLIAM MARTIN CONWAY.

With 100 full-page Illustrations by A. D. McCormick.

"A high place among these books of climbing which appeal to many who cannot climb, as well as to all who can, will be taken by the very pleasant volume 'The Alps from End to End.'"—*Times.*

"There is, perhaps, not another living Alpinist—unless we except Mr. Coolidge, who contributes a valuable *précis* of the topography—who could have combined the requisite knowledge with physical capability for the task. . . . Sir William Conway's book is as vivid as it is charming."—*Standard.*

Second Edition. Large Demy 8vo, cloth, gilt top. One Guinea net.

ICE-BOUND ON KOLGUEV.

By AUBYN TREVOR-BATTYE, F.L.S., F.Z.S., Etc.

With numerous Illustrations by J. T. Nettleship, Charles Whymper, and Drawings by the Author and Ed. Thornton, and Three Maps.

"His book will take and keep an authoritative position. . . . A modest and unvarnished picture of pluck and endurance that do honour to the English name. Ought to be secure of a welcome from a very large number of readers. . . . The story is told in a delightfully simple and spontaneous manner. . . . Mr. Trevor-Battye's simple and unaffected narrative enables us to learn a good deal."—*The Times.*

"One of the most attractive and readable of recent books of Arctic travel."—*Westminster Gazette.*

"A capital book, as fresh as the flowers and birds and simple people it describes. The book is charmingly and originally illustrated. . . . The book is as attractive to read as this Arctic adventure was risky and original to execute."—*Daily Chronicle.*

QUITO, ECUADOR,
May 8th, 1880.

DEAR SIR,

Both my mountaineers got their feet wet, and one of them was badly frost-bitten in the feet; in consequence he was unable to walk for five weeks afterwards, and this entailed serious loss upon me. I, however, kept my feet perfectly dry, and escaped frost-bite in the feet, though I was slightly bitten in the fingers. I was wearing your thick soled elastic-side boots, and my men wore laced-up boots. This, I think, will be interesting to you. I have long held the opinion that laced-up boots are not so good for high mountaineering as elastic sides, as the former hinder the circulation of the blood more than the latter kind. Frost-bite will scarcely ever arise if the blood is kept well in circulation, but it is to be feared if the circulation is not good.

I am, dear Sir, truly yours,
EDWARD WHYMPER.

To Mr. S. W. NORMAN,
Oakley Corner, Westminster Bridge Road, Lambeth, S.E.

BENJAMIN EDGINGTON'S

Tents and Outfits for Africa and the Tropics.

DOUBLE-ROOF RIDGE TENT

As supplied to the Fellows of the Royal Geographical Society.

Made from a Special Canvas, treated by the Copper Rot-Proof Process.

"*December* 3, 1895.

"Dear Sir,

"After four years in East Central Africa, I have no hesitation in saying that, as far as my experience and observation go, your tents are the best that can be procured.

"I have seen other tents, when almost new, torn to pieces after a tropic storm, or giving way after one rainy season, while one of your double-roof tents which I used constantly for two years in Central Africa, is still as strong and sound as ever.

"Yours faithfully,

"R. U. MOFFAT, M.B.,

"Medical Officer, Uganda Protectorate."

H.M. Commissioner Sir Harry H. JOHNSTON writes:—"Nothing could be more serviceable or thoroughly good than those last supplied by yourself, August 16, 1893." (Order for Tents.)

Surgeon-Major PARKE wrote, March 28, 1893:—"I lived under canvas almost continually from 1887 until we emerged from Africa with Emin Pasha in December, 1889. *Unquestionably* yours *are the best Tents made.*"

W. GORDON STABLES, M.D., R.N., says:—"Mr. Edgington's Tents and Cots are the best in the world for comfort in camping out."

For Price Lists and Particulars address—

BENJAMIN EDGINGTON, Ltd., 2, Duke Street (Foot of London Bridge), S.E.

Candidates for admission into the Society must be proposed and seconded by Fellows, and it is necessary that the description and residence of such Candidates should be clearly stated on their Certificates.

It is provided by Chapter IV., § 1, of the Regulations, that—

"Every Ordinary Fellow shall, on his election, be required to pay £5 as his admission fee, and "£2 as his first annual subscription; or he may compound, either at his entrance by one payment of "£35, or at any subsequent period on the following basis:—

Fellows of 20 years' standing and over			... ...	£12 10s.
„ 15 „ „	and under 20		...	£16
„ 10 „ „	„	15	...	£20

"And no Fellow shall be entitled to vote or to enjoy any other privilege of the Society so long as "he shall continue in arrear."

All Subscriptions are payable in advance, on the 1st of January in each year.

The privileges of a Fellow include admission (with one Friend) to all ordinary Meetings of the Society, and the use of the Library and Map-room. Each Fellow is also entitled to receive a copy of all the Society's Periodical Publications.

Copies of the Year Book, Regulations, and Candidates' Certificates may be had on application at the Society's Office, 1, Savile Row, London, W.

NOTICE.

PHOTOGRAPHS.

ROYAL GEOGRAPHICAL SOCIETY.

It would greatly add to the value of the Collection of Photographs which has been established in the Map Room of the Royal Geographical Society, if all the Fellows who have taken photographs during their travels, would forward copies of them to the Map Curator, by whom they would be acknowledged. Should the donor have purchased the photographs, it will be useful for reference if the name of the photographer and his address are given.

No Camera is a Kodak unless made by the Eastman Company.

The **EASTMAN**

CARTRIDGE FILM SYSTEM **KODAKS**

Can be unloaded and reloaded in daylight, so that the use of

A DARK ROOM IS NOT REQUIRED

for changing the rolls of film on which the pictures are taken. It is done sitting comfortably in a chair. The rolls of film can be sent by post to us or to any dealer to be developed and printed. Photography is thus possible to every tourist or traveller **without any previous experience.**

Pocket, Folding Pocket, Bull's Eye, Bullet, Falcon, and Cartridge Kodaks, £1 1s. to £5 5s.

NOTICE.

The "PROCEEDINGS OF THE ROYAL GEOGRAPHICAL SOCIETY," new series, consists of 14 volumes, extending from 1879 to 1892.

Each volume covers on an average 840 pages, the selling price being 18s. per volume.

These volumes not only contain full reports of the papers read at the Royal Geographical Society, by all the great travellers and geographers of the period, but constitute a record of exploration and geographical work in all parts of the world.

Each volume contains numerous maps, all of them original, embodying the results of exploration, and executed in the best style. In the 14 volumes there are some 350 maps, besides numerous illustrations of characteristic scenery in the least-known parts of the world.

It is believed that a complete set of the *Proceedings* would be a valuable addition to public libraries and other institutions, while many private individuals might wish to have the volumes. As it is desired to reduce the stock in hand, the series is now offered, bound in cloth, at £6 per set. Application to be made to the Chief Clerk, Royal Geographical Society, 1, Savile Row, London, W.

In addition to the *Proceedings*, the Society has issued four volumes of "Supplementary Papers," containing a large number of Memoirs and Narratives of considerable length, besides several valuable Bibliographies. These will be sold for half price, £2 for the four volumes. These contain over 30 Maps and numerous Illustrations.

PUBLISHERS' ANNOUNCEMENTS.

The attention of Fellows of the Society is called to the following new books of Travel, etc.

MESSRS. METHUEN'S ANNOUNCEMENTS.

FOUR IMPORTANT TRAVEL BOOKS.

TO BE PUBLISHED IN THE AUTUMN.

NORTHWARD: ACROSS THE GREAT ICE.

By R. E. PEARY. With over 800 Illustrations, Maps, and Diagrams. Two Volumes. Demy 8vo, 32s. net. [*Nearly ready.*

In this important work Lieut. Peary tells the story of his travels and adventures in the Arctic regions. His extraordinary sledge journey and his experiences among the Eskimos are fully described, and this book is a complete record of his Arctic work, for which the Royal Geographical Society has this year awarded him their Gold Medal.

The fact that Lieutenant Peary is about to start on a determined effort to reach the North Pole lends a special interest to this book.

CHITRAL: THE STORY OF A MINOR SIEGE. By Sir G. S. ROBERTSON, K.C.S.I. With numerous Illustrations and Maps. Demy 8vo, 21s. net.

Sir George Robertson, who was at the time British Agent at Gilgit, has written the story of Chitral from the point of view of one actually besieged in the fort. The book is of considerable length, and has an Introductory part explaining the series of events which culminated in the famous siege; also an account of Ross's disaster in the Koragh defile, the heroic defence of Reshun, and Kelly's great march. It has numerous illustrations—plans, pictures, and portraits—and maps, and will give a connected narrative of the stirring episodes on the Chitral frontier in 1895.

THROUGH ASIA. By SVEN HEDIN. With 250 Illustrations by the Author and from Photographs, and 10 Maps. Two Volumes. Royal 8vo, 36s. net.

This book in which Dr. Sven Hedin, the distinguished Swedish explorer, will describe his four years' experiences and his extraordinary adventures in Central Asia, will be in two volumes, with many hundreds of illustrations.

In adventurous interest and substantial results in various departments of knowledge, Dr. Hedin's journey will bear comparison with the travels of the great explorers of the past, from Marco Polo downwards.

The Gold Medals of the Royal Geographical Society and of the Russian Geographical Society have been conferred upon him for this journey.

THE HIGHEST ANDES. By E. A. FITZGERALD. With 40 Illustrations, 10 of which are Photogravures, and a Large Map. Royal 8vo, 30s. net.

Also, a Small Edition on Handmade Paper, limited to 50 Copies. 4to, £5 5s.

A narrative of the highest climb yet accomplished. The illustrations have been reproduced with the greatest care, and the book, in addition to its adventurous interest, contains appendices of great scientific value.

METHUEN & CO., 36, ESSEX STREET, W.C.

ADMIRALTY CHARTS.

The Latest Editions of Charts, Plans, and Sailing Directions, Published by the Admiralty,

CAN BE OBTAINED FROM

J. D. POTTER,

CLOTHED WITH AIR

CELLULAR UNDERWEAR AND SHIRTS.

THE HEALTHIEST AND MOST ECONOMICAL FOR TRAVELLERS.

Extract from C.T.C. HANDBOOK AND GUIDE, 1896-97, p. 52.

"From the peculiar manner in which CELLULAR CLOTH is woven (forming a network of minute air-cells next the skin), it allows, even more fully than wool, the free evaporation of perspiration on the side next the skin. . . . It is less bulky, and is lighter to carry; it dries much more quickly; it is more easily washed, and its prime cost is much smaller. Last, but not least, it is quite free from that bane of all woollen goods, the liability to shrinkage."

BEST FOR ALL SEASONS AND CLIMATES.

ESTIMATES FOR OUTFITS SUPPLIED ON APPLICATION.

To be obtained in all the principal cities and towns in the United Kingdom, the Colonies, and India.

Illustrated Price List of full range of Cellular goods for Men, Women, and Children, sent Post Free on application.

Full assortment of goods at the following retail houses:—

ROBERT SCOTT, Ltd., 14 and 15, Poultry, London, E.C.

DR. J. COLLIS BROWNE'S CHLORODYNE

ONLY GENUINE. ORIGINAL AND

IS THE GREAT SPECIFIC FOR CHOLERA,

COUGHS. COLDS, ASTHMA, BRONCHITIS.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Dr. J. C. BROWNE (late Army Medical Staff) DISCOVERED a REMEDY to denote which he coined the word CHLORODYNE. Dr. Browne is the SOLE INVENTOR, and, as the composition of Chlorodyne cannot possibly be discovered by Analysis (organic substances defying elimination), and since the formula has never been published, it is evident that any statement to the effect that a compound is identical with Dr. Browne's Chlorodyne *must be false.*

This Caution is necessary, as many persons deceive purchasers by false representations.

DR. J. COLLIS BROWNE'S CHLORODYNE. — Vice-Chancellor Sir W. PAGE WOOD stated publicly in Court that Dr. J. COLLIS BROWNE was UNDOUBTEDLY the INVENTOR of CHLORODYNE, that the whole story of the defendant Freeman was deliberately untrue, and he regretted to say it had been sworn to."—See *The Times*, July 13th, 1864.

DIARRHŒA, DYSENTERY. GENERAL BOARD of HEALTH, London, REPORT that it ACTS as a CHARM, one dose generally sufficient. Dr. GIBBON, Army Medical Staff, Calcutta, states: "2 DOSES COMPLETELY CURED ME of DIARRHŒA." *From* SYMES & Co., Pharmaceutical Chemists, Simla. *Jan.* 5, 1880. *To* J. T. DAVENPORT, London. DEAR SIR, — We congratulate you upon the widespread reputation this justly-esteemed medicine has earned for itself all over the East. As a remedy of general utility, we much question whether a better is imported, and we shall be glad to hear of its finding a place in every Anglo-Indian home. The other brands, we are happy to say, are now relegated to the native bazaars, and, judging from their sale, we fancy their sojourn there will be but evanescent. We could multiply instances *ad infinitum* of the extraordinary efficacy of DR. COLLIS BROWNE'S CHLORODYNE in Diarrhœa and Dysentery, Spasms, Cramps, Neuralgia, the Vomiting of Pregnancy, and as a general sedative, that have occurred under our personal observation during many years. In Choleraic Diarrhœa, and even in the more terrible forms of Cholera itself, we have witnessed its surprisingly controlling power.

We have never used any other form of this medicine than Collis Browne's, from a firm conviction that it is decidedly the best, and also from a sense of duty we owe to the profession and the public, as we are of opinion that the substitution of any other than Collis Browne's is a deliberate breach of faith on the part of the chemist to prescriber and patient alike.—We are, Sir, faithfully yours, SYMES & CO., *Members of the Pharmaceutical Society of Great Britain, His Excellency the Viceroy's Chemists.*

DR. J. COLLIS BROWNE'S CHLORODYNE is the TRUE PALLIATIVE in NEURALGIA, GOUT, CANCER, TOOTHACHE, RHEUMATISM.

DR. J. COLLIS BROWNE'S CHLORODYNE is a liquid medicine which assuages PAIN of EVERY KIND, affords a calm refreshing sleep WITHOUT HEADACHE, and INVIGORATES the nervous system when exhausted.

DR. J. COLLIS BROWNE'S CHLORODYNE rapidly cuts short all attacks of EPILEPSY, SPASMS, COLIC, PALPITATION, HYSTERIA.

IMPORTANT CAUTION. The IMMENSE SALE of this REMEDY has given rise to many UNSCRUPULOUS IMITATIONS. Be careful to observe Trade Mark. Of all Chemists, 1s. 1½d., 2s. 9d., and 4s. 6d.

SOLE MANUFACTURER, J. T. DAVENPORT, 33Gt. Russell St., W.C.

TENTS

FOR THE

TRAVELLER

AND

EXPLORER.

Write for our "Red Bound Catalogue" of Tents and Camp Equipment, post free.

THE MOST PERFECT TENT is PIGGOTT BROS. & CO.'S "PROSPECTING TENT." Made double. The inner roof being suspended 12 inches below the ridge, allows of a free circulation of air between the outer and inner roofs. The inner roof has ventilators, protected by mosquito net. *Made from Green Waterproof and Rot-Proof Canvas.*

PIGGOTT BROS. & CO., MANUFACTURERS,
57, 58, 59, Bishopsgate Street Without, LONDON.

For the
Instantaneous and Direct Aeration

Sparklets

by the user of
Water, Still Wines, Milk, and other liquids.

SPARKLETS are small steel receivers containing enough pure liquid carbonic acid gas, when used with our **Special Bottle**, to strongly aerate rather more liquid than is contained in a large size soda-water bottle.

INVALUABLE for Military Service, Shooting, Exploring, Prospecting, and other expeditions, and when Fishing, Yachting, etc.; also for Medical purposes.

A FEW ADVANTAGES.—Purity, Portability, Cleanliness, Simplicity, Economy, Suitability for all Climates, most valuable in Fever Countries.

Supplied by Chemists, Stores, etc.

PRICES.
Special Bottle and Stopper complete 3/-.
Sparklets (in boxes containing 1 dozen) 1/6 per box.

SPECIAL BOTTLE AND STOPPER FOR USE WITH SPARKLETS.

Can be seen in operation at Aerator's Stall, Picturesque England International Universal Exhibition, Earl's Court; 108, Queen Victoria Street, E.C.; Harrod's Stores, Brompton Road, London, S.W.

1 DOZEN SPARKLETS. WEIGHT 4 OZS.

Wholesale from the Patentees—
AERATORS, LIMITED,
8 & 9, BROAD STREET AVENUE,
LONDON, E.C.

TABLETS for making Soda, Potash, Seltzer, Lithia, and other Mineral Waters with the aid of SPARKLETS are also supplied.

No. 2. AUGUST, 1898. Vol. XII.

ON THE ANNUAL RANGE OF TEMPERATURE IN THE SURFACE WATERS OF THE OCEAN, AND ITS RELATION TO OTHER OCEANOGRAPHICAL PHENOMENA.*

By Sir JOHN MURRAY, K.C.B., F.R.S., LL.D., D.Sc.

(*Of the "Challenger" Expedition.*)

1. Introductory.

Temperature may be defined as that state of matter on which depends its relative readiness to give or to receive heat. Variations of temperature are intimately associated with all changes in nature, and no investigation is more important or more interesting to the scientific man than the study of these temperature variations, and their relation to other natural phenomena. In the present communication, it is proposed to consider with some detail the temperature variations which take place in the surface waters of the ocean during the course of the year, and to indicate some of the physical and biological phenomena which appear to be directly or indirectly connected therewith.

On the dry land there is often a very wide *daily* range of temperature in the air immediately resting upon the ground. The temperature at the surface of the sandy deserts of the tropics frequently rises during the day to 120° or 140° Fahr., and more rarely to 200° Fahr.; and when these hot particles of dust are lifted into the air by winds, the temperature of the air rises occasionally to 125° Fahr. in the shade, while during the night the temperature sometimes falls below the freezing-point. Rock surfaces in the tropics, which during the day are heated up to 137° Fahr., are cooled so rapidly by radiation at night that, unable to sustain

the strain of contraction, they split, and throw off sharp angular fragments from a few ounces to 100 or 200 lbs. in weight.* Cold rain falling on these sun-heated rocks produces a similar effect.† At Atacama, in South America, a range of temperature amounting to 91° Fahr. has been recorded in four hours.‡

The *annual* range of temperature is likewise very great at some places on the land-surfaces. At Werkojansk, in Siberia, the range of temperature between the mean of the coldest month and the mean of the warmest month is 120° Fahr.; and at this place, in February 1892, the temperature fell to − 93°·6 Fahr., being absolutely the lowest temperature of the air hitherto recorded. The *extreme* range of temperature of the air which may be found upon the land-surfaces as a whole, as distinct from the daily or annual range at any one spot, is known to exceed 220° Fahr.

When we turn to a consideration of the changes of temperature which occur in the surface waters of the ocean, it is found that these are much less rapid, and that the *daily* and *annual* range at any one spot, and the *extreme* range of temperature from equator to pole, are all very much less than on the land-surfaces. This result is due to the great thermal capacity of water, and to the fact that most of the light and heat rays are absorbed on passing through the surface-layers of the water. The high specific heat of water precludes such a rapid rise or fall of temperature as takes place on land. When the temperature of the water is raised, evaporation tends to check the rapidity of the rise; when the temperature falls, condensation of the superincumbent vapour checks the rapidity of the fall, and, when a low temperature is reached, freezing sets in, again retarding the fall.

The mean *daily* range of temperature in the surface-waters of the North Atlantic, as determined from the *Challenger* observations, made on 126 days from March to August, 1873, and in April and May, 1876 (mean lat. 30° N., mean long. 42° W.), was only 0°·8 Fahr.; while the amplitude of the daily variation in the temperature of the air over the sea on the same 126 days was 3°·21 Fahr., or four times greater than that of the sea over which it lies.§ During this time the *Challenger* was near land on 76 days, and on these days the diurnal variation was 4°·38 Fahr., thus showing a larger range in the temperature of the air when near land than when out in the open sea. An examination of the temperatures taken by the *Challenger* in other parts of the globe renders it highly probable that nowhere in the open ocean does the

BRITISH LIBRARY

mean daily fluctuation of the temperature of the surface water amount to 1° Fahr.; hence, the atmosphere over the ocean may be regarded as resting on, or blowing over a surface, the temperature of which is practically uniform at all hours of the day, being thus a striking contrast to what takes place on the dry land.

The *annual* range of surface temperature in the ocean within any particular 2° square, so far as recorded, does not exceed 53° Fahr.: this greatest annual range being found off the Banks of Newfoundland in the Atlantic, and in the Japan seas in the Pacific—at places where the surface is occupied by cold waters coming from polar areas at one season, and by warm waters coming from tropical areas at another season; but we shall presently show that there are large areas, both in the tropics and polar regions, where the annual range does not exceed a few degrees during the course of the year. The *extreme* range of temperature recorded in the ocean is about 70° Fahr.: from the freezing-point of salt water in the polar regions to 96° Fahr., recorded at the head of the Persian Gulf.

The much greater range of temperature on the surface of the continents than in the surface and subsurface waters of the ocean, might lead one to expect that the distribution of land organisms would be more limited by temperature conditions than that of marine organisms. Such—at first sight, at all events—does not, however, appear to be the case. It has long been recognized that the mean annual temperature, or the annual range of temperature, in any area on the land surfaces produces a very marked effect on the character of the fauna and flora; still, zoologists have, as a general rule, considered topographical features as the most important factor in limiting the distribution of species, while botanists, on the other hand, have considered temperature conditions as the most important factor. The various zoological provinces, into which naturalists have divided the land-surfaces, have been laid down chiefly from a study of warm-blooded and air-breathing animals, which are able to maintain a nearly uniform temperature of their bodies under great variations in the external temperature conditions. If we except hybernation, there is even a rise in the temperature of the body, and an increase in metabolism in Mammalia, with a lowering of the external temperature. Topographical features, such as mountain ranges, deserts, and seas, seem therefore to be more important factors in determining the limits of distribution of terrestrial species than mere temperature or climatic conditions.

In the ocean there are very few warm-blooded and air-breathing animals, and we have to deal chiefly with cold-blooded animals, the temperature of whose blood rises and falls with that of the surrounding water; hence temperature conditions—even with the lesser variation in range—appear to be, as with plants, the most important factor in limiting the distribution of marine animals. In this connection, the following may be indicated as one of the many interesting problems

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [261v] (25/154)

presented to the naturalist. In the tropics a marine animal—a copepod or isopod, for instance—lives constantly in water at a temperature of about 70° Fahr.; in the polar seas, a similar animal lives as constantly in water at a temperature about zero. What is the difference in the rate of metabolism, length of life, rate of reproduction, and general life-history of the two animals? There seems to be little doubt that a satisfactory reply to these questions would explain many of the observed differences between polar and tropical faunas.

The above and some other allied considerations, together with the desirability of having a more precise knowledge of the variations in the range of temperature in different regions of the ocean, induced me some years ago to attempt the preparation of a map showing the annual range of temperature in the surface waters of the ocean within every two-degree square on the water surface of the globe; for it seemed that a comparison of the range of temperature in different places at the surface of the ocean might possibly show an intimate connection with other oceanographic phenomena.

2. Preparation of the Range-Map from Temperature Observations in Every 2° Square.

A first attempt was made by using the Charts showing the surface temperature of the Atlantic, Indian, and Pacific Oceans, published by the Meteorological Council in 1884. In these charts the mean temperature and range are given for the four different months, February, May, August, and November, as recorded within each 2° square throughout the three oceans; in some localities numerous observations made it possible to give the results within smaller areas. In order to arrive at the extreme annual range within each 2° square, the figures were used in the following manner: Taking the map for February, the maximum and minimum temperatures for any particular 2° square in that month were obtained by adding half the given range to the mean temperature for the maximum, and by subtracting half the given range from the mean for the minimum. This operation was repeated with the maps for May, August, and November, and the four maxima and the four minima were entered on specially ruled paper. The extreme range shown by these four sets of figures was laid down on a blank map as the approximate annual range of surface temperature in each 2° square, and lines were drawn for intervals of 10° Fahr. of range of temperature, in the same manner as the lines on the map accompanying this paper.

A map constructed on this principle was exhibited at a lecture, on the structure, origin, and distribution of coral reefs and islands, delivered before the Royal Institution of Great Britain, in London, on March 16, 1888, with special reference to the range of temperature within the coral-reef regions. On careful consideration this map was not published. The method was rejected as unsatisfactory, because the given mean

BRITISH LIBRARY

temperature is not the arithmetical mean between the maximum and minimum temperatures observed in any particular 2° square, but the mean of all the observations, and therefore the maximum brought out by this method may be too high, or the minimum may be too low, according as the great majority of the observations were high or low. For example, in the North-West Atlantic (lat. 42°–44° N., long. 48°–52° W.) a mean temperature of 35° Fahr. is given for the month of February, with a range of 27°; deducting half the range from the mean gives a minimum temperature of 21½° Fahr.—an impossible temperature at the surface of the sea.

Subsequently, an application to the Meteorological Office in London resulted in an arrangement being made, whereby the maximum and minimum surface temperatures for each 2° square throughout the great ocean basins were extracted from the records in that office for the two months likely to give the extremes of temperature, viz. February and August.* These maxima and minima were laid down on maps, and the extreme ranges of temperature shown by these figures were placed in geographical position on other maps, lines being drawn enclosing those regions in which

(1)	the recorded range does not exceed 5° Fahr.						
(2)	„	„	is between	5°	and	10°	Fahr.
(3)	„	„	„	10°	„	15°	„
(4)	„	„	„	15°	„	20°	„
(5)	„	„	„	20°	„	25°	„

(9)	„	„	„	40°	„	45°	„
(10)	„	„	„	45°	„	50°	„
(11)	„	„	is over 50° Fahr.				

In this manner the data supplied by the Meteorological Office, supplemented by information from other sources as indicated in the succeeding paragraphs, have been made use of in preparing the map accompanying this paper, which represents very approximately the annual range of temperature in the surface waters of the ocean throughout the world.

The method adopted in making use of the supplementary information referred to, was to extract the maximum and minimum temperatures recorded in any 1° square throughout the world, and to enter them on

* The maximum and minimum effects of temperature appear to take place in the water about a month later than in the atmosphere, so that, after consultation with Dr. Buchan, the months of February and August were chosen as the most suitable for our purpose.

I am much indebted to the members of the Meteorological Council, and to the officers of the Department, for the permission and assistance given in consulting the records in their possession.

sheets of specially ruled paper. Each sheet was ruled so as to contain in convenient form the maxima and minima within a 10° square, the observations being inserted for each 1° square, while the sheet was subdivided by rulings into 2° squares. Thus, at a glance, the range within any 1° square, or any 2° square, or any 10° square, was available. These sheets have been kept up to date by the inclusion of observations from other sources, and, by including all future observations, they can at any time be made available for the revision and correction of the map. On these sheets, maxima and minima collected from every available source have been entered. We may specially mention the observations of surface temperature in the North Pacific, collected together by Admiral Makaroff in his Report on the voyage of the *Vitiaz* in the North Pacific (published in 1894); the observations published annually in the Admiralty Blue-books (Lists of Oceanic Depths and Temperatures received at the Hydrographic Office); and Prof. Mohn's observations of surface temperature in the Norwegian Sea (published in the Report of the Norwegian North Atlantic Expedition).

In 1895 Dr. Schott published a paper on "Die jährliche Temperaturschwankung des Ozeanwassers" in *Petermann's Mitteilungen* (vol. xli. p. 153), and his map is, so far as we are aware, the only attempt to represent graphically the variation of temperature at the surface of the sea, but it has evidently been prepared from *mean* monthly temperatures, and not from extreme temperatures; the range shown on his map is therefore necessarily less than that shown on the map accompanying this paper.

The total number of observations of surface temperature represented by the figures laid down on our charts is very large, and it is very difficult to arrive at even an approximation; but, with the aid of Makaroff's Tables, an attempt has been made to estimate the minimum number of observations in the North Pacific, as set forth, in zones of 10° of latitude, in the following table:—

NUMBER OF OBSERVATIONS OF SURFACE TEMPERATURE IN THE NORTH PACIFIC, AS RECORDED BY MAKAROFF (1894).

Lat. 0° to 10° N.	... ...	2,557 observations.
„ 10° „ 20° „	... ...	2,866 „
„ 20° „ 30° „	... ...	4,773 „
„ 30° „ 40° „	... ...	7,722 „
„ 40° „ 50° „	... ...	13,970 „
„ 50° „ 60° „	... ...	5,867 „
„ 60° „ 70° „	... ...	1,085 „
„ 70° „ 76° „	... ...	34 „
	Total	38,874

In the above numbers, those cases where observers have given simply a mean for the twenty-fours have been counted as a single

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

observation, though in reality that mean represents several observations. In addition, there are many cases where the number of observations is not recorded, though a maximum or a minimum temperature, or both, are given; these have been counted as one or two observations, according as one or two readings are given. Therefore the numbers in the preceding table are probably considerably below the truth; but, looking upon them as approximately correct, it appears that the number of observations increases from the equator northwards to between 40° and 50° N., where a maximum of nearly 14,000 observations is reached, from whence the number rapidly decreases northward. Northwards of 70° N. only thirty-four observations had been recorded in 1894, and to the north of 76° no observations were recorded.

But a better idea of the amount of material made use of in preparing the accompanying map will be formed from an examination of the table on p. 120, showing (1) the number of 2° squares in which observations are recorded in the two opposite months of February and August, (2) the number of 2° squares in which observations are recorded in the one or the other of these two months, and (3) the number of squares which are blank as regards observations in these two months, between the latitudes of 60° N. and 60° S. in the three great oceans.

From this table it appears that in the 2° squares, which contain water-surfaces, between lat. 60° N. and 60° S., observations are available in considerably more than half of the total number in the two months specified, while in nearly one-fourth of the total number of squares observations are available in only one of these months, and in the remaining one-fifth there are no observations available. To be more exact, of the total number of squares 56 per cent. contain observations in the two opposite months, 23 per cent. contain observations only in one of these months, and 21 per cent. contain no observations in these two months. A fairer estimate would, perhaps, be obtained by excluding the zone between 50° and 60° S., in which zone, more particularly in the Indian and Atlantic oceans, large tracts are blank. Thus, of the total number of 2° squares between the latitudes of 60° N. and 50° S., 59 per cent. contain observations in the two opposite months, 24 per cent. contain observations in only one of these months, and 17 per cent. contain no observations in these two months.

Considering now the figures relating to each of the great oceans, it appears that of the total number of 2° squares which contain water-surfaces in the Indian ocean between 30° N. and 60° S., 70 per cent. contain observations in the two opposite months, 13 per cent. contain observations in one only of the two months, and 17 per cent. contain no observations in these months. The large amount of information regarding the surface temperature of the Indian ocean is prominently brought out by excluding the zone between 50° and 60° S., which is almost a complete blank; for it appears that of the total number of 2°

BRITISH LIBRARY

squares in the Indian ocean, from its northern limits to lat. 50° S., 83 per cent. contain observations in the two months of February and August, 13 per cent. contain observations in one only of these months, while merely 4 per cent. are blank as regards observations in these two months.

Of the total number of 2° squares in the Atlantic ocean between 60° N. and 60° S., 67 per cent. contain observations in the two opposite months, 19 per cent. contain observations in one only of these two months, while 14 per cent. contain no observations in the two months specified. As in the case of the Indian ocean, very few observations of surface temperature are available in the Atlantic south of lat. 50° S. Thus, of the total number of 2° squares in the Atlantic between 60° N. and 50° S., 71 per cent. contain observations in the two opposite months, 21 per cent. contain observations in one only of these months, while merely 8 per cent. are blank as regards observations in these two months.

Of the total number of 2° squares in the Pacific ocean between lat. 60° N. and 60° S., 46 per cent. contain observations in the two opposite months, 28 per cent. contain observations in one only of these months, while 26 per cent. contain no observations in these two months. The zone of latitude from 50° to 60° S. contains relatively many more observations than in the case of the Atlantic and Indian oceans, so that the exclusion of that zone does not alter the proportions in the Pacific to any appreciable extent, the percentages for the Pacific between 60° N. and 50° S. being respectively 45, 29, and 26 as compared with 46, 28, and 26 given above for the Pacific between 60° N. and 60° S.

It will thus be seen that, on the whole, the Pacific basin is the one in which our knowledge of surface temperature is most deficient, and therefore the one in which future observations may be expected to effect the greatest modifications in the map showing the range of temperature. In this ocean the greatest deficiency is within the tropics, the largest number of blank squares occurring between 10° S. and 10° N., from which zone the number of blank squares gradually decreases as far as the 50th parallels north and south; by far the larger proportion of blank squares lie within the six zones between 30° N. and 30° S. On the other hand, in the Atlantic and Indian oceans the number of blank squares is comparatively insignificant, and the blank squares are not grouped together in any particular latitude.

When we consider the recorded temperatures at different seasons of the year towards the arctic and antarctic regions north and south of the 60th parallels, our knowledge is very deficient; still a tolerably correct idea of the range of temperature within the ice-covered seas can be formed, when we remember that the minimum temperature must always be somewhere about 28° Fahr., so that the summer temperatures which have been recorded by explorers may be made use of in arriving at an

مكتبة قطر الوطنية
Qatar National Library

BRITISH LIBRARY

approximation of the range of temperature. In the southern hemisphere south of the 60th parallel, our maps are almost a complete blank, the observations being limited to those taken in the summer by Ross and other antarctic explorers. In the northern hemisphere, on the other hand, we have a good deal of information. As already stated, Makaroff records numerous observations north of 60° N., extending as far north as 76° N., in the North Pacific, and in the North Atlantic we have been able, approximately, to estimate the range of temperature as far as 82° N., from the observations and maps published by Mohn in the Norwegian North Atlantic Expedition Report, from Koldewey's observations during the German Arctic Expedition, from Nansen's published observations, and from records brought home by Mr. Bruce, of the Jackson-Harmsworth Expedition, as well as other arctic explorers. From these sources we have observations in no less than 155 squares between lat. 60° and 82° N., and long. 26° W. and 38° E., which are available in estimating the range of temperature.

3. General Features of the Map.

The lines on the map are drawn for intervals of 5° Fahr. of range of temperature, and different shades of colour are used for intervals of 10° Fahr. Broadly speaking, the map shows that the surface of the ocean may be divided into five great zones: firstly, a circumtropical zone with high temperature and small range (coloured deep red on the map); secondly, two circumpolar zones with low temperature and small range (coloured pale red on the map); and lastly, two intermediate zones with large ranges lying between the circumtropical and the two circumpolar zones (coloured in different shades of blue on the map).

The regions indicated as having a range of less than 5° Fahr. are largely hypothetical, more especially in the polar regions and tropical Pacific, though the small areas laid down in the tropical Atlantic and tropical Indian oceans are based upon numerous observations. In the polar regions the line coincides approximately with the line of perpetual ice.

The northern circumpolar band, with a range not exceeding 10° Fahr., borders the northern shores of Asia and America, lying mostly within the arctic circle. It is probable, however, that a wider range will be found off the mouths of many of the rivers flowing into the Arctic ocean from America and the Eurasian continent. The corresponding southern circumpolar band apparently approaches nearer to the tropics, extending northwards, approximately, as far as lat. 50° S., and penetrating to the north of that latitude in the Atlantic, but it may be expected that more extended observations will necessitate the drawing of the line of 10° range much nearer the antarctic circle, probably throughout its whole extent. In these two circumpolar bands, with a range of less than 10° Fahr., observations are meagre, and indicate

BRITISH LIBRARY

a range from about 28° to about 50° Fahr., though not exceeding 10° Fahr. in any single 2° square.

The tropical band of small range (less than 10° Fahr.) marks out approximately the coral-reef regions of the world. It forms an almost continuous belt around the globe, being broken only by the interposition of the continental masses, and for a short distance in the Pacific, off the shores of Central America. Future observations may show it to be completely broken also off the western coast of Africa, where it is now shown as continuous across the whole Atlantic. The Pacific area is the largest, stretching from near the Central American coast across to the East Indian seas and Barrier Reef of Australia (and passing through the Arafura sea into the Indian ocean), confined almost entirely within the tropics of Cancer and Capricorn, but extending beyond the latter tropic in the Central South Pacific. The observations within this Pacific tropical area show a range from 70° to 90° Fahr., though not exceeding 10° Fahr. in any single 2° square; throughout the area, however, a great many of the squares are blank, and future observations may alter the form considerably.

In the Indian ocean a belt of small range (less than 10° Fahr.) stretches across from the east coast of Africa (south of Cape Guardafui and north of Madagascar) to the shores of the Malay peninsula and Sumatra (and passing through the Arafura sea into the Pacific), lying mostly to the north of lat. 10° S., and filling up the greater part of the Arabian sea and of the Bay of Bengal. The observations within this Indian ocean tropical area show a range from 72° to 87° Fahr.

In the Atlantic the belt of small range (less than 10° Fahr.) extends across from the Caribbean sea and the north-east coast of South America to the Liberian coast of Africa, reaching northward in the central part of the ocean to the northern tropic, and southward to a little beyond lat. 20° S. The observations within this Atlantic tropical area show a range from 72° to 85° Fahr. It includes three squares, in which the recorded range just reaches 10° Fahr., all on the parallel of 10° N.

If we now turn our attention to those portions of the map which are coloured blue, where the range exceeds 10° Fahr., it will be observed that the area with a range of temperature between 10° and 20° Fahr. (indicated by the palest shade of blue) is the most extensive on the surface of the ocean. It fills up the intervals between the three bands of small range just described, and encloses in certain positions areas having a greater range. The line of 15° range cuts this pale blue area into two parts, and it will be observed that the area with an annual range exceeding 15° Fahr. lies mostly in the temperate regions between the tropics and the polar circles. The area does not reach the antarctic circle in the south, but it penetrates considerably beyond the arctic circle in the North Atlantic, extending north of the island of Jan Mayen, and in Bering strait it extends just beyond the arctic circle. In the

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [265v] (33/154)

southern hemisphere it forms a band broken only in the centre of the South Pacific, where, however, observations are scarce, so that it may ultimately prove to be a continuous girdle round the globe.

A band with a range of over 20° Fahr. occurs in the southern hemisphere entirely south of the tropics, continuous across the South Atlantic and across the greater part of the South Indian ocean; in addition, there is an area off the south-east of Australia enclosing Tasmania, an area entirely encircling New Zealand, four small areas off the west coast of South America between lat. 10° and 50° S., and a small area off the west coast of Africa, northward of Cape Frio.

In the northern portion of the Indian ocean a range of over 20° Fahr. is found only off Cape Guardafui, extending into the Red sea, where the temperature varies from 59° to 94° Fahr., and in the Persian gulf and entrance thereto, where the temperature varies from 58° to 96° Fahr.

A large part of the North Atlantic has a range of over 20° Fahr., extending across from the Gulf of Mexico and the eastern shores of North America to the western shores of Europe and Africa, and into the Mediterranean. The eastern boundary of this area stretches from lat. 10° N., on the coast of Africa, to lat. 70° N., near the North Cape on the Norwegian coast.

In the North Pacific an extensive area, with a range of over 20° Fahr., extends across from the eastern shores of Asia to the west coast of North America, and into the Bering sea, where it reaches as far northward as lat. 64° N. There is also a small area in the region of the Gulf of California, with a range exceeding 20°, a range of 27° being recorded in the upper half of that gulf.

A range exceeding 25° Fahr. is found in various parts of the ocean, almost entirely outside the tropics, the only positions within the tropics being off Cape Guardafui and in the Red sea, and off the Chinese coast. In the North Atlantic an extensive area lies off the east coast of North America, between lat. 30° and 50° N., extending seawards beyond long. 30° W.; a second area fills the Mediterranean and Black sea; and a third area occurs in the Irish sea, English channel, North sea, Baltic sea, running up the Norwegian coast to 70° N. In the North Pacific a large area lies off the Asiatic coast, between lat. 16° and 58° N., extending seawards to near long. 170° E., with a small isolated area in the central part of the ocean, between lat. 45° and 50° N., and another in the upper half of the Gulf of California (as already indicated). In the Indian ocean a range exceeding 25° has been recorded off Cape Guardafui, in the Red sea, and Persian gulf.

In the southern hemisphere, a considerable area, with a range of over 25°, lies off the east coast of South America, between lat. 24° and 44° S., extending seawards off the mouth of the Rio de la Plata as far as long. 44° W., with a small isolated patch in the centre of the South Atlantic, about lat. 30° S. Another considerable area lies off the Cape of Good

BRITISH LIBRARY

Hope, extending southwards as far as lat. 46° S., and eastwards on either side of the 40th parallel as far as long. 72° E. An isolated patch occurs to the south of Tasmania, and a larger area off the Sydney coast of Australia.

Considering now those regions of the ocean where a known range of surface temperature exceeding 30° Fahr. occurs, the map shows three small areas in the southern hemisphere, one off the mouth of the Rio de la Plata, and the other two south of the Cape and Madagascar; and in the northern hemisphere two extensive areas, one in the North-West Pacific, the other in the North-West Atlantic; and smaller areas in the Mediterranean and Black sea, in the Baltic, North sea, and English channel, and at the heads of the Red sea and Persian gulf (as already indicated).

In the area off the mouth of the Rio de la Plata the greatest range shown in a single square is 33° (from 42° to 75°), the extreme range within the area being from 40° to 78° Fahr.

In the area laid down to the south of the Cape of Good Hope, the figures supplied by the Meteorological Office show a range of 29° (from 46° to 75° Fahr.) in two different squares, on either side of a square with a range of 28° (45° to 73° Fahr.), surrounded on all sides by squares with ranges of 27° and 26° Fahr., but other records from the same region indicate a range of over 30° Fahr.

In the area in the Southern Indian ocean, south of Madagascar, two adjacent squares show a recorded range of 32° Fahr. (in one case 40° to 72°, in the other 42° to 74°). The temperature within the area ranges from 36° to 74° Fahr.*

The area in the North-West Pacific with a range exceeding 30° lies off the east coast of Asia, between lat. 22° and 56° N., and the observations within the area show a range from 29·8° to 86° Fahr.

The largest area in the North Atlantic basin with a range exceeding 30° lies off the east coast of North America, between lat. 30° and 50° N.; a second area covers the greater part of the Mediterranean and Black sea; and a third small area occurs in the English channel and south-eastern part of the North sea, extending into the Baltic.

At the head of the Red sea ranges of 36° (from 57° to 93°) and of 38° (from 50° to 88°) are recorded, and at the head of the Persian gulf a range of 31° (from 65° to 96°).

A range exceeding 35° Fahr. occurs at the head of the Red Sea, in the eastern Mediterranean, in the north-western part of the Black sea, with large areas in the North-West Atlantic and the North-West Pacific, but there is apparently no region in the southern hemisphere where the records show a range as great as 35° Fahr.

* Off the east coast of Australia, near Sydney, the records show a range in one square of 28° (from 57° to 85°), and in another square of 26° (from 54° to 80°); but future observations may prove that in this locality the range is over 30°.

مكتبة قطر الوطنية
Qatar National Library

A range of surface temperature exceeding 40° Fahr. occurs in the north-western portions of the Atlantic and Pacific oceans, in which positions the greatest range in the surface waters of the globe is found. The observations within the North Atlantic area show a range from 26° to 83°, and within the North Pacific area from 28·8° to 88°. There are indications that in the eastern part of the Mediterranean, near the island of Cyprus, the surface waters have also a range exceeding 40°, while in the north-western part of the Black sea a similar large range occurs.

A range exceeding 45° Fahr. occurs only in the North-West Atlantic and North-West Pacific, each enclosing an area having a range of more than 50° Fahr.

A range of surface temperature exceeding 50° Fahr. is found only in the North-West Atlantic and North-West Pacific. The North Atlantic area is much the larger, extending off the North American coast, to the south of Nova Scotia, seaward to near long. 50° W. The greatest recorded range in a single square is 52° (from 28° to 80°), while the extreme range within the area is from 27° to 83°. The North Pacific area lies off the coast of Asia in the Sea of Japan, in about the same latitude as the Atlantic area (40° N.). The greatest recorded range in a single square is 52·7° (from 28·8° to 81·5°), and the extreme range within the area is from 28·8° to 83·7° Fahr.

From the foregoing discussion it will be seen that the lowest recorded temperature-reading at the surface of the sea is 26° Fahr. in the North Atlantic, eastward of Nova Scotia, and the highest reading in the open ocean is 90° Fahr., recorded in the tropical Pacific both north and south of the equator, though readings of 94° and 96° Fahr. are recorded in the Red sea and Persian gulf respectively. The greatest known range of temperature of the surface waters throughout the whole world is thus 70° Fahr. (from 26° to 96°).*

4. Relation of Range of Temperature to some other Physical Phenomena.

Range of temperature has a very important effect in bringing about a vertical circulation in ocean waters. In the equatorial regions, where there is hardly any variation of surface temperature, the warm water remains at the surface, and there relatively cold water comes nearer to the surface than in those regions in temperate zones where there is a wider daily and annual range. The cooling of the surface layers at night and during winter in temperate regions causes the salter waters of the surface to sink through the underlying layers, carrying with them heat and atmospheric gases to the greater depths. The effect of freezing

* The colours indicated on the map for the bodies of fresh water (such as the North American and Siberian lakes) have been laid down from a study of all accessible information.

BRITISH LIBRARY

in the polar regions is in the end similar to that of evaporation in warmer latitudes. The lighter ice is separated from the denser mother-liquor, which sinks to the greater depths, leaving the ice on the surface.

These statements as to the effects of range of temperature might be illustrated by reference to many parts of the ocean. It will be sufficient to refer to the most striking example, in the southern hemisphere, where there is a band of large range of temperature right round the world. The warm tropical waters, which are driven southwards along the eastern coasts of South America, Africa, and Australia, into the Great Southern Ocean, there become cooled as they flow to the east before the strong westerly winds. On account of their high salinity, these tropical waters can suffer much dilution with antarctic water, and still be denser than water from these higher latitudes at the same temperature. Here the density observations and the seawater gases indicate that a large part of the cold water found at the greater depths of the ocean probably leaves the surface, and sinks towards the bottom of the Southern Ocean, between the latitudes of 45° and 56° S.

At a depth of 100 fathoms, the temperature in one part of the ocean may differ from that to be found in some other part at the same depth by as much as 42° Fahr.; and at 500 fathoms there may be between one part and another a range of as much as 20° Fahr.; at 1000 fathoms, a range not exceeding 11° Fahr.; and at 1500 fathoms, not exceeding 8° Fahr. A consideration, however, of all the available observations shows that there is no evidence of any annual variation of temperature at any one spot in the ocean at a depth of 100 fathoms; and at a depth of 50 fathoms no annual range greater than 2° Fahr. appears to be indicated. This remark applies especially to the open ocean; but, although we have no direct observations, still it is most probable that along certain coasts a wide range of temperature is occasionally produced at the bottom in depths of 50 and even 100 fathoms, due to the lateral shifting of large bodies of water from different sources. The evidence of movements like these comes especially from regions where polar and equatorial currents meet, or run alongside of each other in different directions, as, for instance, in the case of the Gulf Stream and Labrador current off the eastern coasts of North America,* to which reference will presently be made in connection with the destruction of the tile-fish. Those areas, where currents of different temperatures meet, correspond with the areas of greatest annual range, indicated on the map by the deepest shades of blue, and they become the theatre of some remarkable phenomena, specially interesting to the biologist and geologist.

If a comparison be made between the map accompanying this paper and the maps showing the isobaric lines and prevailing winds for

January and July, published in the 'Challenger Report' by Dr. Buchan, it will be seen that there is a general parallelism between the regions marked off by the blue colours and the position of the anticyclonic areas of the ocean. In these intermediate regions, between the equatorial band and the two circumpolar bands of small range, there is probably at all times of the year more insolation, or sunshine, and consequently a greater absence of clouds, than is to be met with in the tropical or polar areas, which may account to some extent for the wide range. It will be noticed that the deepest shades of blue are situated on the polar sides of the anticyclonic areas, and in these positions the greatest cyclonic disturbances are met with; in these regions the strength and direction of the winds and currents vary at different times of the year, owing to the position of the sun in the months of January and July. Currents from widely separated sources are in this way frequently carried over the same position even in the open ocean.

A large range of temperature, due to upwelling, as a result of the action of the winds, is indicated by the blue colours along the west coasts of Africa and South America, and on the east coast of Africa, near Cape Guardafui. The relatively wide range represented by the blue colour which extends from the Gulf of Guinea to the westwards about the equator, and a similar arrangement at the equator off the Gulf of Panama, seem to be due to currents variable in speed but constant in direction, producing greater upwelling at one season than at another, but in currents which are relatively constant in direction and speed a small range of temperature usually occurs.

It is to be noted that in the tropical regions the lines showing the variation spread outwards in the shape of a fan towards the eastern shores of the continents, whereas, on the other hand, in the northern and southern temperate regions they show a tendency to spread out in like manner towards the western shores of the continents; this is especially the case in the Atlantic. This position of the lines is what would be expected from a consideration of the general system of winds and oceanic circulation.

5. Relation of Range of Temperature to Biological Phenomena.

Where cold and warm currents meet at the surface of the ocean there is a rise of temperature for the animals of the cold current, and a fall of temperature for the animals of the warm current, which results in a plentiful destruction of organisms. The tow-net collections during the *Challenger* expedition gave frequent illustrations of this fact by the dead animals collected in such positions off the coast of North America, off the Cape of Good Hope, in the North Pacific, and elsewhere. Dr. O. Fischer records a remarkably large number of bacteria on the borders of such meeting currents. This destruction of life is not limited to minute pelagic organisms, but occasionally affects animals

BRITISH LIBRARY

which live at the bottom of the sea. Some remarkable instances of this kind have been observed between depths of 50 and 100 fathoms off the eastern coast of the United States.

Lieut.-Commander Tanner, commanding the United States Fish Commission steamer *Albatross*, reports that "on the morning of July 20, 1884, in lat. 37° 47′ N., long. 74° 15′ W., near the 100-fathom line, we passed numerous dead octopods floating on the surface. This unusual sight attracted immediate notice and no little surprise among those who knew their habits, as it was not suspected at first that they were dead. We lowered a boat and picked up three or four specimens, which we were unable to identify, but in general appearance they resembled *Alloposus mollis* (Verrill) of unusually large size. These dead cephalopods were seen frequently on the 100-fathom line and outside of it, from the position given above to the meridian of Montauk point, a distance of 180 miles. They were less numerous, however, as we went to the northward and eastward. Several dead squid were seen also, and two specimens were picked up with a scoop-net." *

A still more remarkable instance of this kind is furnished in the well-known case of the destruction of the tile-fish in the same locality in the spring of 1882.† In the months of March and April, 1882, vessels arriving at Philadelphia, New York, and Boston reported having passed large numbers of dead or dying fish scattered over an area of many miles, and from descriptions and the occasional specimens brought in, it was evident that the great majority of these were tile-fish. Naturally, these fish were not evenly distributed over all the area in which they were seen, some observers reporting them as scattering, and others as at times so numerous that there would be as many as fifty on the space of a rod square. As one account after another came in, it became apparent that a vast destruction of fish had taken place, for vessels reported having sailed for 40, 50, and 60 miles through floating fish; and, in one case, the schooner *Navarino* sailed for about 150 miles through waters dotted as far as the eye could reach with dying fishes. Computations made by Captain J. W. Collins seem to indicate that an area of from 5000 to 7500 square statute miles was so thickly covered with dead or dying fish that their numbers must have exceeded the enormous number of one billion. Since there were no signs of any disease, and no parasites found on the fish brought in for examination, their death could not have been brought about by either of these causes; and many conjectures were made as to the reason of this wholesale destruction of deep-water fishes, such as would ordinarily be unaffected by conditions prevailing at the surface, submarine volcanoes, heat, cold, and poisonous gases being

* 'Report of the Commissioner for 1884,' p. 32.

variously brought forward to account for the loss of life. Prof. Verrill has noted the occurrence of a strip of water, having a temperature of 48° to 50° Fahr., lying on the border of the Gulf Stream slope, sandwiched between the arctic current on the one hand and the cold depths of the sea on the other. During 1880 and 1881, Prof. Verrill dredged along the Gulf Stream slope, obtaining in this warm belt, as he terms it, many species of invertebrates characteristic of more southern localities. In 1882 the same species were scarce, or totally absent from places where they had previously been abundant; and this, taken in connection with the occurrence of heavy northerly gales and the presence of much inshore ice at the north, leaves little doubt that some unusual lowering of temperature in the warm belt brought immediate death to many of its inhabitants. This is the more probable, as it is a well-known fact that sudden increase of cold will bring many fish to the surface in a benumbed or dying condition, and there are no indications of any shock or earthquake having occurred at the time the dead fish were first noticed.

It has been estimated that the bottom of the ocean in this region must at the time have been covered to the depth of about six feet with the dead bodies of the tile-fish and other marine organisms, and it seems evident, from the subsequent researches of Prof. Libbey, that their destruction was due to the lateral shifting of currents from different sources and of different temperatures, thus producing a wide range of temperature even at depths of 50 and 100 fathoms.

An indirect effect of the range of temperature, and of the destruction of organisms like those above described, can be recognized in the deposits on the floor of the ocean. It is a rather remarkable circumstance that all the places where the *Challenger* discovered a great development of glauconite and phosphatic nodules in the deposits are intimately associated with a wide annual range of temperature at the surface of the ocean—as, for instance, off the eastern coasts of the United States, off the Cape of Good Hope, and off the east coasts of Australia and Japan. The *Blake* and the *Albatross* have dredged from the area where the tile-fish was destroyed, and in the Florida straits, some very large brown-coloured phosphatic nodules weighing many pounds in weight.* These concretions were made up of the remains of pelagic Foraminifera and the other materials composing the deposits, in depths of 200 and 300 fathoms, and contained 23·53 per cent. of phosphoric acid, and 52·15 per cent. of lime. In one of these nodules there were embedded two Lamna teeth, similar to those dredged in large numbers from the greater depths of the Pacific. It is, however, interesting to note that in the shark's teeth embedded in these phosphatic nodules the cartilaginous base is preserved, as in the specimens from the Tertiary deposits

* Agassiz, 'Three Cruises of the *Blake*,' vol. i. pp. 275–276 (*Bull. Mus. Comp. Zoöl.*, vol. xiv.). 1888.

BRITISH LIBRARY

and elsewhere, while in the specimens from the deep sea this base is never present; only the hard shell of dentine remains.*

The long lines of phosphatic nodules which occur, for instance, in the calcareous Miocene and Oligocene beds of the island of Malta† thus possibly indicate the occasional destruction of a large amount of animal life in the surface waters of the Tertiary ocean, owing to changes of temperature, although it might also be due to changes of salinity and other causes.

On the Agulhas bank, the *Challenger* and the *Gazelle* met with very characteristic glauconite deposits in depths between 100 and 150 fathoms, and the phosphatic nodules in these deposits were of a dark-green colour. An analysis of the *Challenger* material gave 19·96 per cent. of phosphoric acid, and 39·41 per cent. of lime; and an analysis of the *Gazelle* material gave 38·88 per cent. of phosphate of lime. In the same region the *Challenger* dredged similar nodules of a lighter colour in 1900 fathoms. It is probable that the phosphate in these nodules was ultimately derived from the fish and other animals killed at the surface, and in shallow depths, by sudden changes in the temperature conditions, this being one of the areas of wide range indicated on the accompanying map.

Still another effect produced in the deposits by sudden changes of temperature at the surface is that the deposits of Globigerina Ooze appear to be much purer beneath those areas where currents from different sources meet at the surface, especially far from coasts. This, in all probability, arises from the more abundant destruction of these pelagic Foraminifera in such situations than in other areas with a more constant temperature. The rain of the carbonate of lime shells would be more rapid and constant, and consequently they would bulk more largely in the formation of the deposit compared with the inorganic materials which are usually present. In this way there may possibly be a more rapid formation of deposits beneath areas with a large annual range than at other places.

It has already been stated that the circum-equatorial zone, with a high temperature and small range, includes the typical coral-reef regions of the world. In the tropical surface waters there is a great development of organisms which secrete carbonate of lime, such as pelagic molluscs and Foraminifera, coccospheres and rhabdospheres, and in the shallow depths around the shores organisms with massive carbonate of lime shells and skeletons are abundant, such as corals, decapod crustaceans, and a great variety of molluscs and calcareous algæ. As we proceed to the colder waters of the north and south the organisms

BRITISH LIBRARY

with massive shells gradually disappear, or are represented by small dwarfed species. In the cold polar waters the predominant animals belong to the hydroida, holothurioidea, annelida, amphipoda, isopoda, and tunicata, in which there is a feeble development of carbonate of lime.

The secretion by calcareous organisms of the practically insoluble carbonate of lime from the soluble sulphate of lime in sea-water can scarcely be regarded as wholly a direct life process, in so far as it is capable of proof that the reaction results from the decomposition of the calcium sulphate by ammonium or methylamine carbonate, secreted by these organisms in place of urea, as in the Mammalia. Of course, in lime-secreting animals the metabolism gives rise to the formation of either ammonium or methylamine carbonate, or other nitrogenous bodies which quickly decompose and yield ammonium carbonate. It is the waste or effete products of the animal itself which become the sole factor in the building up of the structures known as coral and shell. This point has been satisfactorily investigated by the experiments made by Murray and Irvine at the Granton Marine Station. With regard to the condition of the carbonate of lime so formed, it is an interesting and important fact that it is modified in an extraordinary degree by differences of temperature. For example, if, in imitation of nature, we add to sea-water neutral ammonium or methylamine carbonate in the proportion which will decompose the calcium sulphate present, and expose one portion of the mixture to a temperature of 80° Fahr., so as to represent the heat of equatorial waters, and expose another portion of the mixture to a temperature of 45° Fahr., so as to represent the cold zones of the sea, we find that in the warm water the separation of carbonate of lime begins almost at once, and takes the aragonitic form, whereas in the cold water it begins only after the lapse of a few hours, and is precipitated as well-defined rhombohedral crystals, similar to crystals of calcspar, so that in eight hours the amount of carbonate of lime thrown out of solution in the warm water is about twelve times that in the cold water. When we take into account the increased metabolism of organisms living in water at a temperature of 80° to 90° Fahr., as against the decreased metabolism of those living in colder waters, the abundant secretion of carbonate of lime which takes place in tropical waters, as compared with that in the cold waters of the arctic and antarctic regions, is readily explained. Another interesting circumstance is the greater solubility of lime and some of its salts in cold than in hot water, which fact assists in explaining the increase of calcareous deposition in warm seas over that known to take place in colder regions.*

BRITISH LIBRARY

In those areas where the ocean is occupied by a warm current at one season, and by a cold current at another season, a periodicity can be observed in the deposition of the carbonate of lime in the shells and other calcareous structures of marine organisms, as well as in reproduction. On the other hand, in the polar and equatorial zones, where there is a small range of temperature, periodicity in the deposition of carbonate of lime, or in reproduction, is absent or difficult to recognize.

This comparative absence of massive carbonate of lime shells and corals in the polar waters, when compared with the abundance of these lime-secreting organisms in tropical waters, produces a general resemblance between the marine faunas and floras of the north polar and south polar regions, which is very striking, although this resemblance might have been anticipated from the similarity in the physical conditions, which, with reference to temperature range, is shown on the accompanying map. The resemblance here referred to in the animals of the two polar areas extends frequently to cases of specific and generic identity, the species and genera not now being found in the intermediate tropical area.

In the year 1841, Sir James Clark Ross dredged off the antarctic continent species of animals which he recognized as the same as he had been in the habit of dredging in equally high northern latitudes, and he suggested that they might have passed from one pole to the other by way of the cold water of the deep sea.

When the *Challenger* first reached the great southern ocean, the naturalists of the expedition were much struck with the general likeness of a large number of the organisms captured in the tow nets and trawls to those found on the coasts of Europe and North America. In the reports containing the detailed descriptions of species, the specialists frequently call attention to identical, or nearly identical, species from high southern and high northern latitudes, which appear to be entirely unrepresented in the intervening tropical zones. In many cases, for instance, they have been unable to detect any important differences between specimens from Kerguelen and the coasts of Great Britain, although, from purely geographical considerations, they have given a new specific name to the southern specimens.*

* Thus Stebbing describes a new species from the Southern ocean (*Amphilochus marionis*) which has a great resemblance to *Amphilochus tenuimanus* of European seas, remarking that "altogether the sum of the differences, added to the great distance between the localities at which the specimens occur, makes it unsafe to place the northern and southern examples in one and the same species" (*Zool. Chall. Exp.*, pt. 67, p. 746). Again, Smith describes a new species from the Kerguelen region (*Thracia meridionalis*), which, he says, "is the southern representative of the Greenlandic species, *Thracia truncata*, and, indeed, differs so slightly from it that it is with considerable hesitation I venture to describe it as distinct, being mainly influenced to do so by the difference of locality" (*Zool. Chall. Exp.*, pt. 35, p. 69).

Ortmann, speaking of the Decapod Crustacea, says: "Nach dem Stande unserer jetzigen Kenntniss ist *Keine einzige bipolare Art bekannt*" (Ortmann, *Zoologischen*

Dr. Günther says the most striking character in the distribution of the shore-fishes of the southern temperate zone is the reappearance of types inhabiting the corresponding latitudes of the northern hemisphere, and not found in the intervening tropical zone. This interruption of the continuity in the geographical distribution of shore-fishes is exemplified by species as well as genera; for instance, *Chimæra monstrosa*, *Galeus canis*, *Acanthias vulgaris*, *Acanthias blainvillii*, *Rhina squatina*, *Zeus faber*, *Lophius piscatorius*, *Centriscus scolopax*, *Engraulis encrasicholus*, *Clupea sprattus*, *Conger vulgaris*. Instances of genera are still more numerous: *Cestracion*, *Spinax*, *Pristiophorus*, *Raja*; *Callianthias*, *Polyprion*, *Histiopterus*, *Cantharus*, *Box*, *Girella*, *Pagellus*, *Chilodactylus*, *Sebastes*, *Aploactis*, *Agonus*, *Lepidopus*, *Cyttus*, *Psychrolutidæ*, *Notacanthus*; *Lycodes*, *Merluccius*, *Lotella*, *Phycis*, *Motella*; *Aulopus*; *Urocampus*, *Solenognathus*; *Myxine*.

Many hypotheses have been advanced to account for this bipolarity in the distribution of marine organisms, and altogether the subject is a most interesting one, which will be discussed with greater detail in another communication.

Before the reading of the paper, the PRESIDENT said: I have to welcome here again Dr. John Murray. I may as well mention that the Royal Society last week had a very important meeting, when Dr. Murray read another most interesting paper on the Importance of the Results of Antarctic Exploration, and it was followed by a discussion of great importance and considerable weight, judging from the positions of those who took part in it, and which I believe and hope will have some effect on public opinion. I am sure the meeting will also welcome very heartily the presence this evening of a gallant companion of Dr. Nansen, Lieut. Johansen. He is only here for a few days amongst us, and we are delighted to see him.

After the reading of the paper, the following discussion took place:—

Admiral Sir WM. WHARTON: I suppose the President has called upon me because I have to do with the sea; but my line of investigation is very considerably different from that of Dr. Murray. What Dr. Murray does he does very well,

---

Jahrbüchern, Abth. f. Syst., etc., Bd. ix. p. 585, 1896). Henderson, in his report on the *Challenger* Anomura, in describing *Lithodes murrayi* from the Kerguelen region, says it "is apparently most closely allied to *Lithodes maia*" (from the North Atlantic), "but the latter species is of large size, and the spines on the carapace are more numerous and more uniformly equal in size" (Henderson, *Zool. Chall. Exp.*, pt. 69, p. 44). Henderson writes me that these very slight differences were the only ones he could detect, and it seems evident that had the two specimens been taken from the same haul of the trawl, or from the same locality, they would never have been erected into two distinct species. Henderson writes me further that throughout the entire range of Crustacea there is no better illustration of bipolarity than that furnished by the Lithodidæ. *See* Chun, 'Die Beziehungen zwischen dem arktischen und antarktischen Plankton.' and he has given us a most admirable lecture to-night. He has certainly enlarged my ideas very much on the effect of the changes of temperature in the water. He has done what has not been done before—constructed this map from extreme ranges. It has been taken in some cases from a small number of observations, but probably represents the main facts. He has shown us what a great effect these changes of temperature may have on life, and he has referred also to the great effect it has on meteorological conditions—the formation of cyclones. It has been well known for a long time that the great birthplace of gales are those areas that he has pointed out, where the changes of temperature are the greatest. I am not at all prepared to follow him in his speculations as to how the animals who live in the arctic and antarctic regions have managed to change their localities; but I think he has given us very good proof that the animals are practically identical, and the question of how that has come about, I suppose, will not be solved quite yet. It is a matter for further investigation. I do not think I shall add anything to your knowledge if I say anything more.

Dr. Buchan: In this communication Dr. Murray has made a notable advance in oceanography. Several attempts have been previously made to show the range of the surface temperature of the ocean. But all these attempts have been simply to represent the difference in temperature between February and August, the coldest and warmest months respectively. It is, however, evident that such a range-temperature map of the surface waters of the oceans of the globe is singularly defective in showing the influence of temperature-changes on the living creatures with which the ocean everywhere teems. To do this it is altogether essential to reveal the absolute extremes of temperature to which these living creatures are exposed in the course of years. This is the problem which Dr. Murray has for years resolutely faced, and the map now hanging on the wall is the outcome of this great undertaking. It shows the difference between the absolutely highest and the absolutely lowest temperatures hitherto observed in each 2° square of the ocean, and the Royal Geographical Society is to be congratulated as being the medium of communicating this important investigation to the scientific world, which has been successfully carried out at no inconsiderable labour, time, and expense.

Mr. W. Leighton Jordan: What we have just heard from Dr. Murray evidently forms an admirable basis for a general discussion on the subject, and that has never yet been held since the *Challenger* returned, so I would suggest that the meeting be adjourned; we need not necessarily meet here, but I move that the meeting be adjourned in order that the discussion may be continued. It is too late now to have the discussion.

Dr. Murray: I should not be able to be present; I shall have to return to Scotland within two days.

Mr. Leighton Jordan: I am afraid it is rather late to start a discussion now—ten o'clock.

Dr. Mill: My only claim to speak is that, of all those in this audience, I am, perhaps, the one who has most enjoyed to-night's meeting. I have been associated with Dr. Murray for several years in practical oceanographical work, and it has been a wonder to me to see the way in which he has been able to fix upon those facts that were capable of the widest possible application, and to pass by others that were merely local. In his paper to-night he has brought up a wealth of material suitable for discussion, but unfortunately there are very few—in fact, I feel there is no one—fully capable of discussing this question at the present time except Dr. Murray himself. That is one of the reasons why it is so desirable that we should have some more information, such as a new oceanographical expedition

would collect. Then other people would have an opportunity of knowing something, and possibly of challenging Dr. Murray's opinions in consequence of the acquisition of fresh data.

Mr. GEORGE MURRAY: I can amply confirm the conclusion that Dr. Murray has arrived at with regard to bipolarity of organisms so far as they are concerned with the flora, both the littoral flora (those organisms that we call seaweeds) and also those that live far away from land. There is no doubt this bipolarity is especially striking in these organisms that live far away from land. Quite recently, however, with the help of Miss Barton, I made a minute examination of all the known littoral seaweeds in the arctic and antarctic regions, and we found a very high percentage of species in common; but this, however, is nothing to the community of *type* that exists among those minute organisms that live in the ocean. For example, the polar regions north and south are inhabited characteristically in the open ocean by diatoms, the temperate seas by Peridinieæ and coccospheres, and the tropics by Peridinieæ, coccospheres, rhabdospheres, and other forms. Now, I had my conclusions (which were very likely somewhat cut and dry) a little upset last summer. You know the diatoms are characteristic of the polar sea, and find their finest development there, but yet they are always more abundant near land than they are in the open ocean; in fact, by the use of a tow-net and a microscope, you would know almost as well as with a Thomson sounder when you are coming near land by the increase of the diatoms you get in your tow-net. I found in a traverse of the Atlantic that I made last summer, and from observations made for me for a whole year between the Channel and the Caribbean sea by officers of the Royal Mail Steam Packet Company—I found from those observations that there were very few diatoms as soon as we got away from land, but when we got close to Barbados we got more, and rather more again in the Caribbean sea, and when we got to Panama we got an extraordinary number. The diatoms are abundant in Colon bay from August to February, from the two extremes of temperature (there is very little range of temperature there—from 81° to 83°), and I venture to say they are quite as abundant there as they are in the arctic regions, or as they are in Loch Fyne, which, I believe, holds the record for diatoms in the number to the cubic inch, if I may put it that way. I should like to get an explanation from Dr. Murray; I should like to know whether temperature alone has much to do with this. It is quite true that in a place like Colon bay we have a very stable temperature, just as in the arctic and antarctic we have a very stable temperature. I must say the species we found in Colon bay were inseparable from the species we found in Loch Fyne. I should like to know whether the chemical constitution of the water has not something to do with this. One is rather apt to suspect this from the fact that diatoms are so abundant near land. I should like to know if these other factors have not something to do with this question of distribution, I mean besides temperature. I do not yield even to Dr. Mill in my estimate of the value of the facts brought before us by Dr. Murray; but I do plead for other factors besides temperature being taken into consideration, especially in dealing with such highly complex things as living organisms.

Dr. GREGORY: I am glad of the opportunity as a biologist of expressing gratitude to Dr. Murray for this brilliantly original and suggestive paper, for it is on the researches of physicists that the biologists must rely for the explanation of the riddles of biological distribution. There are many points in the paper, I think, that will help biologists to explain some of those difficulties. During the last few years there has been a strong tendency to attribute all deposition of carbonate of lime from the sea to the direct action of life, but Dr. Murray's experiment of the precipitation of carbonate of lime from sea-water by the addition of ammonium

BRITISH LIBRARY

carbonate may account for that inorganic precipitation of carbonate of lime which the microscope shows must take place. There were one or two points in which one could doubt whether Dr. Murray's explanations are of universal application. For example, with regard to the secretion of carbonate of lime either as calcite or as arragonite. We know that among mollusca living together on the same banks, some have shells of calcite and others of arragonite. In conclusion, I can only repeat my gratitude to Dr. Murray for this extremely suggestive paper.

Dr. MURRAY: I think that pelagic organisms which secrete silica are most abundant in those parts of the ocean where there is clayey matter in suspension, as in the arctic and antarctic seas, and in the West Pacific and off the mouths of large rivers. This, it seems to me, is more important than the temperature of the water. In discussing the causes which have led to a similarity in the fauna and flora of the two polar oceans, I may possibly have been rather speculative, and have given my imagination too much rein. The interest of the subject must be my excuse.

The PRESIDENT: I am sure we are all very glad that Dr. Murray has given his imagination a little rein, but you must also have been impressed with the enormous labour that he undertook and has completed in giving the maximum and minimum ranges of temperature of the surface of the ocean all over the world in 2° squares. It represents a great amount of labour, and from what we have heard to-night we know that it has not been labour in vain; that it has led to most interesting conclusions, and has shown the connection that exists between physical phenomena and biological phenomena, and we can have no doubt that Dr. Murray's most valuable chart will be permanently useful in the study of meteorology and of geographical distribution. I have, therefore, every confidence that the vote of thanks I now offer to Dr. Murray will be passed with acclamation.

AN EXPLORATION IN 1897 OF SOME OF THE GLACIERS OF SPITSBERGEN.*

By Sir W. MARTIN CONWAY.

LAST year (January 25) I had the honour of describing to this Society some of the results of an expedition which, in the year 1896, explored certain parts of the interior of the main island of Spitsbergen. Before that journey the interior was practically unknown. Monsieur Rabot had visited the Sassendal in 1892; and Herr Gustaf Nordenskiöld in 1890 had made the traverse over Torell glacier between two of the western bays, from Horn sound to the so-called Recherche bay of Bell sound. The result of our expedition was to show that a belt of the island bounded by Ice fjord on the north and Bell sound on the south, so far from being a region covered with ice, is practically open country, consisting of boggy hillsides and valleys, divided from one another by ranges of hills which have been carved out of a plateau. I was enabled to show, by examples, the various stages in the evolution of these hills, from their beginning in a plateau intersected by cañons to their final completion as sharp-edged, independent peaks. In no mountain region of

the world, known to me, can this evolution be so plainly traced as in Spitsbergen.

The expedition of 1897 was made by Mr. E. J. Garwood and myself, with the assistance of two Norwegian seamen, one of whom, Nielsen by name, was as serviceable to us as his fellow was obstructive. Our object was to investigate the interior of parts of the country believed to be covered by so-called "inland ice;" that is to say, by ice-sheets of the Greenland character. We accordingly chose two areas, to which, for convenience' sake, I have been obliged to give names. The first is the area bounded on the north by the bottom of Wijde bay and the Chydenius range of hills, on the east by the sea, on the south by Ice fjord and a line running from Temple bay across to Wiche bay, and on the west by Dickson bay; I have called this region Garwood Land, after my excellent travelling-companion. The second area is bounded by Ice fjord and Dickson bay on the east, by Foreland sound on the west. Its northern limit is approximately a line from the head of Cross bay to West fjord of Wijde bay. To this region, reviving the old English whalers' name for Spitsbergen, I have applied the designation King James Land. For the area between Ice fjord and Bell sound, explored in 1896, the name Adventure Land* is perhaps as suitable as any.

We landed at Advent bay on July 9. The little steamer that was to have met us had not arrived from Norway, so that we seemed to be stranded; but Dr. Lerner, who had taken the *Expres* for the summer, kindly offered to carry us across to Klass Billen bay. On the 10th we visited Skans bay. On the 11th, a fine day with a strong south wind, we rowed up Klaas Billen bay, little thinking that just then Andrée was ascending in his balloon from Danes gat. We landed at the foot of the Nordenskiöld glacier, dragged up our whale-boat, and pitched camp. Next day was wet; we spent it in making final preparations for an expedition up the glacier. Two sledges were loaded and dragged over a boggy and stony flat, and up a high steep moraine on to the ice. On the morning of the 13th we started up the glacier. It proved to be very much crevassed. Progress was slow and difficult. Camp was pitched about 700 feet above sea-level 3 miles inland, in the midst of a labyrinth of crevasses. On the 14th we completed the ascent of the crevassed area, and tugged on up steadily inclined snow-slopes. Fog enveloped us all the latter half of the march, and we had to steer by compass. Camp was pitched about 1500 feet above sea-level, on a little plateau at the east foot of a peak climbed by Baron de Geer in 1882. A howling storm

* In this case, as in others where new names are required, I endeavour to supply them, when possible, by reviving old names fallen into disuse or oblivion. Advent bay is a senseless abbreviation of the former name, Adventure bay. It was called Klaas Billen bay by the old Dutch whalers, but this name has been moved across Ice sound to another bay, to which it is now firmly attached.

BRITISH LIBRARY

imprisoned us in this camp for twenty-four hours. We employed the finer intervals in practising with *ski*, by aid of which the remainder of the inland journey had to be accomplished. A brief clearance enabling us to discover the best direction to take over the icy interior, we set forward again through the dense fog. Nothing was visible during the march. The snow was soft, the slope steady; the sledges travelled with difficulty. We camped again in the white wilderness. Next morning there was a short lifting of the fog, which permitted us to see westward for a few minutes, down a broad snowy valley to the line of hills that border Dickson bay on the east. The fog soon returned and blotted everything out. We marched on as before, to the north-east, with nothing visible in any direction. The slope at times steepened so much that we had to take on one sledge at a time, and then return for the other. Late in the day a howling storm burst upon us, and one of our Norwegian seamen broke down from cold, exposure, and fright. He refused to advance further, so camp had to be pitched. We were soon almost snowed under, the sledges being completely buried out of sight.

On the 18th Garwood and I left camp early in the continuing fog, and made a ski expedition to the east and north. On reaching the summit of a snowy dome, we came above the mist, and obtained a clear view to the east, where a broad glacier valley opened at our feet, leading away to the east, and then bending round south. Tributary valleys joined this one on the north. All across the north and east were plateau-fronts or bluffs of rock, with *névé* both below and above them. Garwood set forth down the valley to investigate the rocks of a nunatak; I went north up a higher snow-dome, from the summit of which I had an uninterrupted northward view. In that direction the snow-plateau continued for some distance, cut up by deep glacier valleys, beyond which were several higher mountains. Unfortunately, Wijde bay, all the hills round it, and all the region to the west of me, were buried in cloud. Late in the day we returned to camp, and found the sick man in a feeble condition. He urgently demanded to be taken back to the coast. Accordingly, we packed up camp, and set forth towards the south-east over the highest part of the snow-plateau.

The evening was most beautiful; the scenery superb. High above the clear air that surrounded us was a dark blue roof of cloud, resting on skyey walls of marvellous colours, with streaks of stratus across them, reflecting the golden sunlight. The sun itself was hidden in the north, but beneath it there hung a reticulated web, woven of gold and purple, through which the shafts of tender light drooped like eyelashes upon the snow. All around, the *névé* swept away in gentle curves and domes, greyish-white in some places with purple shadows, bluish-grey in others, here and there strewn with carpets of sunlight. The rocks, too, wherever they appeared, were rich in colour, showing their own ruddy

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [273v] (49/154)

or orange tints enforced by the lustrous atmosphere. There was none of the sharp contrast of black and white that strikes a superficial observer in high mountain views. This panorama was a glorious mass of colour, harmonious without rift, and rich without monotony. At midnight the cloud-roof opened in the north, and a flood of sunshine poured upon us. Camp was pitched just where the slope began to dip towards the head of the Nordenskiöld glacier.

Next day, in glorious weather, we descended to the foot of a mountain, the Terrier, on the left side of the Nordenskiöld glacier, opposite De Geer's peak. We meant to ascend it next day, but were prevented by regathered clouds. Some hours were accordingly passed investigating glacial phenomena in the neighbourhood, a curious long barrel-vault of ice, and a burst glacier lake which had distributed huge masses of ice over a square mile of glacier. On the 21st we rowed down Klaas Billen bay to the Goose islands, where we spent the night. Early on the 23rd we were back in Advent bay.

On the 24th we sailed in the small steamer *Kvik*, and landed next morning at the south-east angle of King's bay. Some time was spent making observations of the great King's glacier's terminal cliff, climbing a peak in the neighbourhood, and preparing for another journey inland. We started, with two new sledges, up the south side of the King's glacier on the morning of the 27th. For the first two days the humpy and crevassed ice and the great moraines caused us infinite labour. We thus gained the King's Highway, the great south-east tributary of the King's glacier. Here were several miles of water-sodden snow to be traversed, and several broad glacier rivers to be crossed. The third march brought us to near the watershed, and on the morning of the 30th we stood on the actual pass, and could see down the whole length of the glacier we had come up, and of another glacier in the opposite direction leading down to Ice fjord, beyond whose waters Advent bay was clearly visible. For the sake of a wider panorama, we climbed to the top of a neighbouring snowy hill (Highway dome, 3000 feet). The weather was fine, and the view most comprehensive. In all directions were a countless multitude of snowy hills, with a labyrinth of *névés* and glaciers amongst them. The remainder of the day was spent in surveying, the sun being painfully hot in the clear air.

Next day we went south over a snow pass, and down on to the *névé* of the next great glacier, which we supposed would likewise flow into Ice fjord. It is a very large glacier, but it bends round south and then south-west, and empties into the head of St. John's bay. Returning by the pass at the head of this glacier, we went down the southern branch of the Highway glacier, and rejoined our old tracks after a long march.

In the angle between the two great branches of King's glacier—Highway glacier and Crowns glacier—stands the fine mountain-group of the Crowns, well known to the old navigators from their

BRITISH LIBRARY

remarkable appearance as seen from King's bay. On August 1 we climbed to the top of a pass over a spur of this group, and next day descended to the left bank of the Crowns glacier, where we encamped at the foot of a dolomite peak, named Pretender (3480 feet), on which we did a day's scrambling, whilst the men returned to the coast for stores. August 4, we moved camp over difficult glacier as far as the foot of the Middle Crown. We climbed the peak (4000 feet), and had a remarkable view, embracing the enormous *névé* of the Crowns glacier, the Cross bay mountains beyond it, the great plateau at its head, cut up into *névé* valleys (like those in Garwood Land) draining south-east towards Ekman bay. South was the irregular mountain region of King James Land. Ice fiord was clear, with the hills of Adventure Land beyond it. In the remote distance we thought that we identified the towering wall of the Hornsunds Tinder.

On the 5th we made an 18-mile *ski* expedition over the *névé*, and climbed a higher peak of the same group, the Diadem (4150 feet). The view was similar to that from the Middle Crown, but more extensive to the north. We climbed the Middle Crown again on the 6th. The 7th and 8th were spent returning down difficult glaciers to our base camp by King's bay. Throughout the whole of this inland expedition we enjoyed the most perfect weather it is possible to imagine. The four days that followed were devoted to boat expeditions in King's bay, but the weather was foggy, and little surveying could be accomplished.

On the 13th we reached and finally quitted Advent bay. We steamed down the west coast, and were dropped in Horn sound on the 14th. Here a week was spent. There was only one fine day (the 18th), on which we climbed to the highest point of Mount Hedgehog, one of the Hornsunds Tinder, though unfortunately not quite the highest point of the range. Mount Hedgehog is the peak the ascent of which was attempted in thick weather by Mr. Garwood and Mr. Trevor Battye in 1896. They reached a high point on the side of the mountain, and then were compelled to descend. Fortune was kinder to us. There was a flat floor of cloud at a level of about 1000 feet, but above that all was clear, and we enjoyed a marvellous and most instructive view, which revealed the geography of all the south part of the island. On the 21st the steamer *Lofoten* called for us on its way to Norway. Landings were made at Bear island and the North cape. Thus an interesting expedition was brought to an agreeable conclusion.

Both Garwood Land and King James Land are described on the chart as covered with "inland ice." Now, if the phrase "inland ice" merely means glaciers, so that it may be correctly applied to the glaciers of any district of snow-mountains, such as the Alps or Caucasus, it is a useless phrase, and ought to be abolished. Most persons of whom I have inquired, receive from it a different impression, and judge it to be descriptive of a complete and continuous icy mantle enveloping a

BRITISH LIBRARY

whole country, as Greenland, for instance, is enveloped. The term is used in that sense in the English edition of Nansen's 'Greenland.' "Ice-sheet" is apparently a better descriptive term for such a mantle, and I shall accordingly so employ it. The term "inland ice," being essentially vague, should, I think, be erased from geographical literature, or used only as a non-committal descriptive term to designate the ice covering some unexplored region vaguely known to be glaciated. As long as a flowing body of land-ice is contained within definite watersheds and mountain ranges, it is a glacier and not an ice-sheet. The juxtaposition of no matter how many glaciers does not form an ice-sheet, but merely a glacial area. It is necessary to be thus particular in definition because, as I shall presently show, neither Garwood Land nor King James Land, nor any large part of Spitsbergen, except New Friesland and North-East Land, is covered by an ice-sheet. They are all merely glacial and mountain areas. The discovery of this fact is the principal geographical result of our second expedition. That it is a not unimportant result I now proceed to demonstrate.

The old theory that glaciers excavate their beds to any considerable extent is practically abandoned. Its supporters naturally considered that the larger the mass of ice the more vigorous would be its excavating action. A great arctic ice-sheet was considered to be an extraordinarily powerful excavator. We now know that moving land-ice does not so operate upon its bed, but, beyond polishing the surface of the rock it covers, and cutting down convex excrescences, has mainly a conservative effect upon it. In the case of a country, like the interior of Greenland, wholly buried under ice, the buried land-surface is being modelled to a very slight degree. On the other hand, in the case of a glacial region, where mountains rise above the mean level, and where rock-faces are exposed to the rapid denudation of all snowy regions, great developments of surface-formation are going forward. Under an ice-sheet, the forces acting on the land-surface are conservative; in the case of a glacial region, the acting forces are formative. Hence the immense importance of clearly distinguishing between these two types of ice-bearing country.

In the glacial regions of Spitsbergen are many cliffs of disintegrating rock, such as the one depicted in the accompanying photograph taken by Mr. Garwood on Highway Dome, where there is *névé* or glacier both above and below the cliff. In such a case the cliff, by the action of frost and aërial denudation, continually moves backward. Its exposed face is being constantly peeled off, and the *débris*, falling upon the glacier, is not suffered to accumulate and so to protect the base of the cliff, but is carried away. The cliff thus maintains its existence, but moves continuously backwards, just as the cliff retreats over which Niagara falls.

In the accompanying diagram (Fig. 2), the glacier DE has at its head such a cliff, CD. This cliff, therefore, steadily eats its way

BRITISH LIBRARY

backward, possibly enough becoming shorter and shorter in the process. As it moves backward, the catchment area of the glacier's snow-field increases, and the glacier therefore tends to advance at its snout. If CD were the face of a sufficiently thick mountain mass, it would gradually eat its way into that mass, till the precipice had, by continuously shortening, disappeared, and the slope of the glacier reached right up to the top of the mountain mass, as in Fig. 1.

But if CD is the face of a relatively thin rock ridge (as in Fig. 2), the glacier DE will eat its way through that ridge; and if, in the valley on the other side of that ridge, there be a big glacier whose direction of flow is at right angles to that of the glacier DE, the glacier DE,

FIG. 1.—SOUTH FACE OF HIGHWAY DOME.

when it has eaten back through the ridge BCD, will carry away the upper portion of the longitudinal glacier, draining it off down its own side valley, and will establish a col between the former head and the snout of the original longitudinal glacier.

In fact, in such a case it would happen with the glacial drainage as in the Himalayas and elsewhere it has happened with the rivers. When the great Asiatic plateau was elevated, whereof Tibet now alone remains in anything approximating to the original surface condition of the whole, the drainage ran off along the hollows in the line of the crinkling of the surface coinciding with the strike of the strata. Now, however, by the operation of rivers eating their way back into the plateau at right angles to the strike of

the strata, all the great rivers flow at right angles to their original direction. The Indus was originally a stream no bigger than the Swat river, flowing down the edge of the elevated region. It ate its way through the Nanga Parbat range into the depression which goes on to Gilgit, and thus robbed all the waters of the upper Indus of to-day, which in the remote past, I believe, discharged themselves (over a high

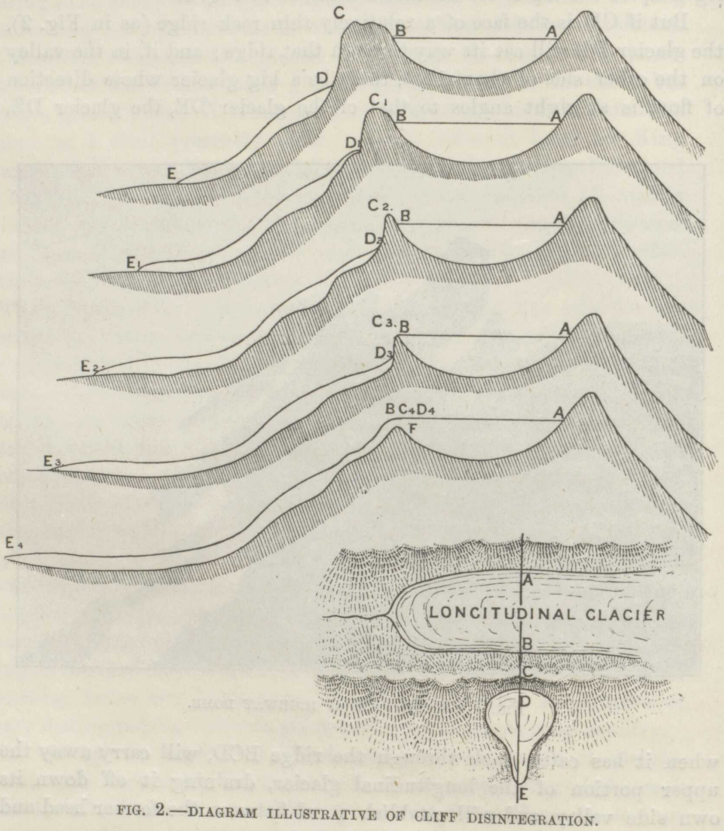

FIG. 2.—DIAGRAM ILLUSTRATIVE OF CLIFF DISINTEGRATION.

region since excavated into mountain ranges) into the Kunar river, and before that into the Oxus. Similarly, a branch of the Gilgit river has eaten back through the Rakipushi range and robbed the Hispar-Hunza river, and a branch of that has eaten back through the Boiohagurdoanas range, and is now cutting through to the Taghdumbash Pamir. It is worth notice that in each case the river has chosen the neighbourhood of the highest point of the range for its transverse gorge, not impro bably (as it seems to me) because there it had a glacier to help it as a

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [276r] (54/154)

BRITISH LIBRARY

carrying agent in cutting through the range. In the case of rivers, this eating-back process is well recognized and understood. I suggest that it is likewise true of glaciers, though of course the phrase "eating back" is used as descriptive of the effect produced, not of the glacier's action. The "eating back" is caused by aërial denudation, not by glacial erosion; but if the glacier were not there to carry away the *débris*, the processes of aërial denudation would be arrested by the accumulation of *débris*.

The best instance I can quote of what seems a clear case of one glacier robbing the *névé* basin of another is in the Karakoram mountains. There the Biafo glacier drains a great snow-field, which appears geographically to belong to the Hispar glacier. When the incredible rapidity of denudation in those regions is remembered, it seems far from impossible that the ridge which bounds the Hispar glacier on the south extended unbroken, and not so very long ago, across the Biafo glacier, and that the gap through which the Biafo glacier now draws off the snow-field behind, is only of recent formation.

Few persons, however, are familiar with the geography of this remote region; it seems, therefore, best to illustrate the theory above propounded, by some possible example nearer home. I cite, but with diffidence, two cases from the Alps, where it seems possible that well-known glaciers may have eaten back a gap through mountain ridges. In both cases, no doubt, the eating back may have been done by water; all that I assert is that, if not done by water, it would have been accomplished by the glaciers which exist on the spot.

My first example is taken from the Mont Blanc range.* I suggest that originally there may have been a glacier with its head near the present summit of Mont Blanc, having for its left bank a ridge (or plateau-edge) now represented by the Aiguille du Midi and other aiguilles, the Aiguille Verte, the Aiguille du Chardonnet, and the Aiguilles Dorées; whilst its right bank was approximately coincident with the modern watershed as far as Mont Dolent, except between Mont Blanc de Courmayeur and the Tour Ronde, where it has been broken away. This ancient drainage system has been broken down, and now the snows of the upper reservoirs are all discharged by such glaciers as the Mer de Glace or the Glacier d'Argentière, which cut across one or other of these old containing ridges or plateau-edges.

Thus too, I suggest, the Upper and Lower Grindelwald glaciers and the Rosenlaui glacier may have invaded the Oberland plateau and crept back into the heart of the mountain mass, isolating as high individual peaks the Wetterhorn and Schreckhorn. Originally they were mere "corrie glaciers," plastered on to the north face of the plateau—just such

* Herr Imfeld's new map is the only one on which this theory can be properly examined.

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [276v] (55/154)

glaciers, in fact, as the Guggi glacier, which lies in the hollow between the Jungfrau and the Mönch. They have crept farther back than it, because for some reason they had the better start, but the Guggi glacier now emulates their former vigorous initiative. The cliffs at its head are being continually broken and worn away by the action of frost. The rocks that fall from them either tumble on to the *névé*, and are carried down by it, or roll into the *bergschrund*, and so get under the ice, where no doubt they are ground to dust, and do some excavating in the process. That, however, can only be in the upper regions; lower down only the waters below the glacier excavate, but not the glacier itself, except, perhaps, at the edge of some subglacial cliff where an icefall is formed. In this way the rocks of the north face of the ridge between the Jungfrau and Mönch are being eaten away, and the ridge itself is not merely being lowered, but its crest is being pushed backward towards the south. Every yard of its movement is made at the expense of the Jungfrau glacier. Let the process go forward for a sufficiently long time, and the area now occupied by the upper basin of the Jungfrau glacier will be occupied by a snow-basin lying at a lower level, and draining northward down the Guggi glacier.

Similar, I suggest, may have been the development of what is now the Great Aletsch glacier. Originally, according to this theory, the Lötschen glacier stretched back to the Finsteraarhorn, and had for its left bank a ridge parallel to, but south of, the range of which the Aletschhorn is now the culminating point. The Aletsch glacier's original head was on the south face of this range, but the glacier ate its way backwards, its head advanced to the north, finally broke its way right through the range and drew off a portion of the ice of the Lötschen glacier.* The snout of the Lötschen glacier was thus disconnected from its former *névé*, and a pass (the Lötschenlücke) was formed between them. The *névé*, at what is now called the Place de la Concorde, flowed as a great icefall over the remnant of the old left bank of the original glacier. It no doubt deepened and widened the breach, and as it did so lowered the level of the snow in the upper reservoir, whose various branches were thus enabled, each in its place, to creep backwards also at the expense of the plateau. Thus were formed the Ewig Schnee Feld, the Jungfrau Firn, and the other *névé* tributaries of the present great glacier. The great icefall gradually diminished in turbulence as the cliff beneath it was broken and rounded away, till now it is merely represented by the crevassed area just below the Concordia Hut.

Whether, in fact, the processes thus suggested took place, or whether water-action forestalled the glaciers by cutting through the ridges in days anterior to the glaciation of the Alps, I am not authority to pronounce. But the position that I do maintain is this—that glaciers

* The Walliser Viescher glacier was similarly employed.

BRITISH LIBRARY

would have cut back and produced the mountain and valley forms that we see in these cases, if water did not anticipate them. That glaciers do not excavate their beds to any considerable extent is now practically admitted; but that, by acting as carrying agents, they eat back into the mountain-masses they drain, and thus perform a great function in the processes which go to the shaping of mountains, is a fact which I think has not been sufficiently emphasized. It follows that the distinction I have endeavoured to make between an ice-sheet and a congeries of glaciers is a distinction of the first importance; for under an ice-sheet none of the processes are going forward which are vigorously proceeding in a glacial region. The old idea of Spitsbergen was that its interior consisted of a great ice-sheet, fringed at the edge by a number of boggy valleys and green hillsides. Our explorations have shown the utter falsity of this conception.

Whether at one time the whole island was enveloped in an ice-sheet which was gradually withdrawn from the west towards the east, or whether the west part of the island has merely been longer raised above the sea than the east part, I do not attempt to determine. The fact, at any rate, seems to be that the forces of denudation have been longer at work, or, at any rate, more vigorously at work, all down the west part of the island, and that the resulting mountain formation is most developed in the west, and becomes continually less developed as you proceed toward the east. All down the western region you find highly specialized mountain-forms—peaks and ranges of considerable abruptness and marked individuality. As you advance eastward the mountains become generally more rounded, till the original plateau-form, and even parts of the undenuded plateau itself, are encountered.

Bearing in mind this general structure of the land-surface, it will now be easy to describe the character of different parts of the main island. The whole of the north coast, as might be expected, bears evidence of a more rigorous climate than districts further south. This was specially noticed by us when proceeding down Wijde bay, at whose mouth the snow lay down to sea-level in the month of August, whilst, 20 miles in, the snow-line was almost 1000 feet above sea-level. The northern rim, therefore, may be regarded as a separate geographical division. At the north-west angle of the island is a region of very bold mountains and large glaciers. It is well represented by the beautiful and often described Magdalena bay. Nothing is known about the interior south-east of it, but some old Dutch charts mark a valley leading from the east side of Mauritius bay up to a sequestered lake in the hills. Whether the draughtsman intended his winding valley and river to represent a glacier and the lake a snow-field, or whether a true lake and river existed here in the eighteenth century, can only be settled by an examination of the ground.

Passing southward down the west coast, we come to the seven parallel

BRITISH LIBRARY

glaciers ending in the sea, known to the whalers as the Seven Icebergs. These all appear to flow down from a high common snow-field which stretches east toward Wood bay and south almost to the head of Cross bay. South-eastward this high plateau is broken by a series of *névé*-valleys, the chief of which discharge themselves towards Ekman and Dickson bays. Their general direction is south-south-east. South of this plateau region comes the mountainous area of King James Land, whose character is shown on the accompanying map. The main watershed here runs north and south. A series of parallel glaciers drain south-south-east from it to Ice fjord. The valley system on the west is less regular, but the glaciers are equally numerous and fine.

The deep north-and-south depression filled by Wijde bay and Dickson bay is bordered on the west by a range of mountains, a group of which intrude between and divide the bays. Some of these are of striking form, but no one has ever been amongst them or accurately determined their position. East of the two bays comes the plateau region. Its edge is cut up by a few deep valleys, down which the ice-sheet of New Friesland sends glacial tongues to Wijde bay, but east of Dickson bay the marginal valleys are longer, and no glaciers come very far down them. The portion of the plateau between Dickson and Klaas Billen bays is a good deal cut up by deep valleys, such as the Rendal, the Skans valley, and the Mimesdal (all well known to geologists), but there are no large glaciers found upon it. Further east comes a great glaciated area approximating in appearance to an ice-sheet, but with many exposed faces and peaks of rock. From it several large glaciers flow into the sea, namely, the glacier that ends in the head of East fjord of Wijde bay, the glacier that fills a wide valley debouching into Hinloopen strait opposite the South Waiigat islands, some more glaciers that empty into Bismarck strait and that neighbourhood, the series of great glaciers at the head of Wybe Jans water, and the Nordenskiöld glacier (specially explored by us) near the head of Klaas Billen bay. All these glaciers are divided from one another by more or less well-marked watersheds.

The neck of Spitsbergen, which may be defined as bounded on the north by a line from the mouth of Nordenskiöld glacier to Wiche bay, and on the south by the Sassendal and the depression across to Agardh bay, is a district that would well repay exploration, and is easily accessible from the Post glacier at the head of Temple bay. Nowhere are the phenomena of mountain formation by plateau degradation under the action of rivers and glaciers better illustrated than here. In the east there are the remains of an ice-sheet; in the west there are deep and wide glacier and river valleys. Between the two are many mountain ranges, and some peaks of considerable height and abruptness.

A line drawn from the head of Van Keulen (Saardam) bay to Whales bay forms the southern limit of the next region to the south—the region that I call Adventure land. It is a country of boggy valleys, rounded

BRITISH LIBRARY

hills, and relatively small glaciers. Originally it was one large plateau, formed of soft, almost horizontally bedded rock, except along its west margin. It has therefore been penetrated by wide valleys radiating in all directions and cut down almost to sea-level. A range of rather fine peaks lies along the west coast, and behind that are some large glaciers descending north into Green harbour and south to the mouth of Low sound. Then the undulating country begins. Several valleys lead inland from Coles bay, whilst from Advent bay starts the Advent dale with its many branches. From Low sound a series of boggy valleys strike in to north and south. At the north angle of its head opens the deep valley of the Shallow river (after the Sassendal the largest valley in Spitsbergen), whose upper part has never been explored. The eastward prolongation of Low sound, which was known to the Dutch as Michiel Rinders bay, is very poorly charted, but we know that at its north angle there is a secluded inner harbour, with a big ramifying valley leading back from it, whilst at its extreme east corner three large glaciers debouch together, one of which probably connects by a high snow-field with the head of Strong glacier descending to Whales bay.

Last comes the south division of the island, over which we had a panoramic view in 1897 from the summit of Mount Hedgehog, one of the Hornsunds Tinder. Unfortunately a roof of cloud covered the glaciers, and we could only see the tops of the mountains rising clear above it. The north-west angle of this region was explored in 1897 by Mr. Victor Gatty, who found it to consist of a ring of snowy mountains surrounding the *névé* of the Fox glacier, which discharges into the so-called Recherche bay. A gap or col, south-east of Dunder bay, separates this group from a range of hills running for some distance south along the coast, and called Roebuck Land. The extremity of these hills abut against the right foot of Torell glacier, one upper bay of which rests against the hills immediately south of Recherche bay, whilst another stretches inland to the east, as far as the main watershed of the island. There are one or two other approximately north and south ranges of hills lying west of this watershed. East of it the plateau-character resumes its predominance. The southernmost part of the island, south of Horn sound, is dignified by the boldest mountain range in the country, that of the Hornsunds Tinder, which lie west of the watershed, and run almost due north and south. East of them are at least two lower parallel ranges, beyond which the ice-covered country seems to dip to the sea.

Of the other islands in the Spitsbergen group, North-East Land is the largest. It is known, from Baron Nordenskiöld's exploration, to be covered with a true ice-sheet, the edge of which descends to the sea all along the south-east coast. The north coast and the small islands off it altogether resemble the northern belt of the west island. The west belt

Qatar National Library

is a low undulating region, from which the ice-sheet has retreated in relatively recent times.

South of North-East Land are two islands, now generally known as Swedish Foreland and King Carl island. These were the "high land," discovered by Giles and Reps in 1707, when they circumnavigated North-East Land, and returned northward by way of Hinloopen strait.* It has generally been supposed that the Wiche Land of Captain Edge was the same pair of islands, but I think that this was not the case. In the years 1616 and 1617 explorations were made to the eastward of Spitsbergen on behalf of the Muscovy Company. Their results are only recorded on Thomas Edge's map, printed in Purchas, and again in Pellham's 'God's Power and Providence,' etc. (of 1631). Edge states (in Purchas) that, in 1617, a ship of sixty tons, with a crew of twenty men, "discovered to the eastward of Greenland [= Spitsbergen] as farre to the northwards as 79 degrees, and an iland which he named Wiches iland,† and divers other ilands." From the map, it is clear that both coasts of Wybe Jans water, right up to its northern extremity,‡ were explored, as well as the north-east coast of Edge Island; but that the eastern extremity of the latter was not reached, still less turned. In fact, the exploration did not extend to any part of the sea east of Edge island. A landing was certainly made on Barents island, for reindeer are marked on it. Doubtless some high point was climbed there on a clear day, and the southern mouth of Hinloopen strait was seen and the extremity of North-East Land, which is marked on the map, "Sir Thomas Smyths Iland." From the same point, no doubt, Swedish Foreland might have been seen, but, if it had been, it could not possibly have been marked as a long north and south coast-line lying between about lat. 76° and 78°, but must have been placed in or above lat. 79°. The *Wiches Lande* of Edge's map, therefore, was not seen from a hill on Barents island; nor was it seen from the sea east of Edge island. But, if seen at all, it must have been seen from some point of land or sea depicted on that map. It was not seen from a hill on Barents island; neither was it seen from the sea east of Edge island, and *à fortiori* not from the sea east of Barents island. Hence it cannot be the same as King Carl's island and Swedish Foreland. In fact, it corresponds to no existing land at all, and doubtless merely represents some bank of fog or other deceptive atmospheric phenomenon.

I have never landed in Barents or Edge islands, though I have seen both from east and from west. Neither possesses an ice-sheet. Both

* See the great chart, "Nieuwe afteekening van het Eyland Spitsbergen op gegeven door de Commandeurs Giles en Outger Rep en in't ligt gebraght en uyt gegeven door Gerard van Keulen Boek en Zeekaart verkooper aan de Nieuwen brug met Previlegie voor 15 Jaaren."

† After Richard Wiche, a governor of the Moscovy Company.

‡ Which is in 78° 40′, but is marked by Edge as extending to about 79° 15′.

NORTHWARD
OVER THE GREAT ICE

BY

ROBERT E. PEARY

CIVIL ENGINEER, U.S.N.

MESSRS METHUEN have much pleasure in announcing that they will very shortly publish the above important work. It will contain the narrative of Lieut. Peary's seven expeditions in the years 1886 and 1891-1897, and its publication at the present moment is particularly interesting in view of the author's forthcoming attempt to reach the North Pole.

That he is likely to succeed in this hitherto impossible task seems probable, and experts of the highest authority have declared that his plans are more practical than those of any other explorer. Dr Nansen has just stated that if anybody reaches the Pole it will be Peary, and he believes that he will succeed.

Mr Peary has lately delivered a lecture before the Royal Geographical Society, and all who heard

him declared that the lecture was the most interesting one delivered there within the memory of living man. The Council has recently awarded him one of its Gold Medals for his extraordinary sledge journey. His brilliant success has roused the greatest enthusiasm and the warmest interest both in this book and in the perilous task which he will undertake in June.

The publishers believe that "Northward" may be worthily compared with Dr Nansen's well-known book, both in value and in interest. But in substance it will differ from it, for, while Nansen traversed the sea, Peary passed over the ice and snow, climbing over the dreaded Ice Cap at an elevation of thousands of feet above the sea level, discovering and mapping Northern Greenland in different expeditions covering long periods of time.

The narrative abounds in infinite variety, dealing as it does with perils on land and sea, terrific snow storms, and the pursuit of big game on water and land, while the explorer has collected a mass of interesting information regarding the strange people with whom he lived so long, the Arctic Highlanders, who live further north than all other human beings.

The book will be produced with great care, in two volumes of over 600 pages each. It will contain about 800 illustrations, 100 of which are full-page ones, together with a large number of maps and diagrams. It is printed in large readable type.

On the next page will be found Lieut. Peary's Preface, which describes the scope and contents of his book.

BRITISH LIBRARY

PREFACE

THIS narrative has been written to supply a complete authentic record of my Arctic work,—a record which I owed it to my family, my friends, and myself, to put in permanent form. It is my first and only book, and it covers all my Arctic work.

It contains the cream of my Arctic material, literary and pictorial. The reader will find no padding. My constant aim has been condensation. The reader will find neither résumés of previous work, nor constant reference to other explorers. This is not because I do not appreciate their magnificent achievements, and have not profited by the experience of Kane, Hayes, Hall, Greeley, Melville, and the long list of my gallant countrymen, as well as those of other[1] countries, my predecessors, but because I have no room or right to rehash their experiences and results. The interested reader can go to their original narratives, and there learn, in their own words, as much or as little of their work as he pleases. As to constant comparisons with the work of others, the cursory reader will not care for these. The specialist can make them himself.

The constant incentive in my work has been an ineradicable feeling that I saw something before me

[1] Lest my omission of the name of Nansen should give rise to erroneous impressions, it is to be borne in mind that though Nansen's books precede this narrative my *work* antedates his.

worthy and possible of accomplishment, and that I could never have content until it was done, or I had satisfied myself that I was not the one to do it.

While it is hoped the narrative itself will not be lacking in attractiveness, yet I feel, outside of this, that it and the accurate and profuse illustrations, most of which are not only "pictures," but typical studies of the features and objects which they represent, will prove of pronounced educational value in showing what the Arctic regions, with their inhabitants and the phases of life there, are really like.

While I have endeavoured in these pages to carefully sum up the general aspects and results of my work, I desire it to be clearly understood that I have made no attempt to have the data I accumulated set forth with scientific fulness and detail.

It has been my aim to make this book worthy of, and adapted for, the most general reading, yet at the same time, to give it a character that may, I trust, secure for it the attention of Arctic students and scientific specialists.

My expeditions have gathered valuable scientific material in ethnology, meteorology, geography, and natural history. This material has not as yet been digested and collated by experts. When it has, it will be presented in monograph form.

Dependent upon the results of my coming expedition, this book will clear the field for something further, or will form the complete record of my Arctic work.

R. E. PEARY

are practically devoid of glaciers down their west coast, and have large glaciers in the east. The whole of the south-east of Edge island is occupied by a great glacier ending in the sea. Barents Land has several sharply pointed peaks, but the Edge island hills are mainly flat-topped, like those along the east coast of the main island.

Prince Charles Foreland now alone remains to be considered. It is very badly represented on the existing chart. At its southern extremity is an isolated hill. Then comes a very flat plain of about 50 square miles, raised but a few feet above sea-level. Next comes a mountain range consisting of fine, sharp snow-peaks. It is cut off on the north by a deep depression, running in a south-west direction from Seehonde bay, which, though marked south of St. John's bay on the chart, lies some miles north of it. North of Seehonde bay and valley the mountain range is continued, but the peaks, though fine in form, are not so high as those of the south group, but they send down eastward an almost uninterrupted series of glaciers into Foreland sound. Further north are yet lower snowy hills, which end in the bold headland called Bird's cape or Fair Foreland.

Before the reading of the paper, the CHAIRMAN (Sir Charles Wilson, Vice-President) said: I am sorry to say that our President is confined to his house by a bad cold, and he begged me to make his excuses for not being here this evening.

Sir Martin Conway is so well known to you all, that it is quite unnecessary for me to say any words of introduction, and I will ask him at once to commence his lecture on "An Exploration in 1897 of some of the Glaciers of Spitsbergen," which I am sure will be very interesting.

After the reading of the paper, the following discussion took place:—

The CHAIRMAN: There are several gentlemen here who I think we should like to hear this evening, and I will first of all call upon Mr. Garwood, who was with Sir Martin Conway in his last expedition.

Mr. E. J. GARWOOD: In deference to the request of our Chairman, I rise to say a few words, although I am afraid the time is getting late. I must ask you to make allowance for my feelings, labouring as I am under the novel sensation of possessing, for the first time in my life, some real territory of my own. Having been told before the meeting that you might like to hear a word or two about the geological features of the country which we explored this year, I have purloined one or two of my slides from Sir Martin's box with which to illustrate the subject.

The first point to which I should like to allude is the height of the snow-line in Spitsbergen. Many of you may be under the impression that in Spitsbergen the snow-line comes down to the sea-level. Before my visit two years ago, I imagined that the typical scenery so characteristic of our own climate was totally absent from the arctic regions; that is to say, that curious denudation curve, that logarithmic curve, so characteristic of a humid climate like our own, and so well seen in the valleys of Scotland and the lake district in Cumberland. I was surprised, however, to find that in the low valleys, where unoccupied by glaciers, this was not the case. We have there true denudation curves produced even up to a height of 1200 to 1500 feet on the western coast of Spitsbergen. This is well seen in photographs of the northern slope of the Trident, in the Sassendal, where the beautiful curve and the wonderfully symmetrical gullies are evidently the work of running water acting during the short summer months.

In our explorations in the more glaciated district further to the north last summer, about which Sir Martin has told you to-night, we found scenery of a markedly different type.

Rising as they do through the inland ice system, whose surface in the interior of King James Land stands at a height of upwards of 3000 feet, the mountain ridges stand out with sharp and cleanly cut contours. These nunataks show a marked absence of the denudation curve alluded to above, and their bold and precipitous outlines are evidently the work of frost alone. This is especially apparent in the range of peaks of which the Three Crowns form the most westerly outliers (Fig. 3).

Without entering into the detailed geology of the district, it is interesting to note the influence exerted by the geological structure on scenery sculptured by frost alone. This influence is much more marked here than it is in a humid climate, where the surface features have been carved by the action of water.

FIG. 3.—THE THREE CROWNS, KING'S GLACIER.

The terminal pyramids of the Three Crowns are composed of carboniferous dolomite, lying nearly horizontally, and traversed by well-marked vertical joints. It is along these planes that the action of frost is most marked, resulting in the production of perpendicular cliffs, frequently quite inaccessible. A sharp line can, however, be drawn at the base of this formation, where it rests on the purple Devonian (Silurian?) shales. In the latter formation, the absence of joints and the friable nature of the shales has resulted in the formation of gentle scree slopes, forming an angle of some 140° with the limestone cliff above. It is thus that we have produced the characteristic rock forms to which the name of the Three Crowns has been so aptly applied. The clean-cut diadems of golden dolomite cushioned on the purple folds of their Devonian pedestals stand like silent monuments of vanished empires.

It is always pleasant to meet old friends, and the fossils enclosed in the limestones recalled days spent on the slopes of Ingelboro', while the fish remains entombed in the Devonian shales had close affinities with the classical collections from the Old Red Sandstone of our own islands.

Here and there, as at the base of the Pretender, rise islets of an earlier age, lifting their heads through their icy covering, and I am proud to state that my patrimony to the East also dates from these Archæan times.

FIG. 4.—THE SUMMIT OF THE KING'S HIGHWAY.

FIG. 5.—HIGHWAY DOME, KING JAMES LAND.

The position of these carboniferous rocks to the north of Highway glacier requires a word of explanation. Their occurrence here appears to be due to a vast

shore of King's bay, causing the carboniferous beds to be tilted on end, and run as a broken ridge across the entrance of Ice fjord and Bell sound, in which latter bay the ridge forms the interesting little Axel island.

I would call your attention to some novel and somewhat interesting structures which we met with this year. They occurred both on the ice of Nordenskiöld glacier, and also on the King's glacier at the foot of the Pretender. They consisted of long arched tunnels running in parallel rows on the surface of the ice, and rising from 3 to 8 feet in height above the general level of the glacier. When we first saw these tunnels on Nordenskiöld glacier, we were inclined to attribute them to surface streams frozen in winter and arched by expansion into their present forms, but after a careful examination of those at the foot of the Pretender, I have come to the conclusion that they result from the snow bridges which here, as in Switzerland, span the crevassed portions of the ice, but which here, owing to the rapid melting and intense frosts, are converted into ice. On reaching smoother and more

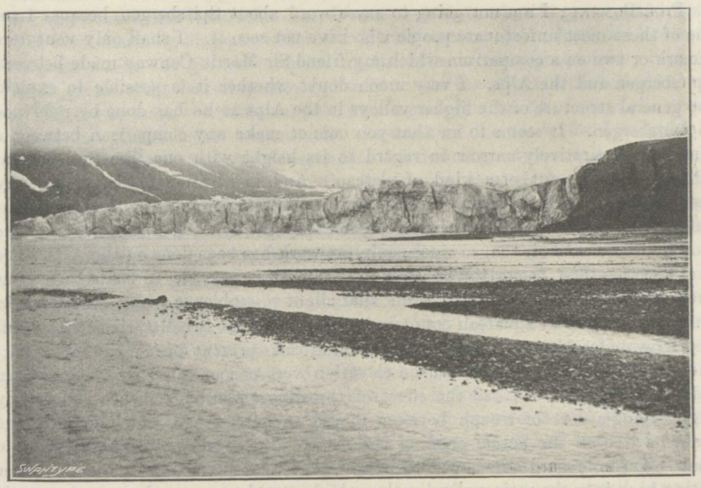

FIG. 8.—NORDENSKIÖLD GLACIER CAMP.

level reaches of the valley, the walls of the crevasses close up, and the bridges are thus forced up into these arched tunnels by lateral compression.

An interesting result of river-action which we came across this year on the ice consisted of horizontal tunnels excavated, not on the surface of the glacier, but in the heart of the ice. One of these, which occurs on the left bank of Highway glacier, had a diameter of 12 to 15 feet, and was nearly circular in section. It was evidently produced by the discharge of a lake which formed between the ice and mountain range to the south, along the line of the thrust-plane described above. This lake would be dammed up every spring by the winter snow, but in summer it would empty itself almost instantaneously as soon as the barrier was broken through. In rushing through the ice-tunnel it carried with it innumerable fragments of rock, which it deposited all over the floor of its channel. This channel ran at right angles to the direction of Highway glacier, and we have here an instance of one possible origin of the gravelly ridges known in our own country as *kames*

BRITISH LIBRARY

and *eskers*; for on the retreat of the ice now occupying Highway valley, this material will be deposited on the floor of the valley, forming a ridge of gravel containing glaciated and water-worn fragments running at right angles to the final drainage-line of the district.

If we examine photographs taken from Mount Nielson, and looking south-east across the island, it will be seen how little was known of the interior previous to our visit; for instead of the "High inland ice" which appears written across the chart at this place, we find, as shown by the photographs, ranges of mountains stretching across the island to North fiord (Figs. 4 and 5).

I cannot resume my seat without attempting to bring home to you something of the beauty and delicacy of the colouring, which is such a characteristic feature of midnight scenery on the coast (Figs. 6 and 7). The photograph (Fig. 6) was taken about 1 a.m., while cruising along the shore of King's bay, threading our way in the whale-boats through the countless icebergs broken off from the front of the King's glacier.

Prof. BONNEY: I am not going to say a word about Spitsbergen, because I am one of those most unfortunate people who have not seen it. I shall only venture a remark or two on a comparison which my friend Sir Martin Conway made between Spitsbergen and the Alps. I very much doubt whether it is possible to explain the general structure of the higher valleys in the Alps as he has done by reference to Spitsbergen. It seems to me that you cannot make any comparison between a district comparatively narrow in regard to its height with one like Spitsbergen, which is carved out of a kind of plateau. And, in addition to that, I may say that the present Alpine valleys seem to me to follow the ordinary lines of denudation, and resemble valleys that have been excavated by water in most parts of the world. But the fact is that so much sculpture work has been done on the Alps since the time they first began to rise that it is almost impossible to conjecture what their original structure was. I think that slight resemblance which he detects in one or two places to a plateau country, is the effect of the two disturbances the central Alps underwent while they were assuming their present form. In that district the great disturbances of the second elevation were concentrated on the northern side, and this no doubt had the effect of throwing that range rather abnormally high, giving a sort of trough between it and an outer range, which may at one time have been the actual crest of the ridge. But I do not think it possible that we can regard the lower Aletsch glacier as made by a small glacier eating back into the main upland valley which once, he presumed, drained towards the Rhone. Because of this—the structure of the Alpine valleys is certainly preglacial; that you can see in every part. You may notice it in the Pontresina district, and in the Val Bedretto. You can see in those very hard rocks that the glaciers have been down in that narrow V-shaped valley almost in the water's edge. Well, in addition to that, when you come to look at the cirques in the limestone districts, one cannot see how those can have been eaten back very appreciably if their beds were filled with *névé*, and further, it is evident from the way they are connected with the valleys, that if the valleys themselves were occupied down to their present beds by ice, so too the beds of the cirques must be occupied. But it may be said, perhaps, there were glaciers before the days of the great ice-age. No doubt, but still, were they glaciers of much importance? When the Alps were first upheaved, the temperature of Switzerland must have been at least 16° higher than it is at present. The effect of that would be to change the position of the snow-line, and, assuming the Alps to be at their present elevation, if the mean temperature were 16° higher than it is at present, you would practically have no glaciers at all, because the snow-line would be about 13,000 feet. With

BRITISH LIBRARY

that it would be impossible to talk of this cutting. No doubt the temperature fell steadily to the ice-age, but my point is that, putting the two things together, namely, the valleys having existed before the ice, and the improbability of there having been any great masses of ice, it is very improbable that material changes, such as the tapping of that upland valley by ice now forming the lower portion of the Aletsch glacier, ever would have occurred. I think, therefore, my friend Sir Martin Conway has really tried to stretch a truth to rather more than it will bear. He has, no doubt, spoken of what is a true cause in modifying the heads of glaciers, but I do think we cannot call it more than a secondary cause, and, at any rate, whatever may be its effect in Spitsbergen—and I cannot say anything about that, because I have not been there—I do not think it has produced any material effect in modifying the structure of the Alps.

Mr. Marr: I have, in the first place, to thank the lecturer for his very able and interesting paper. Geologists are apt to state that geology is the geography of past times. Of course, you may at once retort that shows geologists are geographers not up to date. As it is rather late, I want to refer to one thing only, and that is that very charming diagram which Sir Martin Conway showed on the screen, the diagram where the glacier extended up the hillside, and was gradually robbing a larger glacier; the tear-drop extended until at last the whole of the hillside seemed to dissolve in tears. I would suggest, from a geological point of view, the robbery would have been better without the extension of the tears, for I believe that, although the glacier is largely responsible for draining off one valley system into another, the process is not due to the upper extension of the glacier, but to the action of the weather on the solid rock. The glacier is simply responsible for clearing away the *débris* which the weather has brought down, so that I fancy Sir Martin would make his case better if he did not put that upward extension in.

Sir Erasmus Ommanney: As an old arctic navigator, I wish to express my admiration of what has been accomplished by this expedition. We are extremely indebted, I am sure, to Sir Martin Conway for striking out a new line of exploration in the arctic regions. Whatever we have done hitherto has been by coast navigation; he has had the courage to undertake the inland exploration, and to bring before us the physical features of the interior of Spitsbergen. Sir Martin Conway's experience as an alpine traveller has been able to provide us with the information he has brought us to-night. I believe that we have rarely had a traveller who has brought before us so vividly and so graphically all that he has seen. He has derived a vast amount of glacier information with such a very small party, from the highest elevations as yet attained in Spitsbergen.

Dr. J. W. Gregory: I have listened to the paper to-night with very great pleasure. It was my privilege two years ago to accompany Sir Martin Conway on the expedition to which the one just described was the sequel. Of the country which has been so graphically described by Sir Martin Conway, and which has been so beautifully illustrated by Mr. Garwood's lovely photographs, we caught occasional glimpses in 1896; in that year, as in 1897, the district appeared to be always bathed in sunshine, which was very tantalizing to us then, as we were nearly always wrapped in fogs. But last year Sir Martin Conway and Mr. Garwood had the benefit of the sunshine, and we have had the benefit of it to-night in the photographs which it enabled them to take. In regard to the geological theory in Sir Martin Conway's paper, I agree with the views expressed by Prof. Bonney, and I feel considerable doubt as to how far the agency invoked has been a valuable factor. No doubt it is a true cause, and must have some influence, but the question is whether it is the secondary or the primary cause of changes. The Alpine valley system in the main dates from pre-glacial times, and it is almost impossible

BRITISH LIBRARY

to ascertain how far the system has been modified by post-glacial changes. I heartily congratulate Sir Martin Conway and Mr. Garwood on their perseverance in returning to the country, and on the valuable results they have brought back.

Sir HENRY HOWORTH, M.P.: I have little to say except to emphasize what has been said so well already. I should like to add, however, that, being a member of Parliament, I have been delighted at the number of graceful adjectives these gentlemen have at command. In regard to the theoretical part of the issue raised by my friend Prof. Bonney and my friend Sir Martin Conway, there is this advantage—that what they have had to put forward is at all events consistent with the laws of physics and with the laws of ice-movement. Occasionally we have had to deal with some terrible theories which have been consistent with neither. The first paper I ever read in my life was when I was seventeen, when I read a paper before this Society on the areas of land that are rising round the two poles, which I mapped out and showed to be fairly continuous. One of the interesting points about Spitsbergen is this—that the evidence shows plainly that very recently the Spitsbergen archipelago has risen from the sea to a very considerable extent, and in that way its climate has been altered very much for the worse. Baron Nordenskiöld showed me some wonderful post-Tertiary shells he had found in Spitsbergen, and pointed out that those shells are not found in Spitsbergen now, but prevail in Southern Norway. This is another strong proof of the same fact. Just as the case of Greenland, where we have the same recent change in climate attested by the fact of the land having risen in the first place, and secondly by the occurrence of similar shells. Possibly the most arctic conditions that ever existed in these islands are not in periods that have gone by long ago, but in the current period; and that while we were suffering from tremendous glaciers in the old days, it would appear—and that is the view of more than one recent Danish explorer in Greenland—that the climate and the temperature were very much more moderate than they are at present in these high latitudes. I must, in conclusion, again repeat how delighted we have all been, both at the graceful discourse and the photographs, and I would say, that if ever I travel in these regions, there is no person other than my wife with whom I would rather travel than with one or other of these two graceful persons.

The CHAIRMAN: I think, at this late hour of the evening, it is almost time to close the meeting. I therefore ask you to allow me to return thanks to Sir Martin Conway for his eloquent lecture. We must all admire the way in which he attacked Spitsbergen, and he has brought the results of his journey before us in a very pleasant manner. I hope you will allow me to include in the vote of thanks Mr. Garwood, whose photographs have given us better pictures of the country than we have ever seen before; in fact, I think they are amongst the best photographs of arctic scenery that I have ever seen at the Society's lectures.

MR. FRAZER'S PAUSANIAS.*

By the Rev. H. F. TOZER.

A NEW edition of Pausanias' 'Description of Greece,' in which that work should be illustrated by the light which modern discovery has thrown on the subjects with which it deals, has long been a *desideratum* among

* Pausanias' 'Description of Greece.' Translated with a commentary, by J. G. Frazer. In six volumes. London: Macmillan & Co. 1898.

BRITISH LIBRARY

scholars and classical archæologists, but the greatness of the task has hitherto discouraged the boldest spirits from attempting it. For Pausanias' book is in its way unique in literature. Nowhere else can we find so complete an account of an ancient country, especially in respect of the buildings and works of art which it contained. And the period at which it was composed was eminently suitable for such a task, for at no time, in all probability, had the monuments of Greece been so numerous and in so good preservation as they were in the middle of the second century of our era when Pausanias wrote. In places, indeed, decay had then already begun, but this was compensated by the work of restoration which shortly before that date had been promoted by the Emperor Hadrian. But, in addition to remarkable industry in observing these objects, and carefulness in noting down their details, Pausanias was possessed by an extraordinary curiosity concerning the legends and superstitious beliefs which were attached both to the sacred relics preserved in the temples and to natural features of the ground, such as fountains and groves; and stories connected with these are of constant occurrence in his narrative. Now, in respect of both the subjects by which the old archæologist was thus attracted, an extraordinary advance in knowledge has been made during the last half-century. This has been pre-eminently the age of excavation in Greece, so that, in the course of it, one after another of the most famous ancient sites in that country have been exposed to view, and it has thus been possible to verify the statements of Pausanias on the spot, through the discovery of the buildings and statues which he saw, or of inscriptions relating to them. Again, during this period there has been a remarkable development of the study of folklore, and of the branches of anthropology which are akin to it; so that in numerous instances the portents and marvellous stories which Pausanias records can be paralleled by tales and customs which have been discovered in distant parts of the world, and, instead of being regarded as mere curiosities, can, to some extent, be classified. It is clear that the competent editor of Pausanias should be one who is well versed in both the studies which have just been mentioned.

Such an editor has been found in Mr. Frazer, and the six handsome volumes which compose the present edition furnish ample evidence of his competency for the task. The first of these contains Mr. Frazer's introduction, and his translation of Pausanias' work, by means of which it is brought within the reach of other than classical students; and with the same object in view Mr. Frazer has avoided the use of technical phraseology in his notes, as far as is compatible with a scientific treatment of his subject. The English of the translation is clear and good, and, when the style of Pausanias admits of it—as, for instance, in the history of the Messenian wars—it rises to more than average excellence. The last volume comprises the two indexes, the larger of which, a very

مكتبة قطر الوطنية
Qatar National Library

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [285v] (73/154)

complete one, is devoted to the work itself, the smaller to the notes. The four intermediate volumes contain Mr. Frazer's commentary, which is his most important contribution to the subject. In this the statements of Pausanias are throughout made the starting-points for discussions of theories and for the introduction of fresh information; but to describe it as a body of notes explanatory of that author would give an entirely erroneous view of its contents, especially as regards its archæological side. In reality, it contains a full account of the discoveries that have been made in Greece up to the present time, together with summaries of the views which have been held concerning the identification of localities and buildings and works of art. The labour which this task represents is enormous, and its value to the student is correspondingly great, because the material from which the information is drawn is largely to be found in foreign periodicals and books in various languages, many of which are not easily accessible. Mr. Frazer has also shown great penetration and a well-balanced judgment in deciding between the conflicting opinions, to which, as might be expected, these discoveries have given birth. In addition to this, he has himself travelled extensively in Greece, and has described a large number of the most important sites from his own observation; by which means the notices of the localities mentioned are rendered more lifelike, and the severity of the scientific treatment of the subject is modified by the introduction of personal impressions. Mr. Frazer's learning is not less conspicuous in those parts of his commentary which deal with folk-lore, a study with which he had previously shown himself thoroughly conversant in his book, 'The Golden Bough.'

It is no easy matter to give the reader even an approximate idea of the contents of a work of such magnitude as this; it must suffice, by way of illustration, to mention a few instances of what is to be found in it under various heads. As might be expected, the largest amount of space has been devoted to those places where excavations have been carried out on the greatest scale. Thus to Olympia, the ruins of which were laid bare at the expense of the German Government, 153 pages are allotted; and this allowance does not appear excessive, when we consider that Pausanias devoted the greater part of two out of his ten books to that place. It includes also Prof. Treu's restorations of the gables of the temple of Zeus, and Mr. Stuart Jones's conjectural reproduction of the chest of Cypselus from Pausanias' description. To Delphi, the scene of the latest operations of the French School of Athens, 151 pages are assigned; and in this part will be found an account of the serpent column that supported the tripod commemorative of the battle of Platæa, which was dedicated at Delphi, but was removed thence by Constantine the Great to Constantinople, where the column is still standing in the Atmeidan, or hippodrome. In like manner, the work of the British School at Megalopolis, that of the American School

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [286r] (74/154)

at the Heræum of Argos, and that of the Greek Archæological Society at Eleusis, and at the Hieron of Epidaurus, receive their due share of attention. Mycenæ, too, is well described, and the important questions connected with it—the date and origin of the Mycenæan civilization, the relation which it bore to that which is described in the Homeric poems, and the race to which the Mycenæan people belonged—are discussed with excellent judgment. Mr. Frazer's opinion is that the Mycenæan art was of native development on the shores of the Ægean, though certain elements in it came from Egypt and Syria; that the forms of that civilization which are found in Crete represent an earlier, the Argolic forms a later, stage in its development; and that the Homeric period was somewhat posterior to that which is represented at Mycenæ.

As regards the geographical features of Greece, perhaps the most important notices which are met with in this work are those which treat of the underground passages, which form the only outlets of the water that collects in many of the inland valleys of that country. The most remarkable instance of this phenomenon is found in the basin of the Copaic lake, and this is especially interesting at the present time, because that piece of water has quite recently been drained by the construction of artificial passages to carry off its waters, and the area which it previously covered is now a cultivable plain. Mr. Frazer has given us an account, mainly derived from his own observation, both of the modern system of drainage by which this change has been effected, and of similar attempts which were made in antiquity, for of these latter conspicuous traces remain. The corresponding features which are found in the lakes of Pheneus and Stymphalus in Arcadia, and the periodical disappearances of those pieces of water arising from the opening of the subterranean passages which drain them, are also interestingly described. An equal tribute of praise must be given to the discussions of the arguments relating to certain localities which are disputed at the present day. Conspicuous among these is the question of the position of the fountain of Enneacrunus at Athens. Pausanias' description of this has long been a standing puzzle, for he evidently conceived of it as lying in the valley between the hills of the Pnyx and the Areopagus; and Dr. Dörpfeld, who has recently excavated this neighbourhood, has with great, though somewhat over-subtle, ingenuity maintained the correctness of this view. Mr. Frazer, however, is so strongly impressed with the waterless character of this site, and with the almost unanimous testimony of ancient writers in favour of the traditional position of that fountain in the neighbourhood of the bed of the Ilissus, that he decides unhesitatingly against his author and his modern champion. In respect of another disputed point in Athenian topography—the position of the river Eridanus—Mr. Frazer is at one with Dr. Dörpfeld. This stream has usually been identified with the one which rises at the monastery of Kæsariani, on the side of Mount Hymettus, and joins the Ilissus on

مكتبة قطر الوطنية
Qatar National Library

its left bank, and this view was still maintained by Ernst Curtius in his latest work, 'Stadtgeschichte von Athen' (1891). But Dr. Dörpfeld, relying on the statements of ancient writers concerning the objects which are in its neighbourhood, and especially on the remark of Callimachus, that in his time its water was so foul that cattle would not drink of it, concludes that the Eridanus flowed from the south-western slopes of Mount Lycabettus, and passed through the northern part of Athens, in doing which it would easily be converted into a public sewer; and these arguments appear to Mr. Frazer to be conclusive.

The maps and plans which accompany these volumes are of great service in elucidating the text, and the numerous illustrations will be invaluable to students of Greek sculpture. Altogether, Mr. Frazer is to be congratulated on having produced a monumental work, which is a storehouse of learning and research.

PROPOSAL FOR AN EXPEDITION TO SANNIKOFF LAND.

By Baron E. von TOLL.

On the oldest map of the New Siberia islands, dating from the year 1811, the outlines of two lands are marked, and they bear the inscription, "Land sighted by Sannikoff." One of these stretches on the map from the meridian of the northern point of the Fadeyev island to the longitude of the "High Cape" of the New Siberia island, while the other is marked in the north-west of the island Kotelnyi.

Jacob Sannikoff was a Yakutsk merchant,* who undertook a series of bold journeys to the New Siberia islands from 1805 to 1811, and was first a *promyshlennik* (hunter) in the service of Syrovatski, who had then the monopoly of exploitation of mammoth-tusks in the Liakhov islands; later on he accompanied Mathias Hedenström in his journeys. Sannikoff was one of the discoverers of the New Siberia islands, and we are indebted to him for some very important information concerning the peculiar nature of the islands, which information was transmitted to the world through Hedenström's writings. The first, although unsatisfactory, topographical survey of the islands was made by the topographer Pshenitsyn. Sannikoff was also the first to spend a full summer on the northern island of the New Siberia archipelago. During that stay, he had the opportunity of sighting with his sharp eyes, on clear summer days, those two lands situated the north of the islands, Kotelnyi, Fadeyev and New Siberia, and their supposed outlines were marked on the above-mentioned map according to his indications. His and Hedenström's attempts to reach those lands in sledges drawn by dogs were, however, unsuccessful, because open spaces amidst the ice (*polynias*) soon compelled both explorers to return.

Ten years after the completion of the Hedenström and Sannikoff's journeys, the Imperial Russian Ministry of the Navy sent out the well-known expedition of Lieut. Anjou, which had to settle the topography of the New Siberia Islands, as well as the question relative to the existence of the lands sighted by Sannikoff. After two unsuccessful attempts, made in 1821 and 1822, to overcome with dog-sledges the obstacles offered by the *torosses* (ice-heaps) and *polynias*, Lieut. Anjou declared, in a report addressed to the authorities in 1822, that he was ready to renew the attempt in a boat, starting from the island Kotelnyi, or Fadeyev, but

* More correctly a burger (*myeschanin*) of Zyryan origin, as his descendants said.

that it was impossible to attain those lands in dog-sledges. However, his proposal was not accepted, on account of the considerable danger which it offered, and Anjou returned in 1823, after having made his last sledge-journey along the coasts of the New Siberia Islands, with the full conviction that, "within the distance which could be attained with the means at hand, there was no land in the north of the islands, Kotelnyi, Fadeyev, and New Siberia."

On the authority of Anjou, the "lands sighted by Sannikoff" disappeared from the maps, until full sixty years later, *i.e.* in 1881, the tragical expedition of De Long confirmed, by the discovery of Bennet Land, the existence of the land sighted by Sannikoff from the "High Cape" of New Siberia. This discovery gave support to the idea that the other land, which Sannikoff saw from the Kotelnyi island, but of the existence of which Anjou was doubtful, was not merely an optical mistake, and consequently a dotted shore-line reappeared on the maps, with the name of "Sannikoff Land."*

In the mean time, the tradition about the existence of the land that Sannikoff saw in the north of Kotelnyi island was maintained amidst the *promyshlenniki* (hunters), because those of them who had visited the Kotelnyi island confirmed Sannikoff's statements. In reality, I could convince myself of the exactitude of this affirmation in 1886, during the expedition which was sent out by the Imperial Academy of Sciences, under the leadership of Dr. A. Bunge. On August 13th I saw, during quite clear weather, from the mouth of the Mogur river ("Sannikoff river" on Anjou's map), under 79° N. lat. and 139° E. long., in the direction N. 14° to 18° E.,† the sharp outlines of four truncated cones like table mountains, from which a low foreland extended towards the east. At that time I had no possibility of making an attempt to reach that land. A solid ice-crust seemed to stretch from Kotelnyi island to Sannikoff Land. Perhaps the *polynia* was at that time closed by floating ice, or it opens only during the cold season and after strong storms. At any rate, in order to cover the distance of about 200 kilometres (130 miles) to Sannikoff Land, both dog-sledges and a good boat would have been required, while I had at my disposal only ten worn-out reindeer, with which I had undertaken to make the round of the island. I was bound to return southwards to my headquarters, the winter hut at Uranalakh, where my dogs recovered their forces for the return journey to the mainland. True that a boat had been made there in the mean time out of driftwood, with the aid of a keel and ribs which had been brought from the mainland. But, "uneven-bowed and leaky" as that boat was, it could only be used on August 23 to 25 for a few trips along the coast amidst the ice-floes; it was impossible then to think of a dash towards Sannikoff Land.

In the year 1893 I once more put my foot on the Kotelnyi island, during a rapidly organized excursion, which lasted from May 2 to June 8, and which I made on dog-sledges, but having no boat with me. My main working field was at that time further west, on the Anábar. While I was there, in August and September, the *Fram* sailed along the coast of Siberia towards the New Siberia islands, and passed by Sannikoff Land. Fridtjof Nansen's diary has, under the date of September 20,

* This was done, first, at the proposal made by A. Grigoriev, in his paper, "Sannikoff Land," in connection with the discovery of the expedition of the *Jeannette* (*Izvestia* of the Russian Geogr. Soc., vol. xviii. (1882), fasc. 4, pp. 264–267); also Fr. Schmidt, "Remarks concerning Nordenskjöld's 'Circumnavigation of Asia on board the *Vega*,'" in *Beiträge zur Kenntniss des Russischen Reiches*, II. series, vol. vi. (1883), pp. 355–356.

† Anjou determined the position of the mouth of Sannikoff river as 76° 2′ 3″ and 136° 33′ E. of Paris. His magnetical constants are 16° 40′ E. and 82° 57·7′. Consequently, the mountains of Sannikoff Land ought to have been marked on the map due north of the northern extremity of Kotelnyi island.

the following inscription: "We now held (in lat. 77° 44′ N.) north-west along the edge of the ice. It seemed to me as if there might be land at no great distance; we saw a remarkable number of birds of various kinds. A flock of snipes or wading birds met us, followed us for a time, and then took their way south. They were probably on their passage from some land to the north of us. We could see nothing, as the fog lay persistently over the ice. Again, later, we saw flocks of small snipe, indicating the possible proximity of land. Next day the weather was clearer, but still there was no land in sight. We were now a good way north of the spot where Baron von Toll has mapped the south coast of Sannikoff Land, but in about the same longitude. So it is probably only a small island, and in any case cannot extend far north" ('Farthest North,' I. p. 203).

It appears to me, from Nansen's words, that in his opinion the *Fram* was on that day on the north of Sannikoff Land, and that the birds which he saw were returning from some other unknown land. I believe, however, that the flocks of snipes must have been flying from Sannikoff Land, and that the *Fram* probably was at that moment south of that land. I myself am, to some extent, the cause of that mistake—if mistake there is—because Nansen based himself on my preliminary sketch-map, upon which I had roughly traced the southern extremity of Sannikoff Land in the year 1887. I think, however, for reasons which will be better understood from the following, that in reality Sannikoff Land is situated further north than where I had traced it on the said sketch-map. If it be so, the considerations which made Nansen conclude that that land is but a small island are removed.

The mountains of Sannikoff Land, which I saw through the telescope, very much reminded me by their shapes of the basalt cones of the Svyatoi Nos, as they appear to the eye from the southern shore of the great Liakhov island. The forms of the mountains of the Sannikoff Land thus authorize us to believe that these mountains consist of basalts, like the mountains of Bennet island, the southern point of which (Cape Emma) is said to consist of the same rock, according to the diary of De Long. As to the distance between Sannikoff Land and the Kotelnyi island, we may estimate it as follows:—

When we take into account that the height of the trap, or basalt mountains, in Arctic Siberia altogether is subject to but small oscillations, and, at any rate, seldom exceeds 1200 feet, and that the mountains of the Svyatoi Nos, looked at from the south coast of the Liakhov island, at a distance of about 45 miles, appear to be twice or thrice as high as the mountains of Sannikoff Land, we may conclude that the distance between Kotelnyi and Sannikoff Land is twice or thrice as great as the above—that is, from 100 to 125 miles, or from $1\frac{1}{2}$ to 2 degrees. I conclude, accordingly, that the south coast of Sannikoff Land must be located under about the 78th degree of northern latitude.

As to the probable extension of Sannikoff Land, and the question whether there are to be expected other islands besides those which have been discovered by De Long,—the Bennet, Henrietta, and Jeannette islands—we have, in my opinion, some established points, which permit us to express, with due caution, the following suppositions:—

1. It must be remembered that the traps, which have a wide extension in Siberia, always appear in massives not far apart from each other. Their distribution answers to certain tectonic lines, along which they pierce the sedimentary rocks, whether the latter, being horizontal, build up plateaus, or whether they take the shape of folded series of parallel ridges. The trap mountains are volcanic mantles which spread over the sedimentary deposits; occasionally they have maintained the forms of volcanoes with well-determined craters. Bennet island seems also

BRITISH LIBRARY

to contain, besides the basalts, beds of lignite, which may be considered with great probability as a continuation of the tertiary lignite beds of New Siberia which appear under the same longitude, and are known as the "Wood mountains." The similarity of structure between New Siberia and Bennet island is thus evident, and it is permissible to suppose that Sannikoff Land and Bennet island represent only parts of a trap region having a certain extension.

2. De Long found on Bennet island the antlers of a reindeer, about which he was not certain whether they belonged to a recent or to a fossil individual. In the first case, we could admit either that Bennet island has such a climate as permits reindeer to sojourn there—which would naturally seem highly improbable—or we should be bound to admit that the antlers belonged to an animal which came from New Siberia, and would have been killed in the island, which also seems to me a rather forced explanation. But if these antlers were fossil, then the other contemporaries of the reindeer, the mammoth, the rhinoceros, the musk-ox, etc., whose remains are so characteristic of the New Siberia islands, must also have lived in Bennet island. We should then expect to find in Bennet island and Sannikoff Land the same geological features as in New Siberia. Further, we should then have to conclude that the coast-line of the Post-pliocene Siberian continent not only included the New Siberia islands—which has been firmly established by the two last expeditions of the Academy of Science—but that this old coast-line must be traced still further northwards. How far this old continent—which, like New Siberia, is now broken into an archipelago—stretched northwards, and whether it ended at the spot where Nansen found, in 79° N. lat. and 140° E. long., a depth of 1050 feet, or whether it stretched further to the north and the north-east of the course of the *Fram*, is precisely a most interesting geographical question.

3. One of the results of Nansen's *Fram* expedition is the highly important fact that the drift of the *Fram* was not a continuation of the drift of the *Jeannette*, but, although both had the same origin, the latter was to the north of the former.* What is there producing this bifurcation of the current? I cannot answer this question otherwise than by the supposition that there are lands lying in the north of the New Siberia islands, which lands need not stretch, of course, as far as the pole, but must have a sufficient size to produce the said bifurcation of the current.

4. In the drift course of the *Fram*, as well as along the route followed by Nansen and Johansen, it appeared that floating ice always drifted with a greater facility northwards, while it was mostly blocked when it was pushed south-eastwards—that is, in the direction of the archipelago which I suspect to exist.

If these considerations relative to the probable extension of Sannikoff Land and its belonging to an undiscovered archipelago be true, the whole matter is, of course, only about such masses of land as may have the size of Franz Josef's Land, but hardly the size of Spitsbergen or Greenland. *But even if the archipelago consisted only of Bennet island and Sannikoff Land, the urgency, from a scientific point of view, of an exploration of these two islands would not be smaller than if we expected there the presence of larger extensions of land.*

I will mention briefly the scientific aims of an expedition to Sannikoff Land.

It would be needless to bring further proof for the assertion that such an expedition, made with a ship, would have to solve a series of *oceanographic problems*, of which the first would be the investigation of the dependence, so unexpectedly found by Nansen, of the Atlantic ocean on the polar basin.

The *topographical* and *geographical* questions which the expedition would have

BRITISH LIBRARY

to solve, are already indicated in what has just been said. It need only be added that the working field of such an expedition would touch part of the unknown, *i.e.* never yet visited polar regions which reach the lowest latitudes in the eastern hemisphere.*

Among the physico-geographical researches, *geological* problems stand foremost. Some remarks on this subject have already been made in the exposition of the reasons which make one believe in the existence of an undiscovered archipelago in the north of the New Siberia islands. I will only add what solutions may be found in this region for most important questions relative to the latest periods of the history of our globe.

In the study of the Tertiary sediments which, as already said, must be expected to be found at Cape Emma, on Bennet Island, as a direct continuation of the New Siberia deposits, we meet with one of the most interesting problems, namely, How could sub-tropical plants thrive so near the pole under the present position of the Earth's axis of rotation? It is well known that in Greenland, Grinnell Land, Spitsbergen, and New Siberia, there are Tertiary deposits (Miocene?) which contain impressions of leaves and fruit-cones of several species of *Sequoia*, *Dammara*, and so on, as also large leaves of poplars and other trees which belong partly to a sub-tropical flora. Basing himself upon the words of Schiaparelli, who thinks that astronomy has nothing to object to a change in the position of the Earth's axis of rotation, if geologists prove the necessity of such an admission, Neumayer attempted to explain the, in his opinion, abnormal grouping of the Tertiary floras round the pole by the supposition of the pole having moved since the Tertiary age ten degrees from Northern Asia in the meridian of Ferro. In such case the pole of the Tertiary age would have been situated in the latitude of 80°, where this parallel passes through the archipelago which it is now proposed to explore. However, Nathorst, who has further worked out this theory, thinks that the pole ought to have been situated ten degrees southwards in the direction of North Asia, in which case, what was then the 80th degree of latitude would have passed, as it passed now, through the same archipelago.

The flora of the Tertiary "Wood Mountains" of New Siberia, which is now situated under the 75th degree of latitude, tells, in my opinion, against the theory of Neumayer and Nathorst. But Nathorst remarked that the fossil plants which I brought home in the year 1886, and which represent only fifteen species, are not sufficient to settle the point at issue. In that year I had but a few days for the exploration of the island of New Siberia and its "Wood Mountains," and I had but two dogs to transport my collection, my food supplies, and my baggage. How much better could the Tertiary deposits be explored during a year's stay in Bennet island, and how much more could be collected from the "Wood Mountains" if the collectors had a ship at their disposal for the home journey! I have no doubt that this new expedition would definitively settle the above question.

Another equally important problem is the Quarternary age. The original characteristics of the deposits belonging to that period have long since been explained for Europe and North America by the admission of a wide glaciation during the glacial period. As regards Asia, Prince Kropotkin was till lately alone in maintaining that parts of Asia, and especially middle Siberia, were also glaciated during the Quaternary period; but Northern Asia was considered till quite recently as having not been glaciated at all during the age when the Ice-period prevailed in the two other parts of the globe. Only my observations in the New Siberian islands in the year 1886, and at the mouth of the Anábar in 1893, and the testimony of

Nansen about moraines and glacial striæ on the Taimyr peninsula gave positive evidence for the acceptance of glaciation in Northern Asia.* However, the observed facts seem to offer certain peculiarities, and to somewhat differ from the well-known traces of glaciation in Europe, so that a strict verification is required in order to levy *all* doubts. On the New Siberia island it is the "rock-ice," or the fossil glaciers as I have described them, which can be considered as the last vestiges of a former glaciation. The points of comparison between these fossil masses of ice and the present glaciers of the arctic regions cannot easily be found—the more so as the latter have been but insufficiently studied. Only the detailed investigations of E. von Drygalski, whose beautiful work has just been published, contain the basis upon which "rock-ice" can be better investigated.

If the rock-ice of New Siberia be a remnant of the old continental glaciation, as Drygalski is also inclined to accept with me, we may expect to find, on the islands farther north, the centre of radiation of that glaciation. A number of observations indicate that the motion of the continental ice-mass must have taken place in the New Siberia islands in a meridional direction. The exploration of the archipelago on the north of New Siberia will show whether this movement was directed from the north or not. Moreover, it will show whether I am right in my supposition that the Quaternary mammals of New Siberia inhabited a continent which had once a wide extension towards the north and the east, possibly being connected with America, and only gradually was cut into an archipelago. The sum total of the geological exploration of that archipelago, in connection with the comparative study of arctic literature of other regions, must finally throw new light upon the question whether the arctic islands altogether, with the exception of the New Siberia islands, which are undoubtedly continental islands—are remains of a broken up continent or not.

Going hand-in-hand with the geological observations, the *zoological* and *botanical* investigations will give further information concerning the just-mentioned question relative to the origin of these islands. It will appear whether their sweet-water fauna and flora are akin to the flora and fauna of the Asiatic continent only, or also contain an admixture of American species, or of such species as are characteristic of all other arctic lands. An equally great interest must be offered by *the study of the marine fauna*, and a still greater interest by the study of *the micro-organisms* in the snow flora and fauna, and especially in the fossil masses of ice.

The *meteorological* observations which would be made at a spot situated as far as possible north of the Siberian coasts would be of the greatest importance. They would give, so to say, a basis for the highly interesting meteorological observations which were made during the drift of the *Fram*, and consequently related, like all other travelling observations, to some new spot nearly every day.

As to the importance and necessity of observations on *terrestrial magnetism*, I permit myself to give, in connection with the subject, the following quotation only:—

"For our knowledge of the magnetic conditions of the Earth, the observations which we may make in the course of ten years cannot be a substitute for those observations which we lose the opportunity to make. What has not been done to-day is lost for ever; and the absence of these data will remain for ever a gap and a hindrance. Later on, but only after a long interval of time, it will, perhaps, be possible some day to reconstitute the present conditions in a theoretical way. But the perfection of the theory, which will be required for that end, will only

* Subsequently Vysotsky, who explored the lower Ob in 1896, and Inn. Lopatin, in the diary of his journey of 1866, which was only published in 1898, brought further proofs in favour of the glaciation of these regions.

BRITISH LIBRARY

then be attained when we shall have made for a long time consecutive observations over the whole surface of the Earth." *

I now will pass from these theoretical considerations to the practical question, *How can Sannikoff Land be reached?* The attempts of Sannikoff in 1806–1811, and of Lieut. Anjou in 1821–1823, have shown that with dog-sledges the land lying in the north of the New Siberia islands cannot be reached, on account of the *polynias* (open spaces). On the other side this can easily be done in summer, in a boat, as has been proved by De Long, on his return journey from Bennet island to New Siberia. However, a serious scientific exploration of those lands would be impossible under such conditions. For science' sake, it would be necessary to winter on Sannikoff Land, and in such case the shipping of the necessary provisions on sledges or in boats would evidently be impossible.

The only appropriate way to reach Sannikoff Land would be to make the passage in a ship—from the mouth of Lena, as will presently be shown. As might have been expected, the *Fram* expedition has proved that it is possible to attain the latitude of 78°—that is, the latitude of Sannikoff Land—in a few days by simply following the ice-free drift of the waters of the Lena.† True that in this latitude the *Fram* was frozen, and the famous drift of the unconquerable ship began therefrom. But it must not be forgotten that the *Fram* was very much belated, and that it was frozen on September 25. To avoid such an issue, which would be quite undesirable, it is evident that the journey should be made earlier in the season, and this can only be accomplished with certainty if the ship starts from the mouth of the Lena. That this last is quite free of ice in August is proved, besides many other testimonies, by my boat journey in the delta of the Lena in the year 1893.

There would also be another reason for taking the mouth of the Lena as the starting-point for an expedition to Sannikoff Land; namely, the possibility of providing the explorers with the necessary number of dogs, and the provisions for them. The best draught dogs in Siberia, and in the whole world, are found in the delta of the Lena. So that, if it were intended to reach Sannikoff Land in the course of one summer by starting from a European port, it would still be necessary to call at the mouth of the Lena to take the dogs, or at least (for the sake of saving time) at the mouth of the Olenek, where the dogs would have been prepared in advance. It is self-evident that in such case there would be the risk of missing that part of the season which would be best suited for reaching Sannikoff Land. It would thus be necessary, in order to be sure to attain the aim and to be well equipped, to spend two summers—not to mention that the ship which will next sail past Cape Chelyuskin may be less lucky than its three predecessors, the *Vega*, the *Lena*, and the *Fram*—and in such case may be compelled to winter at Cape Chelyuskin, and then spend a third summer on the way.

Consequently, it seems to me that the surest way would be to charter for the expedition a ship which would lie at anchor in the Lena the winter before. The steamer *Lena* is still there, but she is hardly in a state which would allow her to sail in the polar sea. It would thus be necessary to have another new ship. In case the available means would not allow of building or buying a new vessel, it seems to me reasonable to follow the example of the *Lena* of 1878, that is, to send a ship to the mouth of the Lena for purely commercial purposes. Such an enterprise, especially if a customs-free entrance of the goods at Yakutsk be granted, would be without doubt highly profitable; and it hardly would be advisable that such

* A. Schmidt, "The Geographical Problems of the Exploration of Terrestrial Magnetism," in *Verhandlungen des XII-ten Deutschen Geographentages*, 1897, p. 127.

† The *Fram* passed the mouth of the Olenek on September 15, and on September 20 she was in the supposed latitude of Sannikoff Land.

BRITISH LIBRARY

a ship should attempt to return the same summer with a cargo of goods exported from Siberia. Besides, the visit to the mouth of the Lena by a strong ice-resisting ship, under the guidance of an experienced Norwegian walrus-hunting captain, and the experience which would be thus won in the navigation of the Arctic sea in the waters surrounding New Siberia, would be an epoch-making fact. A successful navigation of the New Siberia waters would mean, on the one side, the beginning of a solid scientific exploration, and of a systematic study of the mammoth tusks wealth of these islands; and on the other side, it would be a prelude to the navigation eastwards of the Lena, to the mouth of the Kolyma, which would answer to a most pressing need of the population settled along this river. As an illustration of this need, it may be mentioned that, in consequence of the difficulties of transport by land, along the nearly 670 miles' long road from Yakutsk, across the 5000-feet-high Takulan pass of the Verkhoyansk range, the *pud* (36 lbs.) of rye-flour costs the Government 7 roubles 57 copeks (15*s.* 4*d.*) at Verkhoyansk; and from this last place the flour has to be taken nearly another 670 miles, until it reaches Kolymsk. What is the price of a *pud* of rye-flour at Nijni-Kolymsk, I don't know,* while the price of flour at Verkhoyansk is taken from an official communication which was made to me, in the year 1893, by the governor of the province of Yakutsk. It is evident that if the flour were sent every year on board ship from the mouth of the Lena, along the coast, to the mouth of the Kolyma, as also of the Indigirka, the Government would find in this mode of transport a great benefit.

As for the sale of European goods, if such be shipped from Europe, they would find, first, the Yakutsk market, and then the market of the gold-mines scattered on the large tributaries of the Lena. The returns of the Yakutsk fair, which takes place in summer, from July to the end of August, attain, according to official data, the figure of 2,000,000 roubles (£200,000), of which one-half represents the value of imports—chiefly cotton and woollen goods, china and earthenware, various colonial produce (excepting tea), and different chemical produce, while the other half represents the exports of fur goods and mammoth tusks.

As to the gold-mines, they are situated chiefly on the tributaries of the Vitim and the Olekma, and lately have been spread to those of the Aldan. The administrations of the two former regions spent, in 1889, the sum of 4,174,150 roubles (£417,415) for goods sold to the workers only. As to the needs of the gold-mines for technical purposes, it will be sufficient to name only dynamite, of which about 900 *puds* (about 33,000 lbs.) were used in 1889. It is certain that the orders for goods from one single of the larger gold-mines would be sufficient to richly pay the journey of a steamer *viâ* the polar sea to the mouth of the Lena.

The idea of a navigation between the mouths of the Lena and the Kolyma is so little new that Baron A. E. Nordenskjöld, more than twenty years ago, made the proposal to open a regular navigation between the Lena and Bering strait, and soon after that proved the possibility of realizing his scheme by his *Vega* journey. I was brought to the idea of the Lena and Kolyma navigation partly through my own knowledge of part of these regions, and partly directly by a considerable Siberian export firm, Gromoff & Co., and their representative, M. Pikhtin. This shows that there is already a demand for that navigation. My proposal is certainly not meant to be opposed to Nordenskjöld's plan, but, on the contrary, I consider its realization as equally desirable and practical.

* According to the testimony of a gold medallist of the Russian Geographical Society, who stayed at Kolymsk for four years and wrote a book about those regions, signed "Dioneo," the price of a *pud* of rye-flour is 14 roubles 70 copecs (£1 10*s.*). As to salt, its price raises to 1 rouble (2*s.*) the pound in the spring, and none is to be had at any price. All fish is eaten frozen and raw, for want of salt. (*Note of the translator.*)

The *realization of the expedition* would be, in short words, as follows:—

1. Next summer, in 1899, the ship—a good sea-going Norwegian walrus-hunter—ought to try to make its way *viâ* to Kara sea and past Cape Chelyuskin, to the mouth of the Lena. If the ship succeeds, as was the case with the *Lena* in 1878, to make its way through one of the arms of the mouth of the Lena, it must go up the river to Yakutsk, and, after having unloaded its cargo of goods, winter at Yakutsk or above that town in the Lena. If, however, no passage which would be suitable for the draught of the ship could be found in the delta of the Lena, the ship would find a good anchorage on the west coast of the Borkhaya bay. With the establishment of the winter, the goods could be easily carried by reindeer over the usual commercial road, about 67 miles long, and over the 1500-feet-high pass, across the 250-feet-high Kharaulakh mountains, to Bulun on to Lena, and from this depôt they would be carried further on on board the steamer *Lena*.

2. Next summer the expedition would start, after having provided itself at the mouth of the Lena with a number of the best dogs and reindeer, and previously, with a few Yakut ponies and with the necessary provisions for the animals. In August, taking advantage of the favourable Lena drift, the expedition could easily call at the New Siberia islands in order to establish there depôts. Then, judging from the experience of the *Fram*, it could reach the coast of Sannikoff Land in a few days. It would be desirable, if open water permits it, to penetrate as far north as possible, and to stop at one of the farthest northern spots of the discovered archipelago, or at the north end of Bennet island, in case the latter has a greater extension towards the north than Sannikoff Land.

3. Here the expedition would land, and the ship return to the mouth of the Lena. One part of the expedition would begin then the building of the house which they would bring with them, for establishing their winter quarters, and begin at once the meteorological and magnetical observations which would have to be carried on for a full year. In the mean time, the other part of the expedition may carry on the topographical and geological survey of the archipelago, so long as weather permits this to be done. In the spring and the summer the same work would be continued, so long as the ship does not come to take the expedition home.

4. On the return journey it is desirable to enlarge the field of observations by taking some other course, such as along the eastern coast of New Siberia, in which case a landing at the "Wood Mountains" would be most necessary in order to widely explore them and to make collections.

5. As to the composition of the expedition, it would be sufficient for me to have three collaborators,—an astronomer, a meteorologist, and a topographer. Besides, I would choose among the best *promyshlenniki* (hunters) a few Yakuts or Tunguses to act as hunters and dog-drivers.

Note by the Translator.

The translator of Baron Toll's admirable paper asks the author's permission to add the following considerations. If five-and-twenty years ago the necessity of exploring the flora of the Tertiary deposits *as near to the pole as possible* was considered as a weighty argument in favour of arctic exploration, the force of this argument is only the greater now. Four important sets of facts have been brought to bear since upon the solution of the question indicated by Baron Toll. On the one side, it has lately been maintained that the Tertiary vegetation which was discovered in polar regions may not have been so much sub-tropical as it had been supposed to be. But making full allowance for possible exaggeration of the amount of sun-heat (though not of *light*) that would be required by the Tertiary plants to grow in high latitudes, and fully admitting that these plants may have grown in

BRITISH LIBRARY

a northern temperate climate, the fact still remains that no imaginable redistributions of seas and sea-currents would account for the growth of even temperate-zone trees and shrubs in those high latitudes, especially when those latitudes were occupied by a large arctic continent. More fossil material from the highest latitudes is therefore required now, even much more than it was required when the remarkable conclusion of Oswald Heer as regards Tertiary vegetation became first known. The great question raised by Heer—and there is no other question of equal importance in the whole domain of Tertiary and Quaternary geology—will remain unsettled so long as we have not more fossil Tertiary plants from very high latitudes, in order to determine the true character of the sub-arctic Tertiary flora.

The latest discoveries relative to the changes of position of the Earth's axis of rotation have given new support to the hypothesis mentioned by Baron Toll, according to which hypothesis the pole may have been situated in Tertiary times several degrees southwards from its present position. The curve which the pole has described within the last few years is—we now know—a spiral, not a closed circle. But, with all that, the distribution of the tertiary vegetation round the pole seems to indicate that the climate was warmer in *all* directions from the pole. A change in the position of the axis may thus be insufficient to explain the facts relative to the Tertiary flora when these become known in their totality. We *must* therefore know the Tertiary flora of high latitudes *in its entirety*; otherwise we are bound to float in incertitude amidst the different hypotheses.

A third set of facts which have lately been discovered, especially due to the latest investigations in the southern hemisphere, is the astounding similarity of the Tertiary flora all over the surface of the globe. These researches are far yet from being complete, but already they seem to indicate that during the Tertiary age the distinctions between the different zones of the Earth were not so sharp as they are now; the climate on the surface of the globe seems to have been more equal than it is at the present time. If this be true, if the sharp climatic distinctions which we now see between the different zones did not exist in Tertiary times to the same extent and with the same sharpness as they do exist now, a great question arises; namely, was not that relative uniformity of climate due to a different composition of the atmosphere of our globe? And this question, of highest importance for geology, can only be solved by getting considerable quantities of fossil Tertiary plants from both the arctic and antarctic regions.

And fourth, a new hypothesis, which assumes, indeed, a change in the composition of the atmosphere, has been brought to the front by the great physicist, Arrhenius, and has been further developed by one of the greatest authorities on the recent geological history of the globe, Prof. Chamberlin, of Chicago. According to this hypothesis, the immense change in the climate of the globe, which took place between the Tertiary times and the Glacial period, may have had its cause in an increase of percentage of carbonic acid in our atmosphere. The volcanic eruptions which took place on an immense scale at the close of the Tertiary age in America, and in the arctic regions (and I will add, in the antarctic regions as well, and on the immense Vitim plateau and its border-ridges in Siberia), may have thrown into our atmosphere considerable quantities of carbonic acid; and Arrhenius has shown that even a very small addition of this gas to the atmosphere would considerably reduce its transparency for the heat-rays of the sun. Besides, one is naturally brought to the suggestion that the gases newly discovered in our atmosphere may also have varied in quantity at different geological epochs, the more so, as one of them, helium, is known to appear in a relatively great proportion in the waters of mineral springs, such springs being closely connected with volcanic outbreaks. In short, the variable constitution of the atmosphere may have been

BRITISH LIBRARY

the cause of changes of climate all over our globe, and one of the most vital geological questions is now to ascertain what was the real composition of the Tertiary flora, not only in the temperate zone, but especially in the arctic and antarctic regions. What was the extent of change in climate which we are bound to admit?

Let me also add that, since botanists have so well proved lately that the flora of each separate region of the globe is a direct descendant, and bears the stamp of the flora which clothed that same region in Tertiary times, the thorough and full knowledge of the Tertiary flora, in all the parts of the globe, becomes a matter of first importance for the evolutional botanist.

Taking everything into consideration, it is no exaggeration to say that, once there is a hope of discovering new beds of Tertiary plants in Sannikoff Land and Bennet islands, *this hope alone*, apart from all other geographical and oceanographical considerations so well indicated by Baron Toll, *would be a sufficient reason for sending out an expedition for the exploration of these Tertiary deposits.*

The same applies in full, and even much more, to the necessity of sending out an antarctic expedition to explore the Tertiary plants, the presence of which has been indicated by both Carlsen and Borchgrevink.

P. KROPOTKIN.

RUSSIAN NAVIGATORS IN THE ARCTIC OCEAN IN 1895-96.*

Communicated by Colonel J. SHOKALSKY.†

THE special expedition organized by the Ministry of Marine in 1894 to explore the estuaries of the Obi and Yenisei and part of the Kara sea, wintered at Yeniseisk, and on the approach of spring was engaged in repairing the vessels—the s.s. *Lieut. Ovtsin* and sailing barge *Lieut. Skuratov*, the former drawing 8½ feet of water.

In the previous year (1894) they had made a successful trial of the coal obtained from the Alexander Nevsky mine, near one of the right tributaries of the Yenisei—the Dudiuka, and, finding its quality to be not inferior to that of English coal, decided on making exclusive use of it for the future.

While these preparations were being made, the commander of the expedition, Lieut.-Colonel A. J. Vilkitsky, together with Lieut. K. V. Ivanov, determined by telegraph the difference in longitude between Yeniseisk and Krasnoyarsk, the former serving as the base for the astronomical work of the expedition. Vilkitsky also conducted, in 1894 and 1896, a series of observations with an apparatus of reversible pendulums by Repsold belonging to the Imperial Russian Geographical Society, by whose desire these observations were undertaken.

On June 15 the expedition left the town of Yeniseisk by the river, and on their way down fixed the position of the village of Gelahino, and observed the magnetic elements at this place and at Dudinsk, where they also took pendulum observations. On July 17 they reached the estuary of the river, and entered the sea to the west of Sibiriakov island. Finding, however, the Gulf of Yeniseisk still

* Map, p. 224.

† Colonel Shokalsky, who has obligingly forwarded this report containing data from unpublished sources, and three charts of this northern navigation, corrected according to recent observations, besides the sketch-map alluded to hereafter, is the Secretary of the Physical Section of the Imperial Russian Geographical Society. He was one of the Russian delegates and a Vice-President at the International Geographical Congress held in London in 1895, at which he communicated a paper on the "Maritime Route to Siberia" (see 'Report of the Sixth International Geographical Congress,' p. 239).

BRITISH LIBRARY

obstructed by ice, they turned back, and spent a week in surveying the Korsakov group of islands and the south coast of the gulf. They also succeeded in fixing a position on the south coast of Sibiriakov island, and carried out magnetic observations there. On the conclusion of this work, they made a second attempt to enter the open sea near Mateh Saleh, but were once more obliged to retire southwards on account of the ice. They accordingly went to an anchorage at Zverevo, near the entrance to the Gulf of Yeniseisk, situated on the west coast. Here they experienced a storm of three days' duration, and then again put to sea, but were caught in a second storm off Sibiriakov island, which caused them no further damage than the loss of an anchor, though they were in some peril of being wrecked on the sand-banks off this island. On August 9 they resumed their voyage, meeting with two floes of rotten ice drifting northward from Lake bay. Forcing their way through these, they stood towards that part of the peninsula of Mateh Saleh visited the previous year by the *Lieut. Ovtsin*. Finding a depth of only 15 feet near the cape, they went north and then east to get more sea-room. Here they met with a large sandy island, which they rounded by keeping to the 5-fathom limit, having the ice-belt in sight to the northward the whole way. They coasted along this island for 30 miles, fixed its position on the chart, and discovered that its southern extremity, ending in a steep cape, bore a complete resemblance to the land seen and described by Lieut. Schwede of the s.s. *Lieut. Malygin* in 1893.

They now set their course for Biely island, intending to fix its position, but thick weather and the arduous work they had before them of surveying the almost unknown Gulf of Obi rendered further delay inexpedient; so, without waiting for fair weather, they turned southwards and entered the wide Gulf of Obi, stretching along the meridian for 400 miles. The navigation here was not difficult, the depth throughout being 10 to 12 fathoms, and no ice being met with. While at anchor off Cape Three Points, at the entrance of Tazov bay, they rode out a storm with the loss of only one cable.

Astronomical observations proved that the whole of the east coast of the gulf was incorrectly placed on the chart, and required shifting 40 miles to the westward, while the position of Cape Three Points was incorrect to the extent of 55 miles.

On reaching the southern part of the bay, they attempted to approach the mouth of the river Nyda or Nadim, but found this impossible owing to shallows, the south wind which had blown persistently for three weeks having driven the water to the northward, and lowered the depth on the bar of the Obi. Four days were spent in discovering the channel, and it was August 24 before they entered the so-called Hamanelsky Obi, the northern channel of the delta, having previously fixed the position of Entrance island and Cape Hamanelsky. On August 30 they arrived at Obdorsk after a successful season's navigation in the Arctic ocean and Gulf of Obi.

The results obtained include accurate positions and definitions of the coasts of the Gulf of Yeniseisk, Sibiriakov island, and the east side of the Gulf of Obi; astronomical positions along the rivers Yenisei and Obi; and a continuous series of magnetic observations from Yeniseisk to Port Dickson and along the Obi. It was found that both sides of the Gulf of Yeniseisk, east and west of Sibiriakov island, were equally deep and free from all hidden dangers. The west coast is more sheltered than the east, but not so accessible, except in clear weather, because Sibiriakov island, which has to be passed at a distance of 8 miles, lies low and cannot be sighted in hazy weather, and is, moreover, surrounded by shoals. By going east, navigators may run a straight course from Cape Mateh Saleh to the North-eastern islands, and from these may pass Sibiriakov island in any weather. The North-eastern islands, being about 200 feet above water and very steep, are

BRITISH LIBRARY

easily approachable. The island discovered by the expedition to the north of Cape Mateh Saleh may be passed in clear weather at a distance of one or even half a mile; but in fog a more northerly course should be held, in soundings of not less than 7 to 8 fathoms.

Neither is the navigation of the Gulf of Obi dangerous. Keeping the east coast in sight from Cape Droviany, they had even soundings gradually diminishing as they went south, and it is only on the west coast off the Hamanelsky Obi, opposite the Yada, that shoals are frequent. The navigation of this gulf is, moreover, facilitated by the fact of the bottom being soft mud, and only sand on the banks. These too begin gradually, so that when the soil brought up by the lead is gritty, precautionary measures have to be taken. There are no rocks either in the gulf or the river Obi.

The navigation of the Yenisei as far as the town of Yeniseisk showed a depth throughout of 4 fathoms. The channel discovered in 1894 off Cape Gostinny was definitively surveyed in 1895, and found to have a depth of not less than 4 fathoms near Cape Doroféyev. Hence it is superior in every way to the older channel, which has only 15 feet of water, and the Lukovaia arm forms a natural harbour accessible to ocean steamers.

Meteorological and hydrographical observations of tides and currents were systematically undertaken, and a variety of notes and collections relating to natural history, anthropology, etc., were made by Midshipman Botkin, M.D. The length of the seconds pendulum was observed in four places, the northernmost of these being on the North-eastern islands in lat. 73½° (Port Dickson).

In 1896 the expedition left the city of Tobolsk on June 4, and entered the Gulf of Obi on the 24th of this month. By August 11 they had completed their survey of the southern part of this gulf and proceeded northwards; on August 22 they entered Yugor strait, and on September 16 arrived at Archangel.

Descending the Obi, they fixed the positions of the village of Elizarovo, the town of Beriosovsk, and the village of Obdorsk, filled in soundings on existing charts, and corrected shore-lines, changes having taken place at the river-bends owing to spring floods. The lesser Obi was navigated from Beriosovsk, the maps of the greater Obi having been corrected the previous year.

The river entrances were carefully examined, but none were found deeper than 9 feet towards the left coast. Crossing to the right, they ran a line of soundings along the bar, and found a depth of 12 feet under the right coast, all other parts averaging 9 to 10 feet. This proves that vessels drawing 12 feet and upwards cannot enter the Obi. Hence it became necessary to discover a sheltered bay where large steamers might safely discharge their cargoes, and thus secure the importance to commerce of the mighty Obi system. Such a harbour was discovered about 20 miles north of Cape Yam Saleh, with 17 feet of water, only exposed to light rollers with a wind from the opposite right shore. This bay, named "Nahodka" (Discovery) bay, has been surveyed in 1897 by an officer of the hydrographical service specially sent for the purpose.

Having completed their survey of the bar, they sketched in the left coast of the gulf and the southern part of the right coast. Numerous sandbanks were found along the former, but none near the latter. Neither were there serious inaccuracies in former charts to correct, as was the case in the previous year's survey of the east coast. Only here and there was it found necessary to shift the coast-line a little to the west. This result might have been anticipated, owing to the circumstance of the survey of the west coast having been corrected in the second decade of the present century, while that of the right or east coast refers back to the Great North Russia expedition about the year 1730.

In rounding Biely island fog interrupted the survey, and no good positions could be fixed, but the soundings led to the belief that existing charts of this part are fairly accurate.

There is now nothing to hinder this northern navigation, and no systematic survey will have to be undertaken in the future; occasional corrections may be made as the opportunity occurs, and next summer it would be advisable to send an officer overland to examine in detail the bay near the bar of the Obi river.

Four astronomical positions were fixed on the coast of the gulf, besides numerous observations from the deck of the vessel; the position of the church in Yugor strait was also fixed, and the magnetic elements ascertained in seven places. In Tobolsk itself, as well as in Beriozovsk, Obdorsk, and Yugor strait, observations with the pendulum were also made. Meteorological and hydrographical observations were continued every four hours. The weather was altogether unfavourable, and on entering the Kara sea the two vessels, the s.s. *Lieut. Ovtsin* and the barge in tow, were for four days exposed to a violent storm from the north, south-west, south, and north-west, accompanied by fog and rain. The steamer ran short of coal, and had it not been for their adopting the novel expedient of coaling by slinging the sacks on the tow-rope and hauling them by means of a block and pulley from the barge to the steamer, it might have fared badly with them. By dint of incessant exertion on the part of officers and men the furnaces were kept supplied, and the little steamer with her charge weathered the storm.

The incidents of this storm are told by Colonel Shokalsky, but we are obliged, for want of space, to curtail his narrative.

When the weather at last moderated, and they were so fortunate as to enter Yugor shar or strait, one of the steamer's screws was disabled, the stock of coal was reduced to one sack and a half, and the officers and crews of both vessels were in a state of exhaustion. In Yugor strait they met with two English steamers at anchor, waiting the arrival of Captain Wiggins. At the request of the English, they were supplied with the Russian maps, and it was probably due to these (though we are not told so) that these English vessels accomplished their voyage to the Yenisei so satisfactorily—one proceeded up the river, the other discharged cargo and returned safely to Norway. Acts of courtesy such as these deserve to be recorded, because they may help to allay that feeling of irritation which characterizes the relations of their respective governments in other parts of the world.

The sketch-map accompanying this paper is compiled from charts kindly supplied by Colonel Shokalsky.

Besides the above surveys, the *Jigit* cruiser, sent to the Glacial ocean in 1895 to protect the Russian fisheries in those seas, took out officers of the Hydrographical Department—Denisobransky and Jdanko—by whom the following surveys were made:—

1. A sketch-map of—
   - (*a*) The southern part of Pechenga bay (Varanger fiord).
   - (*b*) Cape Sétinsky and Volokov bay at the entrance to Kola bay.
   - (*c*) The southern part of the Kola bay.
   - (*d*) The straits of Kildyn.
   - (*e*) Major station and Voroniye Ludki.
   - (*f*) The southern part of Catherine harbour.
2. Boat soundings of—
   - (*a*) Pechenga bay (Varanger fiord).
   - (*b*) Waida bay.
   - (*c*) Kola bay.
   - (*d*) Teribersky bay.
   - (*e*) Part of the roadstead beyond the Yokan islands.

BRITISH LIBRARY

3. One hundred and seventy-one marine soundings.

4. Two hundred and seventy observations on the temperature and density of the surface water, and twenty-one series at different depths.

5. The entrances to Kola bay and Yokanka were buoyed.

6. Magnetic observations of all three elements at Kolguev island, Matochkin shar, Lesser Karmakul, Mushroom bay, and Catherine harbour.

7. Triangulation of church and station of Karmakul.

8. Astronomical positions of Mushroom bay in Novaya Zemlia and Kolguev island.

This last piece of work gave a particularly interesting result. The observations were made near the mouth of the Goose river on the north-west coast of the island. Its position on Russian charts was lat. 69° 27′ 30″, long. 48° 32′ 0″; on English charts (Imray) the position given is lat. 69° 27′ 30″, long. 48° 43′ 0″, or 11′ east of the position assigned on Russian charts. According to Jdanko, it should be lat. 69° 28′ 56″, long. 48° 51′ 9″, *i.e.* nearly 19′ of arc to the east of the Russian position, and 7′ east of the English.

A third expedition for hydrographic work has now been sent to the Kara sea by the Russian Admiralty, also under the command of Colonel Vilkitsky, on a new steamer, the *Pakhtusoff*, constructed at Middleborough, England.

UNITED STATES DAILY ATMOSPHERIC SURVEY.*

By WILLIS L. MOORE.

The United States Weather Service has been in existence twenty-seven years. During the past twenty-five years the daily synoptic charts of the service have shown the most comprehensive atmospheric survey ever presented to the forecaster, or to the broad investigator of the fundamental principles of storms. The vast region now brought under the dominion of twice-daily synchronous observations embraces an area extending 2000 miles north and south, 3000 miles east and west, and so fortunately located in the interest of the meteorologist as to cut an important arc from the circum-polar thoroughfare of storms of the northern hemisphere. The extreme points of observation are Edmonton, in the Canadian province of Alberta, on the north-west; St. John's, Newfoundland, on the north-east; Key West, on the south-east; and San Diego, on the south-west. And arrangements are now complete for a co-operation with Mexico similar to that in operation with Canada, and which will in a few months extend the area of observation southward over Mexico and Yucatan.

A wonderful panoramic picture of atmospheric conditions is, by the aid of simultaneous measurements and the electro-magnetic telegraph joining the places of observation by a magic touch, thus presented to the trained eye of the forecaster. Each twelve hours the kaleidoscope changes, and a new graphic picture of actual conditions is shown. Where else can the meteorologist find such opportunity to study storms and atmospheric changes?

In the middle of the eighteenth century Franklin detected the rotary and progressive motions of storms; early in the nineteenth century Redfield and Espy contended over rival theories as to the mechanical principle involved in the rotation of storms; and a little later Maury studied the winds of the Atlantic ocean; still

BRITISH LIBRARY

later, Loomis, Dové, and Ferrel reviewed these theories and added much to our knowledge; but at this late date no one has been able to satisfactorily co-ordinate the forces operative in cyclones, or to assign quantitative values to the horizontal temperature and pressure gradients, to the surface resistances and internal frictions of convection, to the latent heat of condensation, and to the effect of hemispherical circulation. Probably the only components of cyclonic force that are well understood and accurately computed are the centrifugence and the deflection due to the earth's rotation.

Our early investigators studied only the storms of low levels and humid airs, where convection only needed to carry the moist air-currents to a slightly higher elevation, when cooling by expansion produced condensation, and an immediate acceleration of the cyclone by the liberation of latent heat. They had never seen the whirling cyclones of the arid northern Rocky mountain plateau dash down upon our great lakes with rapidly increasing energy, notwithstanding the fact that there was little or no condensation, and hence no addition of the latent heat which Espy supposed was absolutely essential to a continuation of storms.

The great diversity in elevation, topography, temperature, and aridity of the broad region under our observation, constitute conditions unequalled anywhere in the world for the advantages which they present to the physicist to study the mechanical phases of storm development and progression, or, at least, so far as they can be profitably studied by means of observations taken only at the bottom of the great aërial ocean surrounding the Earth.

Here we see summer cyclones formed under the intense insolation which beats down through a cloudless atmosphere upon the arid waste of the Rocky mountain plateau; or winter cyclones, which, if they form in the northern part of the plateau region, move eastward to our lakes, and thence to the St. Lawrence, with scant rainfall; cyclones which, if they have their origin farther south, on the warmer plains of Colorado, move into the Ohio valley, and thence into New England, with considerably more precipitation; and cyclones which, if they have their inception on the high plains of Arizona and New Mexico, can always be expected to give abundant rainfall when they reach the Lower Mississippi valley, and later, as they pass over the Middle Atlantic states. All of these conditions can be studied during their inception at an average altitude of 5000 feet above sea-level, and under conditions of extreme aridity; they can be viewed later, as they come down nearly to sea-level in the Mississippi valley and reach a more humid atmosphere, 1000 miles from the place of their birth; and, finally, they are seen as they reach the extremely humid air of the Atlantic ocean, 1500 miles farther east.

The great winter cyclones, which originate south of the Japanese islands and cross the Pacific ocean, come under our vision as they successfully surmount the formidable Rocky mountain barriers with but little diminution of energy, sweep across our continent with increasing force and heavy precipitation, and, within three days, pass beyond our meteorological horizon at the Atlantic seaboard, only to be heard from three days later as borean ravishers of Northern Europe.

The great anti-cyclones, or high-pressure eddies, which constitute the American cold-waves, drift into our territory from the Canadian North-West Provinces, and, by means of our charts, are studied under rapidly changing conditions during 3000 miles of their course. The high-pressure eddy, with all the convectional principles of the cyclone reversed, may be said not to depend upon the land of its birth for the cold it brings; for a strong vortical and anti-cyclonic motion at the centre is continually drawing down the cold air from above. In the cold wave it must be conceded that the loss of heat by radiation to a cloudless sky is much greater than that dynamically gained by compression, or else it must be assumed that the

BRITISH LIBRARY

atmosphere possesses such intense cold at the elevation from which the air is drawn that, notwithstanding the heat gained by compression in its descent, it is still far below the normal temperature at the surface of the Earth.

The West Indian hurricanes, always at sea-level and in humid air, and which are the most violent of all American storms, intrude themselves into the domain of the United States weather-map at the bend of their parabolic course, at about latitude 30°. They have for years furnished a fruitful theme for the thoughts of the investigator.

For twenty-seven years the forecasters of the Weather Bureau have studied the inception, development, and progression of these different classes of atmospheric disturbances. From a knowledge personally gained by many years' service as an official forecaster, I do not hesitate to express the opinion that we long since reached the highest degree of accuracy in the making of forecasts possible to be attained with surface readings. It is patent that we are extremely ignorant of the mechanics of the storm, of the operations of those vast yet subtle forces in free air which give inception to the disturbance, and which supply the energy necessary to continue the same. Long having realized this, I determined at once, on coming to the control of the United States Weather Bureau, to systematically attack the problem of upper-air exploration, with the hope ultimately of being able to construct a daily synoptic weather-chart from simultaneous readings taken in free air at an altitude of not less than 1 mile above the earth. Prof. Marvin was assigned to the difficult task of devising appliances and making instruments, and I am pleased to say that we have improved on kite-flying to such an extent that apparatus is now easily sent up to a height of 1 mile in only a moderate wind. We have made an automatic instrument which, while weighing less than two pounds, will record temperature, pressure, and wind-velocity. By January next we hope to have not less than twenty stations placed between the Rocky mountains and the Atlantic ocean, taking daily readings at an elevation of 1 mile or more.

We shall then construct a chart from the high-level readings obtained at these twenty stations, and study the same in connection with the surface chart made at the same moment; being thus able to map out the vertical gradients of temperature, pressure, and wind-velocity, as well as the horizontal distribution of these forces, it is hoped to better understand the development of storms and cold-waves, and eventually improve the forecasts of their future course, extent, and rate of movement.

In exceptional cases we have flown the kites to a height of $1\frac{3}{4}$ mile. From daily readings at only one kite station, at Washington, we have derived information as to the force and direction of the wind above the 1-mile level, which has greatly assisted us in estimating the future direction of a storm-centre when our surface chart gave but negative indications. It will be a fascinating study to note the progress of cold-waves at this high level, and to determine if the changes in temperature do not first begin above. The readings at Washington indicate that contending equatorial and polar winds may be more potent in the formation of storm-eddies than heated and ascending convectional currents.

I am anxious to know the difference in temperature between the surface and the upper stratum in the four quadrants of the cyclone and in the four quadrants of the anti-cyclone, especially when the storm and cold-wave conditions are intense. At an elevation of 5 miles but little effect remains of diurnal temperature variation. At this altitude the atmosphere is free from the disturbing influence of immediate surface radiation, and consequently there is but little change between the temperature of midday and midnight. The vertical distribution of temperature in the several quadrants of the cold-wave or rain-storm areas may give a clue to the future

BRITISH LIBRARY

direction of the storm—to the little aberrations in direction which cause the forecaster to fail in his predictions for considerable areas. When we are able to construct isobaric gradients at the 1-mile level, it may be discovered that the storm-centre at that elevation will not always coincide with the geographica location of the storm-centre at the surface of the Earth. The displacement of this centre may possibly give some indication of the future direction of the storm. In other words, there are many interesting problems to be solved by this investigation.

PERSIAN GULF NOTES.

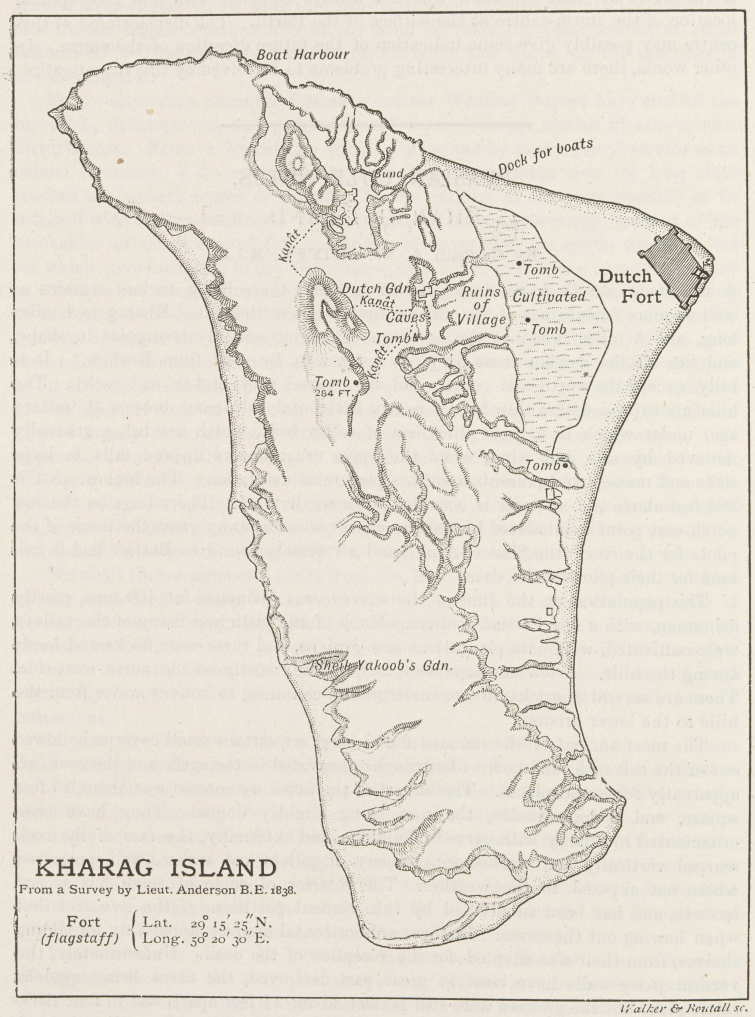
KHARAG ISLAND.

By Captain A. W. STIFFE, R.I.M.

A FEW notes on this island may be of interest, there being ancient remains as well as more recent ones of the time of the Dutch settlement. Kharag is 4 miles long, and 3 miles broad at the northern end, being roughly triangular in shape, and lies off the Persian coast 31 miles north-west by west from Bushire.* It is hilly, except the north-east corner, and the ground very broken and rocky. The hills are capped with a thin bed of nearly horizontal calcareous breccia of tertiary age, under which is a great thickness of softer beds, which are being gradually removed by rain and wind, when the upper crust breaks up and falls in large slabs and masses, and presents a curious picture of desolation. The highest part is 284 feet above the sea, and is occupied by a small tomb. The village on the low north-east point is inhabited by fishermen. It was for many years the home of the pilots for the river (the Shat-el-Arab), and all vessels bound to Basrah had to call here for their pilot for the river.

The population at the time of the survey was estimated at 400 men, mostly fishermen, with a few Persian soldiers. Much of the plain and many of the valleys were cultivated, with date plantations and gardens, and there were flocks and herds among the hills. A few antelope were to be found, mostly on the north-west side. There are several short kanâts, or underground channels, to convey water from the hills to the lower ground.

The most ancient of the remains found here, are certain small caverns hollowed out of the soft rock, and coffin-like troughs excavated in the surface of the rock, all apparently for burial-places. The largest of the caves we entered was about 15 feet square, and 8 high inside, the roof being slightly domed. They have been ornamented internally with carved mouldings, and externally, the face of the rock scarped vertically and worked into tracery of pillars and arches, well preserved where not exposed to the weather. The interior of some of them has arched recesses, and has been subdivided by thin vertical partitions of the live rock left when hewing out the caves. In these are horizontal grooves, apparently for sliding shelves, from their size adapted for the reception of the dead. Unfortunately, the vertical party-walls have been in great part destroyed, the caves being used as cattle-pens, but the grooves were still perfect, about 1½ feet apart, and in four tiers.



Of later remains, the principal is a tomb with a spire (sketch) standing behind these caves, higher up the hillside. It is said to be of Mir Muhammad, a son of

* Properly Abu-Shahar, but the English corruption is so general that it seems impossible now to establish the correct name (see map of island reduced from Lieut. Anderson, R.E.).

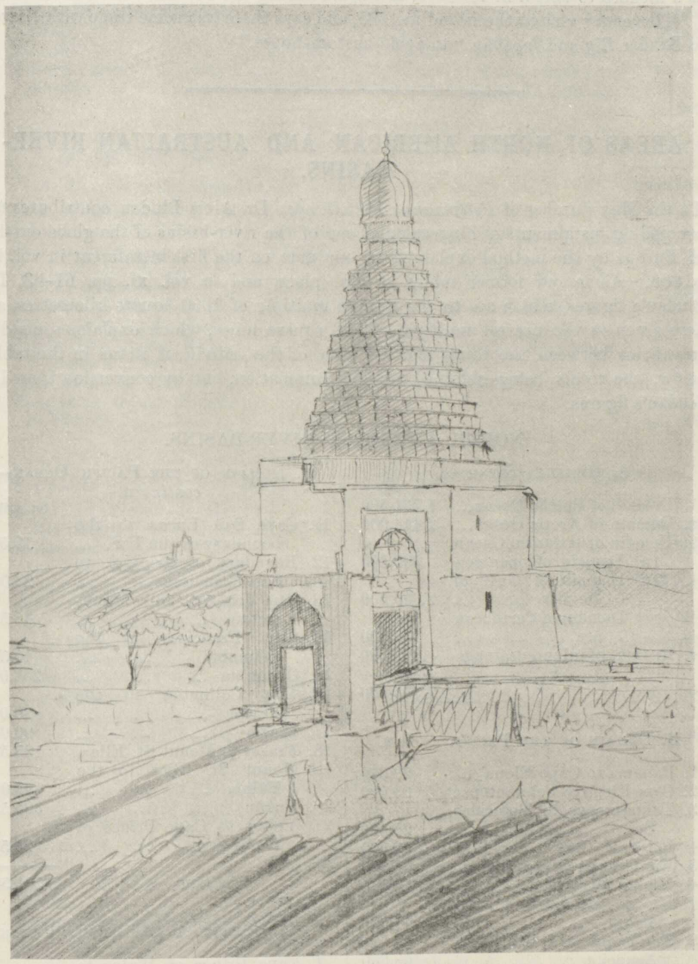
Ali, and has an inscription stating it was rebuilt nearly six hundred years ago. It is still a place of pilgrimage.* There are several other shrines; in one is shown a mark in the rock, said to be the impression of the hand of the prophet el-Khizr.

There is also a tomb 40 ells in length, called Chehil-gazah, of a saint said by tradition to have been of that stature.



* The island is referred to as a place of pilgrimage by Yakút, 1218, who visited it on his way to Kis ('Dict. Geogr. de la Perse from Yagout.' By C. Barbier de Meynard. Paris: 1861).

Bandar Ríg,* a small port on the main, and they do not seem to have attempted to re-establish themselves either here or at any other place in the gulf.

I do not find any reference to the early history of the place in any of the old geographers, it being only mentioned by name. The British occupied the island as a menace to Persia in 1838–42, and again during the Persian war of 1856–7.

Thevenot† visited the island in 1665, and says there was some trade with Basrah to Bandar Ríg and Ispahán "to avoid custom-house."

AREAS OF NORTH AMERICAN AND AUSTRALIAN RIVER-BASINS.

To the May number of *Petermanns Mitteilungen* Dr. Alois Bludau contributes the concluding instalments of his recalculations of the river-basins of the globe outside of Europe by the method explained in our note on the first instalment in vol. ix. p. 666. As in our former tables at that place, and in vol. xi. pp. 61–63, Dr. Bludau's figures, which are to the nearest multiple of 1000 square kilometres, are here given to the nearest multiple of 500 square miles, which explains some discrepancies between the totals and the sum of the individual items in the tables below, the totals being obtained, not by summation, but by conversion from Dr. Bludau's figures.

NORTH AMERICAN RIVER-BASINS.

A. General Synopsis.

	Sq. miles.
1. Domain of Pacific Ocean...	1,731,500
2. Domain of Arctic Ocean...	2,444,000
3. Domain of Atlantic Ocean	
(*a*) Domain of open sea	992,500
(*b*) Domain of Gulf of Mexico	2,009,500
(*c*) Domain of Caribbean Sea	131,000
4. Regions of inland drainage	393,500
	7,701,500

B. Domain of the Pacific Ocean.

1. Panama to Cape Elena ...	23,000
2. Cape Elena to Tehuantepec	35,000
3. Tehuantepec to Petacalco Bay	28,500
4. Petacalco Bay to San Blas	68,500
5. Rio Grande de Santiago ...	50,000
6. Rio de Mesquital ...	19,000
7. Rio de Mesquital to Rio Yaqui	51,500
8. Rio Yaqui and Rio de la Asuncion	68,500
9. Rio Colorado	228,000
10. Rio Colorado to Cape San Lucas	6,000

B. Domain of the Pacific Ocean—*continued.*

	Sq. miles.
11. Cape San Lucas to the boundary of the U.S. ...	17,500
12. Boundary of the U.S. to San Francisco	22,000
13. San Joaquin and Sacramento	48,500
14. San Francisco to the Columbia	40,500
15. Columbia	253,000
16. The Columbia to the Frazer	20,000
17. Frazer	90,000
18. Frazer to Mount St. Elias	123,500
19. Mount St. Elias to the Yukon	197,000
20. Yukon	305,500
21. Yukon to Cape Prince of Wales	25,500
	1,731,500

C. Domain of the Arctic Ocean.

1. Cape Prince of Wales to Mackenzie river ...	160,000
2. Mackenzie...	641,000
3. Mackenzie to Repulse bay	276,000

* Niebuhr, 'Travels in Arabia in 1762,' refers to this potentate as a "detestable monster."

† 'The Travels of M. de Thevenot into the Levant.' London: 1687. Newly done out of French.

C. Domain of the Arctic Ocean—*continued.*

	Sq. miles.
4. Repulse bay to Churchill river	177,500
5. Churchill	158,500
6. Churchill river to Nelson river	7,500
7. Nelson	417,000
8. Nelson river to Cape Chidley	606,000
	2,444,000

D. Atlantic Domain.

A. Domain of the Open Sea.

1. Cape Chidley to the St. Lawrence	169,000
2. St. Lawrence	482,000
3. St. Lawrence to the St. Croix inclusive	67,500
4. St. Croix to Cape Cod	32,000
5. Cape Cod to Sandy Hook	35,000
6. Sandy Hook to Cape Henry (Chesapeake bay)	84,500
7. Cape Henry to Charleston	75,500
8. Charleston to the Straits of Florida	47,000
	992,500

B. Domain of the Gulf of Mexico.

9. Straits of Florida to the Mississippi	149,000
10. Mississippi—	
(*a*) Left bank from the mouth to Cairo	32,000
(*b*) Ohio	204,500
(*c*) Left bank from Cairo to the source	120,000
(*d*) Right bank from the source to St. Louis	84,000
(*e*) Missouri	519,500
(*f*) Arkansas, Red river, and rest of right bank	293,500

D. Atlantic Domain—*continued.*

	Sq. miles.
11. Mississippi to Rio Grande del Norte	193,000
12. Rio Grande del Norte	220,000
13. Rio Grande del Norte to Rio Panuco	21,000
14. Panuco	38,000
15. Tampico to Santa Anna (isth. of Tehuantepec)	46,500
16. Santa Anna to Laguna de Terminos	62,000
17. Laguna de Terminos to Cape Catoche	25,000
	2,009,500

C. Domain of the Caribbean Sea.

18. Cape Catoche to False cape	74,000

THE GLACIERS OF RUSSIA IN 1896.

Owing to the initiative of Prof. Mushketoff, regular observations on the growth and decrease of glaciers in various parts of the Russian empire began to be made a few years ago, and we have now (*Izvestia* of the Russian Geographical Society, 1897, iv.) the results of the measurements and the new discoveries which were made in 1896.

I. The Caucasus.—Thirteen glaciers were visited in the Caucasus: eleven on the northern slope of the Central, the North-Western, and the South-Eastern Caucasus, and two on the southern slope. All thirteen glaciers continued to decrease in length, the averages (some of them based upon eight to ten years' averages) being on the northern slope—15·4 metres for the Central Caucasus, 23·2 for the North-Western Caucasus, and 38·8 for the South-Eastern Caucasus; and 24 to 26 metres on the southern slope. The general averages may be taken as follows: northern slope, 22 metres; southern slope, 25 metres.

Some glaciers which have been measured for the last eight to eleven years gave the following results:—

8.	Glacier Tzeiski, decrease in 10 years				184 metres.
9.	„	Rekomski	„	10 „	95 „
16.	„	Kalaki	„	10 „	160 „
21.	„	Chacha	„	8 „	170 „
24.	„	Khakel (sources of N. Klukhor), decrease in 8 years			192 „
26.	„	Chapchakhi, decrease in 11 years			286 „
33.	„	Khakel (sources of S. Klukhor), decrease in 8 years			264 „
38.	„	Osukako, decrease in 11 years			488 „

On the Kabish glacier the *névé* masses have shown an increase in height of 3·2 metres (1·4 metre since 1895).

Besides, two explorers, N. A. Bush and N. N. Schukin, who were sent out by the Society for botanical investigations, have visited about forty glaciers, several of which were not known before. All the glaciers visited are in a phase of decrease, as was already known from Rossikoff's and Mushketoff's work.

BRITISH LIBRARY

II. Turkestan.—MM. Lipskiy and Barschevskiy have discovered in the Hissar range a number of glaciers formerly unsuspected; namely—

1. Glacier of Severtsoff in the Khazret Sultan mountain group; the end of the glacier lies at an altitude of about 10,500 feet.

2. System of Zigdi (affluent of Varzob, tributary of Kafirnagan). The Zigdi range has on its northern slope the glaciers Zigdi, Sangal, and Buzlyuk, all buried in snow.

3. System of Yagnob: (*a*) On the Barzenga river (chief headwaters of the Yagnob) three great glaciers, the largest of which is immense; it has received the name of Count Rostovtseff; its end is at the altitude of 11,200 feet; top, 13,000 feet; nearly all covered with snow. (*b*) Three glaciers belonging to the system of the Sangdarà river; the largest flows towards north-north-east, and its end attains the 12,500-feet level; and (*c*) the small glaciers Rivut, Tavastvin, Karg, and Kavosang in the Zerafshan range, on the right-bank tributaries of the Yagnob.

4. A small glacier, Kalta-kul.

5. Two big glaciers, one of them reaching the 11,000-feet level (Sokoloff's) on the Tash-kuvat, tributary of Sorbo.

6. A group of big glaciers at the headings of the Namrut river (Mushketoff's, Namrut, Dibarar, Galaist, Galagan), having big circuses, and reaching by their lower ends various levels of from 10,500 to 11,500 feet.

7. Several glaciers, one of them a big one, on the Pakshif, Susob, and Kamarau rivers.

8. A group of large glaciers, Muraka.

9. Several glaciers are also mentioned on the upper tributaries of the Kabud.

Summing up the observations of the expedition, M. Lipskiy writes that most glaciers lie on the northern slope, in groups, especially in the upper parts of the Yagnob. They are mostly buried in snow, and most of them are of easy access. Large moraines, which are seen below the ends of the present glaciers, and large accumulations of morainic *débris*, show that all the glaciers are in a phase of decrease.

M. Maslovskiy's photographs of the lower end of the great Zerafshan glacier show that it has decreased since 1881.

III. Siberia.—The chief interest belongs to the Altai glaciers of the Byelukha, which were visited in 1896 by Prof. Sapozhnikoff ('In the Altai,' Tomsk, 1897), and have, as it now appears, a much greater extension than they were supposed to possess. Thus, the Katuñ glacier consists of two branches, attaining respectively the lengths of $3\frac{1}{2}$ and $4\frac{3}{4}$ miles, while it was supposed to be only $1\frac{1}{2}$ mile long. Close by it lies the Black glacier, 2 miles long. They are all fed by the snows of the Byelukha peak, and are quite separate from the Berel glacier, which also consists of two branches, 2 miles, and about $1\frac{1}{3}$ mile long. The lower ends of the Altai glaciers attain the 6500-feet level. All the glaciers are now much smaller than they have been once.

Other glaciers have been seen at the sources of the Kapchal, and three new ones were discovered by Dr. Tronoff at the head of the Bukhtarma, namely, the Bukhtarma glacier, consisting of two branches, and reaching the 8000 feet level; the Ukok glacier, 5 miles to the east of the former, and about $1\frac{1}{2}$ mile long; and the Alakha glacier, about $2\frac{1}{2}$ miles long, and reaching the 8000 feet level. All are in decrease, as shown by their large abandoned moraines.

M. Soboleff has made some good photographs of the Katuñ glacier (*Zemle-vyedeïne*, 1896, part iv.), as also a relief of the Katuñ mountains.

M. Ignatoff (same periodical, 1897, parts i. and ii.) has discovered a new glacier in the Kimas mountains, at the head of the Bukhtarma, in the South Altai range.

THE MONTHLY RECORD.

EUROPE.

Caucasus.—The nineteenth volume of the *Memoirs* of the Caucasian branch of the Russian Geographical Society is full of most valuable papers. The first paper, "The Alpine Plants of Central Caucasus," by M. Akinfieff, is the result of seven years' work. Being unable at present to publish a further instalment of his 'Flora of Central Caucasus' (Kharkoff, 1894), the author now gives a list of the Alpine plants, 270 species, which were found at altitudes of 9000 feet and more. We have next three papers containing geographical descriptions and full statistical data relative to the Zakataly district and the provinces of Stavropol and Terek, as also a historical sketch of the Terek Cossacks and the towns of the Terek province. These four papers are real mines of information, and one of them is accompanied, moreover, by a map of the province of Stavropol (20 miles to an inch), showing the distribution of landed property among the peasants, the Crown, the domains, and private property. N. Vinnikoff gives next two most valuable lists of all trigonometrically determined points in the government of Kutais (446 points) and in the province of Terek (151 points). Their latitudes, longitudes, and altitudes are given, as well as an alphabetical list of the same points for purposes of reference. V.V. Markovich contributes an interesting paper on the forests of Ichkeria (in Daghestan), which well depicts the forests from the forestry point of view, their utilization, and their inhabitants. Colonel Kartseff contributes a paper on the Kurds—their numbers, their geographical distribution, their language, religion, and division into branches, their institutions, and their present conditions. A most valuable map of Kurdistan (33½ miles to the inch), showing the distribution of the Kurds, the Sunnites, the Kizil-bashs, and the Yezids separately, as also the Armenians and Nestorians, accompanies the paper. The most interesting map of this volume is certainly a map of Trans-Caucasia on a large scale, 13 miles to an inch, showing the division of the country into provinces, districts, cantons, and villages, as also, in different colours, the religions of the population in each village. The appendix contains a masterly paper, by N. Y. Dinnik, on the upper parts of the Urushten and Byelaya rivers, accompanied by a map of the region, on the scale of 3½ miles to the inch, and most valuable "Notes on Suanetia," by Raph. Eristoff (111 pages), which deals with the common law of the Suanes, the children's plays, the legends, the demonology, the beliefs and superstitions, the dwellings, and so on. On the whole, this is one of the best volumes of this remarkably good collection. The twentieth volume of the same publication again contains a work of great value. It is occupied entirely by a first instalment of a large work by Colonel V. Y. Lisovskiy, "Transcaucasia." This first instalment contains the physico-geographical description of the country—the mountains and plateaus; the rivers, lowlands, lakes, seas, climate, vegetation, and animals; a sketch of the origin of the Caucasus isthmus, and its mineral resources. An excellent map of the Caucasus, on the scale of 27 miles to the inch, in which special attention seems to have been devoted to orography, accompanies the very valuable work of Colonel Lisovskiy.

Limnological Studies in the Tirol.—Dr. Halbfass has lately contributed to *Globus* (vol. 73, p. 216; vol. 74, p. 18) some notes on recent studies of the lakes of the Tirol, taken chiefly from articles by G. B. Trener and E. C. Battisti in a new Italian serial published at Trient under the name "Tridentum." They relate chiefly to the lake of Terlago, which, as recently examined by the above-mentioned authors, seems in course of extinction, the maximum depth being now only 9·3 metres (30·5 feet), as compared with 13·8 metres (45·2 feet) recorded by

BRITISH LIBRARY

Damian in 1887 (cf. *Journal*, vol. i. p. 351), while other measurements show a similar decrease. This is due to the fact that the loss by the subterranean outlet (the lake lying in a *Karst* region) more than balances the supply of water by streams. It has been proved by the use of fluorescent liquids that the Ischia Podetti, a small stream which empties itself into the Adige, derives its water from a subterranean outlet of the lake. The results of soundings, temperature determinations, etc., are also given by Battisti with regard to the small lakes of the Fersina district, the most noteworthy point being the phenomenon observed in the Lago delle Valle di Fornace and the Lago Santo, of warmer water in the lower layers than at the surface, in spite of the fact that the lakes were frozen over. Battisti's explanation that this is due to hot springs can hardly, Dr. Halbfass thinks, hold good of the former lakes, where the warmer zone takes up the greater part of the lake.

Increase of the Po Delta during the Nineteenth Century.—Prof. Marinelli discusses the question of the progressive increase of the area of the Po delta in the *Revista Geografica Italiana* (1898, Nos. 1–3). Having, by a comparison of the Austrian map of about 1823 with the result of modern surveys carried out in 1893, arrived at the conclusion that the mean annual increase during those seventy years has been about ·762 sq. kilom. (·293 sq. miles), the author compares this result with those obtained earlier in the century by De Prony and Lombardini, the only observers who had previously studied the question in detail. This comparison leads at first sight to the conclusion that the rate of increase has varied greatly within the period for which data are available, Lombardini's estimate for the interval 1600–1830 having given an annual increase of no less than 1·35 sq. kilom. (·518 sq. miles). Of the causes which might be appealed to as an explanation of such variation, Prof. Marinelli rejects those connected with changes in the amount of rainfall, deforestation, etc. He is more inclined to give weight to such factors as the increased depth of the sea, and its more powerful degrading influence in proportion to the advance of the coast-line, or a possible subsidence, owing to the effects of sedimentation. But an examination of the data on which the estimates respecting the earlier periods are based, shows that no implicit reliance can be placed on these, for a very slight displacement of the position assigned to the coast at an early epoch would materially alter the proportionate increase before and after such date. Taking the mean of the rates of increase given by Lombardini for the periods before and after 1599, a result is obtained which differs but little from that arrived at by Marinelli for the present century, the slight decrease observable in the latter being easily accounted for by the causes above alluded to. The estimated total increase during six centuries amounts to 516 sq. kilom. (198 sq. miles), which means that, by the action of one river alone, Italy has in that period gained no less than $\frac{1}{600}$ of its previous area, while recent surveys show that the increase is actively maintained at the present day. At the end of his article, Prof. Marinelli gives some notes on the length of time which would probably be required to fill up the whole of the Northern Adriatic above 44° 45′ N. lat. The disposition now displayed by the mouths of the Po to bend in the direction of the axis of the gulf introduces a special element of uncertainty, but the writer considers that the time required would certainly exceed 100 centuries, and would probably be more than 120.

ASIA.

Journey in Northern Su-chuan.—A recently issued Consular Report, by Mr. G. J. L. Litton (Miscellaneous Series, No. 457), is of special value, as containing the account of a journey through some of the least-known parts of Northern

Reference: Mss Eur F111/393. Copyright for this page: Creative Commons Non-Commercial Licence

BRITISH LIBRARY

Su-chuan, with abundant details on the physical and commercial geography of the country traversed. Mr. Litton's route touched in places those of Count Széchenyi, Mrs. Bishop, and Captain Gill, but for considerable distances it led through entirely new country. Starting from Chungking, the traveller proceeded northwards by the "lesser north road" up the valley of the Kialing river. Beyond Ho Chau, the great treeless sandstone basin of Su-chuan was reached; it is subject to a tremendous heat, and has a poor soil, rice being grown only in the low gullies, yet the population is swarming, every inch of available ground being cultivated. The country to the east of the Kialing was the scene of the famine of 1896–97, and Mr. Litton remarks that these districts are so over-populated that even a slight failure of crops will in future entail widespread distress. The estimate of 50,000,000 for the whole of Su-chuan is, in his opinion, quite a possible one. Beyond Paoning (visited by Mrs. Bishop), the hilly country of North-Eastern Su-chuan, inhabited by a maize and wheat-eating population, begins. Low ranges branch off from the main range which divides Su-chuan from the provinces to the north-east, traversing the country from north-west to south-east, and the country produces little except the teas of Tai Ping and the salt of Ta Ning. At Kwang Yuen, situated on the Kialing, in a hollow among the mountains, the main Peking-Chengtu road, followed in part by Széchenyi, was struck. This place does an important trade with Kansu, a second road leading hence to Chin Chau and Lan Chau. The chief object of commerce is the "water" or Lan Chau tobacco, but fine sheepskins also come down from Chin Chau, one of the most important centres for this trade in China. Fifteen miles west * of Kwang Yuen the Pai Shui or Pi Kau joins the Kialing, and up its valley, hitherto, we believe, undescribed by Europeans, Mr. Litton proceeded. On entering the gorge of Shi Kuan Tsu—the first of a series which extends beyond the market town of Pi Kau, a limestone region is reached; the stream is little more than a mountain torrent, and traffic is carried on chiefly by a rough and narrow track through a wild and thinly peopled region. Pi Kau derives its importance from the medicine trade, standing at the junction of several mountain tracks from the north and west. It is in Kansu, the southern parts of which might, if immigration were encouraged, supply greatly increased quantities of wheat, hides, medicines, etc. Mr. Litton was prevented by illness from making an extended tour into that province, turning instead south-west towards Lung An. Before re-entering Su-chuan, the central mountain range has to be crossed by the Ta Tao Ling pass (6150 feet), the ascent to which is rough and difficult. On the Su-chuan side the cultivation is entirely maize. At Lung An Mr. Litton struck Captain Gill's route, skirting the great mountain system of North-West Su-chuan to Sungpan on the upper Min river, and then proceeding southwards down the valley of the latter. He speaks with enthusiasm of the scenery and the attractions which the country has for the naturalist, and gives useful details of the trade of Sungpan, and the non-Chinese population of its neighbourhood. The mountain region to the south of the Lung An—Sungpan road is inhabited by Chinese or Chinese-speaking Man Tsu. The population is, however, sparse and of recent origin, and large patches of virgin forest still remain. At Mao Chau Gill's route was left, and the south of the hill country crossed by a track leading to Chungpa and the Chengtu road. Here again Mr. Litton was on new ground, and his observations on the country and people are of much value. His report concludes with notes on the Chengtu plain and its irrigation, on the prospects of foreigners in Su-chuan, and on silk production.

* The direction is given on Kreitner's map (Széchenyi Expedition) as S.S.W.

AFRICA.

Surveys in Buddu, Koki, and Ankole.—In a letter dated Buddu, April 18, 1898, Lieut. Hobart, one of the officers on military duty in Uganda, gives some details respecting surveys carried out by him in the districts to the south-west of that country, accompanied by a map. His routes have intersected Buddu and Koki in all directions, and many minor corrections and additions have resulted. The most important is the insertion of a new Lake, some 14 miles by 3, which drains to the Victoria Nyanza by the Kibale or Kiwale river, just north of the Kagera. The lake lies due north and south, and is named by the natives Kachera, but its discoverer has named it Hobart. A lake, Kanyete or Kachera, was shown by Lugard, who, however, did not visit it, and according to Lieut. Hobart there are two distinct lakes of those names, as well as one named Kajanabátola (Villiers), which means "It comes as you look at it," and refers to the sudden rise and fall of its level, due apparently to subterranean action. Lieut. Hobart says that the Germans have since 1894 occupied the district of Kibumbiro, part of which lies north of 1° south, and therefore properly falls outside their sphere. He urges that the Kagira (Kagera) is the natural boundary of Uganda, and speaks of a current said to set across the Victoria Nyanza from its mouth towards the Victoria Nile. It is known to the natives as Kiira, practically identical with the name of the river.

The Sulphur Springs of Amboni, German East Africa.—In the *Deutsches Kolonialblatt* for May 16, Herr Bornhardt gives a short account of the sulphur springs which have been discovered on the banks of the Sigi, a small river debouching into Tanga bay, and which have been thought capable of utilization as a curative agent. The writer describes the geological features of the neighbourhood, and discusses the probable origin of the springs and the means which might be employed to make use of them for baths. At the point where they occur, the Sigi has cut itself a deep channel through the limestone rock, which ends here as an eastward-facing escarpment. The most copious spring occurs on the left bank at the mouth of the gorge, issuing from a field of piled-up blocks at the foot of the cliff. The level of the river varies considerably, according to the season and the state of the tide, the fresh water being impounded at high tide, though no salt water reaches the spot. The springs are situated at about mean water-level, being completely covered at times. Herr Bornhardt considers that the spring water is collected by the limestone and overlying strata of sandy clay, but is of opinion that the sulphur is obtained from other strata of Jurassic age (marls, clay-slate, etc.), which come to light on a tributary of the Sigi, and have been found to contain concretions of iron pyrites. The broken nature of the limestone formation will render doubtful the success of any efforts to raise the level of the spring-water by dams. At low water, however, it might be utilized at its present level by the excavation of a basin, while at high water it would have to be raised by pumping. A sketch, showing the position of the springs, accompanies the article.

Lieut. Werther's Explorations in German East Africa.—The expedition carried out by Lieut. Werther in 1896–97 to the northern parts of German East Africa, between Masailand and Unyamwezi, has already been briefly alluded to in our pages. The cartographical results have now been published in *Petermanns Mitteilungen* (1898, No. 4) on the scale of 1 : 750,000, accompanied by a general description of the country traversed; and as Lieut. Werther's routes (including those of his former journey in 1893) have intersected the country in all directions, he is able to give, from personal knowledge, a very complete account of its orographical and other features. The Nguru, Usagara, and Rubeho mountains form, in his opinion, a connected system, almost all the streams from which belong

BRITISH LIBRARY

to the basin of the Wami. On the east side of the mountains rain falls throughout the year, so that the streams never dry up; but the western side, as is the case with other mountain groups in this region, is much dryer. The Wami or Makata plain to the south has quite a different character from the country to the north, though both often go by the name of steppe. The former is quite level, and is in great part overflowed during the rains, while the latter—the Masai steppe—has an undulating and broken surface largely covered with grass. Another mountain system is that of Irangi, which formed the primary objective of the expedition. Its general direction is north-east, and it is drained by tributaries of the Bubu, which finally loses itself in a salt swamp in the west of Ugogo. The streams have wide sandy beds, dry at the surface except after rain. Further west we come to the long line of escarpment which constitutes the western edge of the great East African trough. The eastern edge seems to be by no means well marked in these latitudes, and the character of a trough is not always preserved. Besides Lake Manyara, a large number of brackish lakes and swamps occur near the foot of the escarpment; one of them, named Balangidda (about 8 miles by 3½), had not been visited by any other European. Their depth even in the rainy season seems hardly ever to exceed 6 feet, whilst in the dry season they leave a crust of salt mixed with soda. In the centre of Ufiome rises the three-peaked Gijeda-sen, apparently an extinct volcano; both the mountain itself and the whole volcanic district round abound in iron. Further south, and closer to the escarpment, lies the old volcano Gijeda-hanang, or Gurui, which Lieut. Werther ascended. It has a vast crater in the form of a horseshoe, the sides of which slope very steeply both outwards and inwards. West of the escarpment lies the high plateau of Turu, Ussure, and Iramba, in great part covered with bush-forest, and to this succeeds the Wembere steppe, a longitudinal depression running from south to north and north-east, and generally bounded by well-marked walls. Besides Lake Nyarasa (the Eiassi of Baumann) in the north, there is an extensive swamp, filled in the rains, towards the south. In about 4° S. lat. the steppe sends out a wide bay to the west, while to the east rise the much-rifted Isanzu mountains. Still another trough occurs between Lakes Nyarasa and Manyara, or Laua-ya-Mueri. This is the depression in which lies Lake Hohenlohe, discovered by Lieut. Werther in 1893, and which proves to be not a circular hollow, as he then thought it. The bordering heights increase in altitude towards the north-east, those on the eastern edge being the higher; they have a heavy rainfall, and some primeval forest occurs in clefts on their sides. In the wooded region between Lakes Hohenlohe and Nyarasa dwell the Watindiga, a hunting tribe.

Explorations in the Congo Basin.—Although no very important discovery remains to be made in the Congo basin, minor additions to our knowledge continue to be made in various parts. The results of some of the latest explorations in the basin of the Kasai and its affluents are embodied in Sheet ix. of M. Wauters' map of the Congo State, given with the *Mouvement Géographique* for April 24 (No. 17, 1898). A short account of the explorations appears in No. 16 of the same journal. Early in 1897, M. Stache explored the lower course of the Loange, which joins the Kasai from the south, a little below the mouth of the Sankuru. Report had it that the stream was inaccessible owing to its sandbanks and violent current, but M. Stache found that the difficulties had been much exaggerated. It is a fine stream with deep water and a mean breadth of 200 to 250 yards, with wider reaches exceeding 600 yards. It has a very rapid current in places, but is navigable for large steamers. Its banks are comparatively high, without forests, but generally sprinkled with wine-palms. The Kancha, which enters the Kasai some 80 miles lower down, flows through low plains, and its waters are black, deep, and easily

BRITISH LIBRARY

navigated. The population of its banks seems extremely dense. The sixteenth number of the *Mouvement* also contains the first of a series of articles by Lieut. Gustin, who was attached to Van Kerchhoven's expedition of 1891–93 to the upper Welle, accompanied by a map of that river, on which his various routes are laid down. In the seventeenth number, M. Wauters makes some remarks on the hydrography of the region between the Mobangi and the Shari. On the publication of the results of M. Clozel's journey, M. Wauters expressed a doubt as to the connection of the Wom, discovered by him, with the Shari basin. He now points to a recent exploration by M. Perdrizet, as tending to prove that the Wom is identical with the Ombela, a tributary of the Mobangi. In the *Comptes Rendus* of the Paris Geographical Society, however (1898, p. 241), Dr. Herr, M. Clozel's second in command, contests this theory, pointing out that the Wom, after flowing south-east for a short distance, was found by M. Perdrizet to resume its easterly course, and probably turns to the north after reaching the end of the Kare range, supposed by M. Wauters to form part of the Congo-Shari water-parting. The Ombela, Dr. Herr shows, was found by Porel and Brunache to be quite a small river. Finally, it may be noted that since last September commercial enterprise has been initiated on the Lomami, hitherto the most neglected of the Congo tributaries. Factories have been founded on the lower part of the river by M. Langheld, who reports that the population is far more dense than was previously stated, the natives being of an unusually fine type, and well-disposed to Europeans. A company has been formed to open up the region to trade.

Von Carnap's Expedition from the Cameroons to the Congo.—A letter from Lieut. von Carnap, published in the *Deutsches Kolonialblatt* for May 16, supplements to some extent the account of his journey given by the *Mouvement Géographique* (*Journal*, vol. xi. p. 551). The exact route of the expedition cannot, however, as yet be followed on the map. From Yaunde, Von Carnap made his way first towards the north-east to the town of Yoko, in Southern Tibati, proceeding thence south-east in order to visit the important trade centre of Wuchaba. His further route seems to have led along the upper Sanaga, almost to the latitude of Ngaundere, before again bending southwards. The reason for this northerly *détour* was the difficult nature of the country south-east of Yaunde, which is said to consist of an extensive primeval forest. Even on the route followed great hardships were experienced, the native porters suffering especially from the cold. A little later in the year the south of Adamawa would have been impassable, on account of the amount of water. Hausa caravans traverse this region from Yola in the north, and from French Congo in the east, proceeding by various routes to Yoko and Wuchaba already mentioned. Arrived at the French post of Carnotville, on the Mambere, Lieut. von Carnap sent back the greater part of his force by a more direct route to Yaunde, under sub-officers Staadt and Zampa, while he himself proceeded to the south-east corner of the German territory, at the junction of the Ngoko and Sanga. The Dutch and Belgian trading-stations on the Ngoko lie at present on the right bank, but the chief trade is done with German territory, owing to the immense amount of ivory supplied by the forest region between 2° and 4° N. lat. The supply will probably last for a number of years, but Lieut. von Carnap urges that attention should be paid to rubber, which he observed everywhere in large quantities. Some further details respecting the earlier stages of the expedition appear in the issue of the *Kolonialblatt* for June 15.

AMERICA.

Exploration of the Upper Amazon Tributaries.—Dr. A. Rimbach contributes to the *Zeitschrift* of the Berlin Geographical Society (1897, No. 6) a

BRITISH LIBRARY

detailed account of a journey made by him in 1894, accompanied by his brother, Carl Rimbach, to the upper Amazon, for the purpose of studying the physical features, and especially the vegetation, of some of the less known parts of that region. Starting from Cuenca, between the two main chains of the Andes of Ecuador, the travellers first proceeded northward to Riobamba, near the headwaters of the Pastaza, it being their object to descend this little known stream to its confluence with the Marañon. Between the basin of Cuenca and that of Riobamba, the Azuay range (14,700 feet, andesite) had to be crossed, and Dr. Rimbach gives some interesting notes on the character of the vegetation at different altitudes, and on the varying aspect of the Andean ranges visible during the journey. The route to the Marañon *viâ* the Pastaza was used by the missionaries of Quito in De la Condamine's time, and was even followed by Madame Godin in 1769 on her adventurous journey to join her husband, one of the French astronomers who took part in the measurement of the degree in the equatorial regions of South America. It appears to have fallen into disuse of late years, and the path to Canelos, a mission station on the Bobonaza, was so indistinct as to be missed even by Dr. Rimbach's guide, who had often traversed it before. The passage of the eastern cordillera is made by a deep cleft at the northern foot of the volcano of Tunguragua, on the slopes of which the travellers could distinguish the lava stream due to the eruption of 1886. At the village of Baños, within the pass, the travellers found the inhabitants much exercised in mind on account of the Peruvian encroachments, and were taken for spies of that nation. Soon after passing this the vegetation characteristic of the Sierra was replaced by forest, which, however, did not at once assume the moist tropical character typical of the lower regions. The numerous tributaries of the Pastaza mostly emptied themselves into the main stream by waterfalls from small plateaux, which are chosen as the sites of settlements. At Canelos, the travellers were detained some weeks by swelling and ulceration of the feet, due to the long marches through the forest. The route was continued by canoe down the Bobonaza and Pastaza amid incessant rain, which caused the river to rise rapidly, flooding its low-lying banks, and bringing down trunks of trees in dangerous quantities. Below the village of Andoas, at the mouth of the Bobonaza, the banks of the Pastaza were quite uninhabited, except at two spots where Peruvian rubber collectors had settled. One of the Indians of the party having been bitten by a poisonous snake, Dr. Rimbach allowed his escort to return, while he and his brother continued the canoe voyage alone, finally reaching the Marañon, and continuing down that stream to the station of Parinari. A compass survey of the Pastaza was carried out, and its course as given by Dr. Rimbach, differs considerably from that shown on the maps. A sketch of the complete river system of the northern tributaries of the Marañon, based on Dr. Rimbach's observations and inquiries, accompanies the paper. The Marañon, too, was found to be much swollen at the end of May, the chief period of high water lasting from February to May, while a smaller rise takes place in October and November. After exploring the banks of the Samiria, a small stream which enters the Marañon just below Parinari, the travellers proceeded by steamer to Yurimaguas, on the Huallaga, and thence by land to the coast *viâ* Moyobamba, Chachapoyas, and Cajamarca. This route involved the crossing of five high ranges, and gave many opportunities of studying the varying aspects of climate and vegetation in Northern Peru. The forest region which had continued without intermission since the descent from the highlands of Ecuador ceased near Moyobamba, the western slopes of the cordillera east of that place showing a tendency to a xerophytic character. On both branches of the central cordillera the contrast between the moist vegetation of the eastern, and the dry vegetation of the western slopes is most marked, while on both branches of the

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [302r] (106/154)

western or coast cordillera the dry predominates. The peculiar character of this dry vegetation, consisting largely of cacti, was especially noticeable on the sides of the upper Marañon valley. The descent down the heated, waterless, slope occupied nearly a whole day, after the stream had been first sighted.

New Expedition of Dr. Hermann Meyer.—Like his brother, Dr. Hans Meyer, Dr. Hermann Meyer has lately undertaken a new expedition to the scene of his former explorations. It is announced in *Globus* (vol. lxxiv. p. 20) that he is to start during August for South America, where he hopes to explore the Atelchu, one of the Xingu headstreams, discovered by him two years ago. There are still unvisited tribes of Indians on this river, and Dr. Meyer hopes to obtain valuable ethnological results. Three other Europeans are to accompany the traveller.

Sir Martin Conway's Expedition.—Sir Martin Conway has left for Bolivia for the purpose of exploring the high group of the Andes, containing the peaks Illimani and Illampu (Sorate).

AUSTRALASIA AND OCEANIC ISLANDS.

Prof. Haddon's Expedition.—According to news received at Cambridge from Prof. Haddon, the expedition which went out under his leadership to study the anthropology of Torres Straits and other parts of the Eastern Archipelago arrived at Thursday island on April 23. A week later a start was made for Murray island, which was, however, only reached after a week's trying navigation. The expedition took up its quarters on Murray island in a deserted mission house, and work had begun in earnest. Preparations are being made by Rajah Brooke to afford the party every possible assistance on their intended visit to Borneo.

The Island of Rotuma.—Mr. J. Stanley Gardiner in his paper on the "Geology of Rotuma" (*Quarterly Journal of the Geological Society*, vol. liv. part i.), treats at some length on the topography of the island. The author's notes were made during his visit to the island in the months September to December, 1896. The island of Rotuma is situated in lat. 12° 30′ S. and long. 177° 1′ E. It appears to lie on a great submarine plateau which includes the Tongan and Fijian groups, and which has a northward extension of 4° to 5° of latitude, with a depth not greater than 1500 fathoms in a general depth of 2000 to 3000 fathoms. The breadth of this plateau north of, and including Tonga, is about 10°, while in lat. 9° to 13° S., it has a westward extension to join the plateau on which the Santa Cruz and Solomon groups lie. Rotuma consists of two parts joined together by a narrow neck of sand. The eastern end is about 5 miles long by 2½ broad, and the heights of its hills, which are volcanic in character, vary up to 860 feet. On their outer faces, towards the sea, are extensive beach-sand deposits. The western end is very sharply separated from the beach-sand flat at the isthmus by steep cliffs of 70 to 100 feet, surrounding the base of Kugoi, while the same hill continues to the south into Kiliga, but to the north has a sharp drop into a valley, from which Sororoa rises to the height of about 850 feet. A remarkable cavern in the lava of Sol Mafiri, with lava stalactites is described, as also a similar cavern in An Hufhuf. The total annual rainfall of the island is estimated at from 150 to 250 inches. The author is of opinion that Rotuma was first formed of a kind of basaltic rock, such as is found in Kugoi now. This rock he believes to have extended along the whole island as it now runs, but to have been broken up by that great eruption, or series of eruptions, which formed the central U-shaped range of hills of the eastern end. By this eruption he believes that this basaltic rock was in places loosely piled up, and then, by disintegration and admixture with lava, formed the hills and islands of volcanic ash. The last stage is the washing away of these, and the formation of the coral-reef and the beach-sand flats.

POLAR REGIONS.

Drift-casks for the Investigation of Polar Currents.—In the *Bulletin* of the Geographical Society of Philadelphia (vol. ii. No. 3), Commodore G. W. Melville, well known from his participation in the ill-fated *Jeannette* expedition, develops his plans for an investigation of the circumpolar currents by means of drift-casks. His proposal is that a number of oaken casks of a special design shall be constructed and set adrift to the north of Bering strait in sets of five. The shape suggested is that of parabolic spindles, conical at the ends, the material to be of sufficient strength to withstand heavy pressures. They would be provided with the ordinary bung-hole and bung, the intention being to place within each a tightly corked bottle for the preservation of records in various languages, giving details regarding the exact position in which the casks were abandoned, and requesting the finder to communicate with the hydrographical office of the country to which he may belong. The first five casks might be set adrift at or near Herald island, and the rest successively to the northward, along the eastern edge of the polar pack, until about lat. 75° N., long. 170° W. were reached. A map is added showing the probable lines of drift across the polar basin, one, in Commodore Melville's opinion, probably bending to the east, towards the American archipelago.

Departure of Lieut. Peary's Expedition.—The departure of the *Windward* from New York for the North Polar region took place on July 2. On July 9 the ship reached Cape Breton, where Lieut. Peary had arranged to embark, and at once proceeded to coal. An early start northward was expected to be made, the ice in those regions being reported unusually favourable for the time of year. The *Hope*, with coal and other supplies, had sailed previously, and was to meet the *Windward* in the north of Baffin's bay. In accordance with the programme already made public, Lieut. Peary will probably be landed at Sherard Osborn fiord, the ship then returning home if not caught in the ice. In the case of favourable ice-conditions, however, it is possible that he may steam still farther northward before landing. He hopes to reach the northernmost point of Greenland early in the summer of 1899, and to push on for the pole with a small and compact party during the same season.

Mr. Wellman's Expedition.—Mr. Wellman writes to us from Archangel under date July 4, announcing the immediate departure of his expedition for the north. The *personnel* consists of nine in all, four from America, and five from Norway, whilst eighty-three Siberian dogs have been taken on board. A Reuter telegram from Vardo, dated July 15, announces the return thither of Mr. Wellman after a preliminary cruise to the north, heavy pack-ice having been found to bar the way in 77° N. A renewed start was to be made on the 17th. The unfavourable ice-conditions this summer in the Spitsbergen seas are also referred to in *Globus* (vol. 74, p. 18).

Australasia and Antarctic Exploration.—With a view to arousing interest in antarctic exploration in the Australasian colonies, the Hon. C. C. Bowen, who, as a member of the New Zealand Legislature, was present at the Antarctic Conference held last summer at the Society's rooms, has written an article on the subject, which has been published in the *Press* of Christchurch, New Zealand (May 16, 1898). After recounting the various attempts which have been made within the last ten years to set on foot a British expedition to the Antarctic, and lamenting the apathy shown by the Australasian colonies, Mr. Bowen proceeds to sketch the past history of south polar research, as he believes that ignorance of what has been done so far, and of the important problems awaiting solution, is the real cause of the little interest displayed by the colonial public in the matter. Some effect seems to have been produced already by Mr. Bowen's article, which has been reproduced, in whole or in part, in other colonial papers.

Mr. Borchgrevink on his Expedition to the Antarctic.—At the closing meeting of the session Mr. Borchgrevink spoke a few valedictory words on the eve of his departure for the Antarctic, and gave some details as to the composition and objects of his expedition, the funds for which, as is well known, have been provided by Sir George Newnes. Mr. Borchgrevink is accompanied by a strong scientific staff, including Captain Kolbeck and Mr. Louis Bernacchi as magnetic observers, the latter being also an expert photographer; Herr H. Klövstad, M.D., M.A., of Christiania University, as medical officer; and Messrs. N. Hansen and Hugh Evans as zoologists. His ship, the *Southern Cross*, is commanded by Captain Bernherd Jensen, who has already sailed in the antarctic seas, and there are two mates and a crew of twenty-four. Mr. Borchgrevink expressed his sense of the honour which has devolved upon him in being permitted to continue the work of the illustrious Sir James Clark Ross, and his satisfaction that any prospective results will be achieved under the British flag. He expects to return in 1900.

OBITUARY.

Major-General R. G. Woodthorpe, C.B., R.E.

By Colonel Sir Thomas Hungerford Holdich, R.E., K.C.I.E., C.B.

Robert Gosset Woodthorpe, second son of Captain John Bolton Woodthorpe, R.N., was born at Purfleet, in Essex, on September 22, 1844, and was educated at Mr. John Taylor's school at Woolwich, preparatory to entering the Royal Military Academy as a cadet. He obtained his commission in the Royal Engineers on June 22, 1865, and very early in his career he elected for service in India. He "heard the East a-calling," as many others have done, and he responded to that call with the service of a lifetime, finishing his career as Deputy Surveyor-General at Calcutta, and taking his last long leave on May 26.

Nature intended Robert Woodthorpe to be one of the world's explorers. He was gifted with a short, square figure and sturdy frame, immense capacity for endurance, and a courage that no combination of difficulties and dangers could depress. Thus, when the Indian Survey Department pointed the way to geographical distinction, he accepted the chance with alacrity, and was speedily drafted off to some of the wildest and most inaccessible districts of the Indian borderland on survey duty.

His first surveys were carried through the Khasia and Naga highlands, and it was here that he found himself face to face with a people so exceptional in their physical characteristics, and so entirely aboriginal in their manners and customs, that he at once fell into the habit, which never after left him, of illustrating his wanderings with his pencil. As an amateur artist he was of far above average capacity, and his pictorial records of the Eastern frontier must be considered unique in value, not only for the extent of them, but for their minute accuracy, and the patient, painstaking care with which comparatively small ethnographical traits and distinctions are preserved in them. It was a life of adventure and danger that he led, even in those early days. He was with Butler when that intrepid officer was killed by a spear launched from the jungle, which was apparently intended for Woodthorpe himself. Indeed, his records of the Khasia survey alone would fill a book with stories of adventure; but survey officers in India have little time for book-writing, and the world hears little about them. In 1871–72 he was called to accompany the Lushai expedition, which was carried through districts much akin to those of the Khasia community. Here again his

Qatar National Library

The Geographical Journal(Journal of the Royal Geographical Society): Volume XII, No. 2 [303v] (109/154)

pencil came freely into play, and of this particular expedition he did publish an account, which is well worth study.* Here, too, he first made the acquaintance of an officer who had been appointed quarter-master general of the force—Colonel Roberts, v.c.—and the friendship thus inaugurated lasted unbroken until Colonel Roberts became commander-in-chief of the Indian army, under a much more imposing title.

Not long after the Lushai expedition (in the late autumn of 1878), the outbreak of war with Afghanistan gave Woodthorpe another opportunity of exhibiting his peculiar qualifications, not only as an explorer and surveyor, but as a hard fighting and determined soldier.

Captain Woodthorpe was placed in charge of the survey party attached to the Kuram column under General Roberts. The geography of Afghanistan was in those days mostly an unravelled mystery, and the art of carrying on a systematic survey with a moving force in the field was an art which was then in its infancy. Woodthorpe effected on the line of the Kuram what Tanner and others accomplished on the Khyber. The field work which fell to him was both incessant and rough, demanding all the physique of a trained mountaineer, added to the skill of a trained triangulator. On one occasion I remember that there was question of reaching the highest peak of the Sufed Koh range (Sikarám) from a position near the Shutar Gardan pass, in time to admit of a day's work with the theodolite before descending again to camp ere night fell, on a short winter's day. The ascent was one of about 7000 feet, four hours were barely sufficient for the observations, and the descent had still to be included in the ten or twelve hours of daylight that was all that could be reckoned on. At the first attempt Woodthorpe was up to time, but his carriers were not; he had found the way up, but they could not follow him. He punished them all for laziness, and started again with the same men a little earlier next day. This time he scored a complete success. In those days he was occasionally accompanied by another enthusiastic mountaineer, one who was kind enough to assist him in keeping the record of his observations. I lately found some pages of his "angle books" signed by "George White, Major 92nd Highlanders." In fulness of time this gallant officer and most capable climber of high places succeeded Lord Roberts as commander-in-chief in India. But Captain Woodthorpe had his turn of fighting too. He was acting as aide-de-camp to General Roberts during the memorable Peiwar Kotal action, when he unwittingly made a most risky mistake. In taking a short cut back to the staff from some remote corner of the field, he jumped straight into an Afghan sungur, under the impression that it was held by our own troops. Fortunately, he was himself wearing our Afghan pugri at the time, and he recognized his error just a second or two before the Afghan defenders recognized the quality of their casual visitor. Those few seconds gave him a few yards' start out of the sungur again; but a shot at close quarters caught him in the back, broke his revolver, travelled round his ribs, and bowled him over as he retired hastily down the hill "like a rabbit," as he said. But he was none the worse for it! He lost his rifle, but recovered it again a few days afterwards, during the general Afghan retreat. His work in the Kuram earned him a brevet majority, and when the second phase of the war broke out after Cavagnari's massacre, he was again to the front on the same line of advance, and under the same general. This time we worked together (I had previously been on the Kandahar line) after we had joined our respective surveys at a point on the Bala Hissar hill, overlooking the city of Kabul. During the memorable winter which followed Woodthorpe and I shared our quarters in

the "72nd" gate at Sherpur with a brave soldier (Stratton), who was subsequently killed in action; and it was whilst the siege of Sherpur lasted that I had the opportunity of watching and admiring the unfailing cheeriness and unflagging

GENERAL R. G. WOODTHORPE, C.B., R.E.

determination that Woodthorpe evinced in his laudable efforts to "keep things going." Whether they were things professional, theatrical, or social; whether there were amusements to be promoted amongst the men, or conviviality to be shared amongst their officers, Woodthorpe was in the thick of them all.

I have referred to his undaunted pluck. If the quality of courage is one that admits of many varieties, then I can say with confidence that Woodthorpe possessed them all. He was of the stuff that makes V.C. heroes, though he never won that distinction. I watched him once when he was within a measurable distance of it, but on that occasion the race was to the swift, and he just failed to win. It happened thus. I had taken a powerful survey telescope to the top of that Sherpur gateway on which General Roberts was watching the progress of the fighting on the Asmai hills before him. The distance was too great to distinguish the different regiments with the naked eye, but near enough to admit of recognizing individuals with a good telescope. So I reported progress, whilst the general walked up and down the narrow space of the roof. I watched a cloud of skirmishers (72nd and Guides) struggle up the heights held by the enemy, till they appeared on the sky-line, where they broke right and left to clear the ridge. I knew that Woodthorpe was with them, and was certain that he would be in the first flight. On the left, balanced on the very apex of the mountain, was a stone-built sungur, from which the plucky defenders declined to move. I could watch them waiting and reserving their fire to the last, meaning to die (as they did die), every man of them, where they stood. In front of the sungur, flat against the sky-line, was 50 yards or so of open sward; at the end of this a rocky bit of cover. Gradually behind the cover a little band collected, and I waited, with intense expectancy, to see who would be first over the flat and into that sungur. It was a gallant corporal of the 72nd who first broke away from the cover of the rocks. He was speedily followed by a small group, headed by the easily recognized figure of my chum. But he was a second or two too late this time. Corporal Sellar was not to be caught. He reached the foot of the sungur first; and then there appeared on the crest of it a figure which seemed gigantic, as, with flowing robes streaming in the wind, and uplifted arms, he dashed down a heavy stone on to the luckless corporal, and sent him, doubled up in a heap, many yards down the hillside. What followed I did not see; but every Afghan died a soldier's death, whilst Corporal Sellar picked himself up and won a soldier's reward—the Victoria cross. More than once have I discussed this little episode with Woodthorpe, and he admitted that for once he was thoroughly exhausted. During the fighting that took place round Kabul, whilst that never-to-be-forgotten December dragged on, Woodthorpe was always to the front, and once had his clothes torn by a bullet and was again slightly wounded, but he was never ill, and never lost that contagious cheeriness which lightened those gloomy days like sunshine. A well-deserved brevet lieut.-colonelcy rewarded him for his share in the second phase of the Afghan campaign.

There are people who maintain that physical courage in action is a useful idiosyncrasy much to be encouraged amongst soldiers, but that it fails to prove the existence of any moral force of character; so I will add another little story.

Woodthorpe was alone this time—alone and deserted by most of his servants in a pestiferous jungle—when cholera gripped his camp. There was no sustaining excitement now, and he feared cholera personally with a deadly fear. There was no doctor, and he could get no assistance, so he worked by himself amongst his dying coolies; and if he could not stay the terrible enemy, he waited till the end, and then sewed the bodies up in coarse sackcloth *with his own hands*, and buried them. Dead or alive, he would not desert his coolies, and yet it is not too much to say that they were drawn from the scum of Assam. He "funked" the cholera, as he said, and of course he got it. Having got it, he told me that he funked it no longer—and he got over it.

BRITISH LIBRARY

It is impossible to write the life-history of a man whose whole career was one of incident and adventure within the short limits that are suitable to this journal; but I must include an account that has been sent me by Colonel Macgregor, C.B., D.S.O., referring chiefly to Woodthorpe's work on the Assam and Burmese frontier. Colonel MacGregor writes as follows: "Early in 1875 we were associated together in the expedition against the Eastern Nagas, to the south of Jeypore, on the left hand of the Brahmaputra river. These hill men had treacherously attacked a survey party under Captain Badgely and Lieut. Holcombe, killing the latter, and severely injuring the former. In this expedition Woodthorpe was ever to the fore, fighting, reconnoitring, and engineering, and in the taking of the enemy's position at Ninu Niau and Sannoa, was of the greatest assistance to the commander of the expedition (the late General Sir J. M. Nuttall, K.C.B.). I well remember how ready he was to share the contents of his water-bottle with me (when I had finished mine) in many a steep climb, and in this, as in numerous other ways, he showed his unselfishness and kindness of heart. In the cold season of 1883–84 Woodthorpe was employed in the Aka expedition to the north of Tezpur, on the right bank of the Brahmaputra, and was of the greatest service to General R. Sale-Hill, C.B., who acknowledged his indebtedness very handsomely in his despatches. On one occasion I remember seeing Woodthorpe cross over, by himself, the Maj Boreli river by means of an Aka cane cradle bridge in order that he might reconnoitre the opposite bank. It was a most risky thing to do, but "little Woodthorpe" never paused to count the cost before executing any deed of daring. In the Aka expedition I had the pleasure of accompanying him in all his reconnaissances, and we had very exciting experiences. Once (it was New Year's Day) we had two Gurkhas with us, and one had been shot in the neck by an (aconite) poisoned arrow. Woodthorpe scooped out the place with his pocket-knife and sucked the wound, and said, 'We will see the wounded man through the business' (after a hand-grip we heard the Akas yelling in the wood round us, and thought it was nearly 'all up'). Woodthorpe disposed our little party of four behind two trees, and we awaited the expected attack; luckily for us probably, the hill men thought better of it and dispersed. On another occasion Colonel H. St. P. Maxwell, C.S.I. (the political officer), Woodthorpe, and I were ascending a hill in single file, when we heard Akas above us cutting away at the canes and creepers which held together a 'shoot' of rocks. Woodthorpe dashed by me up the mountain-side with the view of stopping the cutting and saving our party, and he succeeded in doing so. In the winter of 1884–85 Woodthorpe explored the country to the south-east of Sadya, in the Upper Assam, and I had the good fortune to accompany him. We followed the course of the Noa Dihing, and then struck across the mountains (where, at an altitude of nearly 10,000 feet, we had to wade through snow), and, descending with four Gurkhas into the fertile valley inhabited by the Bor Kamptis, finally reached the Namkiu (the western branch of the Irrawadi), and Woodthorpe practically settled the much-vexed question of the source of the Irrawadi river (though some of the admirers of the intrepid traveller Prince Henri of Orleans afterwards gave the prince the entire credit of discovering the source, because he had crossed the eastern branch of the river). Woodthorpe's party eventually returned to Assam over the Patkoi range to the north-east of the Hukong valley, after many privations and hardships. Woodthorpe was ever cheery and hearty, and difficulties with him disappeared as if by magic almost as soon as they arose. On one occasion we were 'brought up' sharp by a swollen river running deep and rapid. Under Woodthorpe's supervision, we made a raft of plantain trees with creepers to lash the raft together (the only material available), and crossed over our little party without loss, though the Gurkha soldiers and Khasiâ coolies

were weak and faint (having had no food for nearly two days!). Woodthorpe took the raft across himself every trip (only one passenger could go at a time, as the plantain trees were so heavy and sunk more than a foot under water), and, as usual, worked like a Trojan. On another occasion he made us fell a tree across a deep and rushing mountain torrent, and, rigging up a hand-rail of cane, we crossed safely. Once we were very hard up for food, and saw no prospect of obtaining any. Woodthorpe recollected he had a few dynamite cartridges, so he went on a river in a little Berthon boat, and, exploding the cartridges by the aid of some Bickford's fuses, obtained a plentiful supply of fish, and so saved the situation. I could quote very many instances of the skill, readiness, pluck, and resource of my friend, and it gives me now the greatest pleasure to look back upon the happy and exciting times we have had together.

Colonel H. Godwin-Austen, F.R.S., in his paper read before the British Association at Aberdeen in 1885, on Woodthorpe's expedition from Assam to the Irrawadi, said, "Colonel Woodthorpe possesses all the qualifications that make the successful explorer. Great powers of endurance and observation, zeal for his work, brave but cautious, a talented draughtsman, and last, but not least, the tact to make himself liked by the people of the country." Colonel Sir H. Yule, in the discussion that followed the reading of my paper in 1886 on Woodthorpe's expedition before the Royal Geographical Society, said, "I am delighted to hear the testimony which Major Macgregor has borne with regard to his fellow-traveller, Colonel Woodthorpe, an officer with whose remarkable enterprises I have been much impressed for the last seven or eight years. Colonel Woodthorpe has made several remarkable journeys to the north-east of India; but his explorations have not been confined to that region. He has just returned from a journey in the extreme north-west beyond the British frontier, through passes which have never before been trodden by any European (exploration beyond Gilghit with General Sir William Lockhart). Colonel Woodthorpe has been an explorer in the regions of the sources of the Irrawadi and of the Oxus." On the same occasion, General J. T. Walker (late Surveyor-General of India) said, "Colonel Woodthorpe is one of the ablest and best officers in a department which contains many and excellent men."

In 1885–86 he followed the fortunes of an officer (Sir William Lockhart, who will shortly return to India as the third commander-in-chief, whose friendship and regard Woodthorpe had the good fortune to win) in the hazardous opening-up of friendly tribal relations, and the exploration of routes north of Chitral during the progress of the Afghan Boundary Commission under Sir Peter Lumsden. Sir William Lockhart knows well what his services were on that occasion; his patient, untiring devotion to duty as surveyor of the expedition in face of difficulties that would have paralyzed the courage and swamped the endurance of any ordinary man. Years afterwards, under very different circumstances, the opportunity occurred of testing the accuracy of the work so accomplished by more rigorous methods which the general advance of scientific surveys in these regions rendered feasible. I can only say that I have never ceased to marvel at the completeness and thoroughness of Woodthorpe's results, knowing well what he had to face in order to secure them.

On February 15, 1889, he was appointed by Lord Roberts chief of the Intelligence Branch of the Q.M.G.'s Department in India. No better selection could apparently have been made. The Indian Intelligence system is entirely different to that of England. In England, Intelligence officers can always work on the assured basis of sound maps. In India, both sound topography and general ethnological information have first to be secured by the Survey Department before

the Intelligence officer can graft his theories thereon; and thus the appointment of a survey officer of Colonel Woodthorpe's experience was entirely *apropos* to the requirements of the office. But the close daily routine of office life was not altogether congenial to his adventurous spirit, and he doubtless grew rather impatient of a system which kept him chained to a desk, and in which (as he said) he was the last officer to learn anything new. Independence of opinion is not always welcome in India, and Woodthorpe's views failed to accord with those of his military superiors. A reduction in the status of the office sent Woodthorpe back to his old love and his old life in the Survey. The change might have been altogether for his happiness, but that he accepted it as a reflection on his official capacity. There is no doubt that it affected him greatly, and to his many friends there certainly seemed to have been a want of appreciation of his brilliant services in the nature of those proceedings by which his retransfer was effected.

In the autumn of last year he was appointed Deputy Surveyor-General, which appointment he retained to the day of his death.

If there was one of his characteristics more than another which appealed to his friends, it was his unfailing spirit of genial good-fellowship. His was a cheeriness which spread in ripples around him, and influenced all who fell within its reach. No man could feel "sorry for himself" long in Woodthorpe's company. Such a spirit as this makes more for the final sum of the world's happiness, perhaps, than many of the arts and graces which adorn it. Not that Woodthorpe was insensible to the arts and graces either, for his love of painting amounted almost to devotion, and his accumulated store of life-illustrations is a legacy of which his family must be proud. But he was essentially a man of warm-hearted impulses, and nothing was too much for his generosity—no sacrifice too great for him to make in the interests of a friend.

The world is the poorer for his loss—as much the poorer as generous, true-hearted spirits like his are rare. What the loss to his relations must be it is not for me to say. Woodthorpe never married. He devoted himself with a single-hearted purpose to the interests of those dear to him, who, less happy than he, were not so well able to help themselves. May he rest in peace! He has left many behind who will ever keep his memory green, for we feel that, "taking him for all in all, we ne'er shall look upon his like again."

MEETINGS OF THE ROYAL GEOGRAPHICAL SOCIETY, SESSION 1897-1898.

Afternoon Technical Meeting, Monday, June 27, *at* 4.30 *p.m.*—Sir CLEMENTS MARKHAM, K.C.B., President, in the Chair.

The Paper read was:—

"On a proposed Great Globe on a scale of 1:500,000." By Prof. Elisée Reclus.

GEOGRAPHICAL LITERATURE OF THE MONTH.

Additions to the Library.

By HUGH ROBERT MILL, D.Sc., *Librarian*, R.G.S.

THE following abbreviations of nouns and the adjectives derived from them are employed to indicate the source of articles from other publications. Geographical names are in each case written in full:—

A. = Academy, Academie, Akademie.
Ann. = Annals, Annales, Annalen.
B. = Bulletin, Bollettino, Boletim.
Com. = Commerce, Commercial.
C. Rd. = Comptes Rendus.
Erdk. = Erdkunde.
G. = Geography, Geographie, Geografia.
Ges. = Gesellschaft.
I. = Institute, Institution.
Iz. = Izvestiya.
J. = Journal.
M. = Mitteilungen.
Mag. = Magazine.
P. = Proceedings.
R. = Royal.
Rev. = Review, Revue, Revista.
S. = Society, Société, Selskab.
Sitzb. = Sitzungsbericht.
T. = Transactions.
V. = Verein.
Verh. = Verhandlungen.
W. = Wissenschaft, and compounds.
Z. = Zeitschrift.
Zap. = Zapiski.

On account of the ambiguity of the words *octavo*, *quarto*, etc., the size of books in the list below is denoted by the length and breadth of the cover in inches to the nearest half-inch. The size of the *Journal* is 10 × 6½.

EUROPE.

Sweden—Lake Mälar. *Ymer* (1897): 281–291. **Nerman.**

Några anteckningar om Mälaren och dess vattenstånd. Af Gustaf Nerman.

Sweden— Norrland. **Andersson.**

Den inre omflyttningen. I. Norrland-Akademisk Afhandling . . . af Theophil Andersson. Malmö, 1897. Size 9½ × 6½, pp. 60 and xxv. *Presented by the University of Upsala.*

On the movements of population in Norrland.

Sweden—Upsala. *Meteorolog. Z.* **14** (1897): 393–405. **Westman.**

Die Luftströmungen an der Erdoberfläche zu Upsala, 1891–1895. Von Dr. J. Westman.

On the winds at Upsala, discussed in all the bearings of meteorology.

Switzerland. *Globus* **73** (1898): 277–278. **Halbfass.**

Die Gemeinde Obersaxen, eine deutsche Sprachinsel im romanischen Vorderrheinthal. Von Dr. Halbfass.

Obersaxen is a German-speaking commune in the canton of Graubünden, in the midst of the Romanch-speaking districts.

Switzerland. ——

Les inondations et le reboisement de nos montagnes. La Société des forestiers suisses aux autorités fédérales, cantonales et communales. (Traduction.) Berne: Imp. Michel & Buckler, 1898. Size 9 × 6½, pp. 20. *Illustrations.*

Switzerland. *Rev. G.* **42** (1898): 284–287. **Corcelle.**

Le tunnel du Simplon. Par J. Corcelle.

The effect of the St. Gothard tunnel is said to have been a serious loss to France by the diversion of continental traffic from Marseilles to Genoa. The Simplon tunnel now in progress is anticipated to have a similar result.

Switzerland—Valais. *Rev. Scientifique* **9** (1898): 143–144. **Regnault.**

La langue française dans le Valais. Par M. Félix Regnault.

Turkey and Greece—Boundary. *Deutsche Rundschau G.* **20** (1898): 225–226. ——

Die neue Grenze zwischen der Türkei und Griechenland. *With Map.*

The map is remarkably clear, showing distinctly the areas ceded by Greece to Turkey.

مكتبة قطر الوطنية
Qatar National Library

United Kingdom. *J.R. Statistical S.* **61** (1898): 49–82. **Cannan.**

Demographic Statistics of the United Kingdom: their want of Correlation and other Defects. By Edward Cannan, M.A.

This paper deals critically with the movement of populations as expressed in the Registrar-General's returns, the composition of the population by nationality as dealt with in the immigration and emigration returns, and internal migration as dealt with in the census reports.

United Kingdom—England. **Phillimore and Whitear.**

Historical Collections relating to Chiswick. Edited by W. P. W. Phillimore and W. H. Whitear. London: Phillimore & Co., 1897. Size 8½ × 6, pp. 306. *Illustrations and Map.*

This book touches upon the meaning and origin of the place-names in the neighbourhood of Chiswick.

United Kingdom—England. **Reed.**

A Handbook to the Geology of Cambridgeshire, for the use of Students. By F. R. Cowper Reed, M.A. Cambridge: The University Press, 1897. Size 7½ × 5½, pp. xii. and 276. *Sections. Price 7s. 6d. Presented by the Publishers.*

This is an admirable exposition of the geology of the country around Cambridge, prefaced by a short account of the physical geography of the locality, which will be referred to in the Monthly Record.

United Kingdom—England. **Williams, Eliot, Meade-King.**

P.I. Civil Engineers **131** (1898): 14–99.

The Manchester Ship-Canal. By Sir E. L. Williams. *Five Plates.* Ditto: Mersey Estuary Embankments.—Eastham Division. By W. Eliot. Ditto: Mersey Estuary Embankments and other Works.—Runcorn Division. By Sir E. L. Williams. Ditto: Irlam Division. By W. O. E. Meade-King. Discussion and Correspondence on ditto. *Three Cuts.*

United Kingdom—England. **Hay and Fitzmaurice.**

P.I. Civil Engineers **130** (1897): 50–98.

The Blackwall Tunnel. By David Hay and Maurice Fitzmaurice. *With Plans.*

A tunnel to connect Tilbury with Gravesend was commenced in 1798, and one between Limehouse and Rotherhithe in 1805, but both were abandoned. Brunel's brick tunnel under the Thames between Wapping and Rotherhithe was commenced in 1825 and finished in 1842. The only other tunnel beneath the Thames below London Bridge was the Tower sub-way, opened in 1869. The Blackwall tunnel Act was obtained in 1887, work was commenced in 1891, and the tunnel from Blackwall to Greenwich, of a total length of 6200 feet (1200 feet of which are under the river), was opened for foot passengers and vehicles in 1897. The tunnel in one place is only 5 feet below the bed of the river. It is lined throughout with white glazed bricks, and lighted by electricity.

United Kingdom—England. **Inglis.**

The "Contour" Road Book of England (Northern Division). A Series of Elevation Plans of the Roads, with Measurements and Descriptive Letterpress. By Harry R. G. Inglis. London: Gall & Inglis, 1897. Size 6½ × 4, pp. xxx. and 240. *Maps and Diagrams. Price 3s. 6d. Presented by the Publishers.*

A clear and serviceable guide to cyclists, showing the "ups and downs" of the principal roads in the north of England. The book is very compact and light, so as to be easily carried in the pocket.

United Kingdom—England. **Graham.**

The English Township. By T. H. B. Graham. From the *Gentleman's Magazine*, March, 1898, pp. 252–268. London: Chatto & Windus. Size 9 × 6.

A note on the district of Ditmarsh, between the Elbe and Eider, followed by a history of the origin of the English townships from the early Teutonic village lands.

United Kingdom—England. *Nineteenth Century* **43** (1898): 431–447. **Jessopp.**

Parish Life in England before the Great Pillage. By the Rev. Dr. A. Jessopp.

United Kingdom—England. *Quarterly J.R. Meteorolog. S.* **24** (1898): 42–50. **Marriott.**

The Rainfall of Seathwaite, Borrowdale, Cumberland. By William Marriott. *With Map and Illustrations.*

A note on this paper was given in the Monthly Record for June, vol. xi. p. 663.

BRITISH LIBRARY

United Kingdom—England. *Quarterly J.R. Meteorolog. S.* **24** (1898): 31–41. **Mossman.**
Daily Values of Non-Instrumental Meteorological Phenomena in London, 1763–1896. By R. C. Mossman. *With Diagrams.*

A note on this paper was given in the Monthly Record for June, vol. xi. p. 662.

United Kingdom—England. *Fortnightly Rev.* **63** (1898): 479–485. **Warren.**
The Westminster "Improvement" Scheme. By E. P. Warren. *With Plan.*

The plan shows the projected rebuilding of part of Westminster, the bill to authorize which has failed to pass the House of Commons.

United Kingdom—Ethnography. *British Assoc. Reports* (1897): 452–512. ———
Ethnographical Survey of the United Kingdom. Fifth Report of the Committee.

This report contains a further report on the Folklore of Galloway by the late Rev. Walter Gregor, reports of the ethnographical surveys in Wigtonshire, Kircudbrightshire, and East Anglia, and anthropometric notes relating to Aberdeen, Banffshire, the isle of Lewis, and Cleckheaton in Yorkshire, concluding with a report on the ethnographic survey of Ireland.

United Kingdom—Food-supply. *Nineteenth Century* **43** (1898): 879–889. **Marston.**
Our Urgent Need of a Reserve of Wheat. By R. B. Marston. *With Diagram.*

United Kingdom—Geology. *T. Edinburgh Geolog. S.* **7** (1897): 203–222. **Goodchild.**
Desert Conditions in Britain. An Address to the Geological Society of Edinburgh, at their Opening Meeting on November 19, 1896. By J. G. Goodchild. *With Plate.*

This was referred to in the Monthly Record for June, vol. xi. p. 662.

United Kingdom—Geological. *British Assoc. Reports* (1897): 298–332. **Watts.**
Photographs of Geological Interest in the United Kingdom.—Eighth Report of the Committee.

The work of this committee has been carried on energetically, 364 new photographs of geological interest having been added within the year 1896–97, and the whole collection, which is preserved in the Jermyn Street Museum, now includes 1751, dealing with the various divisions of the country as follows: England, 1027; Wales, 122; Channel Islands, 14; Isle of Man, 30; Scotland, 166; Ireland, 342; and typical rock structures, 50.

United Kingdom—Ireland. **Gardiner and Reynolds.**
Quarterly J. Geolog. S. **54** (1898): 135–148.
The Bala Beds and Associated Igneous Rocks of Lambay Island, co. Dublin. By C. I. Gardiner and S. H. Reynolds. *With Map and Sections.*

A geological map of Lambay island is given on the scale of 4 inches to the mile.

United Kingdom—Ireland. *T.R. Irish A.* **31** (1897): 23–38. **Coffey.**
Notes on the Prehistoric Cemetery of Loughcrew, with Fasciculus of Photographic Illustrations of the Sepulchral Cairns. By George Coffey.

United Kingdom—Ireland. *P.R. Dublin S.* **8** (1897): 421–431. **Kilroe.**
The Distribution of Drift in Ireland in its relation to Agriculture. By J. R. Kilroe. *With Map.*

United Kingdom—Ireland. *P.R. Dublin S.* **8** (1897): 475–507. **Praeger and Sollas.**
Report of the Committee . . . appointed by the Royal Dublin Society to investigate the recent Bog-flow in Kerry. Drawn up by R. Lloyd Praeger and Prof. Sollas. *With Plates.*

United Kingdom—Meteorology. ———

United Kingdom—Ordnance Survey Maps. ———

Board of Agriculture. Ordnance Survey Maps. I. Copies of Three Contracts entered into by the Board of Agriculture, with the Agents appointed for the Sale of Ordnance Survey Maps in London, Edinburgh, and Dublin. II. Copy of the Conditions upon which Agents are appointed in Provincial Towns. III. List of the Agents appointed in England and Wales, Scotland, and Ireland. IV. List of Post Offices at which Ordnance Survey Maps may be ordered. London: Eyre & Spottiswoode, 1897. Size 13 × 8½, pp. 16. *Price* 2*d.*

United Kingdom—Scotland. *P.R.S. Edinburgh* **21** (1897): 105-115. **Mossman.**

On the Seasonal Death-rate from Certain Diseases in Edinburgh during the Period 1878-94, with Remarks on the Relation between Weather and Mortality. By R. C. Mossman. *With Plate.*

United Kingdom—Scotland. **White.**

The Flora of Perthshire. By Francis Buchanan W. White. Edited with an Introduction and Life of the Author, a list of his Scientific publications, and an Appendix. By James W. H. Trail. Edinburgh: Printed for the Perthshire Society of Natural Science by W. Blackwood & Sons, 1898. Size 7½ × 5½, pp. lx. and 408. *Portrait and Map. Price* 7*s.* 6*d. Presented by the Publishers.*

The geographical part of the late Dr. Buchanan White's discussion of the flora of Perth includes the careful subdivision of that county into natural districts, in each of which the distribution of the indigenous plants could be considered. The book forms an important contribution to the slowly accumulating material for a complete geographical description of the British Islands.

United Kingdom—Scotland. **Mossman.**

T.R.S. Edinburgh **38** (1896): 681–756; **39** (1897): 63–208.

The Meteorology of Edinburgh. Parts i. and ii. By Robert C. Mossman. *With Plates. Presented by the Author.*

This monument of laborious compilation brings together a connected series of carefully discussed statistics of the meteorological conditions of Edinburgh for over one hundred years. Not only are instrumental observations discussed, but such observations as the number of days with rain or snow, the occurrence of thunderstorms, etc., are carefully recorded.

United Kingdom—Scotland. **Burns.**

The Coinage of Scotland. Illustrated from the cabinet of Thomas Coats, Esq., of Ferguslie, and other Collections. By Edward Burns, F.S.A. SCOT. 3 vols. Edinburgh: A. & C. Black, 1887. Size 12½ × 10, pp. (vol. i.) xxiv. and 366; (vol. ii.) xviii. and 556; (vol. iii.) *Plates. Presented by the Family of the late Mr. Coats.*

These splendid volumes describe and figure the finest collection of Scottish coins ever brought together, with specimens from other collections, which make the monograph absolutely complete.

United Kingdom—Scotland. *P.I. Civil Engineers* **130** (1897): 276-297. **Kinipple.**

Greenock Harbour. By W. R. Kinipple. *With Plan.*

An account of new harbour works at Greenock, accompanied by a note on the growth of the port.

United Kingdom—Tide Tables. **Harris and Goalen.**

Tide Tables for the British and Irish Ports for the year 1898; also the times and heights of High Water at full and change for the principal places on the Globe. By Captains H. R. Harris and W. N. Goalen. London: J. D. Potter. Size 10 × 6½, pp. xi. and 262. *Presented by the Hydrographer.*

United Kingdom—Wales. *Quarterly J. Geolog. S.* **54** (1898): 119–134. **Pollen.**

Exploration of Ty Newydd Caves, Tremeirchion, North Wales. By the Rev. G. C. H. Pollen, S.J. *With Plan and Sections.*

Russian Turkestan. *Globus* **73** (1898): 268–272. **Vambéry.**

Bilder aus Russisch-Turkestan und Ferghana. Von H. Vambéry. *With Illustrations.*

Siam. **Smyth.**

Five Years in Siam, from 1891 to 1896. By H. Warington Smyth. 2 vols. London: John Murray, 1898. Size 8½ × 5½, pp. (vol. i.) [16] and 330; (vol. ii.) [10] and 338. *Maps and Illustrations. Price* 24*s. Presented by the Publisher.*

These volumes present in a handsome form the results of Mr. Warington Smyth's numerous adventurous journeys in Siam, which have, in part, already been described in the *Geographical Journal* and the extra publications of the Society. The descriptions of travel are supplemented by general chapters on Siamese history and politics, and by a collection of valuable appendices dealing with commercial statistics, natural phenomena, Siamese music and musical instruments. The book is beautifully illustrated by the author's sketches and from photographs.

Siam. **Young.**

The Kingdom of the Yellow Robe. Being Sketches of the Domestic and Religious Rites and Ceremonies of the Siamese. By Ernest Young. With Illustrations by E. A. Norbury. London: A. Constable & Co., 1898. Size 10 × 7, pp. xiv. and 400. *Price* 15*s. Presented by the Publishers.*

This deals with the people of Siam on the basis of several years' residence in Bangkok and much reading. The life and customs of the people are first considered, then the amusements, the predominant industry of rice-growing, which has a chapter to itself, the laws, and ceremonies for the dying and dead. A very full account is given of the temples and the religion of Siam, and the whole concludes with a chapter devoted to elephants. There are numerous illustrations from photographs and sketches.

Siam. *Imp. and Asiatic Quarterly Rev.* **5** (1898): 145–163. **Gerini.**

Shan and Siam. By Capt. G. E. Gerini.

A controversial discussion of the names *Shan* and *Siam*, and of some points in the history of Siam.

Mission Voulet-Chanoine au Mossi et au Gourounsi (1896–1897). Jonction du Soudan au Dahomey. Objet et marche de la mission, résultats obtenus; le pays et ses habitants.

NORTH AMERICA.

Bermuda. **Cole.**
Bulletin of Bibliography Pamphlets. No. 2. Bermuda in Periodical Literature. A Bibliography. By George Watson Cole. Boston: the Boston Book Co., 1898. Size 6 × 4½, pp. 26. *Presented by the Author.*
An interesting collection of the titles of magazine articles on Bermuda, with occasional editorial notes. The entries range in date from 1664 (*Phil. Trans.*) to 1897.

Canada. ———
Annual Report of the Department of the Interior for the Year 1897. Ottawa, 1898. Size 10 × 6½, pp. [596]. *Plates and Maps.*
This report deals with the Dominion lands, the Dominion land-surveys, irrigation, immigration, together with special reports on the North-West Territories, Keewatin, the Rocky Mountains Park, and the Swan River valley.

Canada—Alberta. *Appalachia* **8** (1898): 320–327. **Thompson.**
At the Headwaters of the Bow. By Charles S. Thompson. *With Illustrations.*

Canada—British Columbia. ———
Annual Report of the Minister of Mines for the Year ending December 31, 1897, being an account of Mining Operations for Gold, Coal, etc., in the Province of British Columbia. Victoria, B.C., 1898. Size 10½ × 7½, pp. 449–640. *Map and Plates.*
Photographs are given of a number of the mines, the working of which is fully described.

Canada—British Columbia. *Appalachia* **8** (1898): 327–336. **Habel.**
The North Fork of the Wapta. By Jean Habel. *With Illustrations.*

Canada—Ethnological Survey. *British Assoc. Reports* (1897): 440–451. ———
An Ethnological Survey of Canada. First Report of the Committee.
This report describes the methods by which an ethnological survey of Canada is proposed to be carried out, and includes two appendices: one on the growth of Toronto children, by Franz Boas; the other on the origin of the French Canadians, by B. Sulte, discussing the parts of France from which the ancestors of the present French-speaking population came.

Canada—Historical. *P. & T.R.S. Canada* **2** (1896) (sect. i.): 35–58. **Gosselin.**
Quelques observations à propos du voyage du P. le Jeune au Canada en 1660, et du prétendu voyage de M. de Queylus en 1664. Par M. l'Abbé Gosselin.

BRITISH LIBRARY

Canada—New Brunswick. **Ganong.**
A Monograph of the Cartography of the Province of New Brunswick. By W. F. Ganong, M.A., PH.D. (From the *Transactions* of the Royal Society of Canada. Second Series—1897–98. Vol. ii. sect. ii.) Ottawa: J. Durie & Son, 1897. Size 10 × 7, pp. 313–428. *Maps. Presented by the Author.*

After a general discussion of the character of old maps and the method of studying them, the maps of New Brunswick are considered as belonging to eight different types arranged chronologically; from the "Pre-differentiation type" of 1500 to 1534, to the "Exact type," which, for New Brunswick, does not yet exist. There are lists of maps and a bibliography as appendices.

Canada—North-West Territory. *National G. Mag.* **9** (1898): 105–112. **Scidmore.**
The North-West Passes to the Yukon. By Eliza Ruhamah Scidmore. *With Illustrations.*

Historical notes on the various crossings of the passes of the Coast range into the Yukon district and Alaska.

Canada—Nova Scotia. *P. & T.R.S. Canada* **2** (1896) (sect. iv.): 167–179. **Gilpin.**
Coal-Mining in Pictou County. By E. Gilpin, junr., LL.D. *With Map.*
A history of coal-mining in Nova Scotia.

Canada—St. Lawrence. **Dawson.**
Character and Progress of the Tides in Gulf and River St. Lawrence as ascertained by simultaneous observations with self-registering Tide-Gauges. By W. Bell Dawson. (From the *Transactions* of the Royal Society of Canada. Second Series—1897–98. Vol. iii. sect. iii. Mathematical, Physical, and Chemical Sciences.) Ottawa: J. Durie & Son, 1897. Size 10 × 7, pp. 51–68. *Chart and Diagrams.*

Canada—Tides and Currents. **Dawson.**
Survey of Tides and Currents in Canadian Waters. Report of Progress by W. Bell Dawson. Ottawa, 1898. Size 10 × 7, pp. 16. *Map and Diagrams.*

Canada—Yukon District. *National G. Mag.* **9** (1898): 113–116. **Garland.**
Overland Routes to the Klondike. By Hamlin Garland. *With Illustration.*
The routes considered are from Edmonton, and the old telegraph trail up the Fraser river from Ashcroft, or Kamloops, concerning all of which information is scanty.

Canada—Yukon Goldfields. *National G. Mag.* **9** (1898): 117–120. **Dall.**
The Future of the Yukon Goldfields. By Prof. William H. Dall.
The future considered is the very immediate one of next winter, the paper dealing with the disparity between the number of miners reaching Klondike and the possible transportation for their necessary supplies.

Historical—Cabot. *P. & T.R.S. Canada* **2** (1896) (sect. ii.): 3–30. **Dawson.**
The Voyages of the Cabots in 1497 and 1498. A sequel to a paper in the *Transactions* of 1894. By Samuel Edward Dawson. *With Maps and Illustration.*

Mexico—Lower California. **Merrill.**
Smithsonian Institution. United States National Museum. Notes on the Geology and Natural History of the Peninsula of Lower California. By George P. Merrill. From the Report of the U.S. National Museum for 1895, pp. 969–994. *With Ten Plates.* Washington, 1897. Size 10 × 6½.

Mexico—Orizaba. *Appalachia* **8** (1898): 350–355. **Cogshall.**
A Trip to the Summit of Orizaba. By W. A. Cogshall. *With Illustration.*

Mexico—Orizaba and Popocatepetl. *Appalachia* **8** (1898): 356–361. **Douglass.**
The Altitudes of Orizaba and Popocatepetl. By A. E. Douglass.

United States—California. *American J. Sci.* **5** (1898): 355–375. **Ransome.**
Some Lava Flows of the Western Slope of the Sierra Nevada, California. By F. Leslie Ransome. *With Maps.*

United States—Cliff Dwellings. *B. American G.S.* **30** (1898): 111–123. **Mindeleff.**
Origin of the Cliff Dwellings. By Cosmos Mindeleff.

BRITISH LIBRARY

United States—Massachusetts. **Marindin.**
Tables of Cross Sections on the North Shores of Nantucket and Martha's Vineyard, Massachusetts. By H. L. Marindin. Report of the Superintendent of the U.S. Coast and Geodetic Survey, showing the progress of the work during the Fiscal Year ending with June, 1896. Pp. 305–346. Washington, 1897. Size 12 × 9½.
These measurements were made with the object of determining the position of the shore-line as a measure of past erosion, and as a standard from which future erosion may be calculated.

United States—Michigan. *Science* **7** (1898): 577–585. **Spalding.**
A Natural History Survey of Michigan. By Prof. V. M. Spalding.
Historical account of the natural history survey of Michigan.

United States—Ozark Region. *Science* **7** (1898): 588–589. **Keyes.**
The Myth of the Ozark Isle. By Dr. Charles R. Keyes.
The outcrop of the dome-like Ozark Uplift of ancient rocks in the midst of the more recent sediments of the Mississippi Basin, has been held to prove the existence of an island in the Palæozoic ocean which had never since been submerged; but the author points out evidence of the phenomenon being due to a comparatively recent uplift followed by extensive denudation.

United States—Pennsylvania. **Bascom.**
Department of the Interior. Bulletin of the United States Geological Survey. No. 136. The Ancient Volcanic Rocks of South Mountain, Pennsylvania. By Florence Bascom. Washington, 1896. Size 9½ × 6, pp. 124. *Maps and Plates. Presented by the Survey.*

United States—Sierra Nevada. **Turner.**
Further Contributions to the Geology of the Sierra Nevada. By H. W. Turner. Part i. Pp. 529–740. *Maps and Illustrations.* Washington, 1896. Size 12 × 8.
—Seventeenth Annual Report of the United States Geological Survey . . . 1895–96.

United States—Wisconsin. *J. Geology* **6** (1898): 182–192. **Squier.**
Studies in the Driftless Region of Wisconsin. II. By G. H. Squier. *With Sketch-Maps.*
On the character and origin of land-forms.

Washington and British Columbia. **Hodges.**
Mining in the Pacific North-West. A Complete Review of the Mineral Resources of Washington and British Columbia. Edited by L. K. Hodges. Seattle, 1897. Size 9 × 6, pp. 192. *Maps. Presented by the Editor.*

BRITISH LIBRARY

English of the Original Dutch Account, Published Eighteen years after the Massacre.] From the *Western Mail*, Christmas Number, 1897, pp. 3–11. Perth, W.A. Size 19 × 13½. *Map and Illustrations.*

Western Australia. *T. Edinburgh Geolog. S.* **7** (1897): 174–182. **Cadell.**

Some Geological Features of the Coast of Western Australia. By Henry M. Cadell, B.Sc.

The result of a visit to the Pilbarra goldfield, in the north-west of Western Australia, in 1895.

Western Australia. *Scottish G. Mag.* **14** (1898): 113–136. **Carnegie.**

Explorations in the Interior of Western Australia, between Coolgardie and Kimberley. By the Hon. David W. Carnegie. *With Map and Illustrations.*

This paper was also published in the *Journal* for March, p. 258. The map is, however, different; although on a smaller scale, it includes the whole of Western Australia, and the routes of other recent travellers.

POLAR REGIONS.

Greenland. *G. Tidskrift* **14** (1898): 116–123. **Ryberg.**

Fra Missions- og Handelstationen ved Angmagssalik. Af Carl Ryberg.

An account of the new Danish enterprise in establishing mission and trading station on the east coast of Greenland.

Greenland—Ice Conditions. *Petermanns M.* **44** (1898): 55–64. **Drygalski.**

Die Eisbewegung, ihre physikalischen Ursachen und ihre geographischen Wirkungen. Von Dr. Erich v. Drygalski. *With Illustrations.*

The article is founded on Dr. von Drygalski's great report on his Greenland expedition.

Spitsbergen. *Quarterly J. Geol. S.* **54** (1898): 197–227. **Garwood and Gregory.**

Contributions to the Glacial Geology of Spitsbergen. By E. J. Garwood, M.A., and J. W. Gregory, D.Sc. *With Map and Plates.*

This comprehensive paper treats of the glaciers of Spitsbergen and their action, the varieties of moraine produced by them, the action of marine ice in transporting material and in erosion, traces of former glaciations, and concludes with a series of general conclusions.

Spitsbergen. **Conway.**

With Ski and Sledge over Arctic Glaciers. By Sir Martin Conway. Illustrated from Photographs taken by E. J. Garwood. London: J. M. Dent & Co., 1898. Size 8 × 5½, pp. vi. and 240. *Map. Price 6s. Presented by the Publishers.*

Sir Martin Conway calls this book an appendix to that describing his first journey in Spitsbergen. He cordially recognizes the services of his companions by name in the preface, but kindly veils the identity of a hired Norwegian who was a hindrance. The geographical results of the expedition will be published in full in the *Journal*. The record of the journey is diversified by the historical associations of the now desolate country, which was formerly a summer rendezvous of thousands of whalers and hunters.

PHYSICAL AND BIOLOGICAL GEOGRAPHY.

Meteorology—Kites. *Globus* **73** (1898): 272–276. **Herrmann.**

Die Verwendung von Drachen zu wissenschaftlichen Zwecken. Von Dr. E. Herrmann. *With Illustrations.*

On the use of kites for scientific observations.

Oceanography. **Pettersson and Ekman.**

K. Svensk. Vet.-A. Handlingar **29** (1897): No. 5.

De hydrografiska förändringarne inom Nordsjöns och Östersjöns område under tiden 1893–1897. Af Otto Pettersson och Gustaf Ekman. *With Charts and Sections.* Pp. 1–126.

A discussion of the oceanographical conditions of the western Baltic and Gulf of Bothnia.
